| Sl. No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 8 | Total extend of land to be covered/built | | | 0.80 acre |
| 9 | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | | | 0.80 acre |
| 10 | Extend of Land to be remediated | | | 0.80 acre |
| 11 | Extend of land expected to be under green belt | | | 0.10 acre |
| 12 | Will the proposed project cause the following on Land / Soil: | | | |

| Sl. No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| (i) | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | ✓ | |
| (ii) | Substantial removal of Top Soil (mention area in sqm) | ✓ | | Presence of solid waste beneath the ground level combined with soil is to be excavated for bio-mining process.<br><br>Area-2832.79 |
| (iii) | Any degradation of land / eco-systems expected due to the project? | | ✓ | Leachate can be reused and treated. |
| (iv) | Loss or impacts on Cultural/heritage areas/properties | | ✓ | |
| (v) | Does the project activity involve cutting and filling/ blasting etc? | | ✓ | It is biomining of existing solid waste only. |
| (vi) | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | ✓ | | Waste heap is about 3.3 m above and 1.2 m below from Ground Level which is to be excavated. |
| (vii) | Will the project involve any quarrying/ mining etc? | | ✓ | |
| (viii) | Will the project / any of its component contaminate or pollute the Land? | | ✓ | Positive impact to the environment. |
| (ix) | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | ✓ | Positive impact to the environment. |
| (x) | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | ✓ | Positive impact to the environment. |

| Sl. No | Impacts on Air and Noise Environment | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 13 | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | ✓ | | The process of bioremediation may cause dust emission from process and vehicle movement which shall be managed using effective mitigative measures |
| 14 | Will the project cause or increase pollution due to GHG emissions? | ✓ | | Chances of GHG emissions due to un-stabilised waste. |
| 15 | Will the project cause or increase odor nuisance? | ✓ | | The process of bioremediation may cause odour emission as part of the which shall be managed using effective mitigation measures |
| 16 | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | ✓ | | Will depend on waste composition on the site & presence of any fuel, inflammable materials. |
| 17 | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | ✓ | | Anticipated increase in noise levels due to the vehicular movements and working of machineries like conveyors, trommels etc |

| Sl. No | Impacts on Water Environment | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 18 | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | ✓ | The site is a legacy dumpsite and the project shall reduce the leachate, runoff, waste depositions etc. Process will generate leachate. During rains, this might contaminate storm water, and site must be protected from erosion. |
| 19 | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | ✓ | | The natural stream is at a distance of 25m and HH are at a distance of 15 m from the Dumpsite. Proper leachate treatment and waste disposal is necessary. |
| 20 | Chances of Pollution of Water bodies/groundwater wells, nearby or downstream | ✓ | | The natural stream is at a distance of 25m. HH are at a distance of 15 m from the Dumpsite. Proper leachate treatment and waste disposal is necessary. |
| 21 | Will the activities proposed at the site(s) hinder natural drainage | | ✓ | |

| Sl. No | Impacts on Water Environment | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 22 | Will the activities proposed at the site(s) decrease permeability/rainwater percolation | | ✓ | Positive impact to the environment. |

| Sl. No | Impacts on Biodiversity and Host Communities | Yes | No | Details/Remarks |
|---|---|---|---|---|
| **23** | Will the project necessitates cutting of Trees / Loss of Vegetation | | ✓ | Not Required |
| **24** | Will the project necessitate substantial removal of Top Soil (mention area in sqm) | ✓ | | The legacy waste is combined with soil will be remediated<br><br>Area-2832.79 |
| **25** | Any degradation of land / eco-systems expected due to the project? | | ✓ | The proposed process of bio-mining ensures that there will be no degradation of the land |
| **26** | Will the project result in Health & Safety Risks in the neighbourhood including the release of toxic gases, leachate, accident risks | ✓ | | Residential area is within 15m. So depending on the waste composition at the site, these risks may be expected. |
| **28** | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | ✓ | | Yes. Residential area within 15m. And highway at a distance of 340m. |
| **29** | Potential disruption to common property, accessibility, traffic disruptions, conflicts, or disruption to the local community within the subproject area? | ✓ | | Yes. Residential area |

This Screening sheet must be completed for each of the proposed sites by respective cities/towns and forwarded to the Environment Specialist in Respective DPMU / SPMU along with the following enclosures.

**Enclosures:** Provide maps with the geographical location of the project; and an appropriately-scaled map clearly showing the project area and project sites with land use, existing buildings, infrastructure, vegetation, adjacent land use, utility lines, access roads, and any planned construction, and any other information to describe the project, locations and possible impact as required.(Location )

**Project Categorisation and Need for Safeguards Instruments, Oversight**

| **Project Category** | **E2** |
|---|---|
| **Key Reasons (for categorisation)** | **No sensitive areas nearby, not a large dumpsite.** |
| **Safeguards Instruments Required** | a) ~~E1: Project-specific EIA (impact assessment considering the project details & location) by Independent Consultant (with signed/sealed Screening~~ Form, Consultations, EMP, Budget, Responsibilities)<br>b) E2: Project-specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>~~c) E3: signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities~~ |
| **Additional Responsibilities Expected** (such as i) Specialists to be hired for Physical/Cultural resources, Natural Habitats/others, etc for EIA preparation, and/or supervision), ii) Consultations, iii) any other aspect | |

| **Status** | **Agency / Official** | **Name, Signature with Date and Seal** |
|---|---|---|
| **Prepared by** | PIU or ULB (project in-charge) | |

# ANNEXURE II FIRE RISK ASSESSMENT

## Objectives

The important elements of fire risk Management planning can be classified as:

- Identifying the disaster potential scenarios and advance planning to combat and minimize the damage.
- Vulnerable zone delineation.
- Assessment of loss probability and its severity.
- To deal with such emergencies expeditiously.
- •. Warning, protective actions like evacuation of personnel.
- To contain the disaster by isolating the area, firefighting etc.
- To make efforts to return to normal condition when the situation is controlled.

*Table 7.1 Causes of Fire and Risk*

| Ignition (heat) sources | Fuel Sources | Oxygen Sources |
|---|---|---|
| Lit cigarettes/ butts, matches, lighters<br>Improperly stored batteries<br>Bushfire<br>Self-heating piles<br>Hot loads/contaminated waste<br>Hot work operations<br>Arson<br>Lightning<br>Fires from neighbouring activities<br>Faulty electrical wires | Flammable liquids, gases and solids<br>Combustible goods and waste (e.g. CRWM*)<br>Contamination in CRWM storage<br>Dry and unmanaged vegetation | Oxidising chemicals such as oxy-acetylene sets, bleach, hydrogen peroxide, nitrates<br>Physical introduction of oxygen through unbaling or turning of loose piles |

## Fire Prevention & Management Plan

It is a strategy well evolved, organized and rehearsed to contain the adverse effects of a possible disaster. It aims to mobilize the internal resources and use these with minimal dependence on external agencies for the following purposes:

To control and contain incidents.

- To safeguard employees and people in the vicinity.
- To inform employees, the general public and the authorities about the hazards/risks assessed, safeguards provided, residual risk, if any, and the role to be played by them in the event of disaster.
- To effect rescue and treatment of casualties.
- To prevent recurrence of such a disaster.
- To establish machinery for review, rectification/modification of the emergency
- To ensure safety of workers before personnel re-enter and resume work.
- To work out a plan with all provisions to handle and to provide for emergency preparedness and the periodic rehearsal of the plan.

## Pre-Disaster Stage

The prevention of disaster is of vital importance and is the moral responsibility of each and every individual employed in the dumpsite site. It can be prevented by observance of precautionary and preventive measures. During pre-disaster stage following points will be followed to avert the occurrence of disaster:

The emergency operation procedures of the dumpsite site will be written down so that no confusion is caused in the event of an emergency taking place.

- To reduce the probabilities of accidental leakage of methane.
- Smoking will be prohibited in the areas where handling of dumpsite will be done. NO SMOKING boards will be prominently displayed in Local Language ie Malayalam and English languages.
- All electrical wiring, fittings, cables, equipment will be checked periodically. Temporary wiring will not be permitted to be installed inside the dumpsite area. No inflammable material including papers, Oils, wooden racks will be stored within 1 meter of any electrical fittings. No unauthorized person will be allowed to tamper with electrical fittings.
- Welding, Burning, cutting, Chipping, soldering work, etc will only be carried out by authorized persons.
- Necessary compliance with various Statutory Guidelines and other relevant instructions as issued from time to time will be done.
- The Safety Department will arrange to educate all concerned regarding operational hazards of non-compliance of the safety guidelines. They will also provide necessary

guidance and support in proper implementation of the program. They will also arrange mock exercises periodically.

- The Safety Department will display important telephone numbers and instructions, in Mizo & English languages. The Security Control Room located at the dumpsite site will be equipped with the following –
- Sufficient number of copies of On-Site Disaster/Emergency Management Plan.
- Master plan of the dumpsite site indicating vital locations and possible sources of disaster.
- Important Telephone numbers
- Emergency lights (portable) and Wireless sets if required and possible).
- First Aid boxes
- Stretchers, blankets and other essential items at the fire station under the charge of Fire Services Dep't

## Disaster Stage

The most probable disaster which may occur at the dumpsite site is because of accidental leakage and fire. To control leakage and fire the following measures/precautions will be taken at the dumpsite site:

The guidelines as given below for the protection of fire will be followed:

- The dumpsite's fire protection will consist of structural solutions, fire extinguishing systems and fire alarm systems. The fire extinguishing system will consist of the fire system with fire pumps, distribution pipelines, hydrants and fire hoses and the portable extinguishers.
- The fire alarm system will be a part of the primary systems and take care of the places which are unmanned or will not have any fixed fire extinguishing system.
- The major operation areas shall be equipped with fixed smoke detectors, CO2 extinguishers near the door in the control room.
- All the rooms in the office shall be equipped with fixed smoke detectors.
- The ventilation rooms shall be equipped with fixed smoke detectors. One CO2 extinguisher will be located near the door to the ventilation room.
- The fire alarm and detection system shall be designed, installed, maintained and tested according to relevant standards.

- The water for firefighting shall be stored in the fire water tank (water reservoir).
- CO2 fire extinguishers contain extinguishing carbon dioxide which either by it or under expected conditions of use gives off CO2 to prevent fire.
- Dry fire extinguishers contain an extinguishing medium which either by itself or under expected conditions of use will give fine powder to prevent fire to get oxygen.
- As soon as a fire takes place inside the premises of dumpsite, action to be taken by various persons/officials

## Post Disaster Stage

After the incident a report will be prepared regarding occurrence of event/losses incurred and recommendations thereof for restoration of normalcy

## Reporting of Accidents

Situation in totality will be studied thoroughly, investigated with respect to the cause of the incident, extent of loss of life and property and a detailed report prepared by the individual/team nominated by dumpsite site authorities for this purpose. Based on the investigation report, rescue team would finalize time bound programmes for implementation of corrective measures proposed and regularly monitor the progress thereafter. Rescue, medical and welfare operations would be continued by the concerned agencies.

## Executive Summary

Kayamkulam is a Municipality located in the Onattukara region of Alappuzha district. The primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing the dumping activities, this dumpsite remains as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Consequently, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project for the remediation of legacy waste dumpsites in all the ULBs of Kerala. As part of the project, in phase1 the existing dumpsite at Kayamkulam, Ward No. 22, Murikkumoodu was proposed for remediation.

The Kayamkulam Municipality has an area of 40.41 sq.km with 44 wards. The municipality, with the financial and technical support of KSWMP, has proposed to remediate the existing legacy waste dumpsite located in around 0.70 acres of land in ward 22, Murikkumoodu and to recover land for future developmental activities. The Murikkumoodu dumpsite was used for dumping municipal solid waste from the year 1980 The dumping of solid waste has been stopped since April 2023. Considering the impending threat of fire hazards and leachate issues, the Municipal Council has proposed the remediation of legacy dumpsite as a priority and to utilize the remediated land for setting up other solid waste management facilities.

The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. To assess the quantity & composition of legacy waste & also evaluate the environmental baseline of the dumpsite, samples from representative locations were collected and analyzed for various parameters viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Groundwater and Surface Water. As part of the study, detailed site investigations were carried out for; – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical and Environmental Analysis by M/s Poluchem laboratories.

From the results of the investigations, it was found that the waste was seen up to a depth of 1.2 m below Ground Level and with an average height of 3.3m above GL. The total estimated quantity of legacy waste is around 10261.02 Cum. (Above 9129 Cum + Below 1132 Cum)

As per the SWM Rules 2016, selection of an applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out, and based on the results, remediation can be done by a) Capping without land recovery, b) Bio-mining – reclamation/recovery of land & c) capping with partial land recovery. The selection of technology shall also depend on the available resources viz., manpower, machineries, money, and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for optimum land recovery and forward linkages/utilization of processed

aggregates/byproducts. Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, stationary trommel screening machineries shall be optimum for processing the legacy waste within the stipulated timeline of 31st March 2024.

Environmental & Social safeguards: The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project attracts moderate social risks based on the social mapping, transect walk and consultation with the people living around the proposed project site to assess the problems associated with the legacy waste dumpsite and the impact during the execution of the project.

An area of 0.70 acres will be reclaimed and will be utilized for setting up other solid waste management facilities. Total cost of the project is [redacted].

## 1. Introduction

The issue of municipal solid waste management in Urban India has become one of the foremost concerns during the last couple of decades.

The primary environmental issue currently faced by the municipal authorities in Kerala revolves around a longstanding existing legacy waste dumpsite. It has a long history of more than three decades of continuous dumping of both bio- and non- biodegradable wastes. Though the waste dumping activity has been stopped, the dumpsite remains as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Improper management of such sites pose significant environmental, social, and economic challenges for the communities and ecosystems in the vicinity.

In view of the environmental and social issues connected with dumpsites, the SWM Rules 2016, directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the remediation projects of legacy waste dumpsites in all the ULBs. As part of the project, in phase -1, the existing dumpsite of Kayamkulam ULB was proposed for remediation.

For arriving at a methodology for remediating the legacy waste in the dumpsites, as per the Project Implementation Manual, a feasibility study outlining the technical, economic, and socio- environmental factors has been carried out. As a result of the feasibility study that involved detailed field investigations & assessment, and market sounding, the method proposed for remediation of legacy waste dumpsite is biomining, which will ensure long-term sustainability and environmentally sound treatment, which is found technically feasible, economically viable, and socially acceptable. The details of various steps involved in the feasibility study are described in the following sections.

Kayamkulam municipality is experiencing issues with the treatment and disposal of MSW. The existing waste dumpsite at Kayamkulam (Murikkumoodu) needs to be remediated scientifically and the land reclaimed for productive use. The report is being prepared for the purpose of execution of closure of the dumpsite by Kayamkulam ULB. The site is close to a stream that eventually joins the Periyar River.

## 2. Profile of the ULB

### 2.1 Location

Kayamkulam is a town and municipality in the Onattukara region of Alappuzha district in Kerala. It is the second biggest town in Alappuzha district. It is located on the western coast of India and was an ancient maritime trading center. Kayamkulam is part of the Karthikappally tehsil. Krishnapuram Palace is located nearby. It is located at a distance of about 110 kms south from the state capital Thiruvananthapuram. It is one of the important commercial and tourist centre in the district.

Kayamkulam Municipality is located at latitude 9.173379" N and longitude 76.521623" E and is located as shown in Figure 1.

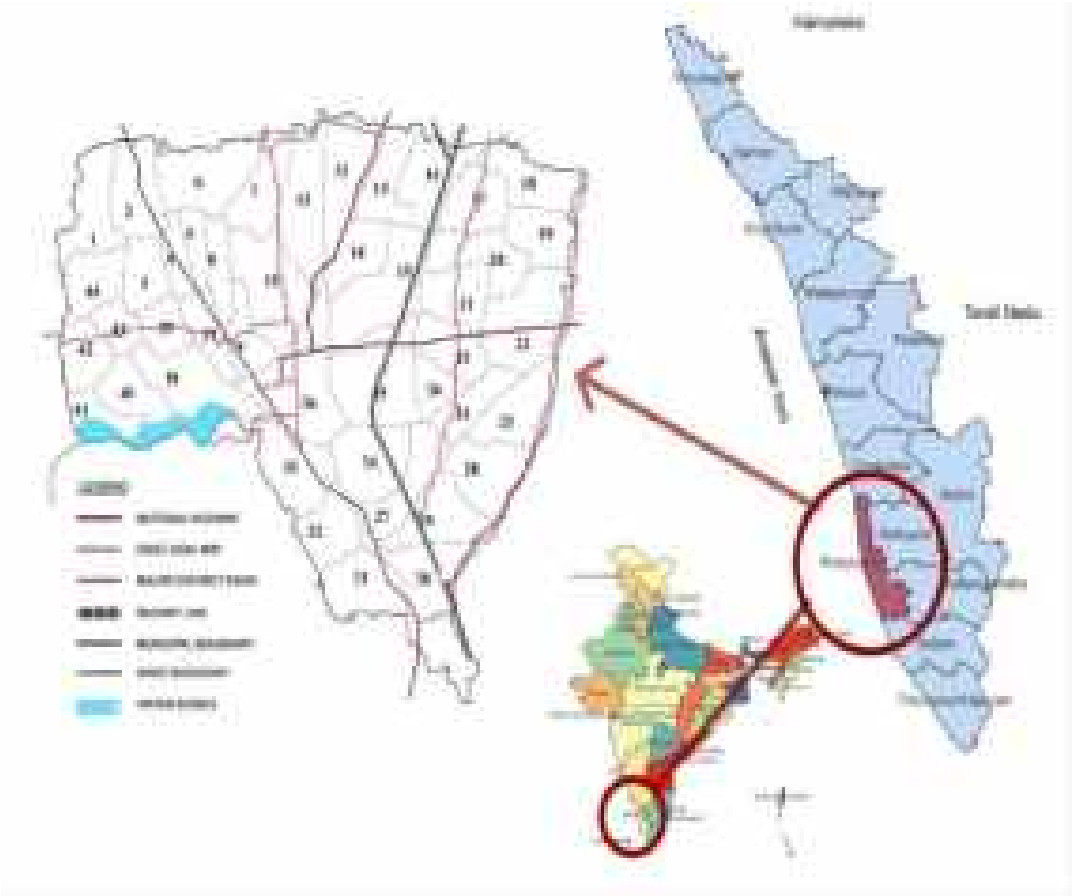

*Figure 1: Location of Kayamkulam Dumpsite*

Ward No. 22 is located at Central part of the municipality and comprise a population of 1809 and 488 households (Source: Census handbook of Alappuzha 2011), which comprises 5.47 % of the ULB population.

## 2.2 Demographic & Socio-Economic Status

The city had a population of 68,634 as per the census conducted in 2011. The projected population by the end of 2023 is around 69,598. Out of the total population of 69,598 of which 32,784 are males while 35,850 are females indicating a Sex Ratio of 1,094 against state average of 1,084. The overall literacy rate of Kayamkulam is 94.81 %. The ULBs portray a literacy rate higher than the state average of 94.00 %. In Kayamkulam city out of total population, 22,088 were engaged in work activities. 78.31 % of workers describe their work as Main Work (Employment or Earning more than 6 Months) while 21.69 % were involved in Marginal activity providing livelihood for less than 6 months. of 17,125 workers engaged in Main Work, 4,963 were Marginal Worker.

## 2.3 Connectivity

Kayamkulam city is well connected to neighboring local bodies and towns through National Highways, State Highways, and other Major and minor road networks. National Highway 66 passes through the municipality connecting Alappuzha, Kochi, Thiruvananthapuram, Thrissur, Kollam, Palakkad and Nagercoil. The Kayamkulam–Punalur road is a major road connecting it to major cities in east sengottai, Tenkasi, Tirunelveli via Pettah parts of the Tamil Nadu state. The nearest railway station and airport is Kayamkulam junction and Thiruvananthapuram respectively located at 1.5 km and 54.89 km from the town center.

## 2.4 Climatic Condition

The climatic conditions of Alappuzha are characterized by a tropical climate. Rainfall is significant most months of the year, and the short dry season has little effect. The mean yearly temperature observed in Alappuzha is recorded to be 26.6 °C | 79.8 °F. The annual precipitation in this location is approximately 2546 mm | 100.2 inch.

In terms of precipitation, the month with the lowest amount of rainfall is January, recording a mere 24 mm in its entirety. This denotes an exceptionally dry period within that particular time frame. Most of the precipitation here falls in June, averaging 435mm.

## 2.5 Geography and Soil Type

Geographically, Kerala State is divided into three regions namely high land, midland and low land from east to west. Kayamkulam is located in Alappuzha district of Kerala. Alappuzha district has a diverse topography. It is a sandy strip of land intercepted by lagoons, rivers and canals. There are neither mountains nor hills in the district except some scattered hillocks lying between Bharanikkavu and Chengannur blocks in the eastern portion of the district. The topography of the project location is almost flat. The general nature of the soil is alluvium with admixture of sand, clay and silt.

## 2.6 Ground Water Level

From monitoring wells dispersed across the state, the depth to water level is observed in the months of April, August, November, and January. According to information published by the

CGWB, the Government of India, the water level in Kayamkulam fluctuates from 0.05 to 0.44 MBGL.

## 2.7 Land use

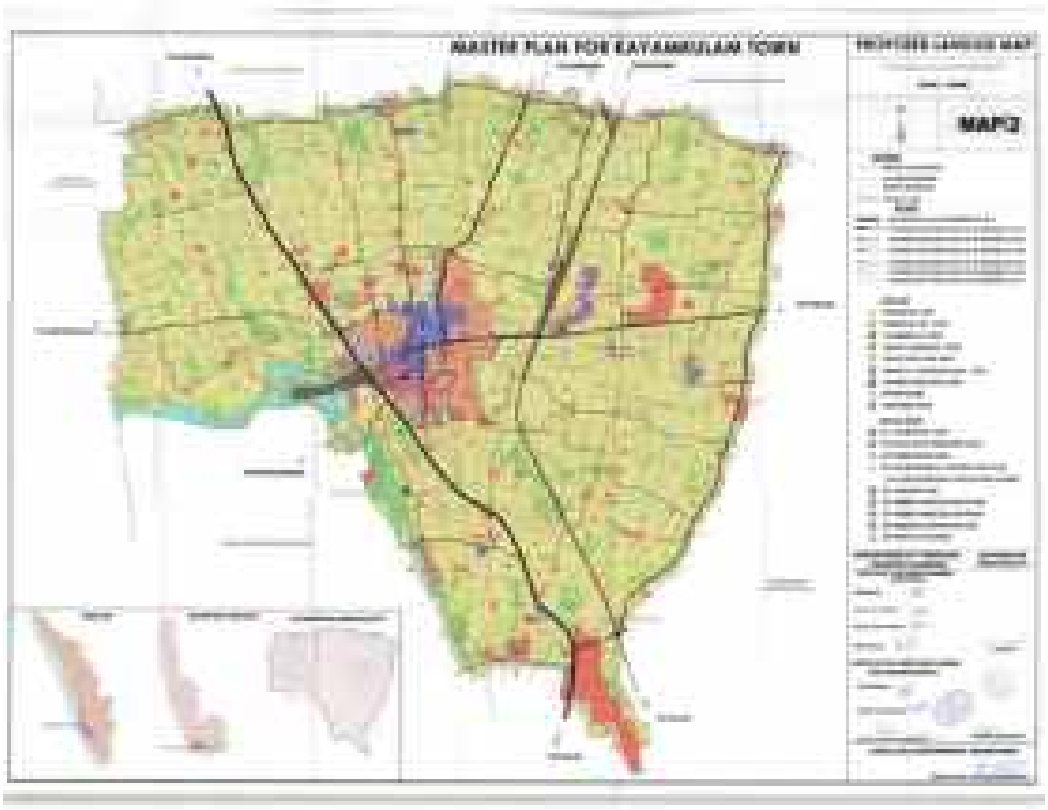

*Figure 2: Existing Landuse Map of Kayamkulam Municipality*

From the above map, it can be concluded that the predominant land use of Kayamkulam Municipality is residential. 67.55% of the total area is under residential use. Existing land use analysis shows following breakups as shown in table. The details of analysis of the land use survey and the resultant findings of existing land use are given hereunder. The glaring aspect of existing land use of Kayamkulam municipality is blessed with potential resources such as agriculture land and water bodies.

The highest percent of land use falls under the category residential/agricultural mix, which include mainly dry agriculture lands where residential developments are co- existent. Rubber is the principal crop followed by paddy, coconut and tapioca.

*Table 2: Landuse Pattern of Kayamkulam Municipality*

| Sl. No. | Land Use | Area in Ha | % of Total Area |
|---|---|---|---|
| 1 | Residential | 1471.9 | 67.55 |
| 2 | Commercial | 49.66 | 2.28 |
| 3 | Industrial | 14.87 | 0.68 |
| 4 | Agriculture | 128.46 | 5.90 |
| 5 | Recreational, open space | 0 | 0 |
| 6 | Transportation | 22.92 | 1.05 |

## 3. Detailed description of the dumpsite

### 3.1 Physical feature of the site

Kayamkulam dumpsite is located approximately 2.9 km from the centre of Murikkumoodu town in western side and encompasses an area of approximately 1 acre of land. The dumpsite is not very far from human settlement. The coordinates of the dumpsite are 9.173379° N & 76.521623° E. It is located in Ward No. 22 of the municipality. Kayamkulam municipality holds the ownership of the dumpsite. A small nallah flows North-eastern side of the dump site within the distance of 69.2 m.

The exact date for start of the dumpsite was not available with municipality; however approximately it had started in the year of 1980 from the information gathered during field visits. Presently, the quantity of waste dumped at this site is about 10261.2 Cum (Above GL 9129 cum + Below GL 1132.02 Cum) as per the topographical survey conducted by ULB. As

of now 68 % of the area is covered with solid waste. The dumping has been irregular with no proper liner system which would have otherwise prevented the leachate from percolating into the groundwater system. There are high chances of water being contaminated in this area due to the irregular dumping. Average height of the waste heaps is 3.3 m above the existing ground level.

*Figure 3: Location and Aerial View of the Kayamkulam Dumpsite*

*Figure 4: Present Dump Site, Kayamkulam*

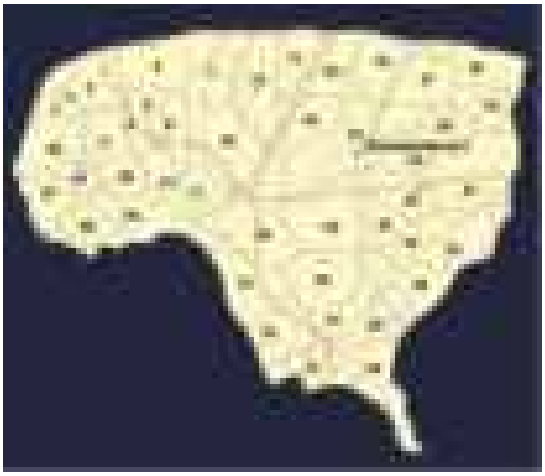

*Figure 5: Dumpsite Ward Location*

The salient feature of the existing dumpsite is presented below:

*Table 3: Salient Features of Kayamkulam Dumpsite*

| | |
|---|---|
| Name of Dumpsite | Kayamkulam- Murikkummodu dumpsite |
| Location of Dumpsite | Ward No. 22 of the municipality |
| Coordinates of Dumpsite | Latitude: 9.173379°N<br>Longitude: 76.521623°E |
| Distance from the central part of the town | 2.8 km |
| Area of dumpsite | 1 acre |
| Average height of dumpsite | Below 1.2m and Above 3.3 m |
| Ownership of dumpsite land | Municipality |
| Distance from nearby features- residential, school, offices, temples, institutions, industry etc.) | There are Residential and other structures within 100 meters from the site |
| Start date of dumpsite | 1980 |
| Utilities on site | 440 LV grid available at 100m from site. Water connection available at dumpsite, drinking water to be supplied by tanker |
| Site demarcated | Site is currently demarcated with a boundary wall. |

## 3.2 Surrounding Features of the Dumpsite

The dumpsite is located adjacent to a residential neighborhood. There is an adjacent drain to the dumpsite. Boundary wall is there for the dumpsite. There is one stream flowing at a distance is 69.2 m from the dumpsite.

## 3.3 Litigation status of the Site

There is no litigation record available with ULB.

## 4.0 Scope of Work

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Kayamkulam includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation optimum land recovery – Biomining, Capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile-compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the ESMF developed for projects envisaged under KSWMP.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Delineation of baseline assessment, impact & risk assessment, mitigations measures, Environmental Management & monitoring plan, budget for EMP, EMOP, institutional responsibilities for implementing monitoring and reporting
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.

- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport,
- Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

### 4.1 Objectives:

- Maximum reclamation of the area and by eliminating the chances of dump fires, leachate generation, and foul odor.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.
- To increase nearby real estate/social value and benefit the citizens.

## 5 Detailed Investigation Strategy

### 5.1 Investigation Strategy

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below;

- Bore hole upto a depth of 10 m and collection of 3 (nos) samples from the soil at interval of 1.5 m.
- Waste analysis viz., leachate sample from 1 (no) locations and physical analysis from 2 (nos) locations, and chemical analysis from 1 (no) location.
- Environmental baseline analysis surface water 1 (nos) location and ground water samples from 3 (nos) locations (Well Water Samples -1 up gradient, 2 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location

### 5.2 Investigation Plan

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

*Table 4: Investigation Plan*

| S.no | Parameters | Sampling Nos |
|---|---|---|
| 1 | **Geotechnical Investigation** | |
| A | Bore Holes up to 10m depth(1No. /2 Hectare) (as per CPHEEO) | 1 |
| B | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, Strength compressibility (vertically-3 samples per borehole). | 1 |
| 2 | **Waste & Environmental Analysis** | |
| A | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammoniacal nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | 1 |
| B | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | 2 |
| C | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium(N-P-K), Total carbon, C/N ratio, calorific value, Biochemical and Biodegradable factor. | 1 |
| D | Ground water (well water samples-1 up gradient, 2 down gradient)- (shallow and deep wells) Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, E Coli and Total coliform (IS 10500-2012). | 3 |
| E | Surface water (pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, E Coli and Total coliforms (IS 10500-2012). | 1 |
| F | Ambient Air Quality (Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |

| S.no | Parameters | Sampling Nos |
|---|---|---|
| G | Ambient Noise level [E(P)] for 24 hours. | 1 |

## 5.3 Sampling Methodology

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

*Table 5: Detailed Investigation Plan Executed for Waste Dumpsite at Kayamkulam*

| Sl. No. | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Within the Dumpsite<br>Dumpsite boundary | The AAQ locations were chosen based on the Windrose data. Two Ambient Air quality monitoring stations were installed within 100 metre distance from the dumpsite in upwind and downwind direction |
| 2 | Noise (1 Location) | Ambient Noise level [E(P)] for 24 hours | Entrance of the dumpsite | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading vehicles. |
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, | Adjacent thodu in 200 m aerial distance | Adjacent thodu sampling was considered. No alternative surface water sources were |

| | | | | |
|---|---|---|---|---|
| | | NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | | identified during sampling. |
| 4 | Ground water (3 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, CI, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, E-coli and Total coliform (IS 10500-2012). | Well water of nearby nearest house in 200 aerial distance | Nearest ground water source in downstream direction |
| 5 | Bore Hole (1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | Centre of the dumpsite | Volume of legacy wastes were found to be higher in the centre part of the dumpsite during investigation. So, the bore hole test was performed in the centre. |
| 6 | Waste Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammoniacal nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | Within the dumpsite | The legacy waste was found to be older and no access to all points. Hence sampling location were chosen also based on the accessibility. |
| | | Physical Analysis of waste (As per CPHEEO Manual) | | |

| | | | | |
|---|---|---|---|---|
| | | including Density, Bulk Density, Moisture content, size of waste constituents. | | |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Poatassium(N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | | |

For the borehole investigation, the samples were collected by rotary drilling a 150mm bore hole using a fast rig attached to a drag bit. The soil drillings are removed by a circulating bentonite slurry which also aids in keeping the side walls stable. An SPT sampler was driven in to collect the representative samples, which is carefully packed in double walled polythene bags, sealed, and sent to laboratory for testing. Standard penetration tests were conducted on soil at every 1.5m depth and the number of blows to achieve 300mm penetration were noted. Fractions recovered from the mining of legacy waste should be tested, especially for the presence of toxic metals and organic contaminants.

The total quantity of waste present in the waste dump is calculated based on the topographic study executed by ULB (towards calculating quantum of waste above ground level) and the results of borehole investigation (towards calculating the quantum of waste below ground level).

## 5.4 Analysis and Interpretation of Exploratory Data

The baseline condition of the waste dumpsite at Kayamkulam has been assessed through the geotechnical investigation and Waste & Environmental baseline assessment executed through M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Polluchem Laboratories (P) Ltd respectively. The results of Topographical survey conducted in the year 2022 also considered for the analysis. The signed reports of all analysis are enclosed as Annexures.

### 5.4.1 Topographical Survey Interpretation

A topographical survey was conducted for KSWMP by M/s Technosol Consultants, Kollam at the site for assessment of accumulated waste quantity and other features at the site in the month of November - December 2022. The objective of a topographical survey is to assess the waste profile, volume and the extent of garbage spread over the area of disposal site. This survey gives an indicative estimation for Quantity of Legacy waste. From the geotechnical survey it is evident that the site is not uniformly distributed with waste. In Figure 4, the topographical survey output is furnished.

*Figure 6: Contour drawing of the site (Source- Toposurvey by Technosol, Kollam)*

- Above GL the height of waste heap 3.3 m & Below GL its 1.2 m
- Estimated waste volume: 9129 cum Above GL, & 1132.02 cum Below GL
- Map shows Approx. 70 cents of land used for waste dumping

The topographical survey input has been converted to ArcGIS in order to represent the nature of Kayamkulam (Murikkumoodu) disposal site through a three-dimensional elevation-based representation. Considering the facts that the site is very old with no record of exact date of start of its operations, no regular records of incoming waste quantities since the date of operation, significant waste loss due to rag picking activity, open burning & its decomposition with time, it is not possible to cross verify the waste volume estimate. The cross section of the dumpsite and the contour map is appended as Annexure 1

### 5.4.2 Physical Analysis of Legacy Waste

Physical analysis of the legacy waste disposed at the Kayamkulam dumpsite was conducted by a NABL approved lab M/s Poluchem. The result of the physical analysis conducted in the presence of DPMU, PIU and TSC is provided in the following table.

*Table 6: Grain Size analysis of waste at Kayamkulam dumpsite*

| Sl No | Sieve Size | Quantity retained (Kg) | % fraction |
|---|---|---|---|
| 1 | +80m | 2.319 | 18.49% |
| 2 | 37.5mm | 2.058 | 16.41% |
| 3 | 10mm | 2.953 | 23.54% |
| 4 | 4mm | 3.092 | 24.65% |
| 5 | Pan | 2.121 | 16.91% |
| | Total | 12.543 | 100% |

About 16.90% of the material consists of organic/silt material. This material can be used for recovering compost and can be enriched with nutrients. The RDF / SCF material makes up about 26.51 % of the total and consists of plastics and rags/clothes. The other 49.51 % of the waste will be landfilled.

### 5.4.3 Chemical Analysis of Legacy Waste

The result of the chemical analysis of the samples collected from the Kayamkulam dumpsite is provided below in the following table.

*Table 7: Results of Chemical Analysis*

| CHEMICAL PARAMETERS |
|---|

| Sl. No. | Parameters tested | Test Method | Unit | Result |
|---|---|---|---|---|
| 01 | pH@25°C | USEPA | .. | 7.72 |
| 02 | Biodegradable Factor | USEPA | % | 2.3 |
| 03 | Total carbon | USEPA 9060A | % | 3.8 |
| 04 | Phosphorus(P) | USEPA | % | 0.018 |
| 05 | Nitrogen(N) | USEPA | % | 0.21 |
| 07 | Potassium(K) | USEPA | % | 0.017 |
| 08 | C/N Ratio | USEPA | .. | 18:1 |
| 09 | Calorific Value | ASTM D 5865 | Kcal/kg | 2867 |

*Table 8: Analysis of Toxic metals in waste*

| TOXICITY ANALYSIS- HEAVY METALS | | | | | |
|---|---|---|---|---|---|
| **Sl. No.** | **Parameters tested** | **Test Method** | **Unit** | **Result** | **Permissible Values** |
| 01 | Iron (Fe) | USEPA 3050 | % | 1.8 | |
| 02 | Arsenic (As) | USEPA 3050 | mg/kg | <0.1 | 41 USEPA, 12 Canada |
| 03 | Selenium (Se) | USEPA 3050 | mg/kg | <0.1 | 2 Canada |
| 04 | Nickel (Ni) | USEPA 3050 | mg/kg | <0.1 | 50 |
| 05 | Zinc (Zn) | USEPA 3050 | mg/kg | 24.5 | 1000 |
| 06 | Cadmium (Cd) | USEPA 3050 | mg/kg | <0.1 | 5 |
| 07 | Copper (Cu) | USEPA 3050 | mg/kg | 3.86 | 300 |
| 08 | Chromium (Cr) | USEPA 3050 | mg/kg | 6.5 | 50 |
| 09 | Lead (Pb) | USEPA 3050 | mg/kg | 16.1 | 100 |
| 10 | Mercury (Hg) | USEPA 3050 | mg/kg | <0.1 | 0.15 |
| 11 | Manganese (Mn) | USEPA 3050 | mg/kg | 97.4 | |

The average Nitrogen, Phosphorus and Potassium (NPK) content in the legacy waste samples picked from the site is 0.21, 0.018, 0.017, respectively by weight. This is far lower than 0.8, 0.4 and 0.8 as specified by the Fertilizer Control Order (FCO) 1985 for city compost and hence cannot be used as compost. The carbon: nitrogen ratio is 18.1 which is much lesser than the

specified standard. This could be due to the materials being exposed to sun and air over the years or that the carbon content may have leached into the ground through leachate during the rainy season. Another possible contributor to the reduced carbon levels could be multiple fire incidents at the site. Although the material has very less carbon content, the NPK value can be enriched by adding additives like poultry litter. The enriched material can be given to farmers or used for horticulture purposes. The material cannot be sold as organic compost in the present form due to very low carbon content.

The toxicity analysis of heavy metals present in waste is given in Table 8. None of the metals are exceeding the permissible standards. In addition to the chemical analysis to understand the NPK value, carbon content and ash content, a sample was chosen to check the calorific value of the RDF / SCF material. Calorific value analysis is useful to decide if the material can be used for generating heat or energy. The result of calorific value analysis is provided in the following table.

*Table 9: Calorific value of RDF / SCF material from Dumpsite*

| Sl. No. | Parameter | Unit | RDF / SCF Material |
|---|---|---|---|
| 1 | Calorific Value | Kcal/Kg | 2867 |

### 5.4.4 Key Findings from Physical and Chemical Analysis of Legacy Waste

The chemical and physical tests indicate that there is no scope to recover compost as the material. The nutrient value is extremely low. The carbon content is also low with the biodegradable factor being only 2.30. The material cannot be sold as compost in the present form since the carbon content in the material does not meet the FCO standards.

The average total calorific value of the material is 2867 kcal/kg. This material can be used for generating energy after drying and processing to reduce the moisture content and removing the inerts. This process would also increase the calorific value of the material to meet the calorific value requirement of RDF / SCF material to be used in kilns for generating heat. The full chemical report is appended as Annexure 2.

### 5.4.5 Geotechnical Investigation Interpretation

Geotechnical investigation was carried out to assess the quality of the dumped garbage at the site. The subgrade soil was encountered at 1.2 m, the drilling continued until 10.5 m that is 9.3

m below the waste depth. The soil did not exhibit any plasticity index. The clay fraction is between 2 to 5%. The permeability value is between 1.24 E-04 to 1.45 E-04 cm/sec. The full geotechnical report is appended as Annexure 3.

The base soil is non-plastic soil and the clay and silt fractions accounted for less than 40%, which implies the soil is not suitable for sub-base material. The safe bearing capacity of the soil is 150kPA, implying that the maximum height of fill may be only a maximum of 12m. During excavation, the side slopes should be maintained at 1 (V) and 3 (H). The Cation Exchange Capacity (CEC) of the soil is 11.91 meq/100gm which can adsorb heavy metals in case it is present in the soil.

## 5.5 Leachate Management System

There is no leachate collection/management system in the dumpsite. To address the concern of contamination of the groundwater and soil due to uncontrolled dumping, leachate samples are picked for analysis. The data is presented in Annexure 4. The data indicates that the TDS is about 5395 mg/l while the suspended solids is about 57 mg/l. The chlorides are high at 1429 mg/l, while the COD, BOD are 380 mg/l and 98.6 mg/l respectively.

*Table 10: Leachate characteristics at Kayamkulam dumpsite*

| **GPS Reading: N-09 º10 ’24.114” E -76º31’18.084”** | | | |
|---|---|---|---|
| **Parameters tested** | **Test method** | **Results** | **Limit As per SWM Rule 2016/Land disposal** |
| pH | IS 3025 (P) 11 –1983RA2017 | 7.81 | 5.5 to 9.0 |
| Total Dissolved Solids (Inorganic) | IS 3025 (P) 16 – 1984RA2017 | 5395 mg/l | 2100 |
| Total Suspended Solids | IS 3025 (P) 15 – 1984RA2017 | 57 mg/l | 200 |
| Chloride as $Cl^-$ | IS 3025 (P) 32 – 1988RA2014 | 1429 mg/l | 600 |
| COD | IS 3025 (P) 58 -2006RA2017 | 380 mg/l | - |
| BOD (3 days at $27^O$ C) | IS 3025 (P) 44 – 1993RA 2014 | 98.6 mg/l | 100 |
| Total Kjeldhal Nitrogen as N | IS 3025 (P) 34 – 1988RA2014 | 254 mg/l | - |

| | | | |
|---|---|---|---|
| Ammoniacal Nitrogen as N | IS 3025 (P) 34 – 1988RA 2014 | 196 mg/l | - |
| Phenolic Compound as $C_6H_5OH$ | IS 3025 (P) 43-1992RA2014 | 1.3 mg/l | - |
| Fluoride as F | IS 3025 (P) 60 -2008RA2014 | 0.36 mg/l | - |
| Cyanide as $CN^-$ | IS 3025 (P) 27-1986RA2014 | BDL (MDL- 0.01 mg/l) | 0.2 |
| Nickel as Ni | IS 3025 (P) 54– 2003RA2014 | BDL (MDL- 0.01 mg/l) | - |
| Cadmium as Cd | IS 3025 (P) 41– 1992RA2014 | BDL (MDL- 0.001 mg/l) | - |
| Lead as Pb | IS 3025 (P) 47– 1994RA2014 | 0.87 mg/l | - |
| Copper as Cu | IS 3025 (P) 42– 1992RA2014 | 2.4 mg/l | - |
| Mercury as Hg | IS 3025 (P) 48 – 1994RA2014 | BDL (MDL- 0.001 mg/l) | - |
| Zinc as Zn | IS 3025 (P) 49 – 1994RA2014 | 5.4 mg/l | - |
| Total Arsenic as As | IS 3025 (P) 37– 1988RA2014 | BDL (MDL- 0.01 mg/l) | 0.2 |

The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from Legacy waste.

*Figure 7: Leachate Collection*

## 5.5 Environmental Conditions of the Dumpsite

The specific environmental issues associated with the Kayamkulam disposal site are being discussed in the following sections.

### 5.5.1 Groundwater Contamination

The permeability of the soil is high ($1.45 \times 10^{-4}$ cm/s) implying that the leachate has a possibility of percolating through the base of the dumpsite and contaminating the groundwater. There is a natural stream adjacent to the north-east part of the dumping ground. The surface flow as well as the leachate from the site also has a possibility to contaminate the same. The ground water sampling tests within the site's vicinity have indicated high levels of TDS, Hardness, Chlorides, COD and BOD.

### 5.5.2 Soil Contamination

As it is an unlined dumpsite, there is a probability of finding traces of contaminant from waste and leachate in the underlying soil. Since it is an uncontrolled disposal site, the mixed waste contains different types of pollutants which may eventually have an impact on the soil. Results of soil analysis of the samples taken from the borehole in the Murikkummodu dumpsite is as shown below:

*Table 11: Chemical analysis of soil extracted from borehole at Kayamkulam dumpsite*

| Sl. No | Parameter | Result | US (NY State-Codes, rules and regulations) Industrial Use |
|---|---|---|---|
| 1 | Cadmium (Cd) mg/Kg | < 5.0 | 60 |
| 2 | Chromium (Cr) mg/Kg | 134.5 | 800 (Hexavalent) 6800 (Trivalent) |
| 3 | Copper (Cu) mg/Kg | 18.9 | 10000 |
| 4 | Nickel (Ni) mg/Kg | 11.0 | 10000 |
| 5 | Lead (Pb) mg/Kg | 24.9 | 3900 |
| 6 | Zinc (Zn) mg/Kg | 282.9 | 10000 |
| 7 | Mercury (Hg) mg/Kg | < 1.0 | 5.7 |
| 8 | Arsenic (As) mg/Kg | 4.0 | 16 |

While comparing results of the report with the US Industrial Use benchmark, it is observed that the values are significantly within the benchmark values. Bioremediation may be carried out to reduce traces of heavy metals in soil and for site clearance. The location may be used for industrial landuse for setting up the SWM facilities like Material Collection and Resource Recovery Facility. However, the solution may be considered after proper soil and groundwater investigation post dump-clearing stage.

### 5.5.3 Ambient Air Quality

Solid Waste Management has a wide variety of impacts on the environment including those associated with climate change. All the three major greenhouse gas (GHG) that are making the largest contribution to global warming viz., carbon dioxide ($CO_2$), methane ($CH_4$) and nitrous oxide ($N_2O$) are generated during the waste management process. There is no open burning within this site. The site does not receive any fresh organic waste and therefore the odors are not perceptible.

## 5.6 Analysis and interpretation of exploratory data (Environmental Baseline)

The concentration levels of the exploration are compared with the appropriate standards for the interpretation. The air pollution data indicates that the levels are within acceptable NAAQs. The noise levels are influenced by the highway passing nearby and are also within the acceptable levels. The dumpsite is not having any operation that causes noise. The results are tabulated below and there is no significant contribution from the dumpsite.

The ground water quality results indicate that the dumpsite has not caused any major increase in pollution levels and the quality parameters are within the IS 10500:2012. The results are tabulated below.

*Table 12: Results of ground water sample within 10m from Kayamkulam dumpsite*

## 5.7 Risk assessment based on applicable source-pathway-receptor-combinations for human health

The gaseous emissions from the dumpsite are not significant and do not pose a problem of air pollution. Similarly, the soil pollution seems to indicate minimal risk as far as soil pollution is concerned. The water analysis also does not indicate any significant pollution either in surface water or groundwater.

Surface Water: Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and pathogens. Proper containment and management of leachate are essential to prevent water pollution.

The analysis of surface water reveals that all the parameters are within the acceptable limit, except it is slightly acidic and the dissolved oxygen content is less than prescribed limit, so also the BoD is greater than the allowable limit, indicating that the water contains organic load.

**Risk Assessment- surface water**

| Risk Assessment | |
|---|---|
| Source | Legacy waste Dumpsite |
| Pollutant | Leachate from Dumpsite -BOD Higher than the acceptable limits |
| Pathway | Water/Run off |
| Receptor | Human, Animals,Aquatic life and flora fauna |
| Risk | High BOD Indicates the water is highly polluted and its is harmful to ecosystem as fish and other aquatic life may suffocate in oxygen-depleted waters.Also it will contain more Pathogen and make the water unfit for human and animal |

Groundwater: Pollutants from dumpsites can infiltrate into the underlying groundwater, particularly if the dumpsite is not adequately lined or if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

The analysis of ground water samples taken at one location reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 6.35, which is in a slightly acidic range which can make the water not fit for any industrial purpose as it is more corrosive.

**Risk Assessment - Groundwater**

| Risk Assessment | |
|---|---|
| Source | Legacy waste Dumpsite |
| Pollutant | Leachate from Dumpsite - pH is acidic in nature |
| Pathway | Water,soil |
| Receptor | Human, Animals,Aquatic life and flora fauna |
| Risk | Possible risk to human health<br>Diarrhea<br>Nausea and Vomiting<br>Abdominal Pain<br>Weakness<br>Possible risk to flora<br>It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increase the availability of some elements to toxic levels, particularly aluminum and manganese. |

Air: Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gas from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens, etc. to be ensured.

**Risk Assessment - Air**

| Risk Assessment | |
|---|---|
| Source | Legacy waste Dumpsite |
| Pollutant | Particulate matter, VOCs, Dioxins |
| Pathway | Air |
| Receptor | Human, Animals,Aquatic life and flora fauna |
| Risk | No Anticipated risk |

Soil: Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

**Risk Assessment - Soil**

| Risk Assessment | |
|---|---|
| Source | Legacy waste Dumpsite |
| Pollutant | Heavy metals |
| Pathway | soil |
| Receptor | Human, Animals,Aquatic life and flora fauna |
| Risk | Possible risk to human health soil that contains substances such as heavy metals which may be toxic to humans can pass those substances on to humans through crop uptake leading to unsafe foods.<br>Possible risks to animals- when farm animals consume the plant grown from contaminated soil it affected the health of animal<br>Possible risk to flora- soil pollution may after plant metabolism and reduce crop yield, also the trees and plants that absorb the soil contaminants enter into the food chain |

Bioaccumulation in Biota: Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the land and minimizing the exposure of organisms to contaminated environments

**Risk Assessment - Bioaccumulation in Biota**

| Risk Assessment | |
|---|---|
| source | Legacy waste Dumpsite |
| Pollutant | Leachate and heavy metals |
| Pathway | Air,water and soil |
| Receptor | Human, Animals, flora and fauna |
| Risk | Possible risks to human health, animal flora and fauna<br>Accumulation of contaminants in flora and fauna indirectly through food chain affects human health |

## 6 Evaluation of Remediation Techniques

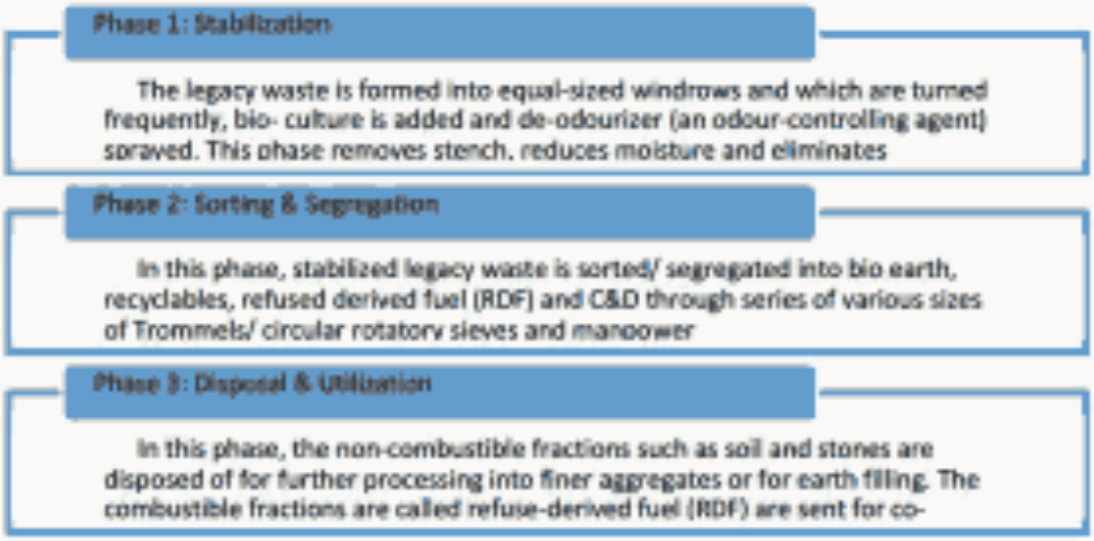
Reclamation of existing unmanaged municipal waste dumpsites is becoming a key requirement for ULB's in India as unscientific and unplanned methods of waste disposal in non-engineered landfills have led to lot of environmental issues including soil and ground water contamination, uncontrolled landfill gas emissions into the atmosphere and exposure to disease vectors and scavengers. The Hon'ble NGT seized with these problems across the country has ordered that the respective authorities to remedy this at the earliest.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

Remediation of waste dumpsite is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

- Environment Enhancement - reduction in greenhouse gas emissions, soil pollution, groundwater contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.

- Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
- Land - Dumpsite land becomes available for utilizing the same for the establishment of other Waste Management Facilities.
- Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled, or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels



For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- Baseline study of heavy metals; subsurface soils and water; rainfall; soil type; surface hydrology; topography; wind direction etc. Shall be studied prior to bioremediation
- Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

Alternative analysis for the various dumpsite remediation options are detailed in following section.

## 6.1 Bio-Mining – Reclamation/Recovery of Land

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

| | |
|---|---|
| Salient Features | • Land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>• Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>• Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>• Compliance to SWM Rules and NGT orders.<br>• Improvement in aesthetics and quality of life & health. |
| Applicability | • The ownership is well defined.<br>• Working space is available in the dumpsite.<br>• Linkage for utilization by-products is available |

### 6.2 Capping Without Land Recovery

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas. |

| | |
|---|---|
| | • Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years<br>• Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep- rooted vegetation.<br>• Recurring expenditure will be incurred for regular maintenance. On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio-mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>• SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | • Simple & robust, least expensive method among various available technologies |

### 6.3 Capping with Partial Land Recovery

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bioremediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can be linked to relevant buyers and the inert material will be capped over lower footprints, with well-designed slopes to prevent further degradation of the environment.

The reclaimed land may be covered with loamy soil that has plants with high transpiration rates. The plants do not permit the ingress of water into the soil thereby reducing the possibility of leachate generation. The plants and soil microbes also behave as oxidation layer. The soil is compacted and maintained with gentle slopes with 1V to 3 H. Contour drains may be provided to divert the water away from the soil thereby preventing ponding of water. The reclaimed land may be covered with solar panels to generate renewable energy during the period of observation following the post closure.

| | |
|---|---|
| Salient Features | ● The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>● Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>● Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |
| Applicability | ● Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>● Lack of linkage for disposal of inert<br>● Recovery land for public use is not a priority |

## 6.4 Selection of Remediation Option

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Moreover, as per Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping

However, after the bioremediation municipality wants to use the land for setting up of Material Collection Facility and Resource Recovery Facility. Hence backfilling of the site with boulders and inert are planned.

For the execution of dumpsite bio-mining two strategies can be adopted;

- *Insitu biomining*: Here the biomining is carried out within the premises of the dumpsite after clearing the waste and reaching the original ground level or in a land adjoining the dumpsite. The advantage is that only the finished products are moved out of the premises, inerts may be used for gradation and filling up low lying areas within the site, or in a

newly developed sanitary landfill. This is quite economical when legacy waste quantities are significant. The possibility of gaseous emissions, noise and odor and formation of leachate exist as the processing takes place at the site. The location would remain affected for the time till all waste are processed.

- *Ex Situ biomining:* In small dumpsites, or where the area is a constraint, the entire waste is excavated and taken away to an alternate location for processing. The work in the dumpsite can be completed quickly and the disturbance due to the excavation can be minimized. The cost of transportation of the whole waste adds to the cost of bio mining. But since the process plant can serve multiple locations, economies of scale may be achieved and may also compensate for the added transport cost.

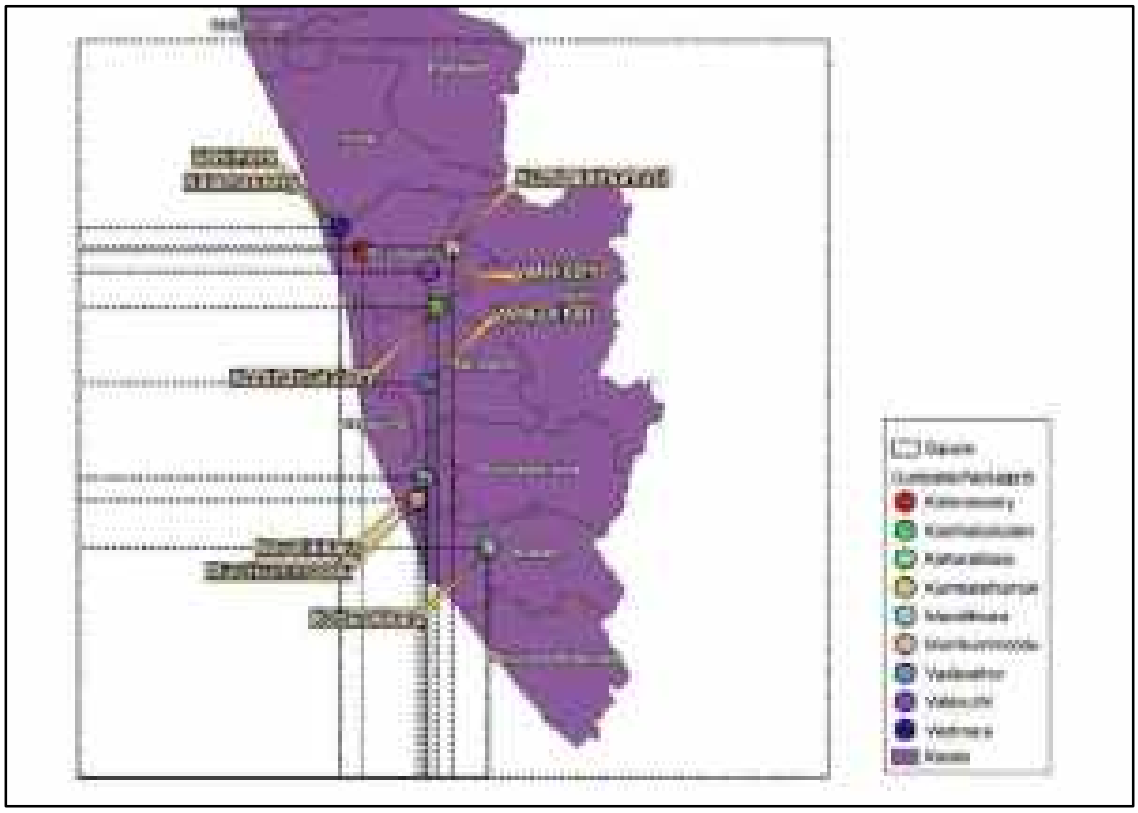


*Figure 10: Location of Other Dumpsites nearby*

# 7 Technical Description of the Selected Option

## 7.1 Methodology

The legacy waste dumpsite reclamation through bio-mining with recovery of land involves

Phase 1: stabilization

Phase 2: sorting & segregation

Phase 3: disposal & utilization

Phase 4: Back filling of boulders and inerts

## 7.2 Selection of Machineries

The type of machinery, capacity and type of screens to stabilize the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type of machinery available for the bio mining are as follows:

- Stationary screening machinery and
- Mobile/compact machinery

### 7.2.1 Stationary Screening Machinery

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process
- Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.

- Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

### 7.2.2 Mobile/Compact Screening Machinery

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation

***Structure***: The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity

***Screening Mechanism***: The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

***Separation System***: Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

***Treatment Process***: In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

***Transport***: Quick and easy folding of conveyor helps in quick setup time.

***Discharge height***: Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, stationary trammel machine shall be the optimum screening machinery

## 7.3 System Requirements

The following are the infrastructural facilities required for setting up of machineries and equipment in biomining of a dumpsite: These are required irrespective of the option of in-situ or ex-situ processing.

- Fencing and secure entrance gate
- Security and reception office
- Weighing bridge
- Records room
- Laboratory
- Medical room
- Workers' area
- Parking for vehicles (heavy earth equipment, trucks, etc.) with tire washing facility.
- Administrative building
- Fire control unit (detailed methodology for fire management plan)
- Toilet–bath complex, with personnel protection equipment (PPE) storage room)
- Overhead water tank
- Leachate collection and treatment unit
- Environmental monitoring unit
- Segregation and processing area
- Temporary storage area for rejects, domestic hazardous waste and sanitary waste
- Material storage area
- Waste drying and windrow area.
- DG set

The total area required is about 900 sqm in an in situ biomining plant. The process shed needs to be covered building. Temporary construction power at 440V needs to be obtained from KSEB. This can be easily availed as there is an existing electrical infrastructure passing through the site. A 440V, 125KVA needs to be established for the project. Water storage tanks needs to be provided for the duration of the project. The water may be supplied by tankers. Labour

will reside in Kayamkulam and commute daily to the site, hence no labour sheds are envisaged during this project. The requirements are only indicative, and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards.

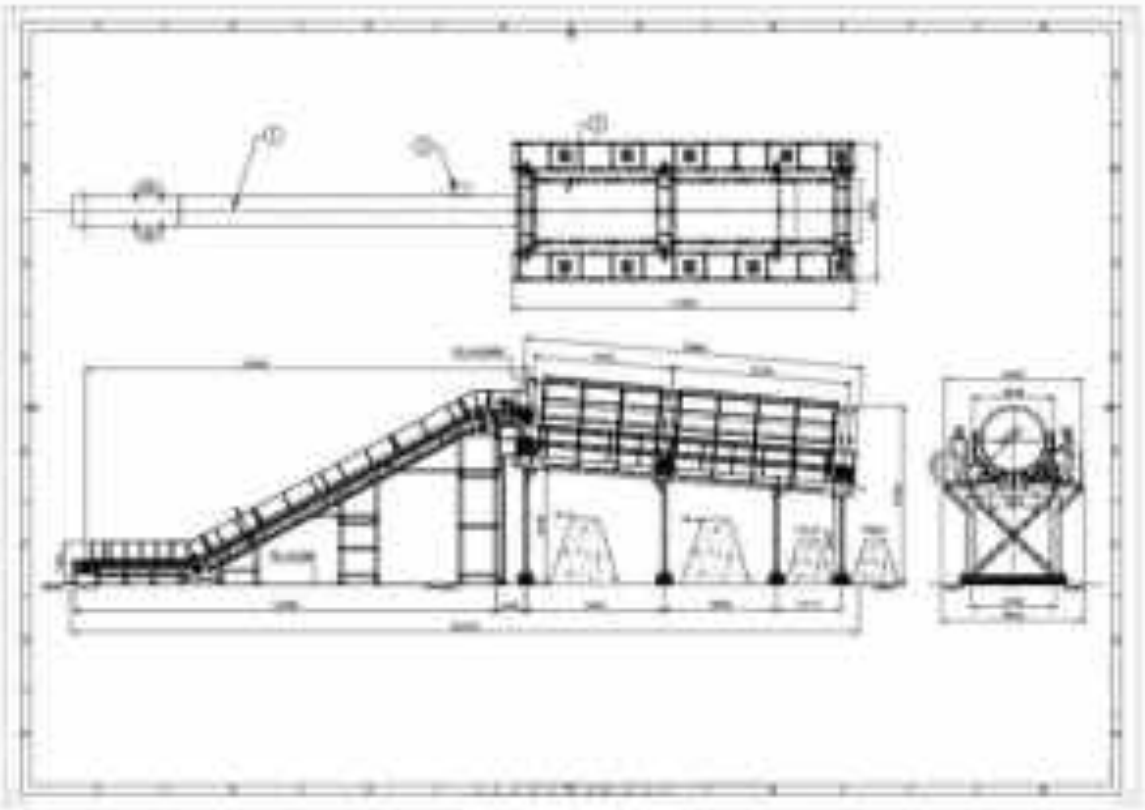

*Figure 11: Schematic of the Segregation System*

## 8 Scope of Disposal for RDF, Bio Soils, C & D Waste, and Others

### 8.1 Utilization of By Products

The details of the utilization of aggregates/by-products screened out by processing of the stabilized legacy waste are provided in the table below

*Table 16: By Product Composition*

| By products | Percentage Composition | Quantity (Cum) | Utilization/Linkage/Usage |
|---|---|---|---|
| RDF | 18.49 | 1897.26 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. |

| | | | |
|---|---|---|---|
| Recyclables | 23.54 | 2415.44 | |
| Inert | 16.40 | 1682.80 | Can be utilized for filling at the site itself |
| Compost Soil Enricher | 41.56 | 4264.47 | Can be used as a soil enricher and given to farmers. The same cannot be sold as fertilizer unless it is enriched with carbon content to meet the standards suggested by FCO for city compost |
| Total | 100 | 10,261 | |

The **Table 9.1** details the expected recovered items in line with the investigation results present. However, during the execution stage, the bidder is required to analyse each recovered fraction at least every 15 days and report submitted to the concerned authority. It is to be noted that the RFB document should cover necessary clause in this regard.

RDF / SCF consists largely of combustible components which are shredded into a uniform size, in order to produce a homogenous material which can be used as substitute for fossil fuels in e.g. cement plants, lime plants, coal fired power plants or as reduction agent in steel furnaces. The calorific value of the RDF should be higher than 1500kcal/kg for use in cement plants.

The nearest cement Industry that can accept the RDF from Kayamkulam is located near Trichy, Tamil Nadu at a distance varying between approx 360 kms from the Dumpsite site. The other sites are at Karnataka between 740km to 1074km, while cements plants at Andhra are at 740km to 900kms.

*Table 17: Distance to potential RDF / SCF users*

| Name of the cement plant | Location | State | Distance from Kochi (KM) |
|---|---|---|---|
| Dalmia Bharath | Ariyalur | Tamilnadu | 458 |
| Dalmia Bharath | Dalmiapuram | Tamilnadu | 424 |
| ACC | Wadi | Karnataka | 1,075 |
| Chettinad | Karikazhi | Tamilnadu | 315 |
| Chettinad | Kallur | Tamilnadu | 386 |
| Dalmia Bharath | Belagavi | Karnataka | 956 |
| JK | Muddapur | Karnataka | 965 |
| Dalmia Bharath | Kadapa | Karnataka | 739 |
| Bharathi VICAT | Kalburgi | Karnataka | 1,074 |

| | | | |
|---|---|---|---|
| JSW | Kurnool | Andhra Pradesh | 901 |
| Bharathi VICAT | Kadapa | Andhra Pradesh | 739 |
| Ultratech | Tadipatri | Andhra Pradesh | 815 |
| Zuari | Yerraguntla | Andhra Pradesh | 877 |

## 9 Details of Estimated cost

The details of the estimated cost for bio-mining - recovery of land by remediating legacy waste dumpsite is provided in the table below:

*Table 18: Project cost estimates and revenues from sale of product*

| Sl. No | Activity | Rate/ m3 | Quantity (m3) | Amount (in INR) |
|---|---|---|---|---|
| 1 | **Bio-mining Operations** | | | |
| a | Processing the Waste | [redacted] | [redacted] | [redacted] |
| 2 | **Disposal Cost** | | | |
| a | Disposal of RDF | [redacted] | [redacted] | [redacted] |
| b | Disposal of Compost/ Soil enricher | [redacted] | [redacted] | [redacted] |
| d | Disposal of Inert | [redacted] | [redacted] | [redacted] |
| | **Total (1+2)** | | | [redacted] |
| | E& S Safeguards from ESIA | | | [redacted] |
| | Contractors Profit and Overheads at 15% | | | [redacted] |
| | Net Cost | | | [redacted] |
| | Average Cost Index for Kerala based on DSR 2018 is ~1.35 at present. Considering the same, the Grand Total is | | | [redacted] |
| | Cost per $m^3$ | | | [redacted] |

## 9.1 Revenue from the Project

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at free cost and transportation cost also not borne by the cement industries.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable

## 9.2 Funding for Project

The estimated cost of INR [redacted] for the project Dumpsite Remediation. The sources and funding pattern is given below:

*Table 19: Sources of Funds*

| **Item wise funding pattern** | | | |
|---|---|---|---|
| Item | Bank Share (70%), ₹ | State Govt. (30%), ₹ | Total cost ₹ |
| Dumpsite remediation for the Kayamkulam | [redacted] | [redacted] | [redacted] |

# 10 Project Implementation Plan

Kayamkulam Municipality intends to complete this project as early as possible. However, considering the time required for mobilisation, installation, sieving and handling recoverable etc, a time frame of about 06 months is considered.

## 10.1 Timeline

The broad timeline for the execution of this project is given below.

*Table 20: Project Timeline*

| TIMELINE CHART FOR EXECUTION | | | | | | | |
|---|---|---|---|---|---|---|---|
| **S. No.** | **Task Name** | **M 1** | **M 2** | **M 3** | **M 4** | **M 5** | **M 6** |
| 1 | Planning & Mobilization | | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries, Hiring & Installation of Machineries, Electrical Works | | | | | | |
| 3 | Excavation of Legacy Waste | | | | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | | | | |
| 5 | Windrow Formation & Spraying of Bio culture | | | | | | |
| 6 | Sieving Operations | | | | | | |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | | |
| 8 | Project Closure Activities:<br>Levelling of Reclaimed Land using Bio-soil<br>Handover the available infrastructure at site to the ULB<br>Closure Report Submission to ULB, | | | | | | |

## 10.2 Contract Model

***Execution Method:***

Design, Own, Operate and disposal/Management of by-products/aggregates with -zero residues and maximum land recovery. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

***Working Model***

- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for setting up the plant to the Contractor.
- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- ULB shall facilitate the disposal/Utilization of By-products and contractor is responsibility for disposal of RDF, recyclables and aggregates

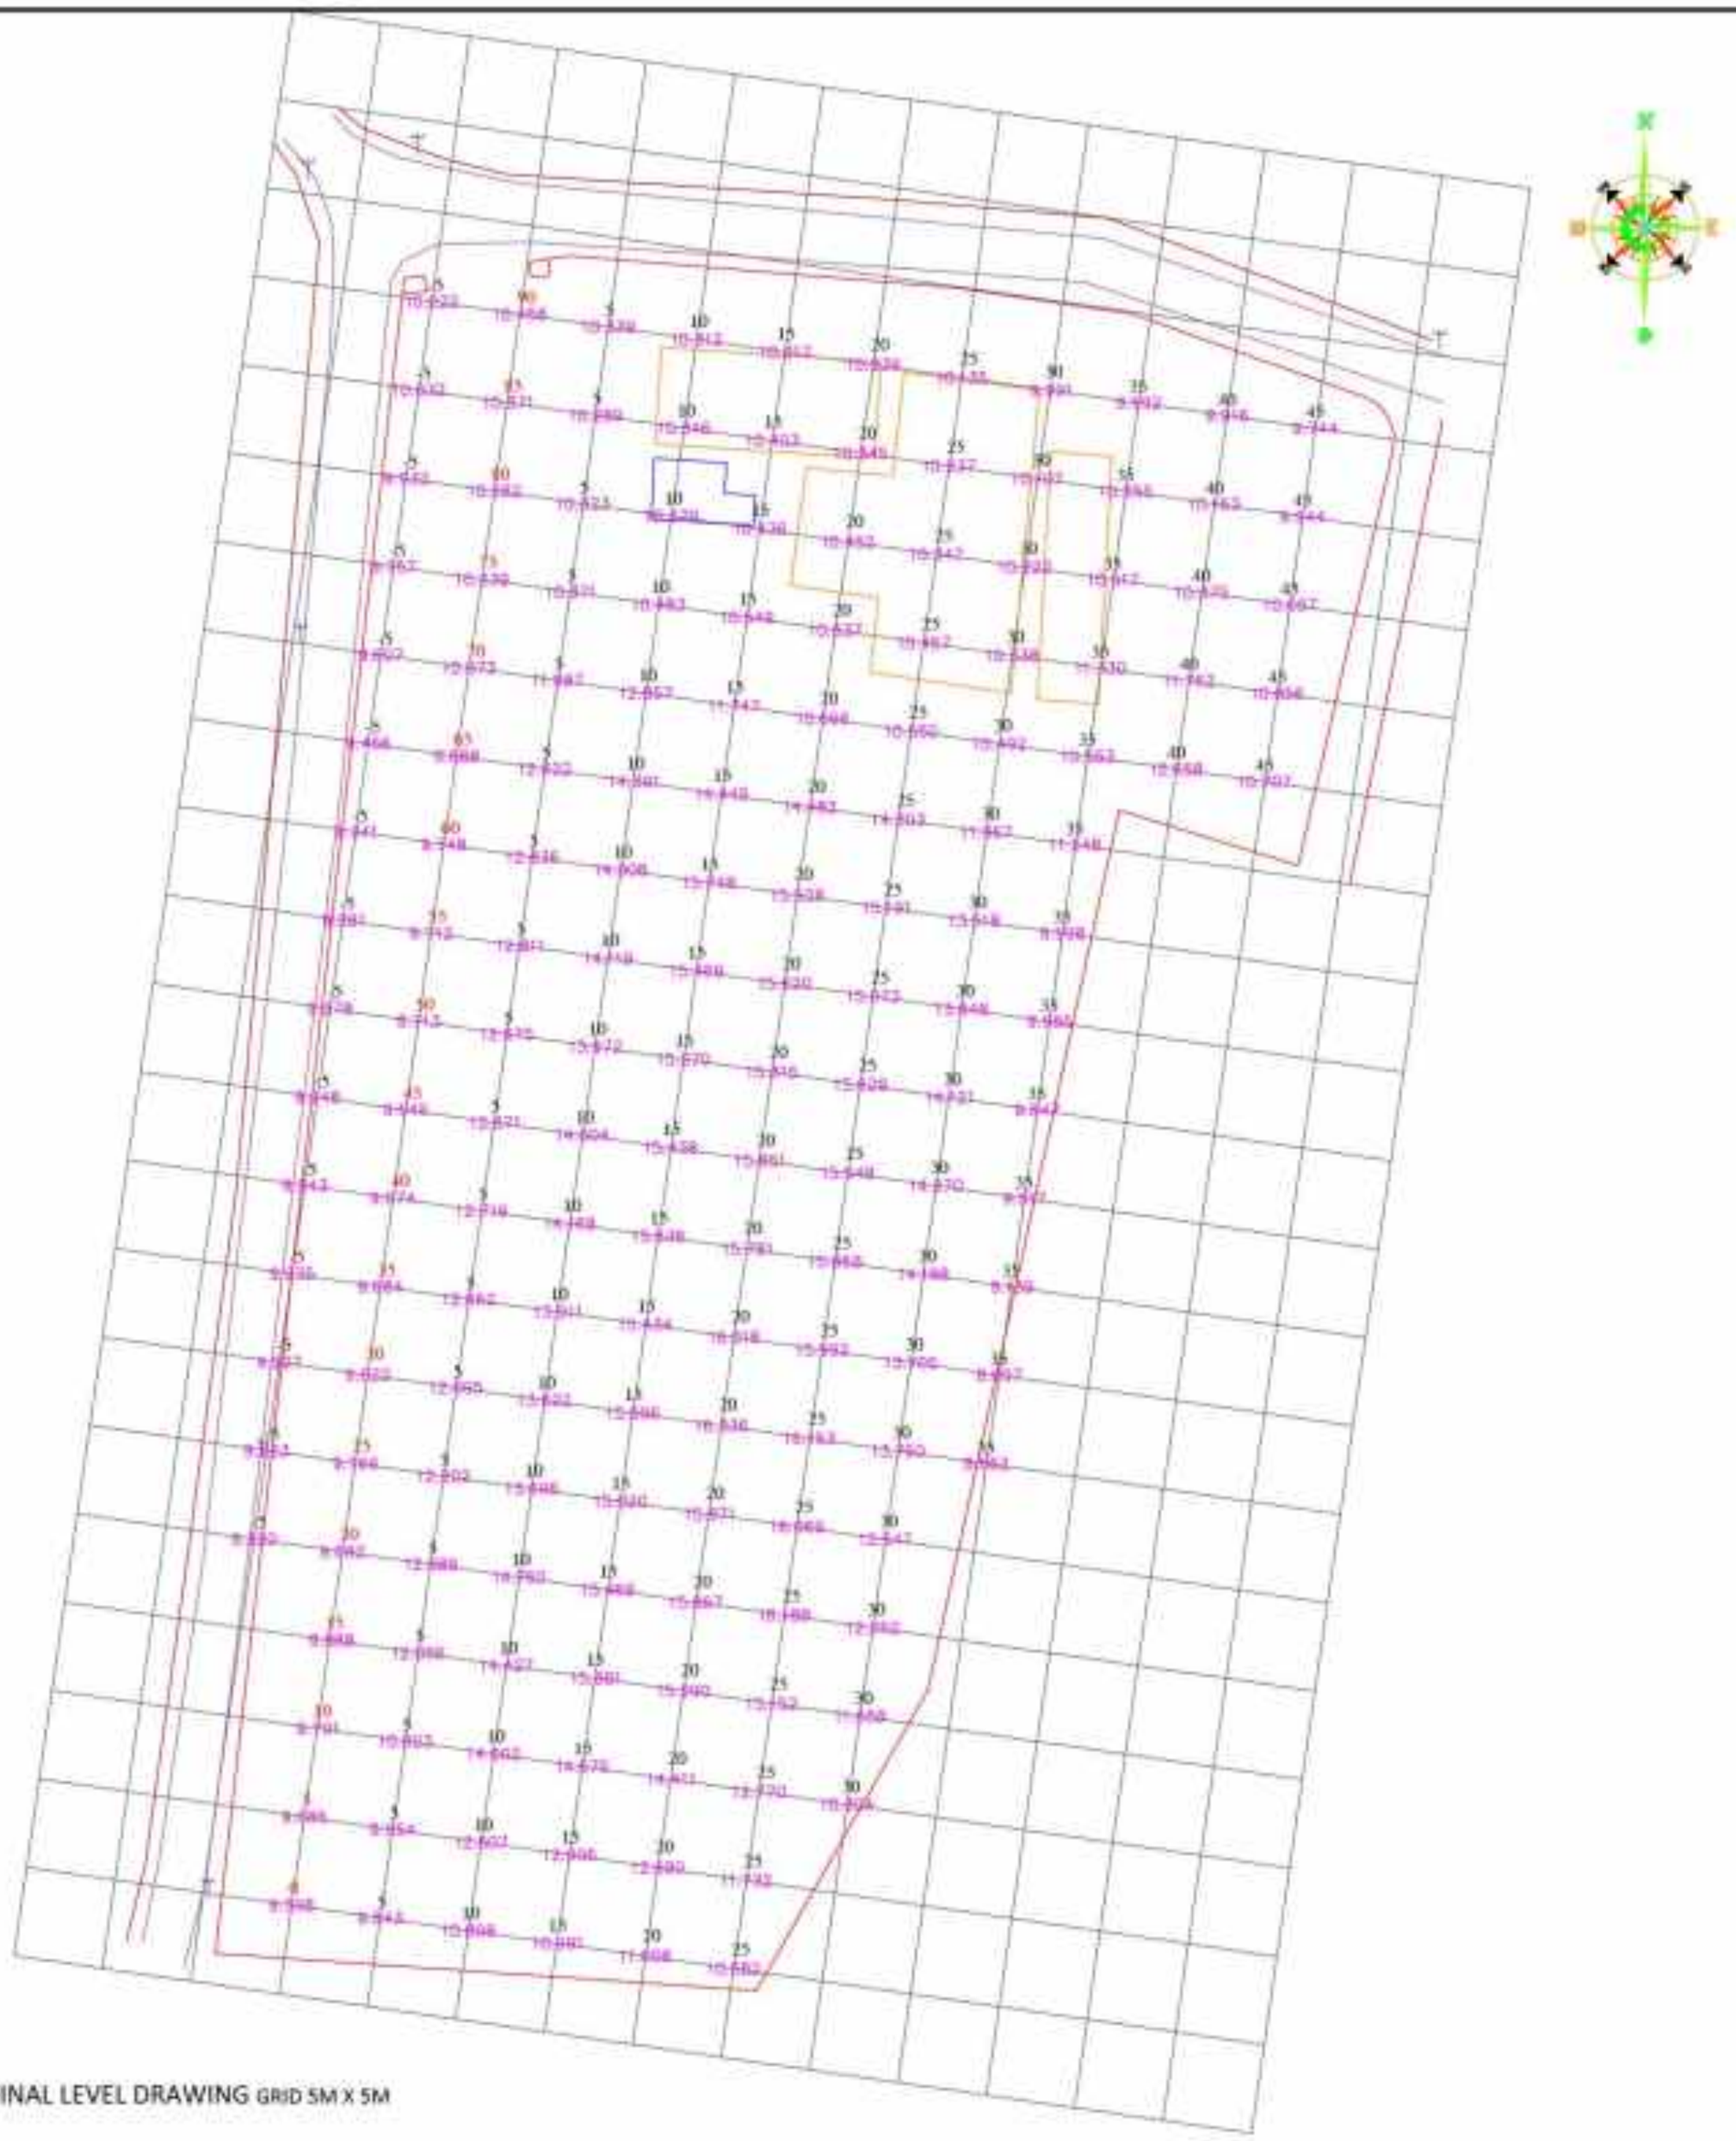
## 11 Benefits of the Project

The project benefits of dumpsite remediation at Kayamkulam are ;

- Reclamation of Land: An area of 1.25 acres will be reclaimed which can be used for resetting SWM facilities of ULB
- Environmental Protection: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity
- Health Improvement: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- Enhanced Water Quality: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to safe drinking water.
- Aesthetic and Social Benefits: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- Operational & Life cycle Aspects - Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through a bio-mining process.

## 12 Conclusion

- The activities of the bio-mining will be commenced from December 2023 to Mar 2024. An area of **1.25 acres** will be reclaimed and will be used for setting up other solid waste management facilities in future.
- Optimum of the land will be reclaimed and recovered through the biomining process, and this will by ensuring environmental safeguards.
- For the optimum screening of the **23332.83 m3** of legacy waste, mobile / compact screening machinery shall be used.
- Favourable site conditions for bio-mining:
    - Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
    - Piped water supply is available at the dumpsite.
- The project activity requires “Site Authorization, Consent to Establish and Consent to Operate” from KSPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, NGT orders, KSPCB norms, World Bank guidelines and KSWMP ESMF and other regulatory rules & norms Environmental & Social safeguards:



- The project attracts E2 Environmental category based on the project activities and status of the environment baseline.
- Site specific Environmental Assessment and Environmental Management Plan has been developed.
- The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.

- Total cost of the project is Rs [redacted]

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Marikkumoodu, Kayamkulam to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 29th May 2023. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 13th June 2023 and was completed on 14th June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

# 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along with Mr. Ravi Kumar of IPE Global during the fourth week of May 2023, in order to collect the information regarding the site prior to mobilizing the equipment for drilling.

The location of the dumpsite is situated where there was human habitation in the surrounding area of the dumpsite.

**Figure 1 : Location of the borehole drilled at the dumpsite.**

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste in the landfill.

### 4.2 Drilling equipment

Mechanical drilling machine was used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by

drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log - commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of

each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing are presented in **Appendix II**.

**Table 1: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |
|---|---|---|---|
| 1 | Soil | Grain-Size Analysis | IS: 2720(Part-4)-1985 |
| 2 | | Atterberg's Limit | IS: 2720(Part-5)-1976 |
| 3 | | MDD/OMC(Light Compaction) | IS:2720(Part-7)-1980 |

## 6 SUMMARY

The geotechnical investigation of the original ground below the waste at the dumpsite at Marikkumoodu, Kayamkulam, Alappuzha district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was drilled through the waste into the ground using a rotary drilling method. The waste of height of 4 m is cleared at the borehole location to provide a platform to the machinery before drilling. The maximum depth of investigation was 10.5m (1.2 m in waste and 9.3 m in the ground). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples.

Based on the investigations carried out, it is observed that the original ground below the dumped waste comprises of sandy layer of 7.0 m thickness underlain by a clay layer until depth of termination. As per the information provided by the client, the waste in the dumpsite needs to be excavated, segregated using a few machinery and the inert material left after the bio-mining needs to be dumped within the site. As informed by the client, during the process of bio-mining the waste would be excavated from one feasible location of the site and transferred to another location of the site. During these operations, any temporary storage waste in the form of heaps should be carried out ensuring the stability of the sloping face of the waste. It is suggested that for slopes with a height ≤ 1.5 m the angle of face should not be steeper than 45°. For slopes of a height greater than 1.5 m the slope should be limited to 30°

to horizontal or flatter. It is not advisable to use slope heights > 5 m without a proper stability analysis. If the inert material is being disposed at the site with no further plans of transporting it or transferring it, it is recommended to compact the material into layers using an 8-10 T roller with compacted lift thickness not exceeding 300 mm.

**The Safe Bearing Capacity (SBC)** is calculated as per IS 6403:1981 (Reaffirmed 2021). For any temporary structures planned at the site, the **recommended allowable bearing pressure** for isolated footings at a minimum depth of 1.0 m below **original ground level** is **300 kPa.** For any slope stability calculations involving the natural ground, the parameters presented in the summary sheet of laboratory results can be used.

The above recommendations are made based on the subsoil profile and laboratory test results obtained on the samples collected from the site. If there is any variation in soil profile during execution, fresh recommendation may be obtained from M/s Matter Material Testing & Research Laboratory (P) Ltd. or from a qualified and experienced geotechnical engineer.

# SHEAR STRENGTH TEST REPORT

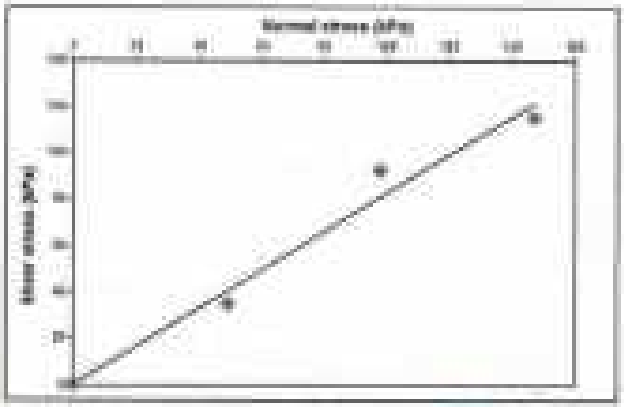
Report No: ML23/R-02166/A
Issue No : 1
Report Date: 04/07/2023

| | |
|---|---|
| Client: | IPE Global |
| Address: | Karaimat Building, Kaneyannoor Village, Kakkanad, Ernakulam, Kerala - 682030 |
| Contact: | Mr. Ranabir Dey |
| Project No: | - |
| Project Name: | Geotechnical Investigation at Dumpsite in Kayamkulam |
| Consultant: | - |
| Owner: | KSWMP |
| Contractor: | - |
| Project Location: | Marikkunnoolu, Kayamkulam |
| Tel / Email: | - |

**Sample Details**

| | | | |
|---|---|---|---|
| Received Date: | 04/06/2023 | Client Sample Ref.*: | Soil (UDS-1), BH 01, Depth 1.50m |
| Work Order ID: | ML23/W-02166 | Sample Submitted By: | Geotechnical Division |
| Sample ID: | ML23/W-02166/02 | Source* | BH 01, Depth 1.50m |
| Date Sampled: | 13/05/2023 | Sampled By: | Geotechnical Division |
| Sampling Method: | IS: 2132 - 1986 | Sample Size(Kg): | 5 Approx |
| Sample Location:* | Marikkunnoolu, Kayamkulam | Date Tested : | 27/06/2023 - 28/06/2023 |
| Sample Cert. No: | - | Test Method Variation: | None |
| Test Location: | MatterLab - Kozhikode | Lab Sample Desc.: | Soil (UDS-1), BH 01, Depth 1.50m |
| Tested By: | DK | Client Sample Desc.: | Soil (UDS-1), BH 01, Depth 1.50m |



**Test Results** — Method: IS 2720 (Part-13)-1986

| | |
|---|---|
| Area of specimen (cm²) | 36 |
| Height of specimen (mm) | 20 |
| Rate of strain (mm/min) | 1.25 |
| Test Condition | Unconsolidated Drained |
| Bulk Density (Mg/m³) | 1.79 |
| Moisture content (%) | 8.0 |
| Dry Density (Mg/m³) | 1.66 |

| Load Increment | Applied Normal Stress (kPa) | Maximum Shear Stress (kPa) | Displacement at Max. Stress (mm) |
|---|---|---|---|
| 1 | 49 | 34.9 | 1.8 |
| 2 | 98 | 82.8 | 2.2 |
| 3 | 147 | 118.4 | 1.4 |

Cohesion Intercept (C'), kPa: 0

Angle of Internal Friction (ϕ'): 38°

**Comments**

*Information provided by client.

Material tested was passing 4.75 mm test sieve, recompacted at maximum achievable density and moisture content

The report and the samples cover only the tested items and is prepared for the exclusive use of the client. MatterLab is not responsible for any misuse of the report by the client or any other party. The report shall not be reproduced except in full, without the prior written approval of the issuing laboratory. Results apply only to the samples tested.

**ACCREDITED BY KSPCB AS "A" GRADE LABORATORY**

## TEST REPORT

**Ref.No: PL/RT/SW/5284/2023**

**Date of Issue: 28/06/2023**

Name & address of customer : M/s. Program Manager
IPE Global Ltd
Kavanatt,Building Kakkanad
Ernakulam
(TSC Package D, KSWMP )

Sample drawn by : Poluchem Laboratory Sample Collector
Sampling Method : IS 3025 Part 1 1987- Reaffirmed 2014
Sample Description : Surface Water
Sample Location : Kayamkulam- Murikkummoodu
Gps Reading : N- 09°10'24.29"
E -76°31'24.07"

Sample code : F/5284/2023
Date of Sample Collected : 20/06/2023
Date of receipt of sample : 21/06/2023
Date of analysis started : 21/06/2023
Date of completion of analysis : 28/06/2023

| Parameters tested | Test method | Result | Limit as per IS 2296 | |
|---|---|---|---|---|
| | | | Class A | Class C |
| Nickel as Ni | IS 3025(P) 54– 2003RA2014 | BDL(MDL- 0.01mg/l) | -- | -- |
| Cadmium as Cd | IS 3025(P) 41– 1992RA2014 | BDL(MDL- 0.001mg/l) | 0.01 mg/l | 0.01 mg/l |
| Lead as Pb | IS 3025(P) 47– 1994RA2014 | BDL(MDL- 0.01mg/l) | 0.1 mg/l | 0.1 mg/l |
| Copper as Cu | IS 3025(P) 42– 1992RA2014 | BDL(MDL- 0.01mg/l) | 1.5 mg/l | 1.5 mg/l |
| Manganese as Mn | IS 3025(P) 59– 2006RA2017 | BDL(MDL- 0.01mg/l) | 0.5 mg/l | --- |
| Mercury as Hg | IS 3025(P) 48 – 1994RA2014 | BDL(MDL- 0.001mg/l) | 0.001 mg/l | --- |
| Zinc as Zn | IS 3025(P) 49 – 1994RA2014 | BDL(MDL- 0.01mg/l) | 15 mg/l | 15 mg/l |
| B.O.D ( 3 days at 27$^0$ C ) | IS 3025 (P) 44 -1993RA2014 | 6.3 mg/l | 2 mg/l | 3 mg/l |
| C O D | IS 3025 (P) 58 -2006RA2017 | 12 mg/l | --- | -- |
| TOC | APHA5310 | BDL(MDL- 0.1mg/l) | -- | -- |
| Total Kjeldhal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 4.5 mg/l | --- | -- |
| Total Chromium as Cr | IS 3025 (P)52 – 2003RA2014 | BDL(MDL- 0.01mg/l) | 0.05 mg/l | 0.05 mg/l |
| Total Arsenic as As | IS 3025(P) 37– 1988RA2014 | BDL(MDL- 0.01mg/l) | 0.05 mg/l | 0.2 mg/l |

Class A-Drinking water source without conventional treatment but after disinfection

Contour Map

Site Operational Proposal Plan

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the contractor to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to biweekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

# 1.Introduction

Dumpsite is an open piece of land where all kind of waste are being openly dumped for long period without any scientific disposal practice. Dumpsite mainly emits gas and contaminated water as well as wind-blown litter and dust. Through dumpsite remediation these negative impact on health would be addressed finally; this may be defined as a process by which disposed waste in an existing dumpsite is excavated and either reused or disposed in scientific manner. However, during the execution there are some potential health hazards for the people those who would be directly engaged in the remediation work.

Along with the health hazards some social impacts are there. There is no land issue but there is the chance of traffic congestion during the execution as because within 200 metres of the location there are more than 100 houses so proper traffic management plan and installation of public disclosure board is necessary here. As no rag picker's livelihood depends upon this dumpsite so their livelihood would not be at stake due to the remediation work and there is no tribal population resident in the nearby location of the dumpsite.

This report provides an overview on the potential social risks envisaged during the social screening and transect walk along with the mitigation measures of that risk of the remediation sub project of the Kayamkulam dumpsite; it also oversees the budding social benefits of the remediation works.

## 1.1 Kayamkulam Municipality

Kayamkulam municipality is located in Karthikapally taluk in Alappuzha district. The Kayamkulam Municipality has an area of 21.79 sq km and extends to the Keerikad, Kayamkulam, Krishnapuram and Pathiyoor villages. The panchayaths of Chettikkulangara, Pattiyoor panchayaths in the North, Krishnapuram Panchayath in the east, Devikulangara Panchayat in the west and Kayamkulam Kayal are the boundaries of Kayamkulam. Kayamkulam town is located on the coast. The Kayamkulam municipal area is about 6 km east of the Arabian Sea. It has three soils that are sandy loam, mud soil and marshmallows. Kayamkulam city is from the west to east and slopes and plains. Kayamkulam was the original capital of the old Odanadu region.

After the development of the region gradually came to be known as the capital of the region. The construction of Kayamkulam town was established in 1905 as the Town Improvement Committee. In 1907, Kayamkulam was declared Town Municipality. In 1956, the municipal area was expanded by adding the suburbs. Four Muslim schools were established long before the government started education institutions. The main cultural centers are Kayamkulam Municipal Library, Mahatma Gandhi Memorial Library, KPAC and Yadavadhara Arts Club. Kayamkulam is an important trading center of Alappuzha district. It was famous for salt processing and marketing in ancient times. Cashew processing is the main industry in Kayamkulam today. Traditional industries such as coir making, and cottage industries such as straw making industries are also active. There are three ways of road transport, rail transport, and waterways. The major roads that pass through this include NH-47, the ancient Kayamkulam-Punalur road and Kayamkulam-Thiruvalla road.

**Some basic information of Kayamkulam is presented in the table below**

| SOCIO ECONOMIC PROFILE DATA | |
|---|---|
| District Name | Alappuzha |
| Taluk Name | Karthikapally |
| Town Name | Kayamkulam (m) |
| Total Population of Town | 68634 |
| Total Male Population of Town | 32784 |
| Total Female Population of Town | 35850 |
| Total Scheduled Castes Population of Town | 4477 |
| Total Scheduled Castes Male Population of Town | 2311 |
| Total Scheduled Castes Female Population of Town | 2166 |
| Total Scheduled Tribes Population of Town | 137 |
| Total Scheduled Tribes Male Population of Town | 75 |
| Total Scheduled Tribes Female Population of Town | 62 |

***Data Source: ULB baseline Data (Annual plan)***

**1.2 Murikkumoodu dumpsite**

The 105-year-old Murukkumoodu dumpsite was one of the oldest sites in Kerala which was recently closed permanently by the Kayamkulam municipality. As per the municipality, the site was initially used for the burial of dead bodies. later that site was started to use as dumpsite. Initially the area was not inhabited by humans, currently the area is highly populated. This is in Murukkumoodu, specifically in Ward 22. It covers an area of 80 cents and falls within the jurisdiction of Kayamkulam Municipality in Karthikapally taluk, Alappuzha district. The GPS coordinates of the site are 9.17356" N 76.52152 "E. The dumpsite is located within the existing common solid waste management facility of the Kayamkulam Municipality. The facility includes a Material Collection Facility (MCF), and a Resource Recovery Facility (RRF). The dumpsite has a very narrow (3.5mtrs) road access. There are public utilities, like shops, temple, on this road. There are at least 20 households within 200 meters of the dumpsite. Therefore, there is an immediate residential impact from the dumpsite remediation project. Currently 88 HKS workers are engaged in the existing MCF & RRF.

### 1.3 Socio economic baseline of host community

It is identified that there are around 20 households situated within the 200 meters from the dumpsite. Almost 100 households located in the abutting vicinity. Socio-economically this community may be considered as a mixed community. There is no rag picker and ST settlements. There are 3-4 shops and one temple which may be considered as public utilities. The dumpsite has very narrow road access which may create traffic congestion in the time of remediation of the dumpsite. The HKS workers engaged in the MCF & RRF located in the same compound may be engaged in other MCF/ RRF to continue their livelihood.

### 1.4 Vulnerability mapping of host community

During the survey phase, it is identified that there are no scheduled tribes, rag pickers and other vulnerable communities living near the dumpsite. However, the community staying in nearby locality of the dumpsite; their health is always vulnerable. During remediation work the issue should considered with the high priority, especially for the aged and children. There are 40 nos of elderly people with above 60 years and the number of below 14yrs children are around 25; the cancer victims are 2, the number of persons suffering from asthma and other allergic diseases are 16; there is 1 expecting mother in the nearby community. This information gathered from the female representative of ULB level GRM committee. As because the proximity of the dumpsite and habitation is very close; the bio mining process may create vulnerabilities such as mobility, sound, water, and air pollution etc.

*Table 1Vulnerability Details*

| Sl. No. | Particulars | Number |
|---|---|---|
| 1 | Elderly people with above 60 years | 40 |
| 2 | Children below 14yrs | 25 |
| 3 | Cancer victims | 2 |
| 4 | Persons suffering from asthma and other allergic diseases | 16 |
| 5 | Expecting Mother | 1 |

***Data source: Ward level health data of ULB***

## 2. Data Collection

Data collection process taken place to gather relevant information regarding the dumpsite through primary and secondary sources. The following stapes were followed to collect data.

### 2.1 Social Screening

The social screening has been conducted with a social screening checklist to identify the potential social risks which are presently existing and can be anticipated during the dumpsite remediation. Major findings during the screening process are shown below.

Kayamkulam dumpsite is very close to the habitation/settlements. Around 100 household are there in which 20 households are located within 50 metres from the dumpsite. The dumpsite has only one narrow road access, thus there may be disruptions in the routine traffic of the local people and commercial establishments. The access of public utilities/ facilities may be disturbed. Alternative livelihood may be required for the HKS workers in the MCF & RRF located in the same compound temporarily during the remediation time. Other social risks anticipated are shown below.

- Health issues of the host community.
- Occupational and health hazards of the workers engaged in remediation process
- Labour issues among the workers/labours engaged in remediation process
- Gender based violence issues towards the women workers and neighbouring community.

As per the social screening, it is envisaged that there are some adverse social impacts on dwellings, labour, livelihood, community resources of host and other vulnerable communities There are no scheduled tribes, rag pickers and other vulnerable communities living near the dumpsite. Since there are some considerable risk factors in respect to the social and economic conditions of the host communities, the sub project can be categorized as "Substantial Risk".

2.2 **Transect walk**

A transect walk was conducted in and around the dumpsite on 24.5.2023. The aim of the transect walk was to assess the site and gather information about its location, potential social risks, existing infrastructure and the impact on surrounding communities. The group explores environmental and social resources, conditions and systems by observing, asking, listening, looking and producing a transect diagram. Information collected can be used to reveal land use practices, hazards and vulnerabilities to inform disaster mitigation and water management. Representatives from ULB, households, civil society organizations and officials were present during the visit.

### 2.2.1 General observations from transect walk and social screening

- Dumpsite is very close to the habitation/settlements. Awareness shall be given to the entire community residing in the abutting areas about the remediation process for seeking cooperation and support.
- The approach road of the dumpsite is very it may cause traffic congestion in the course of remediation work.
- The provision of alternative livelihood of the HKS workers should be arranged as during remediation work their jobs may be seized.
- It is an old dumping yard which is not functional, but the dumped waste is legacy in nature, less biodegradable waste is present in the site. Same time the presence of flammable plastic waste content is much higher. And the nearest fire station is located 5 kilometres away from the site.
- During the transect walk, it was observed that there are no rag pickers associated with the dumpsite. Therefore, there are no livelihood risks for rag pickers in this context.
- As for this sub project there is no need for additional life so no impact on land, customary rights, is observed.

### 2.2.2 Findings from transect walk

- The approach road of the site is very narrow which indicates during remediation work traffic congestion may happened so traffic management measures should be in place.
- Arrangements for alternative livelihood shall be made for the HKS workers engaged in the existing MCF & RRF of the site as their job may be seized in the time of remediation work
- As the site is located in the densely populated area so it is expected that all remediation work will take place in the day time only.

**2.3 Focus Group Discussion (FGD)**

One FGD was conducted dated on 04-11-2023 in NSS hall with the residents living near to the dumpsite. In the discussion that followed, people shared their concerns. Below are the concernsraised by the participants and their solutions.

| Concern | Mitigation measures |
|---|---|
| What are the things to be done to control the dust thatmay arise? | Covering and watering around the site can help prevent dust from comingout |
| The site is surrounded by forest, it would be better if steps were taken to clear the trees. | The chairperson informed that steps will be taken todecongest the premises. |
| After removing the garbagefrom here, what will this place be used for | Solid waste treatment plants, MCF systems, inoculum manufacturing units and value-added products from waste can be generate employment and income for the locals. |
| How many feet will be dug toremove waste? What machines are used for this? | It was understood from thetests that there is waste up to 2 feet deep. This is the removal of waste at such adepth. The main machinesused for this purpose are conveyor belt and JCB. Tipper lorries will also be used to remove the sortedwaste. |

The participants unanimously said that they will do all the help to change this as soon aspossible. The dumpsite clearing activity videos are shared in the ward whatsup group to allay theconcerns of the local community.

## 3. Stakeholder analysis

The remediation process requires collaboration of the following stakeholders.

| SL No | Stakeholder | Remark/Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| **Primary Stakeholders** | | |
| 1 | Residents who are staying nearby the site – Murukkumoodu. | Since the residents who are staying nearby the site who falls under the catchment area (200 metres) are the primary beneficiary of this program and they are responsible to support the program and report or take up any immediate issues affect them during the remediation process through established GRM for this purpose. |
| 2 | Kayamkulam Municipality | a. The Kayamkulam municipality will be benefited through this process in the following:<br>• Longstanding litigation related to the dump site can be solved with various parties<br>• Since free land availability is scarce for SWM activity/Public utility, the ULB can make available 6.5 Acres of land in a prime location.<br>b. Tendering, finalization and deputing contractor/agency for remediation |
| **Secondary Stakeholders** | | |
| 1 | Govt institutions like PCB, KSEB, KWA, Health Department, etc | To deliver necessary approvals and provide necessary services for remediation purpose |
| 2 | ULB Officials | Support and monitoring of the process |
| 3 | KSWMP | Monitoring and evaluation |
| 4 | TSC/PMC | Technical support and consultation |
| 5 | Contractor | Execution of the remediation process |
| 6 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| 7 | Labors of contractor/Agency at site | Execution of work by strictly following labour management plan and preventive GBV Action plan |
| 8 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |

| | | |
|---|---|---|
| 9 | End recyclers | Process the inert and legacy waste safely after remediation |
| 10 | Media | Create an enabling environment for the successful completion of the project through positive reporting by the media. |
| 11 | Police | Ensure law and order in the area, if required |
| 12 | Fire and safety | Extend assistance in case of an emergency. |

## 4. Positive social impacts after remediation.

### a) Enhanced quality of life

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing in ward 22, the project can contribute to an improved sense of well-being. Also, it results to a clean and hygienic work environment for the workers engaged in MCF and RRF.

### b) Livelihood and employment of vulnerable community

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

### c) Economic opportunities

Municipality planned to carry out the remediation process in a scientific manner and thereby to reuse the land for future development activities. The total extend of this land is 80 cents. Municipality is planning to renovate the existing MCF with different civil works located in the dump site premise and one new RRF has been planned to construct in this compound. These projects will create more job opportunities to the people who are looking for employment in waste management sector. The value of land will also increase.

### d) Access to service

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the exiting site.

## 5. Site specific required action plans

- **Labour Management Plan**

Maximum of 12 labours are expected to be engaged in remediation process at a time. A detailed labour Management plan has been formulated and followed at site by the contractor.

- **Labour Influx Management Plan**

Since the site is not away from the habitation, the influx of labour may affect the host community at any way.

- **Preventive GBV Action plan**

The HKS workers will not be engaged in the same site during remediation work. However, if any women were in the remediation work for them and host community GBV action plan is required.

- **Citizen Engagement Plan Action**

Since the dumpsite is situated in the thickly populated area with a past history of protest,a detailed citizen engagement plan is required.

**Livelihood impact and land requirement**

As per the detailed assessment of potential social risk during the remediation process, the identification from social screening with screening checklist, transect walk and focus group discussion indicates that there will be a chance of temporary loss of livelihood of HKS members in the existing MCF and RRF located in the same site. A detailed impact assessment shall be conducted by the TSC, and Livelihood Action Plan will be prepared accordingly

It is identified that land acquisition is not required as sufficient land is available.

## 6. Conclusion.

The social screening and transect walk at the Kayamkulam dumpsite provide insights for the dumpsite remediation project. As there are households residing within 200 meters of the site, the immediate residential impact is there. Not only that, the presence of public utilities/facilities and the history of hazards highlight the need for careful planning and implementation to ensure the safety and well-being of the community. The availability of land and law social risk for the implementation of dumpsite remediation activities are positive factors of the project.

# Annexure 1

## Citizen Engagement Plan

### 1 Brief introduction about the project

Dumpsite is an open piece of land where all kinds of waste are being dumped for long- long years back. Dumpsites mainly emit gas and contaminated water as well as wind-blown litter and dust. Through dumpsite remediation these negative impacts on health would be addressed finally; this may be defined as a process by which disposed wastes in an existing dumpsite are excavated and either reused or disposed of in a scientific manner. However, during the execution there are some potential health hazards for the people who would be directly engaged in the remediation work. The site used to receive untreated unorganized mixed waste stream, there is a possibility of biomedical and hazardous items within the accumulated waste in the dumping ground.

Along with the health hazards some social impacts are there. There is no land issue but there is the chance of traffic congestion during the execution as because within 200 meters of the location there are around 100 houses so a proper traffic management plan and installation of a public disclosure board is necessary here. As no rag picker's livelihood depends upon this dumpsite so their livelihood would not be at stake due to the remediation work and there is no tribal population resident in the nearby location of the dumpsite.

### 2. Stakeholder identification

**a) Waste Generators*:*** The nearby community, viz., resident, commercial establishments, different institutions are the waste generators.

**b) Service Providers:** The service provider may be considered a primary and secondary. Primary service providers are the HKS workers, where the secondary service providers are all concerned staff including the ward councilors, office bearers of the Kayamkulam municipality.

**c) Agency Workers for Remediation Work:** For this project the agency workers will play the most crucial role so basic orientation of the project along with some other awareness programs like GBV, OHS etc. are very pertinent here.

### 3. Socio-economic profile of the community

Kayamkulam municipality is in Karthikapally taluk in Alappuzha district. The Kayamkulam Municipality has an area of 21.79 sq km and extends to the Keerikad, Kayamkulam, Krishnapuram and Pathiyoor villages. The panchayaths of Chettikkulangara, Pattiyoor panchayaths in the North, Krishnapuram Panchayath in the east, Devikulangara Panchayat in the west and Kayamkulam lake are the boundaries of Kayamkulam. Kayamkulam town is located on the coast. The Kayamkulam municipal area is about 6 km east of the Arabian Sea. It has three soils that are sandy loam, mud soil and marshmallows. Kayamkulam city is from the west to east and slopes and plains. Kayamkulam was the original capital of the old Odanadu region.

After the development of the region gradually came to be known as the capital of the region. The construction of Kayamkulam town was established in 1905 as the Town Improvement Committee. In 1907, Kayamkulam was declared Town Municipality. In 1956, the municipal area was expanded by adding the suburbs. Four Muslim schools were established long before the government started education institutions. The main cultural centers are Kayamkulam Municipal Library, Mahatma Gandhi Memorial Library, KPAC and Yadavadhara Arts Club. Kayamkulam is an important trading center of Alappuzha district. It was famous for salt processing and marketing in ancient times. Cashew processing is the main industry in Kayamkulam today. Traditional industries such as coir making, and cottage industries such as straw making industries are also active. There are three ways of road transport, rail transport, and waterways. The major roads that pass through this include NH-47, the ancient Kayamkulam-Punalur road and Kayamkulam-Thiruvalla road.

### 4. Vulnerability data of host community:

There are no scheduled tribes, rag pickers and other vulnerable communities living near the dumpsite. However, the community staying in the nearby locality of the dumpsite; their health is always vulnerable. During remediation work that issue should be considered with the high priority, especially for the aged and children. There are 40 aged persons and the number of below 14yrs children is around 25; the cancer victim is 2, the number of persons suffering from asthma and other allergic diseases is 16; there is 1 expecting mother in the nearby community. This information was gathered from the female representative of the ULB level GRM committee. Because the proximity of the dumpsite and habitation is very close; the bio mining process may create vulnerabilities such as mobility, sound, water, and air pollution etc.

**Table. Vulnerability Mapping in Respect of Health Issue**

| Sl. No. | Particulars | Number |
|---|---|---|
| 1 | Aged Persons (60+ yrs) | 40 |
| 2 | Children below 14 yrs. | 25 |
| 3 | Cancer Victim | 2 |
| 4 | Persons suffering from asthma and other allergic diseases | 16 |

***Source: Ward level health data of ULB***

### 5. Need of the plan:

The management of municipal solid waste is one of the main functions of all Urban Local Bodies (ULBs) in the country. All ULBs are required to meticulously plan, implement, and monitor all systems of urban service delivery especially that of municipal solid waste. As per the 74th Constitution Amendment Act, the SWM Rules, 2016 and the State Municipal Laws, ULBs are primarily responsible for the provision of municipal solid waste management services which includes the following initiatives regarding dumpsite:

- Stop land filling or dumping of mixed waste soon after the timeline as specified in rule 23 for setting up and operationalization of sanitary landfill is over.
- Investigate and analyze all old open dumpsites and existing operational dumpsites for their potential of bio- mining and bioremediation and where so ever feasible take necessary actions to bio-mine or bio-remediate the sites.
- Kayamkulam dumpsite is very close to the habitation/settlements. 100 households are there, around 20 households are located within 50 mtrs from the dumpsite. The dumpsite has only one narrow road access which is being used by the nearby community also. It is not functional now, but a huge quantity of legacy waste has already been dumped there. So, it is the need of the time to remediate all the dumped legacy waste from there.

## 6.Objective of the plan

- To reduce pollution effects
- To protect groundwater sources
- To reduce the health hazards of the host community
- To improve the aesthetic ambience of the locality
- To improve workers friendly environment for those engaged in the MCF& RRF located in the same site

## 7. Stakeholder concern

### a) Waste Generators:

The waste generators will comply with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future; not only that their cooperation during the remediation work is highly expected.

### b) Service Providers:

Officers and the council members are responsible for tendering, finalization and deputing contractor/agency for remediation & arranging alternative livelihood of the HKS workers engaged in the MCF, RRF functional in the same compound and monitoring the day to day project activities. HKS workers, and the other staff engaged directly to collect the waste from the doorstep of the waste generator expected to collect and segregate the waste properly to prevent further dumping after remediation

### c) Workers for Remediation Work:

All the labours, drivers, supervisors, security staff of the contractor/ agency engaged in the remediation work directly are the main player of the to make it successful. They will play the most crucial role in remediation work and not only that during the execution they may be primary contact person of the neighbourhood community.

**8. Public disclosure**: Project-related information shall be disclosed through a public consultation and making relevant documents available in public locations. The project agencies and associated line departments shall provide relevant safeguards information promptly, in an accessible place, and

the manner and language understandable to affected persons and other stakeholders. For illiterate people, other suitable communication methods will be used.

The following documents shall be made available at the offices of municipality, Bus stand, Local Police Station, Project site and other public places for public reference and shall also be uploaded on respective websites.

(i) Summary of project (in English and local language - Malayalam)

(ii) Draft ESMF Report (in English; translated summary in Malayalam)

(iii) Environmental monitoring reports

(iv) Grievance addressing measures

## 9. Activities proposed

**9.1 Community/citizen Awareness**: Before remediation work community / citizen awareness regarding the whole process of remediation work is the precondition for smooth execution of the project. Informed community is always the power bank of the proper and time bound execution of any community-based development work. During the execution of the process regular interaction with the host community is also required. They are the important stakeholder of the total process.

**9.2 Awareness to Service providers:** All primary and secondary service providers should come under awareness activity under the remediation work; the mode of communication may vary depending upon their status of primary or secondary, but the total process of the remediation work should be imparted. They should be intimated regarding the benefit of the activity and their important role in this concern.

**9.3 Awareness to the Agency Workers**: All the labors, drivers, supervisors, security workers of the agency who would be awarded for the work should be aware about the project and their responsibility, the community, issues concerned with GBV, OHS, basic labour laws. They should also be aware about the important services like fire, police, and health facilities for emergency situations.

## 10 Citizen Engagement Plan Matrix

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Awareness on project activities - bio mining | Proper awareness will be created. | Exposure visit | PIU/Contractor |
| 2 | Awareness boards. | Proper awareness will be created. | Installation of boards and signages. | Contractor |
| 3 | Health and safety education. | Do's and Don'ts will be cleared. | Orientation session. | Contractor / PIU / DPMU |
| 4 | Traffic management | Schedules are to be finalized. | Planning meeting. | PIU |

**Budget**

| S. No | Activity | Specification | Quantity | Cost |
|---|---|---|---|---|
| 1 | Exposure visits to Alappuzha | Road trip - vehicle hire. | 12 Pax | [redacted] |
| 2 | Sign boards | Printed boards | 10 Nos | [redacted] |
| 3 | Site specific IEC / trainings | Meetings | 200 Pax | [redacted] |
| | Total | | | [redacted] |

# Annexure -2

## Preventive GBV Action Plan

**1. Sub project information**

Bioremediation of existing dumpsite in ward 22 of Kayamkulam Municipality

**1.1 Details of labours**

The project is under pre planning stage. ULB must finalize contactor/Agency for Remediation. So, the exact number of Labors are not available. But approximately we can expect maximum of 12 labors

| | |
|---|---|
| Total number of labors | : 12 (Approx.) |
| Category of labors (Age/sex/gender) | : Not available |
| Data of migrant labors, if any | : Not available |

**2. GBV Issues likely to be identified at site**

1. Issues against female workers at site
2. Lack of safe and Gender friendly toilets at work sites
3. Disparity in work and wages based on gender
4. Threat of GBV or Sexual Exploitation Abuse (SEA) incidents to female members of the host community

**3. Activities under GBV Action plan**

**3.1 Formation of Internal Complaints Committee**

The committee should be Presided by a senior woman, and more than half of the total Committee members should be women. There should be an external member who has experience in dealing with issues related to women. Preferably a Social Worker /Advocate/NGO Representative.

**3.2 Placing of ICC informatory board at Work site**

| Insert Logos of KSWMP,WB,AIIB | | | |
|---|---|---|---|
| Project Name (KERALA SOLID WASTE MANAGEMENT PROJECT) | | | |
| Sub Project Name:_____ | | | |
| Internal Complaints Committee | | | |
| Sl.No | Name | Designation | Contact Number |
| | | | |
| | | | |
| | | | |
| EMERGENCY CONTACT NUMBER | | | |

**3.3Gender Sensitization trainings for Labors**

The Project expect around 12 labors will be employed in a day and women participation in the labor force is limited, even the project is taking precaution to protect and prevent any GBV incidence at the site. Taking into consideration all these aspects, the project plan to conduct a half day sensitization program in the following subjects, viz. the type of GBV, the action to be taken by the victim, the laws and the support organizations which extend support to the victim of GVB and the role of ICC and their contact details etc.

**3.4Sensitization for host community members special focus on female**

The citizen engagement plan has proposed an activity of host community meeting in which the importance and expected social risk of GBV will be discussed and the mitigation measures inbuilt in the project will be elaborated to the host community members especially to the women.

**3.5 Allocation of Gender friendly and safe toilet facilities for women**

Project has taken special care to arrange a separate toilet, wash and rest facility for female workers to protect their privacy and safety, and the same must be arranged by the contractor.

**3.6 Keeping of wage register at site to restrict wage disparity based on gender**

The project actively opposes gender-based wage disparity at any site funded under the KSWMP-supported SWM project. To ensure gender parity in various aspects such as wages, division of labor, and facilities, an appropriate monitoring mechanism, such as a wage register, should be maintained for the scrutiny of the project implementers.

**4 Details of GBV Service Providers identified**

The government of Kerala has constituted a help desk under Kudumbashree to support or to prevent and extend support to the GBV victims, and their details are given below.

Kudumbashree Snehitha Gender Help Desk

Contact Number – 0477-2230912
Toll free number - 18004252049

**5 GBV (Preventive) Implementation plan Matrix**

| Sl No | Activity | Timeline | Primary Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Formation of Internal complaint committee | Pre-Construction Phase. | Contractor/ULB | DPMU |
| 2 | Placing of ICC informatory Board at worksite | Pre-Construction Phase. | Contractor | DPMU/TSC |
| 3 | Gender sensitization Training to labors | During Construction | Contractor/TSC | DPMU |
| 4 | Group Discussion with female host community members | Pre-Construction Phase. | ULB | TSC |
| 5 | Ensuring Gender friendly and safe toilet facilities | Construction stage | Contractor | TSC |
| 6 | Keeping Wage Register at site | Construction stage | Contractor | TSC |

**Budget**

| Sl No | Particulars | Cost |
|---|---|---|
| 1 | Placing of ICC informatory board at site | [redacted] |
| 2 | Gender sensitization trainings to labor | [redacted] |
| 3 | FGD among female host community members | [redacted] |
| | **Total Cost** | [redacted] |

**6 Monitoring plan**

| Activity | Monitoring Indicators | Means of Monitoring | Reporting Period | Responsibility |
|---|---|---|---|---|
| Formation of Internal complaint committee | Minutes of Meeting/Bye Law of Committee/Reports | Verification of Minutes of Meeting and Reports | 15 days after commencement of work | DPMU |
| Placing of ICC informatory Board at worksite | Photos of Board placed | Physical verification | 15 days after the commencement of work | DPMU |

| | | | | |
|---|---|---|---|---|
| Gender sensitization Training to labors | Attendance and Photographs | Verification of Documents | 5 days after the commencement of work | DPMU |
| FGD among female host community members | Attendance and Photographs | Verification of Documents | 5 days after the commencement of work | DPMU |
| Ensuring Gender friendly and safe toilet facilities | Gender friendly signage's, Condition of latches, Floor Condition, Status of Flush | Physical verification | Before Commencement of work | DPMU |
| Keeping Wage Register at site | Photographs | Verification of Register | 5 days after the commencement of work | DPMU |

# Annexure-3

## Labour Management Plan

### 1 INTRODUCTION

**1.1** PROJECT TITLE:

Project for the remediation of abandoned dumpsite at Murukkumoodu, owned by Kayamkulam municipality

**1.**2 PROJECT AREA

The Murukkumoodu dump site of Kayamkulam municipality is situated ward 22, covering an area of 01.05 acres.

### 2. SCOPE AND STRUCTURE OF THE LABOUR MANAGEMENT PLAN

The scope of the LMP shall be as outlined in the World Bank's ESMF. The engagement will be planned as an integral part of the project's social assessment and project design and implementation. This document has 10 chapters. This chapter viz., chapter 1 served as introduction. Scope and structure of LMP is provided in chapter 2. An overview of labour use in the project is presented in chapter 3. Key potential labour risks are listed in chapter 4. Legislative framework governing labour employment in India/Kerala is discussed in chapter 5. Implementation Arrangements, policies and procedures follow in the subsequent chapter. Grievance redressal mechanism, contractor management are presented in the last chapters.

### 3. OVERVIEW OF LABOUR USE ON THE PROJECT

**3.1** Details of Labors

The proposed remediation process at Murukkumoodu requires following category and number labors

| Sl.No | Equipment | Category of labours | Required No.of labours |
|---|---|---|---|
| 1 | One trommel | Labours for waste segregated purpose | 5 |
| 2 | One excavator | Operator | 1 |
| 3 | One JCB | Operator | 1 |
| 4 | One small tipper | drivers | 1 |

| | | | |
|---|---|---|---|
| 5 | Support Staff | Security | 2 |
| 6 | | Supervisor | 2 |
| **Total Labors** | | | 12 |

## 4. ASSESSMENT OF KEY POTENTIAL LABOUR RISKS

### 4.1 Project Activities:

The bioremediation of the dumpsite at Muruldumoodu includes the following activities.

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement
- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

### 4.2 Key Labour Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery. lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages, or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.
- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites

- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female SWM workers are engaged.
- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form workers organizations, etc.
- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

## 5. BRIEF OVERVIEW OF LABOUR LEGISLATION: TERMS AND CONDITIONS

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to |

| | | |
|---|---|---|
| | | be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10. | Industrial Disputes Act 1947: | the Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

## 6. RESPONSIBILITY MAPPING

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring labourers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing labourers, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect

and assist vulnerable groups of workers, including individuals with disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the laborers. The ULB will actively monitor the contractor's compliance with legal and welfare requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

## 7. CODE OF CONDUCT

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured.

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favours or other forms of humiliating, degrading or exploitative behaviour)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behaviour with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)
- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favours, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)

- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

**8. SYSTEMATIZING THE CODE OF CONDUCT**

Awareness raising: The contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

**9. TRANSPARENCY IN CONTRACT SPECIFIC TERMS AND CONDITIONS**

All contracts must contain

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism

## LABOUR MANAGEMENT PLAN MATRIX

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on.<br><br>To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board<br><br>One notice board | As soon as the work is started.<br><br>Do | Photographs of the notice board where the license is displayed.<br><br>do | Contractor |

| | | | | |
|---|---|---|---|---|
| To conduct pre- employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the construction period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |

| | | | | |
|---|---|---|---|---|
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. Female members should be minimum 50%. ) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act<br>2. The Employee compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act<br>5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity Benefit Act<br>F | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| Conduct HIV/AIDS awareness programmes | As per requirement | Once in six months | Reports, photographs etc | Contractor |

| | | | | |
|---|---|---|---|---|
| All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of license ids to be collected | PIU |

# SUMMARY

**INTRODUCTION:** Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. Bio mining and bioremediation of Koothattukulam dumpsite figures in Cluster 1. The selected dumpsite is Koothattukulam which is falling under this cluster 1 and is located near Ward no 15 Koothattukulam municipality, Ernakulum District.

**RATIONALE FOR THE PROPOSED SUB-PROJECT:** Koothattukulam ULB proposes bio mining and bioremediation of the Koothattukulam legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

**PROPOSED SUB-PROJECT DETAILS:** Koothattukulam dumpsite is located at a distance of 1.0 km from the centre of Koothattukulam town in SE side and encompasses a total area of 0.29 acres of land. The geographical coordinates of the dumpsite are 9°51'49.2" N & 76°35'27.3" E. The volume of legacy waste to be remediated in the dumpsite is 2061.41 Cu.m. The legacy waste is presented about 0.8 m above and 3.0 m below the ground level respectively. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts.

**APPLICABLE NATIONAL, STATE LEGISLATIONS AND TECHNICAL GUIDELINES:** To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed.

**THE WORLD BANK SAFEGUARDS POLICIES, AND KSWMP ESMF**: The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are ensured.

**SUB-PROJECT SCREENING AND ITS CATEGORIZATION:** The subproject site has been screened for potential impacts due to proposed developments. On the basis of Environmental screening report and baseline consideration, Potential odour nuisance and air borne microbial contamination which may have moderate environment impacts to the surroundings during remediation period. Considering all the above factors, also the time extent of the impact during remediation stage and the mitigation measures proposed, the sub-project has been considered as E2 category.

**ENVIRONMENTAL BASELINE:** Physiographically, Koothattukulam in and around topographical features, is gentle slope and undulating terrain zone. The favourable time for remediation is between October-2023 to March-2024 non-monsoon period. As per Wind rose diagram, the predominant wind directions are blowing from West and WSW direction throughout the year. As per the geotechnical investigation, the subgrade soil was encountered at 3.0 m below the waste depth of the dumpsite and the predominant soil is gravelly clay. The dumpsite is surrounded by predominantly of Dry cultivation land use and the same will act as odour attenuation during remediation. The cultural heritage zone near dumpsites is Koothattukulam Mahadeva temple at a distance of 1.1 Km in SE direction. Hence, no significant physical impact to the heritages sites is envisaged during remediation. The total number of vehicles that will be operational at the dumpsite is 5 numbers per day which increase the traffic load by only 0.1% per hour and reducing the impacts to negligible. As per the district disaster management plan-2015 and flood vulnerability map the dumpsite is not under flood prone zone.

**DESCRIPTION OF ENVIRONMENTAL PARAMETERS:** The analysed air pollution data indicates that the levels are within acceptable limits of NAAQs. The ambient Noise Levels are well within the National Ambient Noise standards for Commercial Area for both day and night. The ground water quality results indicate that the dumpsite has not caused any major increase of the parameters and the quality parameters are within the IS 10500:2011, except the color and coliforms which are found to be higher than the above said standard. Similarly, the surface water sample shows that it is not largely influenced by the dumpsite as the quality is

within the limits of IS 2296, except for color, iron BOD value of about 4.1 mg/l and COD of 12 mg/l. The leachate monitoring data indicates, the TDS is about 367 mg/l, while the suspended solids is about 142 mg/l. The chlorides are 52.1 mg/l, while the COD, BOD are 480 mg/l and 110 mg/l respectively.

**SOCIO-ECONOMIC BASELINE:** Koothattukulam Municipality has population of 17253, literacy rate of 96.65%, Density of population of 744/Sq. Km as per Census 2011. The dump site is situated in the land owned by the Municipality. They have full authority to plan and implement the remediation process in this land. The remediation process will be conducted by an experienced agency decided by the Municipality with the supervision of a ULB level project implementation unit.

**SOCIO-ECONOMIC ENVIRONMENT:** The dumpsite remains in close proximity to 40 houses in 200 m, a fire station, a veterinary hospital and a beverage outlet are situated within 200 metres of the dumping yard. A Weekly market place is also functioning in the adjacent plot; it shares the same compound wall. The wall is around 5ft high. There will not be any livelihood loss or resettlement issues observed directly connected with the remediation process. The site is covered with a compound wall and gate.

**ANALYSIS OF ALTERNATIVES:** After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

**ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS:** Environment: During operational phase (bio-remediation), the main potential nuisances caused by a dump site are fugitive dust, odour, foul gases, smoke from the site (in case of fire), and leachate generation. Birds, vermin, and rodents, littering, noises both from machineries operating at the site and waste collection vehicles. Social: No specific social risk is identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process. It can be overcome by using adequate protective measures properly.

In connection with the dumpsite only one family is residing in an aerial distance of 200 m and the remediation process will not affect them in any way.

**ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN:** The management plan proposed are for pre-remediation as well as during remediation stage. The mitigation measures are recommended for impacts from air, noise, water, leachate, health and safety, OH&S aspects. The proposed monitoring plan includes leachate, surface and ground water monitoring for a period of once in three months. The cost of [redacted] is required for implementation and supervision of EMP.

**SOCIAL MANAGEMENT AND MONITORING PLAN:** The social management plan proposed are for pre-remediation as well as during remediation stage. The mitigative measures proposed addressing concern of local community about remediation work, labour management issues, health and safety risks of labours, gender discrimination.

**EMERGENCY PREPAREDNESS PLAN:** The identified emergency situations which may arise from remediation activities are fire risk in summer, occupational health and safety related risks. The Koothattukulam police station at 1.0 km, Taluk hospital at 1.0 km, Koothattukulam Fire and Rescue station at 0.2 km are the nearest emergency services. Periodic Compliance monitoring system will be done by the contractor during remediation.

**PUBLIC CONSULTATION AND INFORMATION DISCLOSURE: A** Transect walk was carried out on 06.06.2023 covering the surrounding area of the dump site. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact. Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the process at the site. Site control measures should be enforced to prevent unauthorized personnel into the work site.

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# CHAPTER 1 INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-Lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio-mining of multiple Legacy Waste Dumpsites in various districts. There are 19 dumpsites identified for remediation under the Kerala Solid Waste Management Project. Several others have been taken up for remediation directly by the ULBs. Currently, 7 dumpsites are considered from three districts (Ernakulum, Alappuzha and Idukki) falling under Package B, selected by Kerala Solid Waste Management Project (KSWMP) for remediation. One of the selected dumpsite is Koothattukulam which is in Ward no 15 of Koothattukulam municipality, Ernakulum District.

## 1.2 The Rationale for the Proposed Sub-Project:

Koothattukulam dumpsite in Koothattukulam Municipality at ward no.15 has a total waste quantity of 2061.41 cum, spreading over 30 Cent. The site is located between Lat- 9°51'49.2" N and Long - 76°35'27.3" E and has an elevation of MSL +40 (m), with a flat terrain but a nullah flows at a distance of 20m from the dumpsite boundary in the southern side. During the monsoon season, due to the presence of a nullah near the site, leachate from waste flows towards the nullah, which then joins the Uzhavoor River on the western side of the site and the Uzhavoor River is at a distance of 1.2 km from the dumpsite in the southern side. Koothattukulam ULB proposes bio-mining and bioremediation of the Koothattukulam legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio-mining and bioremediation, it is proposed to undertake an

Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Proposed Sub-Project Details:

Koothattukulam dumpsite is located at a distance of 0.65 km from the centre of Koothattukulam town in south-east side and encompasses total area of approximately 40 cents of land. Out of this, 30 cents of land are covered with solid waste. The dumps site is not very far from human settlement. The coordinates of the dumpsite are 9°51'49.2" N & 76°35'27.3" E. It is located in ward no. 15 of the municipality. Koothattukulam municipality holds the ownership of the dumpsite. In the northern direction, the municipal cattle market is located adjacent to the dumpsite. In the eastern direction, the existing Material Collection Facility (MCF) of Koothattukulam is within the compound of the dumpsite. The southern side provides access to the dumpsite, with the Nadappuram Bypass - Sreedhareeyam Hospital Rd passing through it. A small nullah flows southern side of the dump site within the distance of 20 m in the southern direction. In the northwest direction, there is a settlement located at a distance of 40 meters from the dumpsite. The exact date for start of the dumpsite was not available with municipality; however approximately it had started 40 years ago, the information has been gathered during field visit.

Currently, the quantity of waste dumped at this site is about 2061.41 cum. As of now 75 % of the area is covered with solid waste. The legacy waste present at site is about 0.8 m above and 3 m below from the existing ground level. Since there is a possibility of leachate pollution and other environmental issues associated with the open dump, bioremediation is essential to mitigate the impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues.

## 1.4 Objectives and Scope of the EIA & SIA:

As per indicative categorization for dumpsite bio-mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (40 cents), waste spread (30 cents) and absence of environmentally sensitive features around, this subproject is individually considered as E2, and EIA is prepared accordingly. Required monitoring and analysis are carried out considering the possible impacts.

The EIA & SIA process involves the identification of the potential environmental issues in the project and trying to address them during design interventions. The EIA & SIA further carries out impact prediction and evaluation of residual environmental and social issues of a Project. It then goes on to outline the proposed mitigation measures for residual impacts and enhancement measures for positive impacts which the Project will implement.

## 1.5 Structure of the Report:

The Consolidated EIA & SIA report has been structured into the following Chapters:

- Introduction and Project Description.
- Policy, Legal and Administrative Framework presents a review of the existing Institutions and legislation relevant to the project at the National and the State levels;
- Environmental Assessment Methodology discusses sequence of tasks carried Out in preparing EIA;
- Existing Environmental Scenario presents a consolidated picture of the existing Environmental setting of the project;
- Assessment of Potential Impacts identifies and quantifies the potential impacts on each of the environmental components due to the proposed project development;
- Analysis of Alternatives discusses the criteria for analysis of alternatives of technology for remediation.
- Mitigation Measures presents an elaborate listing of the nature of impacts on each of the environmental components and the avoidance and mitigation measures suggested.
- Public Consultation details the stages and types of public consultations carried out during the project preparation stage and people's perceptions of the project benefits and the Potential impacts;

# CHAPTER 2 POLICY AND REGULATORY FRAMEWORK

## 2.1 Applicable National, State Legislations and Technical Guidelines

**National Environmental Rules and Regulations: -**

To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed. A summary of environmental legislation/regulations relevant to project is furnished in the following **Table-2.1**.

*Table 2.1 Summary of Environmental Legislation /Regulations*

| Sl. No. | Act / Rules | Purpose | Applicable (Yes / No) | Reason for Applicability | Authority |
|---|---|---|---|---|---|
| 1 | Environment Protection Act, 1986 | To protect and improve overall environment. This is an umbrella Act. | Yes | As all environmental notifications, rules and schedules are issued under this act. | MoEF&CC, CPCB, SPCB |
| 2 | Solid Waste Management Rules, 2016 | To manage collection, transportation, Segregation, Treatment, and disposal of solid wastes (other than Hazardous water, Plastic Waste, Bio Medical waste) | Yes | Dumpsite remediation/ biomining | MoEF&CC, CPCB, SPCB |
| 3 | Air (Prevention and Control of Pollution) Act, 1981 | To control air pollution by controlling emission of air pollutants as per the prescribed standards. | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 21 of Air (Prevention and control of Pollution) Act 1981. | State Pollution Control Board, Kerala |
| 4 | Water Prevention and Control of Pollution) Act, 1974 | To control water pollution by controlling discharge of pollutants as per the prescribed standards | Yes | Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 25 of this Act. | State Pollution Control Board, Kerala |
| 5 | The Noise Pollution (Regulation and Control) Rules, 2000 & amendments | The standards for noise for day and night have been promulgated by the MoEF&CC for various activities. | Yes | This act will be applicable for all construction equipment deployed at worksite and in operation. | State Pollution Control Board, Kerala |
| 6 | Public Liability and Insurance Act, 1991 | Protection from accidents. | Yes | This act will be applicable for providing immediate relief to the persons affected by accident occurring during work | State Pollution Control Board, Kerala |
| 7 | Central Motor Vehicle Act 1988 | To check vehicular air and noise pollution. | Yes | This rule will be applicable to vehicles deployed for construction activities and construction Machinery. | Motor Vehicle Department |
| 8 | The Plastic Waste Management Rules, 2016 | For the storage and disposal of plastic wastes through authorized vendors. | Yes | This act will be applicable for the storage and disposal of all the plastic wastes. | State Pollution Control Board, Kerala |
| **Other applicable Rules** | | | | | |
| 9 | Construction & Demolition, Waste Management Rules, 2016 | | | | |
| 10 | Batteries (Management and Handling) Rules, 2001 | | | | |
| 11 | E-Waste (Management) Rules, 2016 | | | | |

| | |
|---|---|
| 12 | Kerala Municipality Act, 1994 & Rules |
| 13 | Hazardous & Other Wastes (Management And Transboundary Movement) Rules, 2016 |
| 14 | Bio-medical Waste (Management & Handling) Rules, 1998 |

**Applicable Social and Other Legislation**

**Other legislations applicable to Sub-project activities under the project**

- Workmen's Compensation Act 1923 (the Act provides for compensation in case of injury by accident arising out of and during the course of employment);
- Payment of Gratuity Act, 1972 (gratuity is payable to an employee under the Act on satisfaction of certain conditions on separation if an employee has completed 5 years);
- Employees PF and Miscellaneous Provision Act 1952 (the Act provides for monthly contributions by the employer plus workers);
- Maternity Benefit Act, 1951 (the Act provides for leave and some other benefits to women employees in case of confinement or miscarriage, etc.);
- The Sexual Harassment of Women at Workplace (Prevention, Prohibition and Redressal) Act, 2013 is introduced to prevent and provide redressal of complaints of sexual harassment.
- The Protection of Women from Domestic Violence Act, 2005 defines domestic violence, describes the powers and duties of protection officers, service providers and lists the procedures for obtain reliefs.
- Contract Labor (Regulation and Abolition) Act, 1970 (the Act provides for certain welfare measures to be provided by the contractor to contract labour);
- Minimum Wages Act, 1948 (the employer is supposed to pay not less than the Minimum Wages fixed by the Government as per provisions of the Act);
- Payment of Wages Act, 1936 (it lays down as to by what date the wages are to be paid, when it will be paid and what deductions can be made from the wages of the workers);
- Equal Remuneration Act, 1979 (the Act provides for payment of equal wages for work of equal nature to Male and Female workers and not for making discrimination against Female employees);
- Payment of Bonus Act, 1965 (the Act provides for payments of annual bonus subject to a minimum of 83.3% of wages and maximum of 20% of wages);
- Industrial Disputes Act, 1947 (the Act lays down the machinery and procedure for resolution of industrial disputes, in what situations a strike or lock-out becomes illegal

and what are the requirements for laying off or retrenching the employees or closing down the establishment);

- Industrial Employment (Standing Orders) Act; 1946 (the Act provides for laying down rules governing the conditions of employment);
- Trade Unions Act, 1926 (the Act lays down the procedure for registration of trade unions of workers and employers. The trade unions registered under the Act have been given certain immunities from civil and criminal liabilities);
- Child Labour (Prohibition and Regulation) Act, 1986 (the Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of child labour is prohibited in Building and Construction Industry);
- Inter-State Migrant Workmen's (Regulation of Employment and Conditions of Service) Act, 1979 (the inter-state migrant workers, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home to the establishment and back, etc.);
- The Building and Other Construction Workers Act (BOCW), 1996 is a social welfare legislation that aims to benefit workers engaged in building and Other Constructions Works.

## 2.2 The World Bank Safeguards Policies, and KSWMP ESMF

The World Bank policies and directives on environmental and social safeguards have adhered to the dumpsite remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are summarized in the following table.

**Environmental Codes of Practices (ECoP):** The ECoPs provide guidelines for environmental management of bio-mining and bio-remediation activities which are seen to be of limited extent of impacts/risk, temporary and reversible, and readily managed with good practices during the implementation. The following key points should be considered.

**Key Points of ECoP to be considered:**

- The bio-mining activities and preparatory activities shall follow the "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" published by CPCB in February 2019.
- Bio-mining methods include Tractor Tiller, Trench method, Cone Method, windrow, Thin Layer Method, etc. More appropriate may be the Cone method for legacy waste and window for relatively fresh waste.

- Leachate channelization and treatment facility shall be set up before starting the bio-mining works. Works shall take place only during the non-monsoon period; and there shall be suitable precautions to prevent any rainwater disturbing the operations (like seasonal unexpected rains, storm water, runoffs from other sources).

- Ballistic separator and trommel may be used for screening. Screened fractions into which waste is segregated include RDF, inert, Compost, and C&D wastes.

**Applicable World Bank Operational policies**

- OP 4.01 Environmental Assessment Help to ensure the environmental and social soundness and sustainability of investment projects. Support integration of environmental and social aspects of projects in the decision-making process
- OP 4.04 Natural Habitats Promote environmentally sustainable development by supporting the protection, conservation, maintenance, and rehabilitation of natural habitats and their functions.
- OP 4.09 Pest Management includes training to prevent risk to human beings or animals from Bio-culture, enzymes, insecticides and such formulations used for remediation.
- OP 4.11 Physical Cultural Resources (PCR) includes resources of archaeological, paleontological, historical, architectural, religious (including graveyards and burial sites), aesthetic, or other cultural significance. Assist in preserving PCR and in avoiding their destruction or damage. PCR
- WB General EHS Guidelines Recommendations of these guidelines would be incorporated in EMP & SMP and Bidding document for this project.

The Environmental Management Framework (EMF) has been prepared to assist screening, assessment, and management of environmental risks of all solid waste management projects at an early stage during the planning and integration mitigation hierarchy during the subproject design, implementation, and operation. The framework helps provide specific guidance on the policies and procedures to be followed for environmental assessment along with the roles and responsibilities of the implementing agencies.

# CHAPTER 3 ENVIRONMENTAL AND SOCIAL BASELINE

## 3.1 Project Location of the site

Koothattukulam dumpsite is located at a distance of 0.65 km from the center of Koothattukulam town in south-east side and encompasses total area of 40 cents of land. Out of this, 30 cents of land is covered with solid waste. The coordinates of the dumpsite are 9°51'49.2" N & 76°35'27.3" E. The dumpsite is surrounded by municipal cattle market in Northern direction, MCF in the Eastern direction and a Settlement in the NW side at a distance of 40m from the dumpsite. A small nullah flows in southern direction of the dump site at a distance of 20 m. In the surrounding area of the dumpsite, around 3-5 households are residing within a 100m radius, and one household is located at 25m. Nangelil Ayurveda Hospital 200m away, Devamatha Hospital 300m away from the project location. The google map image showing the location of Koothattukulam dumpsite is shown below in **Figure: 3.1**.

*Figure 3. 1 Google Image Showing the Locations of the existing Dumpsite at Koothattukulam*

## 3.2 Methodology for Environmental Baseline Studies

The baseline appraisal should consider all aspects of the environment that may be altered by the proposed project. These can be categorized as physical, biological or socioeconomic attributes. The baseline should be based upon the findings of the screening and scoping studies. Surface water and sediments, groundwater, air quality, noise, soils and land use Biodiversity Socio-economic (social), cultural heritage, traffic and transport Physical Biological Socio-economic. The scope of the baseline study, including attributes that will be appraised, and the geographical extent of the analysis, will typically have been agreed with the relevant decision makers as an outcome of the scoping phase. It is important to re-emphasize that the scope (and detail) of the baseline study should be commensurate with the size and scale of the project and hence the potential changes that the project may have upon the environment and society. The baseline study will typically be developed in three stages:

**Desktop study:** Office-based exercise during which readily available existing information (i.e. that can be used to describe the existing environment) is collected and reviewed to ensure its appropriateness for use within the EIA & SIA;

**Field study:** The stage within which additional data is captured in the field, with the intent of addressing any gaps that have been identified in the existing knowledge base; and

**Reporting stage**: Collation of the captured information into the baseline report.

The below table indicates the environmental attributes and location of monitoring.

*Table 3. 1 Environmental Attributes*

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Upwind direction in North East boundary of the dumpsite. | The AAQ locations were chosen based on the Wind rose data obtained for Koothattukulam. The most predominant wind direction are from West and WSW. |
| | | | Downwind direction in West South West (WSW) boundary of the dumpsite | |
| 2 | Noise (1 Location) | Ambient Noise level [E(P)] for 24 hours | At the entrance of the dumpsite. | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading |

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | | Distance 4 m from the boundary of dumpsite. | vehicle. Please note that the site is devoid of proximity to any sensitive receptors within a 200 m radial circle . |
| 3 | Surface water (2 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | Surface water sampling location Upstream and downstream of nallah at 20 m from the dumpsite. | Surface water sample points are selected based on the water flow from upwards to downwards and for this site, it is South-East to South-west. |
| 4 | Ground water (2 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | Groundwater sampling location at 47 m distance in Southern direction.<br>Groundwater sampling location at 35 m distance in North East direction. | |
| 5 | Bore Hole (1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | Centre of the dumpsite | Volume of legacy wastes were found to be higher in the center part of the dumpsite during investigation. So the bore hole test was performed in the center. |

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | Centre of the dumpsite | |
| 6 | Waste & Environmental Analysis | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | Centre of the dumpsite | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | 1 sampling location | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. |

## 3.3 Environmental Audit of the Existing Dumpsite

There is a-functional MCF for dry waste within the Koothattukulam dumpsite compound. The MCF is not supported under KSWMP under this subproject. However, an environmental audit of the facility is important as this may be used as an associated facility to which some recyclables may be channelized to and since it is situated at the same site, might be impacted during the bio-mining activities.

*Table 3.2 Environmental Audit of Existing facilities*

| S. No | Aspects | Remarks |
|---|---|---|
| 1 | Structural Characteristics | Area - approx. 100 (in Sq. m)<br>Buffer/setback around the MCF – 3 ft<br>Distance from waste pile of dumpsite- 10 m.<br>Roof: (GI Sheet Roof. Good condition) |

| | | |
|---|---|---|
| | | Floor (Cement Floor, Good Condition)<br>Walls: (Concrete, Good Condition)<br>Doors & windows: Available, but during bio-mining dust emission and odor can impact the MCF facility. |
| 2 | Functional Characteristics (MCF & BSF Units) | Activities in the MCF: Functional<br>Materials and condition of stacking: Yes<br>Activities spilling out onto the dumpsite: Yes<br>Access to the MCF (Common access for MCF & Dumpsite. Both are in the same premises.)<br>No: of workers - 40 |

## 3.4 Physiography and Climate

**Physiography**

Koothattukulam is situated in the southern part of India, in the western coastal region. The topography of the region is characterized by gentle slopes and undulating terrain, typical of the Western Ghats and the coastal plains of Kerala. The town have a mix of flat and slightly hilly areas, with elevation changes depending on the specific location within the town.

**Climate**

Summer season begins from March and ends in May. The climate in Koothattukulam during the season is moderately hot and humid. Like all other places in Kerala, Koothattukulam experiences heavy showers during monsoon season. Most of the precipitation here falls in June - August with an average of 568 mm. The warmest month of the year is March with an average temperature of 31 °C. January is the coldest month, with temperatures averaging 23.5 °C. So, the favourable time for remediation is between October-2023 to March-2024 non-monsoon period. As per wind rose diagram, the most predominant wind directions are blowing from WSW and West direction, hence it was being considered for AAQ monitoring location. The wind rose diagram for Ernakulam is shown in **Figure: 3.2.**

**Source:** meteoblue

*Figure 3. 2 Wind rose Diagram for Ernakulam*

## 3.5 Hydrology, Hydrogeology, and Soil

**Hydrology**

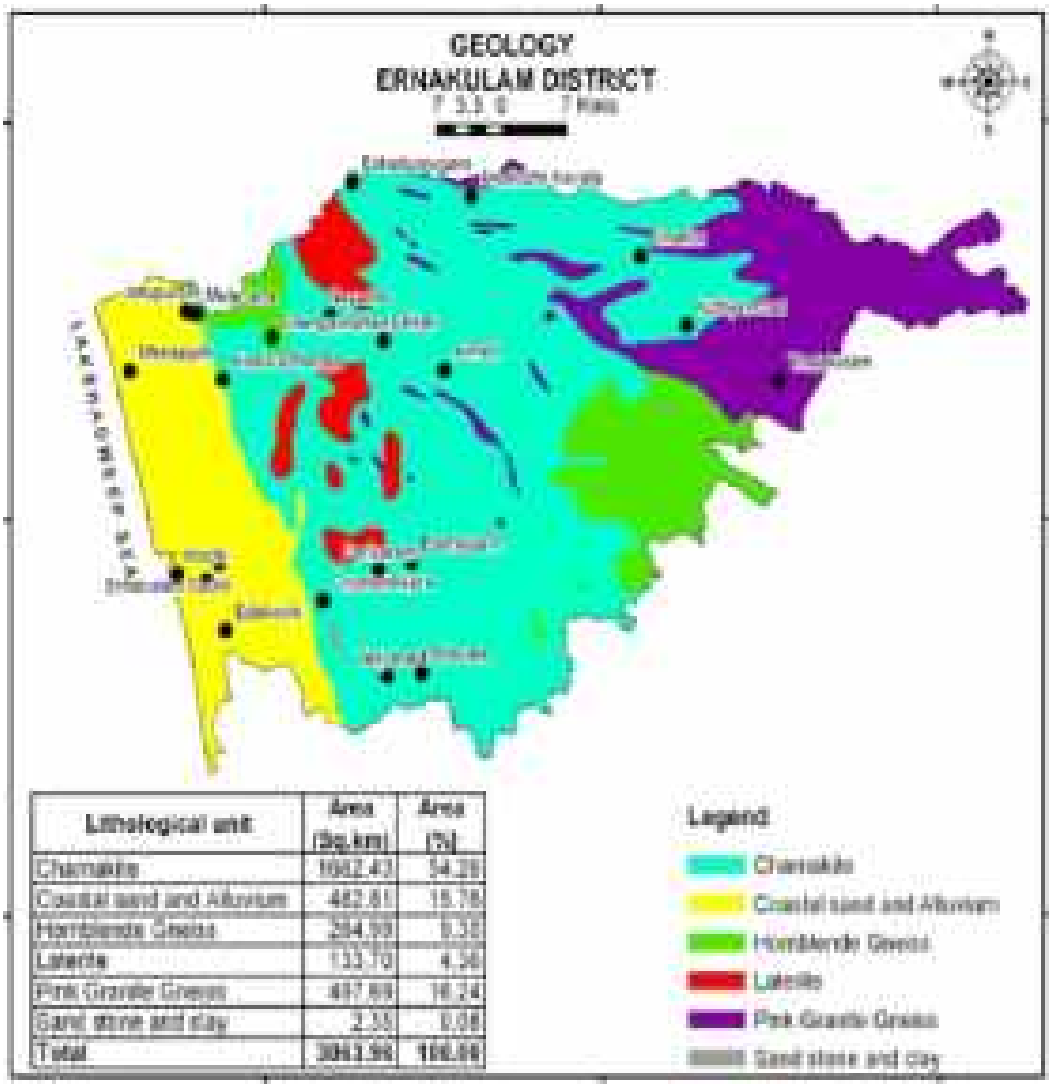
Koothattukulam municipality is situated within the Muvattupuzha river basin, making its hydrology closely interconnected with this vital water system. The municipality's hydrological characteristics are influenced by the intricate network of rivers, streams, and tributaries that form the Muvattupuzha river basin. Notably, a small nullah flows southward in close proximity to the dumpsite.

**Hydrogeology**

The occurrence and movement of ground water is mainly controlled by factors like physiography, geological setting, etc. The ground water table level ranging from 2 to 5 mbgl during most of the year.

**Geology**

The geology of Koothattukulam is predominantly of charnockite group. The geology map of Ernakulam District is shown in **Figure: 3.3.**



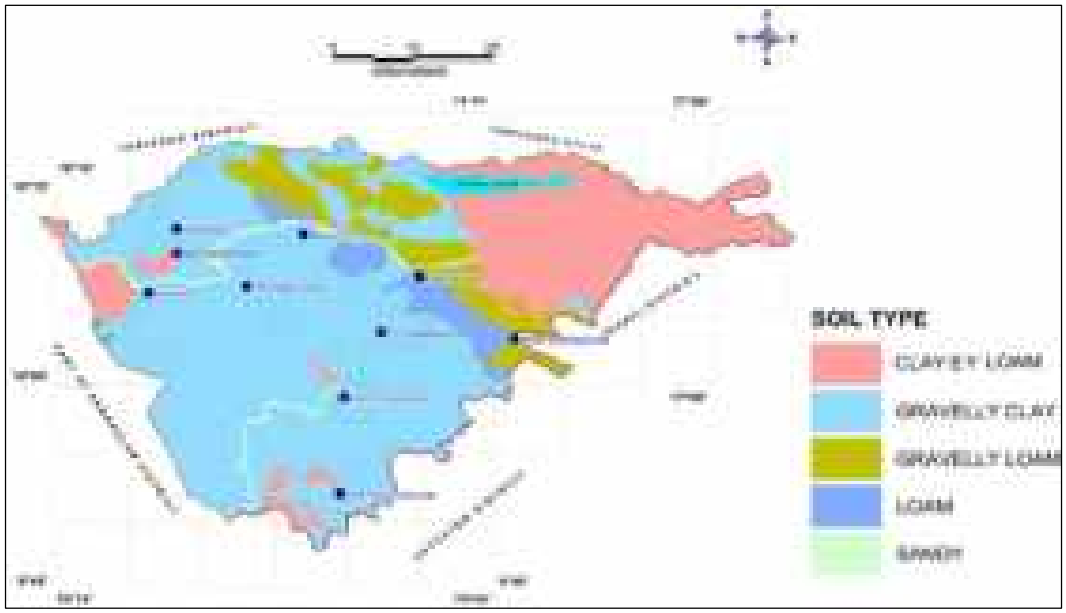


*Figure 3. 3 Geological Map of Ernakulam District*

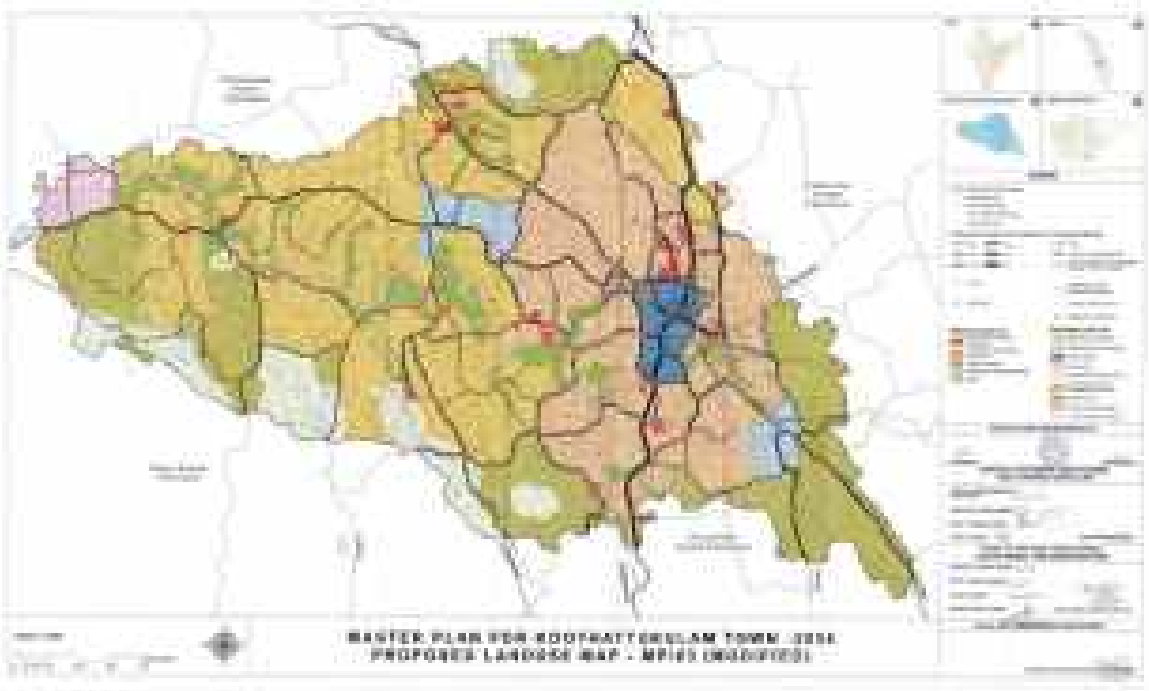
**Soils**

As per the geotechnical investigation, the soil was encountered at 3 m below the waste depth of the dumpsite and the predominant soil is gravelly clay. The detailed geotechnical investigation report is enclosure in the FR. The soil type of Ernakulam is shown in **Figure: 3.4.**

***Source:*** *CGWB, Ernakulum*

*Figure 3. 4 Map Showing Soil Type of Ernakulam District*

## 3.6 Land Use & Land Cover



The land use survey of 2009 revealed that the predominant land use of Koothattukulam Municipality is residential. 18.38% of the total area is under residential use. Existing land use analysis shows following breakups as shown in table 3.3. The glaring aspect of existing land use of Koothattukulam municipality is blessed with potential resources such as agriculture land and water bodies.

The highest percent of land use falls under the category residential/agricultural mix, which includes mainly dry agriculture lands where in residential developments are co- existent. The main cash crops are: rubber, paddy, coconut, areca nut, ginger, turmeric, kacholam and pepper.

*Table 3.3 Landuse & Landcover Map of Koothattukulam Municipality*

| Landuse | | | Area in ha | % of Total Area | % of Developable Area |
|---|---|---|---|---|---|
| Residential | | | 421.65 | 18.19 | 18.38% |
| Commercial | | | 31.76 | 1.37 | 1.38% |
| Industrial | | | 12.98 | 0.56 | 0.56% |
| Public & Semi public | | | 42.65 | 1.84 | 1.86% |
| Open space | | | 0.23 | 0.01 | 0.01% |
| Traffic & Transportation | | | 85.77 | 3.7 | 3.73% |
| Agricultu re | Dry Agriculture | Plantation | 1168.51 | 50.41 | 50.91% |
| | | Mixed crops | 397.08 | 17.13 | 17.3% |
| | | Total | 1565.58 | 67.54 | 68.22% |
| | Wet Agriculture | | 129.34 | 5.58 | 5.64% |

| Barren Land | | | 0.93 | 0.04 | 0.04% |
| Vacant Land | | | 3.71 | 0.16 | 0.17% |
| Water body | | | 23.41 | 1.01 | |
| **Total** | | | **2318.01** | **100** | **100** |

**Source:** Masterplan for Koothattukulam Municipality

**Source:** Masterplan for Koothattukulam Municipality

*Figure 3. 5 Map Showing Landuse of Koothattukulam Municipality*

## 3.7 Cultural Heritage

In Koothattukulam, the Koothattukulam Mahadeva temple is of great significance from different viewpoints such as historical, architectural, archaeological and cultural. The temple has a prominent place among the 108 famous Shiva temples in Kerala.

## 3.8 Ecology and Biodiversity

The wild faunal species present are, mainly dogs, rodents and flies, seen near to the dumpsite. Also, crow, egrets, and other birds are seen feeding on the wastes. The flora includes shrubs, tubers, and trees.

## 3.9 Site Connectivity

The state highway –MC Road is passing about 500 m away in the SW direction from the dumpsite. As per IRC, the highest design service volume is 3600 PCUs/Hr which has not been achieved during the peak period. There will be a marginal increase in traffic of medium sized vehicle (trucks) due to the forward linking of recovered products from dump site (i.e. For compost, plastic and other recyclable waste). The total number of vehicles will be operational at the dumpsite is 5 numbers per day which increase the traffic load by only 0.1% per hour. These vehicles will operate within an operational period of 8 hours per day, reducing the impacts to negligible.

## 3.10 Natural Disasters

As per the district disaster management plan-2015 and flood vulnerability map, the dumpsite is not under flood prone zone.

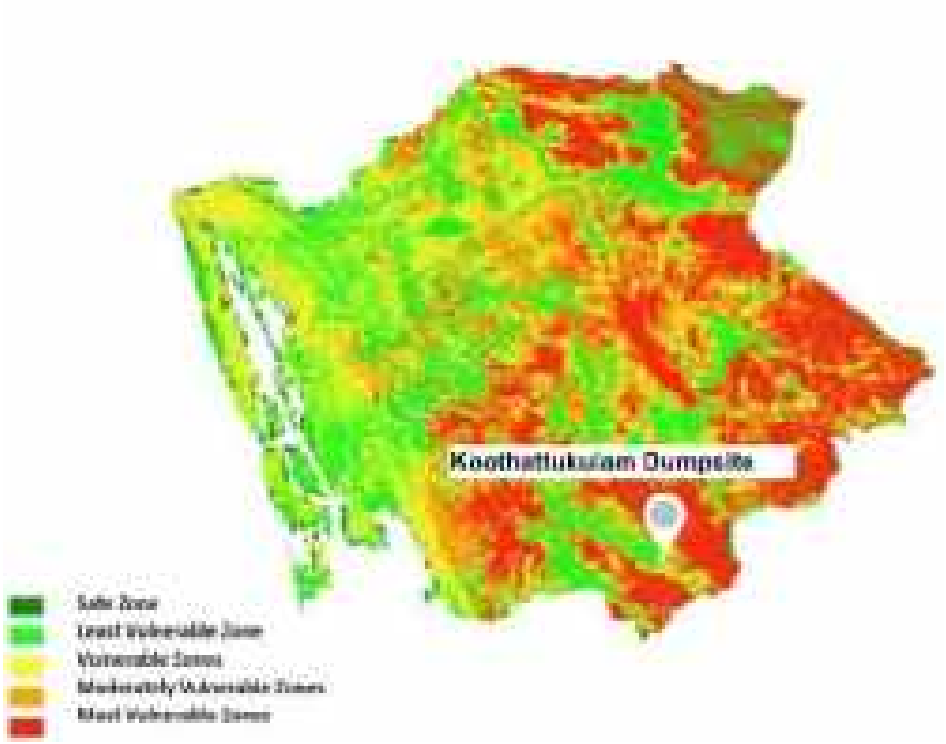

*Figure 3. 6 Map Showing Flood Vulnerability Map of Ernakulam District*

## 3.11 Description of Environmental Parameters

*Table 3. 4 Description of Environmental Baseline Parameters*

| No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| 1 | Water Supply<br><br>a) Surface water<br>b) Ground Water | A) Surface water: Nullah is 20 m from the site in Southern direction and Surface water sample was collected and the test results showed – all parameters are well within limits except BOD. | Site Drainage & leachate Impacts due to bio-mining activity (esp during any seasonal rain) is important as far as the nearby soil |

| No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| | | B) Ground Water collected from 2 different locations (Residences within 200m radius)– all parameters are well within limits except for colour and Turbidity. | & water environment are concerned. |
| 1.2 | Leachate | Sample collected within the dumpsite in the southern side. The data indicates that the TDS is about 367 mg/l while the suspended solids is about 142mg/l. The chlorides are low at 52.1 mg/l, while the COD, BOD are 480 mg/l and 110 mg/l respectively. The measured parameter values are found to be below the permissible limits. The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from the waste. | |
| 1.3 | Air Quality | Air samples were collected from 2 locations along the boundary of the dumpsite and results found to be well within the permissible limits | |
| 1.4 | Noise Level | Noise Level monitoring samples collected at a distance of 4 m at the entrance of the dumpsite. Since the dumpsite is in a commercial area; Daytime (6:00 AM - 10:00 PM): The permissible noise level is 65 dB in a commercial area; Nighttime (10:00 PM - 6:00 AM): The permissible noise level is 55 dB in a commercial area should be considered. The observed values ranges from 48 dB (A)– 56.5 dB (A) Day time which is within the permissible limit. | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity. |

# CHAPTER 4 ANALYSIS OF ALTERNATIVES

## 4.1 Alternative 1: Zero or No Project Alternative (without Dumpsite Remediation)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site. If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.

1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.

2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.

3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.

4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.

5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

## 4.2 Alternative 2: Mode of Execution / Management Alternative

Koothattukulam Municipality intends to complete the remediation project as earlier. However, considering the time required for mobilization, installation, sieving and handling recoverable etc., a time frame of about six months will be considered. The broad timeline chart for the execution of this project is given in below **Table – 4.1**.

*Table 4. 1 Timeline Chart For Execution*

| Sl. No. | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
|---|---|---|---|---|---|---|---|
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries , Hiring & Installation of Machineries, Electrical Works | ■ | | | | | |
| 3 | Excavation of Legacy Waste | | ■ | ■ | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | ■ | ■ | | |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 5 | Windrow Formation & Spraying of Bio culture | | | | | | |
| 6 | Sieving Operations | | | | | | |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | | |
| 8 | Project Closure Activities:<br>• Levelling of Reclaimed Land using Bio-soil<br>• Handover the available infrastructure at site to the ULB<br>• Closure Report Submission to ULB, | | | | | | |
| 9 | Buffer Period (Rainy Season) | - | | | | | |

## 4.3 Alternative 3: Technology Alternatives

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as,

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

# CHAPTER 5 ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS

Bio mining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, bio-mining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition to the below mentioned,

(i) Drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,
(ii) Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,
(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and
(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

## 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Koothattukulam dumpsite.

### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Bio-mining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.

- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity. However, magnitude of cumulative impacts of various dumpsite remediation might be High.

*Table 5. 1* Aspects for Determining the Magnitude of Impacts

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite biomining activities will be on larger extent) | A specific location within program component or site boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| Likelihood of potential impacts occurring | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most | Occurs under abnormal, exceptional or emergency | Unlikely to occur |

| | | | | |
|---|---|---|---|---|
| | | situations (Likely) | conditions (Occasional) | |

NOTE: Anticipated Project Duration - 5 to 6 months

### 5.1.2 Sensitivity of Receptor

The sensitivity of a receptor shall be determined based on a review of the population (including proximity/ numbers/ vulnerability) and the presence of features on the site or the surrounding area. In the surrounding area with 200 m there are 40 Households (With one household situated 25m from the boundary of the dumpsite on the northwest side, located on an elevated ground) and Nangelil Ayurveda Hospital 200m away, Devamatha Hospital 300m away from the dumpsite. But there is not much of sensitive receptors near to the dumpsite. Hence sensitivity of receptors will not affect much to the bio-remediation process of the dump site and can be categorized as low Vulnerable receptor capacity to absorb proposed changes or/and good opportunities for mitigation.

### 5.1.3 Significance of the impact

The significance of the project impact is tabulated below: -

| **Project Details** | **Sensitivity** | **Vulnerability of Resource** | **Importance of Resource** |
|---|---|---|---|
| No project Impacts | Medium | Medium | Medium |
| Project with Bio Remediation (mining) | Low | Low | Low |

Overall, Bio mining will have a Low impact, with more of a positive Impact on the Environment and Human health in longer term.

**Source-Pathway-Receptor Analysis**

A) **Source:** The source of contamination is the legacy waste remaining and being deposited at the Koothattukulam closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is more than 40 years old, as dumping had started in year 1981 and still functional. The total waste volume is 2061.41 cu. m with the dumpsite spread over 30 cents and the legacy waste is about 0.8 m above and 3 m below from the existing ground level. In addition to the landfill gas and leachate, windblown dust and litter are also considered as sources of contamination.

B) **Pathways:** The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite towards the eastern side along the boundary of the dumpsite. Since, there is boundary wall

in the eastern side and the site area is a flat terrain the water will not get out of the dumpsite. But, during heavy rainfall, the runoff from the dumpsite will flow towards the nullah and join the Uzhavoor River that flows within the town region.

The leachate flows with groundwater and acts as the pathway. Surface water contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals and rivers are further transported by surface waters and in this case the surface water acts as the pathway.

C) **Receptors:** Receptors are air, surface water (drain passing through residential areas) and ground water. For drinking purpose, they mainly use municipal water supply (about 40 Nos Households within 200 m and 1 households at 25m distance), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the nearby residences. As the dump is not contaminated by hazardous wastes, remediation would improve the pollution scenario provided the bio-earth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from bio-mining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after bio-mining activity, activities in bio-mined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post bio-mining activity.

## 5.2 Impacts on Air Environment

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCF in this case), nearby communities of Ward 15.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.

## 5.3 Impacts on Water Environment

**Ground water**

- Borehole data indicates waste upto depth of 3m with clayey strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. Slightly high BOD levels of the drain and ground water wells around are indicative of leachate and runoff pollution. Oozing & pooling of leachate & it draining to nearby areas during rains

would be an important aspect to be managed during bio-mining to prevent ground water contamination

- Leachate samples: BOD, COD, TDS exceeding limits may impact the ground water quality in nearby residences, wells, and long term soil pollution.
- Borehole data: Dump below water table may impact water resources and wells nearby.
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

**Surface water**

- The dumpsite experienced flooding during 2018 floods but the site is not in the flood plain as per KSDMA Map. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas. Nalluh is at a distance of 20 m from the dumpsite in the southern side.
- Gentle slope is in the Eastern Direction. At Western and southern direction, (end direction) there are residential households and dry vegetation. During rainy season leachate from the site flows to the Eastern side of dumpsite. Since, the dumpsite is having boundary leachate flowing outside the dumpsite is not possible, but during heavy rainfall the runoff may flow towards the nearby nalluh. It is important to contain and treat leachate from the proposed bio-mining activities on site. Treated leachate may be recirculated or used for other purposes.

## 5.4 Impact due to Odour

Dumpsite of organic, or partly organic waste, always results in anaerobic degradation of the waste and consequently, the production of landfill gas, consisting mainly of methane, $H_2S$, Ammonia, and carbon dioxide. If not properly managed the gas can cause odor problems in the neighborhood and since landfill gas is a highly potent greenhouse gas it will also contribute to the increased level of greenhouse gases (GHG) in the atmosphere. Dumpsite gas may also increase the risk of fires or explosions at the landfill site and surroundings.

## 5.5 Impact on Noise

A potential nuisance is a noise from transport of vehicle and machinery operating during remediation phase of the Dumpsite and transports of waste to the Dumpsite. The topography is favorable to attenuate noise to the surroundings. The distance to nearby residential areas is at 30m with 3 households. Hence, the impact will be higher during remediation to the residents.

## 5.6 Impacts on Soil

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be

excluded from the site as bio-mining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.

- Spillover of activities to nearby road and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste bio-mining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.

- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Koothattukulam, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Koothattukulam does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while biomining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste), Feb 2019) and World Bank EHS Guidelines. A plan shall be prepared to auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

## 5.7 Other impacts on Biodiversity - Fauna/Flora

- There are no sensitive biodiversity areas within 10 km of the site. However, since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 36 Km from the site, there is an Idukki Wild life sanctuary.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora: Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke.
- Disturbance to other fauna and flora on site: onsite activities including those related to MCF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species identified which are listed by IUCN.

## 5.8 Other Impacts on existing or proposed activities on site/s

- There may be approvals from various agencies for bio-mining activities and associated facilities; depending on utilities and uses on site & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of bio-mining on existing facilities on site such as MCF, etc. (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post bio-mining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped, or if this is dumped elsewhere or not processed, it will lead to health and environmental issues. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health & Safety impacts on workers, communities. Also, forward linkages are considered as associated facilities/linked activities. Impacts of transportation of these fractions (traffic increase, odor, leachate, dust), impacts during rains & emergencies, handling, storage at the identified locations, reuse etc. shall be mitigated.

# CHAPTER 6 ENVIRONMENTAL AND SOCIAL MANAGEMENT AND MONITORING PLAN

## 6.1 Proposed Environmental and Social Management Plan

The detailed Environmental and Social Management plan is presented in the below table.

*Table 6. 1 Proposed Environmental Management Plan*

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| *A* | **Planning and Pre-Construction Stage** | | | |
| | ***Planning for bio mining facility*** | | | |
| 1 | Bio mining & Bioremediation Plan & Capacities | • Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / biomined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these biomined material in line with the agreements with such facility owners and National, State regulations and WB EHS<br>• Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate Management Plan.<br>• The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>• Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU/ULB |
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>• The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>• To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>• Grading shall be performed where necessary to provide a neat appearance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality, odor, water contamination due to leachate, health and safety impacts of the people working in the site assessment* | ▪ Carry out site assessments as per Guidelines for Biomining of Legacy Waste Dumpsites of CPCB<br>▪ Consider safe biomining & gas / leachate generation from existing capped portion of the site<br>▪ Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>▪ Provision of appropriate PPE's to the team undertaking the site assessments<br>▪ Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>▪ Plan for machinery operated which will be operated by skilled operators at all times.<br>▪ Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>▪ Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | TSC, ULB, Contractor | SPMU/DPMU/ULB |
| 4 | Absence / Delay in Permissions for Developing the biomining facility and associated works as per National regulations | ▪ Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labor Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes *(Air Pollution) and Visual Blight due to excavation* | ▪ Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>▪ Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>▪ PPEs to be used by workers<br>▪ Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU/ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 6 | Material sourcing, transport, and stacking of construction materials *(Occupational Health and Safety issues and Air noise pollution)* | ▪ Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>▪ Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>▪ Materials shall be sourced only from approved quarries<br>▪ Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>▪ The driver should be with required license and follow speed regulations<br>▪ Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>▪ Material transport and unloading activities should not result in noise disturbance to locals and should be during daytime<br>▪ Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>▪ Provide vehicle wheel wash area on site<br>▪ Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves.<br>▪ Proper rest area on site shall be provided with water, first aid, toilets | Contractor | SPMU/DPMU/ULB |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | ▪ Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>▪ Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>▪ Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>▪ It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with landowners wherever the labour is accommodated<br>▪ Camp must not be provided in an area prone to Hazards<br>▪ Camp should be adequately at higher plinth levels to prevent water intrusion<br>▪ Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>▪ Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc. | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>(Refer ECOP section 06 and section 11 of EMF for KSWMP) | | |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. especially in case of providing support facilities *(Impacts on Fauna / Flora)* | ▪ Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in bio mining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>▪ Identify appropriate government site to avoid land acquisition and resettlement impacts<br>▪ Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences, slope and other landuses | Contractor | SPMU/DPMU/ULB |
| 9 | Contamination of groundwater due to leaching. Leachate parameters; BOD, COD, TDS, Ecoli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | ▪ During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>▪ Depending on the contractors plan for biomining of the site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ULB |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke burning, trampling/machinery | ▪ Movement routes of vehicles to be planned to avoid key fauna/flora on site<br>▪ Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU/ULB |
| 11 | Nuisance hazards to neighboring areas | ▪ Ensure proper design and adequate compound wall; high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements | Contractor | SPMU/DPMU/ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • In case of waste mound and site edges are sliding or unsafe; provide engineered retention walls. | | |
| 12 | Treatment & Disposal of wastes and rejects | • Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & inert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Biocarth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>• Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| ***B*** | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| | | **Implementation of biomining of the dumpsite** | | |
| 1 | Impact due to the vehicular movement *(Air and noise environment & Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | • Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>• All vehicles and machinery should obtain Pollution Under Control Certificates<br>• HORN PROHIBITION signpost to be erected.<br>• Rumble strips/speed breaker to be provided on access roads.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emission standards prescribed.<br>• Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>• Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>• Avoid heavy vehicle movement through Nadappuram Bypass – Sreedhareeyam Hospital Road during peak hours 7 a m to 10 a m mention: school hrs / peak hrs: and during important period / festivals when people use the road to access temple<br>• Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | Contractor, ULB | SPMU/DPMU/ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 2 | Impact due to the use of heavy vehicle and equipment *(Air and Noise environment)* | ▪ Mixing equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>▪ Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>▪ Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>▪ Labor to be provided masks / PPEs.<br>▪ Construction / Biomining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighboring sensitive land uses<br>▪ Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>  ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>  ▪ Using modern, well-maintained and regularly serviced vehicles.<br>  ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>  ▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>▪ Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>▪ As Koothattukulam dumpsite has sensitive receptors and settlement areas within 150m (1 house within 30 m radius) of it, noisy works shall be stopped from 22:00 to 06:00.<br>▪ Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>▪ Avoid noisy activities/machines near South side of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>▪ Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | Contractor | SPMU/DPMU/ULB |
| 3 | Impact during the construction activities *(water environment)* | ▪ Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>▪ Vehicle washing or maintenance near water bodies are to be avoided.<br>▪ Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 4 | Leachate and Runoff from biomining activities *(Soil contamination and groundwater contamination)* | ▪ Provide site cut off drain around the site to divert off stormwater from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>▪ Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>▪ Ensure stormwater drains will lead to drain outlets<br>▪ Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area<br>▪ Provide proper treatment of leachate and storm water that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by biomining activities like excavation and waste segregation and stabilization<br>▪ The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>▪ The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>▪ Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>▪ Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>▪ Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>▪ Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | Contractor | SPMU/DPMU/ULB |
| 5 | Soil decontamination from accumulated waste levels *(Impact on leachate, odor)* | ▪ Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bioculture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>▪ Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>▪ Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU/ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 6 | Excavation of waste from the waste mound *(Health and safety impacts)* | ▪ The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>▪ Machinery operated for excavation should be operated by skilled operators at all times.<br>▪ Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>▪ Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>▪ In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>▪ When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | Contractor | SPMU/DPMU/ULB |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles *(Air, Odour nuisances; spills and littering impacts on Air, Water, Land)* | ▪ All vehicles shall carry only approved load of weight<br>▪ Regular cleaning of roads & drains and removal of spills if any.<br>▪ All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>▪ Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>▪ Adopt required measures as per CPCB guidelines, and site specific safety requirements. | Contractor | SPMU/DPMU/ULB |
| 8 | Occupational health and safety impacts of the workers during the biomining & construction of support facilities:<br>• Health impacts of exposure to a variety of harmful | ▪ Avoid direct & double handling of wastes through avoidance measures (suitable planning & equipment), engineering controls & use PPEs<br>▪ Work area & Labour camps shall be provided with First Aid and other related activities.<br>▪ Emergency Preparedness plans shall be prepared and implemented for all manpower working centers and its field extension centers.<br>▪ An Environment Health & Safety policy shall be prepared and implemented<br>▪ Adequate manpower shall be provided & manager & staff shall listen and act upon the manpower related grievances.<br>▪ Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles | Contractor, ULB | SPMU/DPMU/ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, biocultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | ▪ Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed without slip, trip, fall especially on waste, leachate or trenches<br>▪ Proper training will be provided regarding the maintenance of health<br>▪ Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper hand wash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>▪ First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>▪ Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>▪ Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>▪ Measures such as deferred timings and stretch break to be adopted<br>▪ Secure all installations from unauthorized intrusion and accident risks;<br>▪ Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every day start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipment, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>▪ EHS specialist with adequate experience & third party supervision are important for bio-mining activity<br>▪ Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>▪ Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>▪ Ensure the visibility of workers through their use of high visibility vests when working in | | |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | or walking through heavy equipment operating areas;<br>▪ Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>▪ Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br>▪ Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near those in close proximity to this location, there is a transformer. Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>▪ All workers shall be registered as per prevalent labor laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>▪ Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractor's person/insurance agent<br>▪ While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>▪ While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>▪ Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>▪ A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>▪ No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor<br>▪ All works related to working at heights will be undertaken only during the daytime when sufficient sunlight is available;<br>▪ Use of temporary fall protection measures and outer edges of any elevated work surfaces, such as handrails and toe boards to prevent materials from being dislodged will be done;<br>▪ All excavation activities to be conducted in supervision of the site contractor; | | |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ Proper signage and lights to be provided in all work or activity areas & work permit system to be ensured.<br>▪ All records on emergencies, accidents, workers & their duty schedule, important site events, waste storage & disposal etc shall be maintained on site. All accidents including Indicative, Serious and Severe accidents to be recorded. All severe & serious accidents to be reported to the Bank & procedures followed for root cause analysis & Corrective Action Plans prepared and implemented, as per Banks Incident Reporting Tool | | |
| 9 | Risk of fire due to conditions leading to spontaneous combustion *(Air environment, disturbance to communities and workers, health impacts, safety issues)* | ▪ Follow CPCB Directions (May 26, 2022) Directions under Section 5 of EP Act (1986) – for Implementation of SWM Rules 2016 – regdg Fire Incidents at MSW Dumpsites (https://cpcb nic.in/openpdffile.php?id=UHVibGljYXRpb25GaWxlLzQyNDRfMTY1NDE2Mzk3N19tZWRpYXBob3RvNzYxMi5wZGY= ), LSGD Kerala Government GO on Fire Safety of MRF, MCFs (for the MRF on site if used for storage of wastes)and other Regulations, guidelines applicable<br>▪ Divide the site & plan for work in each area/quadrant as per work plan & prepare fire safety plan & emergency response plan in line with EIA Annexure 3; and National/State regulations & WB EHS<br>▪ Examine the site everyday by experienced Fire Safety / OHS personnel for any smokes<br>▪ Avoid conditions that can lead to spontaneous combustion such as:<br>o Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard<br>o Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.<br>▪ Design the facility for access by firefighting equipment, including clear aisles among waste heaps or work areas and access to adequate water supply.<br>▪ Ensure workers are briefed of fire hazard & its management<br>▪ No unauthorized entry shall be permitted to the site; including of workers during holidays, nighttime, or hours other than normal work hours under the supervision of site engineer / supervisor. Fencing and barricades with proper signage boards indicating “trespassers not allowed”<br>▪ The following activities should be implemented to prevent fires from occurring at the facility<br>o adequate fire-fighting equipment should be made available on-site and stored in an accessible manner<br>o all operating staff should be trained and able to manage fire outbreaks at any part of the facility.<br>o clear signage should be established to inform workers and the public that flammable liquids are not permitted on the site. This should be reinforced by advice to customers | Contractor, ULB | SPMU/DPMU |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | at the gatehouse and inspection of loads at the organic reception area.<br>o Approved quantities of combustible contaminants that have been separated (such as tires and plastic bottles) should be stockpiled in small piles or windrows.<br>o all fuels or flammable solvents for operational use should be stored in an appropriately ventilated and secure store (at appropriate height). This store should be located away from the biomining, storage, and processing areas.<br>o all flammable liquids should be stored within a bund that can hold 110% of the volume of the flammable liquids stored there so that any release of raw or burning fuel cannot cause a fire in the combustible organics present on the site or have an impact on contaminating stormwater.<br>▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented throughout the biomining activity in line with National State regulations, guidelines and international good practices<br>▪ Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.<br>▪ Contain all local smokes/small fires inside the dump asap. Fire brigade help shall be sought on all smokes/fires outside the dump<br>▪ Ash from fires to be contained at the earliest within the site using bunds or screens, rather than allowing to disturb nearby receptors. Early clearing and disposal of such ash at TSDF to be ensured.<br>▪ Provide contact details of Fire Department & ambulance other essential emergency services on site & ensure training to the workers by such service providers | | |
| 10 | Construction of new facilities in retrieved land | ▪ The excavated site shall be protected from any dumping during or after the biomining activity and shall be reserved for SWM activities in line with SWM Rules 2016<br>▪ Any new facility under KSWMP to be constructed on the retrieved land, shall follow EMF procedures & National State regulations | ULB | SPMU/DPMU |
| 11 | Pest / Vermin Control & Visual impacts (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted; preferably in coordination with Health section of ULB & local Health Center<br>▪ Communities around shall be made aware of possible pest menace & ULB shall support those in need with required pest management measures and offered health checkups<br>▪ Biopesticides / biological control shall be followed. However, biopesticides, or bio cultures used shall be tested to ensure the presence of no banned chemicals or hazardous materials<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used<br>▪ Visual blight to be curtailed by screens, proper lighting, housekeeping, leachate | Contractor, ULB | DPMU, SPMU |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | management | | |
| 12 | Odour nuisance | ▪ Waste with a strong odor to be covered immediately they are emptied from vehicles.<br>▪ Control and manage leachate treatment to minimize odor.<br>▪ Provide buffers screens to curtail odor from reaching surrounding communities especially to North side of site.<br>▪ Using natural deodorizers such as lemongrass, eucalyptus etc. and planting fragrant flowering plants around the site to mask odor. | Contractor, ULB | DPMU, SPMU |
| 13 | Storage, Collection, Transport, Treatment & Disposal of wastes and rejects | ▪ Storage, Collection, Treatment, treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste<br>▪ Storage, Collection, Transport, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc); & adequate protection shall be made to prevent such impacts even during rains / disasters<br>▪ Waste handling shall be inline with existing regulations & guidelines & avoid health & safety impacts<br>▪ No material is allowed to remain on site after the contract period<br>▪ Adequate fire safety arrangements & awareness & training to workers shall be ensured on site & at disposal / treatment areas for wastes in discussion with Local Fire Brigade to prevent any fire on legacy waste site or retrieved & stored wastes or that is transported<br>▪ Vehicles movement shall be tracked by ULB to ensure disposal of material/rejects/interts in designated or agreed area & are in line with schedule; using GPS.<br>▪ Given that the access road is used by the public, it is imperative to implement the required safety precautions and environmental protection measures when transporting the waste. | Contractor, ULB | DPMU, SPMU |
| 14 | Other activities | ▪ No activity other than biomining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>▪ If existing MCF shall be used for storing biomining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after biomining works shall be after proper cleaning / washing & disposal of all rejects/inerts & tools to ensure good housekeeping & no H&S impacts<br>▪ If existing MCF shall be used by the ULB for storing dry wastes from Town, during biomining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 15 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & biomining / construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees | Contractor | ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Waste water and Leachate to be treated & recycled/reused | | |
| **C** | **Future Site Usage (EMP shall be updated in line with EMF & used if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Biomining, but of the future facility operator & ULB** | | | |
| 1 | Future use of the biomined site: Green Park, MCF, MRF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | • ULB to ensure that the site will not be used for future dumping.<br>• Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around.<br>• ULB shall plan the future use of the site shall be in consultation with the communities.<br>• Phase 1 Environmental Assessment to be carried out. EA for existing facilities & EIA for proposed development in line with EMF in case this is proposed to be developed under KSWMP<br>• All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF/MRF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment, a nuisance to healthiersity, communities, Health impacts)* | • The movement route shall be scheduled for each vehicle.<br>• Enforce speed limits applicable and make drivers aware of this<br>• Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule; preferably using GPS<br>• Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles<br>• Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards<br>• Proper lubrication shall be provided to minimize squeaking noise due to friction<br>• Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br>• The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public<br>• Traffic will be managed at the site by providing adequate space for parking of vehicles<br>• Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design<br>• No waste or material shall be disposed in any place other than the designated area; including water bodies, coasts/forests, or sensitive areas. | Future Facility operator | ULB |
| 3 | Exhaust emissions *(Air impacts)* | • No idling of vehicles on site.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed | Future Facility operator | ULB |
| 4 | Plying of vehicles through kutcha / | • Vehicle movement shall be well planned – through topped roads. In case of necessity to move through Kutcha roads, ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Future Facility operator | ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | unsurfaced roads and idling<br>*(Air pollution: SPM, CO, CO2)* | | | |
| 5 | Impact on the ambient noise quality during the operations<br>*(Noise, nuisance to sensitive receptors, health impacts)* | ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines;<br>▪ Using modern, well-maintained and regularly serviced vehicles;<br>▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>▪ Provision of earmuffs and ear protection to workers and employees in high noise areas | Future Facility operator | ULB |
| 6 | Occupational health and safety impacts of the workers:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | ▪ All OHS and CHS measures to be followed in line with applicable regulations, guidance<br>▪ Workers & communities shall be made aware of OHS, CHS risks and impacts & mitigation measures adopted<br>▪ Emergency management plan to be prepared & followed<br>▪ Workers shall be appropriately trained or OHS during construction & Operation of all future facilities | Future Facility operator | ULB |
| 7 | Pest / Vermin Control (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted<br>▪ Biopesticides / biological control shall be followed.<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be | Future Facility operator | ULB |

| Sl. No. | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | used | | |
| 8 | Fire Safety | ▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations, guidelines and international good practices | Future Facility Operator | ULB |
| 9 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

### 6.1.1 Disposal phase of By-products from Bio-mining process:

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within a three-month period, penalties will be imposed on the contractor.

## 6.2 Disaster Management and Emergency Preparedness

A disaster is a catastrophic situation in which suddenly, people are plunged into helplessness and suffering and, as a result, need protection, clothing, shelter, medical and social care, and other necessities of life. In the case of Dumpsite remediation, Disaster Management Plan is aimed to ensure the safety of life, protection of the Environment, protection of installation, restoration of the remediation process, and salvage operations in this same order of priorities.

For effective implementation of the Disaster Management Plan, it should be widely circulated and personnel training is to be provided through rehearsals/drills. The disaster management Plan Comprises of Onsite Emergency Plan and an offsite Site Emergency plan, which is outlined here for Emergency Preparedness.

*Table 6. 2 List of Emergency Helpline Services*

| Sl. No. | Emergency Services | Distance from the dumpsite |
|---|---|---|
| 1 | Koothattukulam police station | 1 Km |
| 2 | Koothattukulam Fire and Rescue station | 0.2 Km |
| 3 | Koothattukulam Govt. Hospital | 1 Km |

### 6.2.1 Approach to Disaster Management Plan

The objective and approach of the Disaster Management Plan is to make use of the combined resources of the plant and the outside services to achieve the following:

- Effect the rescue and medical treatment of casualties;
- Safeguard other people;
- Minimize damage to property and the environment;
- Initially contain and ultimately bring the incident under control;
- Identify any dead;
- Provide for the needs of relatives;
- Provide authoritative information to the news media;
- Secure the safe rehabilitation of the affected area;

Preserve relevant records and equipment for the subsequent inquiry into the cause and circumstances of the emergency.

In effect, it is to optimize operational efficiency to rescue rehabilitation and render medical help and to restore normalcy. Disaster Management Plan should include Emergency Preparedness Plan, Emergency Response Team, Emergency Communication, Emergency Responsibilities, Emergency Facilities, and Emergency Actions.

#### *6.2.1.1 Identified Emergency Situations*

Major disasters which can affect the remediation process are as follows:

- Floods due to heavy rainfall
- Fire risk in summer
- Occupational and health risks during the remediation process
- Safety-related accidents during the remediation process

#### *6.2.1.2 Proposed Organizational Structure for Disaster Management Plan*

**Response team:** Setup an Emergency Organization. Emergency Organization includes the senior executive (head of EO as a Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

- All Incident control would be reported to the Site Controller. Each Incident Controller organizes a team responsible for controlling the incident with the personnel under his control.
- **Shift In-charge** would be the reporting officer, who would bring the incident to the notice of the Incidence Controller and Site Controller.
- **Emergency Coordinators** would be appointed who would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential and support services. For this purposes, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.
- In each shift, the electrical supervisor, in charge, and other maintenance staff would be drafted for emergency operations. In the event of power or communication system failure, some of the staff members in the office/facility would be drafted and their services would be utilized as messengers for quick passing of communications. All these personnel would be declared as essential personnel.

## 6.3 Proposed Monitoring Plan

The proposed monitoring plan is presented in table below,

*Table 6. 3 Proposed Monitoring Plan and Frequency*

| Monitoring media/parameters | Items and parameters | Frequency | Location |
|---|---|---|---|
| **Ambient Air Quality** | PM10, PM2.5, NOx, CH4, CO, Ammonia | Quarterly (1 sample) | 2 point |
| **Noise** | Leq Day and Night | Monthly | 2 point |
| **Health safety Hazards** | Medical records, documentation of injuries and accidents, Health and safety assessments | As and when accident/injury occurs | Incident reports |
| **Leachate** | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins<br>• Heavy Metals (As per the schedule II of SWM rules 2016) | Quarterly | 2 point |
| **Groundwater quality** | Parameters will be defined and sampling, preservation, and analysis of water will be carried out following those stipulated in the subsections below and Standards Methods for Testing Water and wastewater, 21st edition, published by American Public Health Association (2005). | Quarterly | 8 points |
| **Surface water quality** | | Quarterly | 6 points. 2 upstream and 4 downstream |

## 6.4 Estimated Budget for Implementation and Supervision of EMP & SMP

The estimated capital cost of [redacted] is required for budget provision for implementation and supervision of EMP & SMP. The remediation will be only during shorter time duration and hence the recurring cost won't be incurred. The estimated cost particulars for EMP & SMP is mentioned below.

*Table 6. 4 Estimated Budget For EMP*

| Particulars | Capital Cost (In Lakhs) |
|---|---|
| Dust Mitigation Measures Including site barricading, water sprinkling, Wheel Washing and leachate management | [redacted] |
| Mobile Toilet, Pest Control, Disinfectant | [redacted] |
| Medical cum First Aid facility | [redacted] |
| PPE for workers & welfare, Fire Fighting Equipment | [redacted] |
| Monitoring / testing (air, noise, water, soil, leachate) | [redacted] |
| **Total** | [redacted] |

# CHAPTER 7 INSTITUTIONAL ARRANGEMENTS

## 7.1 Proposed Institutional Arrangement for Implementation of EMP & SMP, Supervision, Monitoring

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organisation will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU.

## 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for HKS (Health & Hygiene, source level waste segregation and source level treatment, Fire and Safety)

- Training program for ULB Councilors and Ward convener (Proposed SWM project plan of KSWMP)
- Training program for Political and trade union leaders (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for Residence Association leaders (Health, Hygiene different composting methods and source level waste segregation, littering of waste, Public Health, Fire and Safety)
- Training program for workers of Municipal Sanitary workers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for school / college students (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for ULB officials (Proposed SWM project plan of KSWMP, proposed policies, existing policies etc... to improve the existing pattern into zero waste concept of the municipality)
- Training program for School children, Parents and Teachers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Massive awareness campaign on 5R (Reuse, Recycle, Repurpose, Reduce and Refuse)

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

## 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – grmkswmp@gmail.com / Toll free number-18004250238). The

complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

# CHAPTER 8 PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

## 8.1 Approach to Public Consultation

KSWMP have developed detailed strategy and installed various inclusive mechanism in the different stages of the remediation process considering the project affected persons, families, and commercial establishments.

As the initial step, a **Transect walk** was carried out on **06.06.2023** covering the surrounding area of the dump site. The aim of the transect walk was to assess the site and gather information about its location, potential social risks, existing infrastructure and the impact on surrounding communities. The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions and systems by observing, asking, listening, looking and producing a transect diagram. Information collected can be used to reveal land use practices, hazards and vulnerabilities to inform disaster mitigation and water management.

**A public consultation meeting** was conducted on 25$^{th}$ July 2023 related to the formulation of Solid Waste Management Plan engaging a wide audience who are experienced in solid waste management sectors of the ULB. Municipal council members were also participated in this meeting. Remediation of the proposed site was one of the agendas included in the discussion.

**Ward level Consultation Meetings** will be conducted before the commencement of remediation in the leadership of ward councillor by engaging the representatives from different resident's associations, commercial establishments and other institutions in the ward for explaining about the remediation process and thereby to gain public support and cooperation.

## 8.2 Information Disclosure

Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the remediation process at the site. Site control measures should be enforced to prevent unauthorized personnel into the work site. Work zones should be delineated around specific bore holes, excavations and other areas that may pose the risk of potential exposure to the hazards.

## ANNEXURE I: INITIAL ENVIRONMENTAL AND SOCIAL EXAMINATION

### Section II: Environmental Screening Form

**INITIAL ENVIRONMENTAL EXAMINATION**
**(To be prepared for each subproject)**

Checklist to be followed for Environmental Screening during the Initial Environmental Assessment Stage has been provided below:

**Subproject Details**

| | |
|---|---|
| **Name of Subproject:** | Koothattukulam Solid Waste Dumpsite Reclamation by Biomining |
| **Subproject Components:** | Dumpsite Remediation by Bio-mining |
| **Subproject Location (City / Town/ Village with ward numbers):** | Near Municipal Market, Ward 15, Koothattukulam Municipality |

**Stage 1: Exclusion List**

**Is the Project Excluded from Consideration due to the following:**

| *Sl No:* | *Non-permissible Activities* |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |

*(This space can be used to add details on the above, reason for exclusion from the Project etc.)*

*This dumpsite remediation project involves 1. (i) no construction in demarcated Forest areas or protected areas or their buffers, (ii) no construction of landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) no treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). 2. NO activities which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas, 3. No activities with (i) any impact on or due to Dams or embankments (ii) and project will not purchase, store and use Banned Pesticides.*

*Hence, not excluded*

*Proceeding to Stage 2 Screening*

*(Do not proceed to Stage 2; if the subproject is Excluded as per Stage 1 Exclusion List)*

**Stage 2: Environmental Screening Checklist**

| Project Details | | |
|---|---|---|
| **Sl.No** | **Components** | **Details** |
| 1 | Project components | Dumpsite Remediation by Bio-mining |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities / associated facilities) | Bioremediation of Koothattukulam Dumpsite: -<br>A total station survey was conducted to determine the quantity of legacy waste, revealing a total of 899 cubic meters. |
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination)<br>Site Survey No:/s (attach map) with ownership details, Geographical co-ordinates of the site location [including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | **Location:** Near Municipal Market, Ward 15, Koothattukulam Municipality<br>**Survey Number:**<br>**Ownership –** Koothattukulam Municipality<br>**Land use –** Solid Waste Management facility<br>**Geographical Coordinates:**<br>Latitude: $9^0$ 51'49.2" N<br>Longitude: 76 $^0$35'27.3" E<br>**Earthquake zone**: III<br>**Cyclone:** Moderate<br>Access road of width 4m (Nadappuram Bypass – Sreedhareeyam Hospital Road)<br>Dumpsites have existed since the year 1981. |
| **4** | Land Area proposed to be used: Location wise (in sq. km / sq. m) | Current total land area of 1214 sq. m. will be fully remediated through bio-mining. |
| **5** | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | For domestic usage 1 KLD will be met from a private supplier |
| **6** | Power Required and Source of Power | No DG set requirement for this sub-project. Electricity connection is available within the site.<br>Source: KSEB |

***Baseline Environmental Conditions***

| ***Sl. No*** | ***Environmental Aspects*** | ***Yes*** | ***No*** | ***Details (include distance in Km, info on its importance)*** |
|---|---|---|---|---|
| 1 | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | | |
| *(i)* | Critically Vulnerable Coastal Areas (CVCAs), Eco-sensitive Areas (ESAs) | | ✓ | No Critically Vulnerable Coastal Areas and Eco sensitive Areas in the study area |
| *(ii)* | Cultural Heritage site, Protected monuments - listed by ASI/State | | ✓ | Koothattukulam Mahadeva temple – 1.1 Km away |
| *(iii)* | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species? If Yes, which is the area? | | ✓ | No Eco-Sensitive Areas in the study area |

| Sl. No | Environmental Aspects | Yes | No | Details (Include distance in Km, info on its importance) |
|---|---|---|---|---|
| (iv) | Other Wetlands/ Mangrove/ Estuarine Region | | ✓ | There is no Wetlands/ Mangrove/ Estuarine Region in the study area |
| (v) | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | ✓ | There is no Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves in the study area |
| (vi) | Other Sensitive Environmental Components listed in EMF | | ✓ | There is no other Sensitive Environmental Components in the study area as listed in EMF |
| (vii) | Drinking water source, upstream and downstream uses of rivers, etc | ✓ | | Nullah 20m away on the roadside in front of the proposed site |
| (viii) | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | ✓ | Site is not in low-lying area and site does not falls in CRZ area |
| (ix) | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | ✓ | | Nangeli Ayurveda Hospital 200m away, Devanatha Hospital 300m away, Around 25-30 houses (with 1 house at 25m distance) and commercial Establishment within 200 m from dumpsite. |
| 2 | Is the site in Critical / Over Exploited Ground Water Block. Provide the level of the groundwater table | ✓ | | Water level ranges from less than a metre to 12 metres |
| 3 | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | | ✓ | The site is not vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, etc. |
| 4 | Describe the type of soil and vegetation on site | | | Clayey soil is the most predominant soil type, presence of vegetation ( shrubs ) |
| 5 | Is the site present in the flood plains as recorded in the last 100 years? Provide the HFL level of the site/region | | ✓ | Site is not located in a flood prone area. |
| 6 | Existing pollution/contamination or degradation on site | ✓ | | Dumpsites have existed since the year 1981. |
| 7 | Any other remark on baseline condition | | ✓ | In the baseline environmental analysis, the results have been determined to fall within permissible limits. |

***Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils***

| Sl. No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 8 | Total extend of land to be covered/built | | | Total Land: Approx. 0.30 acres<br>Quantity of legacy waste: 2061.41 cum. |
| 9 | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | | | |
| 10 | Extend of Land to be remediated | | | |
| 11 | Extend of land expected to be under green belt | | | Green belt of 20m should |

| Sl. No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| | | | | be provided |
| 12 | Will the proposed project cause the following on Land / Soil: | | | After bio-mining the land will be remediated and will have a positive impact to the land and soil. |
| (i) | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | ✓ | No Impact on Surrounding Environmental Conditions |
| (ii) | Substantial removal of Top Soil (mention area in sqm) | | ✓ | Presence of solid waste beneath the ground level combined with soil is to be excavated for bio-mining process.<br>Total Area – 30 cents |
| (iii) | Any degradation of land / eco-systems expected due to the project? | | ✓ | No land use change or ecosystem change due to implementation of this project since the land will be reclaimed. |
| (iv) | Loss or impacts on Cultural/heritage areas/properties | | ✓ | No impacts or loss of cultural/ heritage areas/properties due the implementation of the project since the existing one is at a distance of 4.5 Km from the dumpsite. |
| (v) | Does the project activity involve cutting and filling/ blasting etc? | | ✓ | It is bio-mining of existing solid waste only |
| (vi) | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | ✓ | | Waste heap is about 1.5 m in depth from Ground Level which is to be excavated. |
| (vii) | Will the project involve any quarrying/ mining etc? | | ✓ | The project does not involve quarrying/ mining |
| (viii) | Will the project / any of its component contaminate or pollute the Land? | | ✓ | The land remains unaffected by the process of bio-mining, as evidenced by the absence of any discernible impacts observed during our assessment |
| (ix) | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | ✓ | Positive impact to the environment. |
| (x) | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | ✓ | Bio-mining will be conducted following the necessary mitigation measures. Hence, no impacts |

| Sl. No | Impacts on Air and Noise Environment | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 13 | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | ✓ | | The process of bioremediation may cause dust emission from process and vehicle movement which shall be managed using effective mitigation measures |
| 14 | Will the project cause or increase pollution due to GHG emissions? | ✓ | | Chances of GHG emissions due to unstabilized waste |
| 15 | Will the project cause or increase odor nuisance? | ✓ | | The process of bioremediation may cause odour which shall be managed using effective mitigative measures |
| 16 | Is there a potential for release of toxic gases or accident risks (eg. potential fire outbreaks) | ✓ | | Chances of GHG emissions due to un-stabilized waste |
| 17 | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | ✓ | | Project activity stage (during the process of bio remediation) due to vehicular movements& working of machineries). |

| Sl. No | Impacts on Water Environment | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 18 | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | ✓ | | Nullah 20m away on the roadside in front of the proposed site. Hence, Proper leachate treatment and waste disposal is necessary |
| 19 | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | | | |
| 20 | Chances of Pollution of Water bodies/groundwater wells, nearby or downstream | | | Nullah is around 20m away from the dumpsite. Hence, proper leachate treatment and waste disposal is necessary |
| 21 | Will the activities proposed at the site(s) hinder natural drainage | | ✓ | The hindrance to natural drainage caused by the deposited waste at the site will be resolved through the implementation of the bio-mining process. |
| 22 | Will the activities proposed at the site(s) decrease permeability/rainwater percolation | | ✓ | No impacts to the permeability/rainwater percolation of site |

| Sl. No | Impacts on Biodiversity and Host Communities | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 23 | Will the project necessitates cutting of Trees / Loss of Vegetation | | ✓ | Cutting of trees are not required. |
| 24 | Will the project necessitate substantial removal of Top Soil (maintain area in sqm) | | | Presence of solid waste, no topsoil. Excavation of legacy waste – 2061.41 cum |
| 25 | Any degradation of land / eco-system expected due to the project? | | ✓ | The process of bio-mining ensures that there will be no degradation of the land. |
| 26 | Will the project result in Health & Safety Risks in the neighbourhood including the release of toxic gases, leachate, accident risks | | | 25-30 households are within 200 m to the dumpsite. Hence bioremediation should be conducted considering proper mitigation measures |

| *Sl. No* | *Impacts on Biodiversity and Host Communities* | *Yes* | *No* | *Details/Remarks* |
|---|---|---|---|---|
| *28* | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | ✓ | | 25-30 households are within 200 m to the dumpsite. Hence, bioremediation should be conducted considering proper mitigation measures. |
| *29* | Potential disruption to common property, accessibility, traffic disruptions, conflicts, or disruption to the local community within the subproject area? | ✓ | | Only merge noise pollution due to machinery operation and line source.<br>Enclose noisy equipment or use barriers to minimize sound propagation. This could involve using soundproof enclosures or acoustic panels. |

### *Project Categorisation and Need for Safeguards Instruments, Oversight*

| | |
|---|---|
| **Project Category** | □ **E1** □ **✓ E2** □ **E3** |
| **Key Reasons (for categorisation)** | During screening, it has found that the proposed subproject is moderately causing impact to the base line environment, land/ soil / water /noise environment, biodiversity or to the community. Site is not close to any Environmental Sensitive Receptor. Moreover, Project results positive impacts on Environment. The Environmental Baseline analysis reveals that dumpsite not having any Heavy metal contamination. Hence it is categorized as E2. |
| **Safeguards Instruments Required** | ~~a) E1: Project-specific EIA (impact assessment considering the project details & location) by Independent Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)~~<br>b) E2: Project-specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>~~c) E3: signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities~~ |
| **Additional Responsibilities Expected** (such as i) Specialists to be hired for Physical/Cultural resources, Natural Habitats/others, etc for EIA preparation, and/or supervision), ii) Consultations, iii) any other aspect | |

# ANNEXURE II: FIRE RISK ASSESSMENT

**Objectives:** The important elements of fire risk Management planning can be classified as:

- Identifying the disaster potential scenarios and advance planning to combat and minimize the damage.
- Vulnerable zone delineation.
- Assessment of loss probability and its severity.
- To deal with such emergencies expeditiously.
- Warning, protective actions like evacuation of personnel.
- To contain the disaster by isolating the area, firefighting etc.
- To make efforts to return to normal condition when the situation is controlled.

*Causes of fire and Risk:*

| Ignition (heat) sources | Fuel Sources | Oxygen Sources |
|---|---|---|
| Lit cigarettes/ butts, matches, lighters<br>Improperly stored batteries<br>Bushfire<br>Self-heating piles<br>Hot loads/contaminated waste<br>Hot work operations<br>Arson<br>Lightning<br>Fires from neighbouring activities<br>Faulty electrical wires | Flammable liquids, gases and solids<br>Combustible goods and waste (e.g. CRWM[2])<br>Contamination in CRWM storage<br>Dry and unmanaged vegetation | Oxidising chemicals such as oxy-acetylene sets, bleach, hydrogen peroxide, nitrates<br>Physical introduction of oxygen through unbaling or turning of loose piles |

**Fire Prevention & Management Plan**

It is a strategy well evolved, organized and rehearsed to contain the adverse effects of a possible disaster. It aims to mobilize the internal resources and use these with minimal dependence on external agencies for the following purposes:

- To control and contain incidents.
- To safeguard employees and people in the vicinity.
- To inform employees, the general public and the authorities about the hazards/risks assessed, safeguards provided, residual risk, if any, and the role to be played by them in the event of disaster.
- To effect rescue and treatment of casualties.
- To prevent recurrence of such a disaster.

- To establish machinery for review, rectification/modification of the emergency
- To ensure safety of works before personnel re-enter and resume work.
- To work out a plan with all provisions to handle and to provide for emergency preparedness and the periodic rehearsal of the plan.

**Pre-Disaster Stage**

The prevention of disaster is of vital importance and is the moral responsibility of each and every individual employed in the dumpsite site. It can be prevented by observance of precautionary and preventive measures. During pre-disaster stage following points will be followed to avert the occurrence of disaster:

The emergency operation procedures of the dumpsite site will be written down, so that no confusion is caused in the event of emergency taking place.

- To reduce the probabilities of accidental leakage of methane.
- Smoking will be prohibited in the areas where handling of dumpsite will be done. "NO SMOKING" boards will be prominently displayed in Local Language i.e., Malayalam and English languages.
- All electrical wiring, fittings, cables, equipment will be checked periodically. Temporary wiring will not be permitted to be installed inside the dumpsite area. No inflammable material including papers, Oils, wooden racks will be stored within 1 meter of any electrical fittings. No un authorized person will be allowed to tamper with electrical fittings.
- Welding, Burning, cutting, Chipping, soldering work, etc. will only be carried out by authorized person.
- Necessary compliance with various Statutory Guidelines and other relevant instructions as issued from time to time will be done by the contractor.
- Safety Department will arrange to educate all concerned regarding operational hazards of non-compliance of the safety guidelines. They will also provide necessary guidance and support in proper implementation of the program. They will also arrange mock exercises periodically.
- Safety Department will display at prominent places important telephone numbers and instructions, in Mizo & English languages. The Security Control Room located at the dumpsite site will be equipped with the following:
- Sufficient number of copies of On-Site Disaster/Emergency Management Plan.
- Master plan of the dumpsite site indicating vital locations and possible sources of disaster.
- Important Telephone numbers
- Emergency lights (portable) and Wireless sets if required and possible).
- First Aid boxes

**Disaster Stage**

The most probable disaster which may occur at dumpsite site is because of accidental leakage and fire. To control leakage and fire the following measures/precautions will be taken at the dumpsite site:

The guidelines as given below for the protection of fire will be followed:

- The dumpsite's fire protection will consist of structural solutions, fire extinguishing systems and fire alarm systems. The fire extinguishing system will consist of the fire system with fire pumps, distribution pipelines, hydrants and fire hoses and the portable extinguishers.
- The fire alarm system will be a part of the primary systems and take care of the places which are unmanned or will not have any fixed fire extinguishing system.
- The major operation areas shall be equipped with fixed smoke detectors, $CO_2$ extinguisher near the door in the control room.
- All the rooms in the office shall be equipped with fixed smoke detectors.
- The ventilation rooms shall be equipped with fixed smoke detectors. One $CO_2$ extinguisher will be located near the door to ventilation room.
- The fire alarm and detection system shall be designed, installed, maintained and tested according to relevant standards.
- The water for firefighting shall be stored in the fire water tank (water reservoir).
- $CO_2$ fire extinguishers contain extinguishing carbon dioxide which either by it or under expected conditions of use gives off $CO_2$ to prevent fire.
- Dry fire extinguishers contain extinguishing medium which either by itself or under expected conditions of use will give fine powder to prevent fire to get oxygen.
- As soon as a fire takes place inside the premises of dumpsite, action to be taken by various persons/officials.

**Post Disaster Stage**

After the incident, an incident report will be prepared regarding occurrence of event/losses incurred and recommendations thereof for restoration of normalcy.

**Reporting of Accidents**

Situation in totality will be studied thoroughly, investigated with respect to the cause of the incident, extent of loss of life and property and a detailed report prepared by the individual/team nominated by dumpsite site authorities for this purpose. Based on the investigation report, rescue team would finalize time bound programmes for implementation of corrective measures proposed and regularly monitor the progress thereafter. Rescue, medical and welfare operations would be continued by the concerned agencies.

## Executive Summary

Koothattukulam in the midland directly to the eastern part of Ernakulam district. Even though the ULB has an excellent practice of waste management, the primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing the dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Consequently, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project for the remediation of legacy waste dumpsites in all the ULBs of Kerala. As part of the project, in phase1 the existing dumpsite at Koothattukulam ward 15, Town ward was proposed for remediation.

The Koothattukulam Municipality has an area of 23.18 sq.km with 25 wards. The municipality, with the financial and technical support of KSWMP, has taken up steps to remediate the existing legacy waste dumpsite located in around 1203.97 Sqm (29.757 cents) of land in ward 15, Town ward and to recover optimum land for future developmental activities. The Koothattukulam dumpsite was used for dumping municipal solid waste from the year 1985. The dumping of solid waste (biodegradable waste) was stopped once the ULB level OWC was set up. Considering the impending threat of fire hazards and leachate issues, the Municipal Council has taken up the remediation of legacy dumpsite as a priority and to utilize the remediated land for setting up other solid waste management facilities. Since the cessation of dumping activities in 2018, only sweeping waste from towns and streets were dumped at the facility daily and has now been discontinued.

The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. To assess the quantity & composition of legacy waste & also evaluate the environmental baseline of the dumpsite, samples from representative locations were collected and analysed for various parameters viz., physical, and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Groundwater, and Surface Water. As part of the study, detailed site investigations were carried out for; – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical and Environmental Analysis by M/s Poluchem laboratories.

From the results of the investigations, the total estimated quantity of legacy waste is around **2073.18 Cum**. (Above GL 899.55 Cum and Below GL 1173.63 Cum)

As per the SWM Rules 2016, selection of an applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out, and based on the results, remediation can be done by a) Capping without land recovery, b) Bio-mining – reclamation/recovery of land) capping with partial land recovery. The selection of technology shall also depend on the available resources viz., manpower, machineries, money, and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/byproducts. Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste

dumpsite. Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, stationary trommel screening machineries shall be optimum for processing the legacy waste within the stipulated timeline of 31st March 2024.

Environmental & Social safeguards: The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project attracts moderate social risks based on the social mapping, transect walk and consultation with the people living around the proposed project site to assess the problems associated with the legacy waste dumpsite and the impact during the execution of the project.

The activities of bio-mining will commence from Nov 2023 and are expected to end by March 2024. An area **of 29.757 Cent** will be reclaimed and will be utilized for setting up other solid waste management facilities. Total cost of the project is Rs**.** [redacted]

## 1.0 Introduction

In view of the environmental and social issues connected with dumpsites, the SWM Rules 2016, directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the remediation projects of legacy waste dumpsites in all the ULBs. As part of the project, in phase -1, the existing dumpsite of Koothattukulam ULB was proposed for remediation.

For arriving at a methodology for remediating the legacy waste in the dumpsites, as per the Project Implementation Manual, a feasibility study outlining the technical, economic, and socio- environmental factors has been carried out. As a result of the feasibility study that involved detailed field investigations and assessment, and market sounding, the method proposed for remediation of legacy waste dumpsite is biomining, which will ensure long-term sustainability and environmentally sound treatment, which is found technically feasible, economically viable, and socially acceptable. The details of various steps involved in the feasibility study are described in the following sections.

## 2.0 General Description about the Project

Koothattukulam is experiencing the issues of treatment and disposal of MSW. The KSWMP project aims to improve the overall SWM system in all the 93 ULBs and covers the waste collection, transportation, processing, and disposal of rejects in a scientific landfill.

The existing waste dumpsite at Koothattukulam needs to be remediated scientifically and the land reclaimed for productive use. This feasibility report outlines the current status including the environmental and social aspects, examines various remediation options and suggests the most feasible option for the given context is being prepared for the purpose of availing for execution of closure of by Koothattukulam ULB.

## 3.0 Profile of ULB- Koothattukulam Municipality

### 3.1 Location

Koothattukulam Municipality is located at latitude 9.8621862 "N and longitude 76.5980931” E in the Ernakulam district as shown in **Figure 3.1**. Koothattukulam is a town and Municipality situated in Muvattupuzha Taluk, towards the southeast corner of Ernakulam district in Kerala. The total geographical area of Koothattukulam municipality is 23.18 sq km. The Municipality is divided into 25 administrative wards. The Dumpsite is in ward 15 next to the Koothattukulam New Market and KSRTC Bus stand.

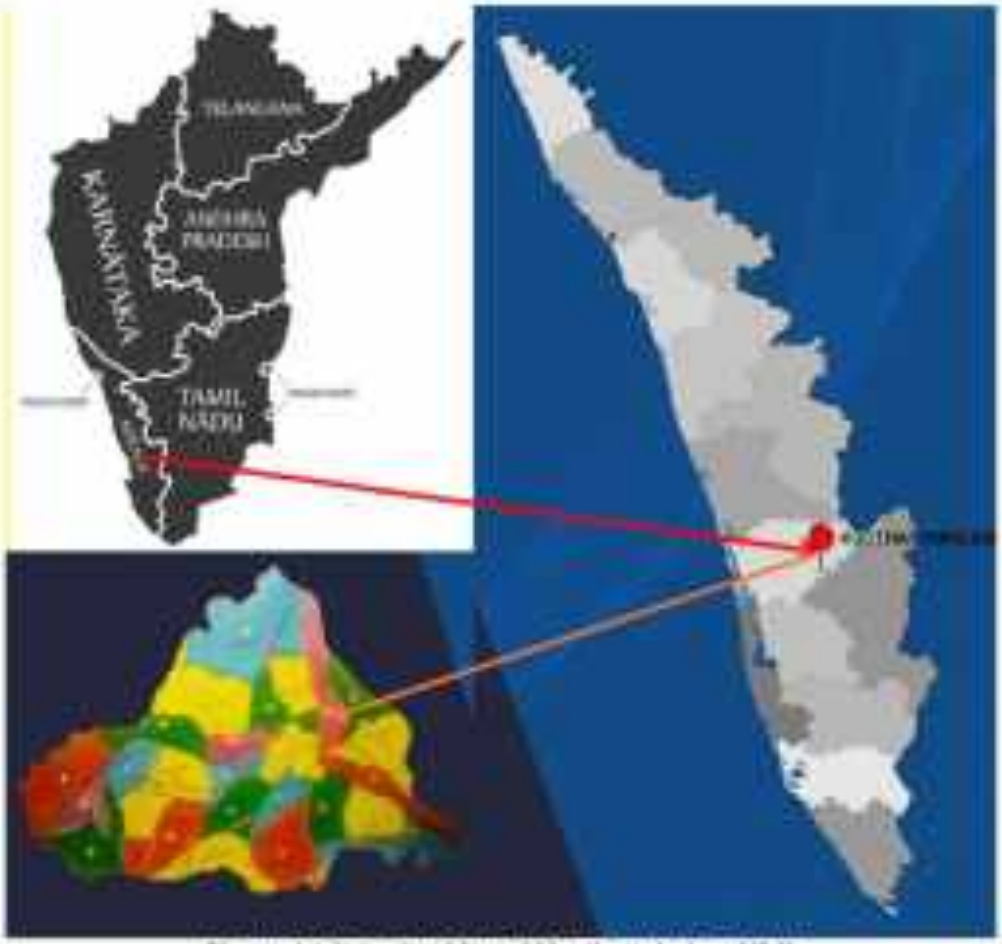

**Figure 3.1 Location Map of Koothattukulam ULB**

## 3.2 Demographic & Socio-Economic Status

The municipality has a total population of 17,253 of which 8,384 are males while 8,869 are females as per report released by Census of India 2011 indicating a sex ratio is of 1.058 against state average of 1.084. The overall literacy rate of Koothattukulam town is 96.38 %, which is higher than the state average of 94.00 %. The estimated population in 2023 is 17,529 with a decadal growth rate of 2.43 %.

In Koothattukulam, out of total population, 7074 were engaged in work activities. 81.81 % of workers describe their work as Main Work (Employment or Earning more than 6 Months) while 18.19 % were involved in marginal activity providing livelihood for less than 6 months. Of 7074 workers engaged in Main Work, 742 were cultivators (owner or co-owner) while 407 were Agricultural labourers.

**Table 3.1 Workforce Participation Details, Koothattukulam**

| Category | No of Person | Percentage |
|---|---|---|
| Main Workers | | |
| Cultivators | 742 | 4.3% |
| Agriculture Labourer | 407 | 2.35% |
| Household Industries | 7074 | 41.00% |
| Total Workers | **8223** | 47.66% |
| Non-Workers | **9030** | 52.33% |
| Grand total Population | **17253** | 100% |

*Source: Census of India 2011*

### 3.3 Connectivity

Koothattukulam town is well connected to neighbouring local bodies and towns through National Highways, State Highways, and other Major and minor road networks. National Highway 966A passes through the municipality. Kochi – Salem Highway also passes through the town. The Main Central Road also passes through the municipality.

The nearest railway station, Piravom Road railway station is located 22 kms from the town center. Koothattukulam's nearest airport is Cochin International Airport situated at 49.5 km distance.

### 3.4 Climatic Condition

All parts of Ernakulam district including Koothattukulam have a wet monsoon type of climate. Entire district experiences heavy rainfall during the southwest monsoon season followed by northeast monsoon. During the other months the rainfall is considerably less. March, April, and May are the hottest months. December to February are the coldest months. The overall meteorological condition of Ernakulam District is presented in Table 3.2

**Table 3.2 Meteorological Condition of Ernakulam District**

| Meteorological Parameter | Details |
|---|---|
| Temperature | The mean monthly maximum temperature ranges from 28.1 to 31.4°C and the minimum ranges from 23.2 to 26 °C. The maximum temperature occurs during March and April months and the minimum temperature occurs during December and January months. |
| Relative Humidity | The humidity ranges from 68 to 89% during morning hours and 64 to 87% during evening hours. The maximum humidity is observed during May to October months. |

| | |
|---|---|
| Evaporation | Evaporation is more during summer months of January to April and it is low during the rainy months May to August. The maximum rate of 4.8 mm per day is recorded in March and the lowest rate of 2.6 mm is recorded during July |
| Wind | The wind speed ranges from 6.7 to 10.9 km/hour with mean speed of 9.1 km/hour. The wind speed is high during the period from March to September |

Source: Groundwater Information Booklet of Ernakulam District published by Central Ground Water Board

### 3.5 Ground Water Level

From monitoring wells dispersed across the state, the depth to water level is observed in the months of April, August, November, and January. According to information published by the CGWB, the Government of India, the water level in Koothattukulam fluctuates from 2 to 15 MBGL.

### 3.6 Land use

The vicinity of the project area has a few households within a radius of 200 m. The land use survey of 2007 revealed that the predominant land use of Koothattukulam Municipality is dry cultivation The landuse map of Koothattukulam Municipality is presented in following Figure 3.2

**Figure 3.2 Existing Land Use Map of Koothattukulam Municipality in 2007 Published by Department of Town and Country Planning Ernakulam**

## 4.0 Detailed Description of the Dumpsite

Koothattukulam dumpsite is located approximately 1.0 Km from the centre of Koothattukulam town on the western side and encompasses an area of approximately 29 cents of land. The dumps site is not very far from human settlement. The coordinates of the dumpsite are Latitude 9.863771° N and Longitude 76.909936° E. It is in ward No. 15 of the municipality. Koothattukulam municipality holds the ownership of the dumpsite land. A small canal flows adjacent to the dumpsite. Also, market area and KSRTC bus stand are located adjacent to the dumpsite.

The exact date for start of the dumpsite was not available with the municipality; however approximately it had started in the year of 1990, the information has been gathered during field visit.

## 4.1 Physical Feature of the Site

The salient features of the dumpsite existing within Koothattukulam municipality is present in table below. There is a high chance of water being contaminated in this area due to the irregular dumping and air pollution because of odour problems to the nearby residents.

**Figure 4.1 Photograph of Koothattukulam Dumpsite**

**Table 4.1 Salient Features of Koothattukulam Dump Site during Site Visit**

| Particulars | Details |
|---|---|
| Name of Dumpsite | Koothattukulam dumpsite |
| Location of Dumpsite | Ward No. 15 of the municipality |
| Co-ordinates of Dumpsite | Latitude: - 9.863771° N<br>Longitude: - 76.909936° E |
| Distance from the central part of the town | 1.0 km |
| Area of dumpsite | 29.737 cents |
| Average height of dumpsite | 0.8 m (Above GL) |
| Ownership of dumpsite land | Municipality |

| Particulars | Details |
|---|---|
| Distance from nearby features- residential, school, offices, temples, institutions, industry etc.) | There is Residential and other structures within 20 metres from the site |
| Start date of dumpsite | 1990 |
| Quantity of waste dumped per day | None |
| Utilities on site | Electricity connection is available |
| Details of manpower available in dumpsite | 18 persons |
| Site demarcated | Site is currently demarcated with boundary wall. |
| Details of weighbridge available at dumpsite | No weighbridge at site |
| Plant adjacent to dumpsite details | Nil |
| Availability of electrical power | 440 LV grid available at 100m from site |
| Availability of water for process | Water is not available at dumpsite, water to be supplied by tanker |
| Road Width (for vehicle access) | 3.5 m |

### 4.2 Surrounding Features of the Dumpsite

The dumpsite is located adjacent to the KSRTC Bus Stand. It is located on the back side of the market, besides the fire station. A canal runs nearby to the dumpsite. Within 500 metres of the dumpsite house and shops are present.

### 4.3 Relevance in local or regional SWM plans

The ULB is planning to utilise the reclaimed dumpsite land for the construction of a state of art Material Recovery Facility. The non-biodegradable waste from the ULB shall be brought to this facility and materials collection facilities and processed for further use. The project is being funded under the KSWMP project.

### 4.4 Litigation status of the Site

There is no litigation for the dumpsite in the Koothattukulam Municipality.

## 5.0 Scope of Work

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Koothattukulam includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Pollachem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.

- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (land recovery – Biomining, Capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the ESMF developed for projects envisaged under KSWMP.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Delineation of baseline assessment, impact & risk assessment, mitigations measures, Environmental Management & monitoring plan, budget for EMP, EMOP, institutional responsibilities for implementing monitoring and reporting
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport,
- Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 Objectives:

- To remediate the dumpsite by 31st March 2024.
- To reclaim area and by eliminating the chances of dumpsite fires, leachate generation, and foul odour.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.
- To increase nearby real estate/social value and benefit the citizens.

# 6 Detailed Investigation Strategy

## 6.1 Investigation Strategy

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below;

- Bore hole upto a depth of 10 m and collection of 3 (nos) samples from the soil at interval of 1.5 m.
- Waste analysis viz., leachate sample from 3 (nos) locations and physical analysis from 2 (nos) locations, and chemical analysis from 1 (nos) location.
- Environmental baseline analysis surface water 1 (nos) location and ground water samples from 3 (nos) locations (Well Water Samples -1 up gradient, 2 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location

## 6.2 Investigation Plan

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

| S.No | Parameters | Sampling Nos |
|---|---|---|
| 1 | **Geotechnical Investigation** | |
| A | Bore Holes up to 10m depth(1No./2Hectare) (as per CPHEEO) | 1 |
| B | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, Strength compressibility (vertically-3 samples per borehole). | 1 |
| 2 | **Waste & Environmental Analysis** | |
| A | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016). Suspended solids, Dissolved solids(inorganic), pH, Ammoniacal nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | 3 |
| B | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | 2 |
| C | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium(N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor. | 1 |
| D | Ground water (well water samples-1 up gradient, 2 down gradient)-(shallow and deep wells) Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, CL NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | 3 |

| S.No | Parameters | Sampling Nos |
|---|---|---|
| E | Surface water (pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | 1 |
| F | Ambient Air Quality (Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise level [E(P)] for 24 hours. | 1 |

## 6.3 Sampling Methodology

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

**Table 6.1 Detailed Investigation Plan Executed for Waste Dumpsite at Koothattukulam**

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Within the Dumpsite<br>Dumpsite boundary | The AAQ locations were chosen based on the Windrose data |
| 2 | Noise (1 Location) | Ambient Noise level [E(P)] for 24 hours | Entrance of the dumpsite | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading vehicle. |
| 3 | Surface water (2 Locations) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | Surface water near to the dumpsite [stream] | It is important to identify area nearest to the dumpsite to assess any contamination due to the project thus location was selected |
| 4 | Ground water (2 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | 2 wells identified near the dumpsite area | It is important to identify area nearest to the dumpsite to assess any contamination due to the project thus location was selected |

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 5 | Bore Hole (1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | Within the dumpsite area | As per requirement on the waste dump based on the objective of the sampling and preferably at the centre of the dumpsite |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammoniacal nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | Within the dumpsite area | |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents | Within the dumpsite area | |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium(N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | Within the dumpsite area | |

For the borehole investigation the sample were collected by rotary drilling a 150mm bore hole using a fast rig attached to a drag bit. The soil drillings are removed by a circulating bentonite slurry which also aids in keeping the side walls stable. An SPT sampler was driven in to collect the representative samples, which is carefully packed in double walled polythene bags, sealed, and sent to laboratory for testing. Standard penetration tests were conducted on soil at every 1.5m depth and the number of blows to achieve 300mm penetration were noted. Fractions recovered from the mining of legacy waste should be tested, especially for the presence of toxic metals and organic contaminants.

The total quantity of waste present in the waste dump is calculated based on the topographic study executed by ULB (towards calculating quantum of waste above ground level) and the results of borehole investigation (towards calculating the quantum of waste below ground level).

## 6.4 Analysis and Interpretation of Exploratory Data

The baseline condition of the waste dumpsite at Koothattukulam, has been assessed through the geotechnical investigation and Waste & Environmental baseline assessment executed through M/s. Matter Material Testing & Research Laboratory (P) Ltd and M/s Poluchem Laboratories (P) Ltd respectively. The results of the Topographical survey conducted in the year 2022 are also considered for the analysis. The signed reports of all analysis are enclosed as Annexures as detailed below;

Annexure 1 – Topographical survey report

Annexure 2 –Geotechnical Survey report

Annexure 3- Waste Characterization study report

Annexure 4 - Waste & Environmental baseline assessment reports

The initial site visit was carried out by M/s. Matter Material Testing & Research Laboratory (P) Ltd on 23rd May 2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 6th June 2023 and was completed on 8th June 2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 3rd June 2023 by M/s Poluchem Laboratories (P) Ltd.

### 6.4.1 Topographic Survey Results

Topographic survey was conducted by ULB itself in the year 2023 towards assessing the quantum of the waste present in the dumpsite above the ground level. The Topographical survey report is presented in **Annexure 1**. The inference of the Topographical survey is as follows:

- Topographical Survey Map shows approximate 29.757 cents of land used for waste dumping.
- Maximum height of waste dump above soil is 0.8 m (above GL)
- Estimated waste volume above ground level is 899.55 cum which will constitute 944 T of waste (density of waste is 1.05 T/cum as per the characterization study results presented in subsequent sections)

### 6.4.2 Geotechnical Exploratory Details

The geotechnical investigation at the dumpsite at Koothattukulam, Ernakulam district was carried out by M/s. Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 7m (3 m in waste and 4 m in the ground). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples. The full geotechnical

report is appended as **Annexure 2**. The major inference of the geotechnical investigations are as follows;

- In the borehole investigation it was asserted that the depth of the waste column is 3 m.

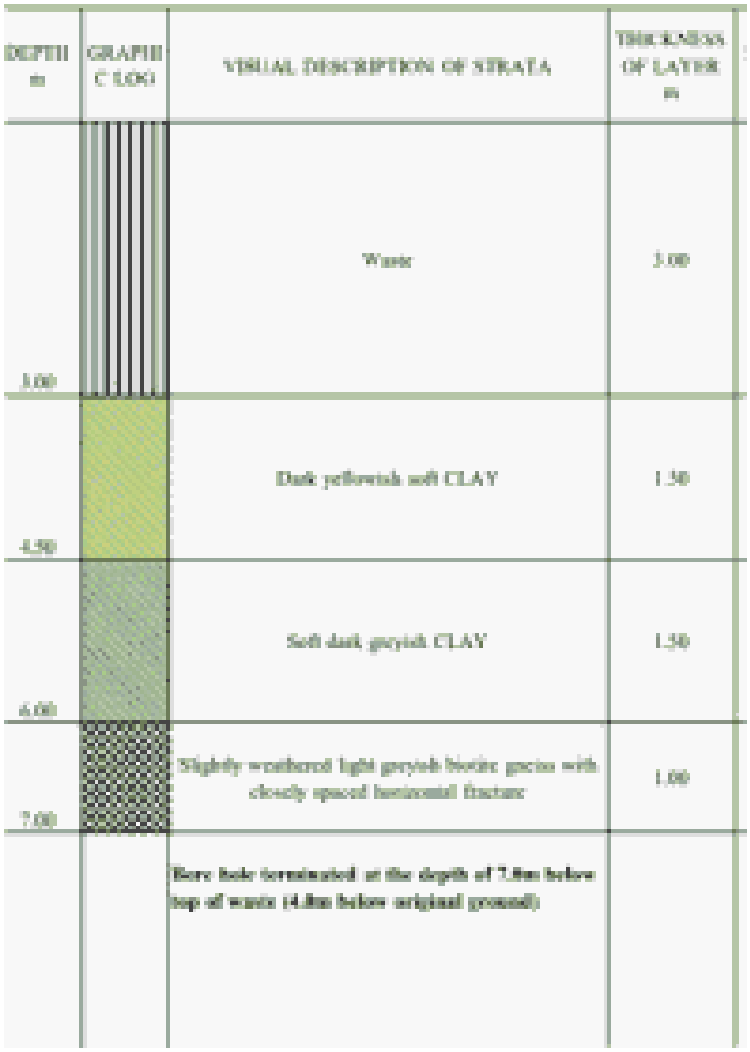

**Figure 6.1 Borehole Strata Obtained for Koothattukulam Dumpsite**

- The soil exhibited a plasticity index of 33. The base soil has a plasticity index greater than 10 and the clay and silt fractions account to more than 30%, which makes it a good soil for the subbase.
- The clay fraction is 60 %.
- The pre-consolidation pressure is b 145 KPa.
- The permeability value is 1.44 E-05.
- The Cation Exchange Capacity (CEC) of the soil is 11.91 meq/100gm

### 6.4.3 Estimated Total Quantity of Waste

The total quantity of waste is estimated based on the contour/ topography survey of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). As detailed under section 6.4.1, the estimated quantity of the waste above the ground level is **899.55 Cum**.

Quantity of waste below the ground level is estimated as **1203.97 Cum**. The quantity of waste below ground level may vary as per actual site conditions. We recommend taking 4 more bore holes for estimating exact quantity or the assessment of quantity below ground level may be included in the contractor's scope.

Thus, the total legacy waste present in the Koothattukulam dumpsite is calculated as below:

**Table 6.2 Total Waste Quantification for Koothattukulam Dumpsite**

| Sl No | Name of Dumpsite | Quantity of Waste present above the Ground level | Quantity of Waste present below the Ground level | Total quantity of legacy waste to be managed |
|---|---|---|---|---|
| 1 | Koothattukulam | 899.56 Cum | 1203.97 Cum | 2103.52 Cum |
| | | 944 T | 1264.16 T | 2208.70 T |

### 6.4.4 Legacy Waste Characterization

The characteristics of the legacy waste were assessed by collecting a 15kg sample. The legacy waste samples were collected on 3rd June 2023 by M/s Matters lab (P) Ltd. The assessment of waste characteristics. was done based on the results of the analysis. The details of the physical characteristics are provided in the tables below: The detailed legacy waste characterisation reports are enclosed as **Annexure 3**

**Table 6.3 Grain Size Analysis of Legacy Waste**

| Sieve Size (mm) | Percentage Retained |
|---|---|
| 80 | 13.3 |
| 37.5 | 13.8 |
| 10 | 47.3 |
| 4 | 20.5 |
| Pan | 5.1 |

**Table 6.4 Characterisation of Waste Material Retained in Each Sieve**

| Test/ Parameters | Waste Material Retained on each sieve in % | | | |
|---|---|---|---|---|
| | 80mm | 37.5 mm | 10mm | 4mm |
| Plastic Waste | 42.7 | 6.9 | 1.6 | 0 |
| Cloth | 2.1 | 0 | 0 | 0 |

| Test/ Parameters | Waste Material Retained on each sieve in % | | | |
|---|---|---|---|---|
| | 80mm | 37.5 mm | 10mm | 4mm |
| Glass | 0 | 0 | 0.2 | 0 |
| Wood | 0.7 | 3.4 | 0.9 | 0 |
| C&D | 0 | 0 | 0 | 0 |
| Bio Fraction | 0 | 0 | 0 | 0 |
| Gravel | 47 | 89.7 | 95.7 | 100 |
| Rubber | 7.5 | 0 | 0 | 0 |
| Metal | 0 | 0 | 1.6 | 0 |

**Table 6.5 By Product Composition**

| Particular | Percentage of Composition (%) |
|---|---|
| RDF | 9.38 |
| Recyclable | 0.76 |
| Inert | 82.94 |
| Compost Soil Enricher | 5.10 |

**Table 6.6 Physical Characteristics of Waste**

| Sl No | Parameter | Test Method | Unit | Value |
|---|---|---|---|---|
| 1 | Moisture@105°C | ASTM D 2216 | % | 28.01 |
| 2 | Bulk Density | USEPA | kg/m3 | 1098 |
| 3 | Density | USEPA | g/cm3 | 1.0555 |
| 4 | Calorific Value | ASTM D 5865 | K cal /kg | 124 |

**Table 6.7 Chemical Analysis**

| Sl No | Parameters tested | Test Method | Unit | Result |
|---|---|---|---|---|
| 01 | pH@25°C | USEPA | .. | 7.3 |
| 02 | Biodegradable Factor | USEPA | % | 3.4 |
| 03 | Total carbon | USEPA 9060A | % | 5.3 |
| 04 | Phosphorus(P) | USEPA | % | 0.064 |
| 05 | Nitrogen(N) | USEPA | % | .32 |
| 07 | Potassium(K) | USEPA | % | 0.047 |
| 08 | C/N Ratio | USEPA | .. | 16.5:1 |

*Note: The average Nitrogen, Phosphorus and Potassium (NPK) content in the legacy waste samples picked from the site is 0.32, 0.047, 0.064, respectively by weight. This is far lower than 0.8, 0.4 and 0.8 as specified by the Fertilizer Control Order (FCO) 1985 for city compost and hence cannot be used as compost. The carbon: nitrogen ratio is 16.5 which is much lesser than the specified standard. This could be due to the materials being exposed to sun and air over the years or that the carbon content may have leached into the ground through leachate during the rainy season. Another possible contributor to the reduced carbon levels could be multiple fire incidents at the site. Although the material has very less carbon content, the NPK value can be enriched by adding additives like poultry litter. The enriched material can be given to farmers or used for horticulture purposes.*

### 6.4.5. Soil Conditions of the Dumpsite

As it is an unlined dumpsite, there is a probability of finding traces of contaminant from waste and leachate in the underlying soil. Since it is an uncontrolled disposal site, the mixed waste contains different types of pollutants which may eventually have an impact on the soil. Results of soil analysis of the samples taken from the borehole in the Koothattukulam dumpsite is as shown below:

**Table 6.8: Chemical analysis of soil extracted from borehole at Koothattukulam dumpsite**

| Sl. No | Parameter | Result | US (NY State-Codes, rules and regulations) Industrial Use |
|---|---|---|---|
| 1 | Cadmium (Cd) mg/Kg | <5.0 | 60 |
| 2 | Chromium (Cr) mg/Kg | 172.4 | 800 (Hexavalent) 6800 (Trivalent) |
| 3 | Copper (Cu) mg/Kg | 62.9 | 10000 |
| 4 | Nickel (Ni) mg/Kg | 68.8 | 10000 |
| 5 | Lead (Pb) mg/Kg | 39.9 | 3900 |
| 6 | Zinc (Zn) mg/Kg | 601.0 | 10000 |
| 7 | Mercury (Hg) mg/Kg | <0.1 | 5.7 |
| 8 | Arsenic (As) mg/Kg | 2.0 | 16 |

On comparing results of the report with the US Industrial Use benchmark, it is observed that the values are significantly low and within the benchmark values. Bioremediation may be carried out to reduce traces of heavy metals in soil and for site clearance. The location may be used for Industrial landuse as a site for the SWM facilities like Material Collection and Resource Recovery Facility. However, the solution may be considered after proper soil and groundwater investigation post dump-clearing stage.

### 6.4.6 Leachate Characterization and Quantification

There is no leachate collection/management system in the dumpsite. To address the concern of contamination of the groundwater and soil due to uncontrolled dumping, leachate samples are picked for analysis. The data is presented in **Annexure 4**. The data indicates that the TDS is

about 367 mg/l while the suspended solids is about 142 mg/l. The chlorides are high at 52.1 mg/l, while the COD, BOD are 110 mg/l and 480 mg/l respectively.

**Table 6.9 Leachate characteristics at Koothattukulam Dumpsite**

| Parameters tested | Test method | Results |
|---|---|---|
| Sampling Location | N-9°59'23.582'' E -76°33'51.031 | |
| pH | IS 3025 (P) 11 –1983RA2017 | 7.48 |
| Total Dissolved Solids (Inorganic) | IS 3025 (P) 16 – 1984RA2017 | 367 mg/l |
| Total Suspended Solids | IS 3025 (P) 15 – 1984RA2017 | 142 mg/l |
| Chloride as Cl- | IS 3025 (P) 32 – 1988RA2014 | 52.1 mg/l |
| C O D | IS 3025 (P) 58 -2006RA2017 | 480 mg/l |
| B O D (3 days at 27 C) | IS 3025 (P) 44 – 1993 RA 2014 | 110 mg/l |
| Total Kjeldhal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 24.3 mg/l |
| Ammoniacal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 19.07 mg/l |
| Phenolic Compound as C6H5OH | IS 3025 (P) 43-1992 RA2014 | 1.3 mg/l |
| Fluoride as F | IS 3025 (P) 60 -2008RA2014 | 1.2 mg/l |
| Cyanide as CN- | IS 3025(P) 27-1986RA2014 | BDL (MDL- 0.01 mg/l) |
| Nickel as Ni | IS 3025 (P) 54– 2003RA2014 | BDL (MDL- 0.01 mg/l) |
| Cadmium as Cd | IS 3025 (P) 41– 1992RA2014 | BDL (MDL- 0.001 mg/l) |
| Lead as Pb | IS 3025 (P) 47– 1994RA2014 | BDL (MDL- 0.01 mg/l) |
| Copper as Cu | IS 3025 (P) 42– 1992RA2014 | 2.3 mg/l |
| Mercury as Hg | IS 3025 (P) 48 – 1994RA2014 | BDL (MDL- 0.001 mg/l) |
| Zinc as Zn | IS 3025 (P) 49 – 1994RA2014 | 3.5 mg/l |
| Total Arsenic as As | IS 3025 (P) 37– 1988RA2014 | BDL (MDL- 0.01 mg/l) |

*BDL- Below Detection Level, MDL- Minimum Detection Level*

The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from waste.

### 6.4.7 Environmental Baseline

The environmental baseline was assessed from the analytical results of air, surface & groundwater, noise and leachate. The samples were collected by M/s Pohchem Laboratories (P) Ltd. The Environmental baseline was analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the ESIA Section in **Annexure 5**

### 6.4.8 Risk Assessment

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and pathogens. Proper containment and management of leachate are essential to prevent water pollution.

The analysis of surface water reveals that all the parameters are within the acceptable limit, except it is slightly acidic and the dissolved oxygen content is less than prescribed limit, so also the BoD is greater than the allowable limit, indicating that the water contains organic load.

**Table 6.10 Risk Assessment- surface water**

| Risk Assessment | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite - BOD Higher than the acceptable limits |
| **Pathway** | Water/Run off |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | High BOD indicates the water is highly polluted and it is harmful to the ecosystem as fish and other aquatic life may suffocate in oxygen-depleted waters. Also, it will contain more Pathogen and make the water unfit for human and animal |

**Ground Water**: Pollutants from dumpsite can infiltrate into underlying groundwater, particularly if the dumpsite is not adequately lined or if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

The analysis of ground water samples taken at one location reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 5.61, which is in a slightly acidic range which can make the water not fit for any industrial purpose as it is more corrosive.

**Table 6.11 Risk Assessment - Ground water**

| Risk Assessment | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite - pH is acidic in nature |
| **Pathway** | Water, soil |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health are;<br>• Diarrhea<br>• Nausea and Vomiting<br>• Abdominal Pain<br>• Weakness<br>Possible risk to flora |

| | |
|---|---|
| | It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increases the availability of some elements to toxic levels, particularly aluminium and manganese. |

**Air**: Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens, etc. to be ensured.

**Table 6.12 Risk Assessment - Air**

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Within the limits |
| **Pathway** | Air |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | No Anticipated risk |

**Soil**: Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

**Table 6.13 Risk Assessment - Soil**

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Heavy metals |
| **Pathway** | soil |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health: Soil that contain substance such as heavy metals which may be toxic to human can pass those substances on to human through crop uptake leading to unsafe foods.<br>Possible risks to animals: when farm animals consume the plant grown from contaminated soil it affected the health of animal<br>Possible risk to flora: Soil pollution may affer plant metabolism and reduce crop yield, also the trees and plants that absorb the soil contaminants enter into the food chain |

**Bioaccumulation in Biota**: Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. As pollutants move up the food chain, their

concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the land and minimizing the exposure of organisms to contaminated environments

**Table 6.14 Risk Assessment - Bioaccumulation in Biota**

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate and heavy metals |
| **Pathway** | Air, water and soil |
| **Receptor** | Human, Animals, flora and fauna |
| **Risk** | Possible risks to human health, animal flora and fauna<br>Accumulated of contaminants in plants and animals indirectly through food chain affects human health |

## 7.0 Evaluation of Remediation Techniques

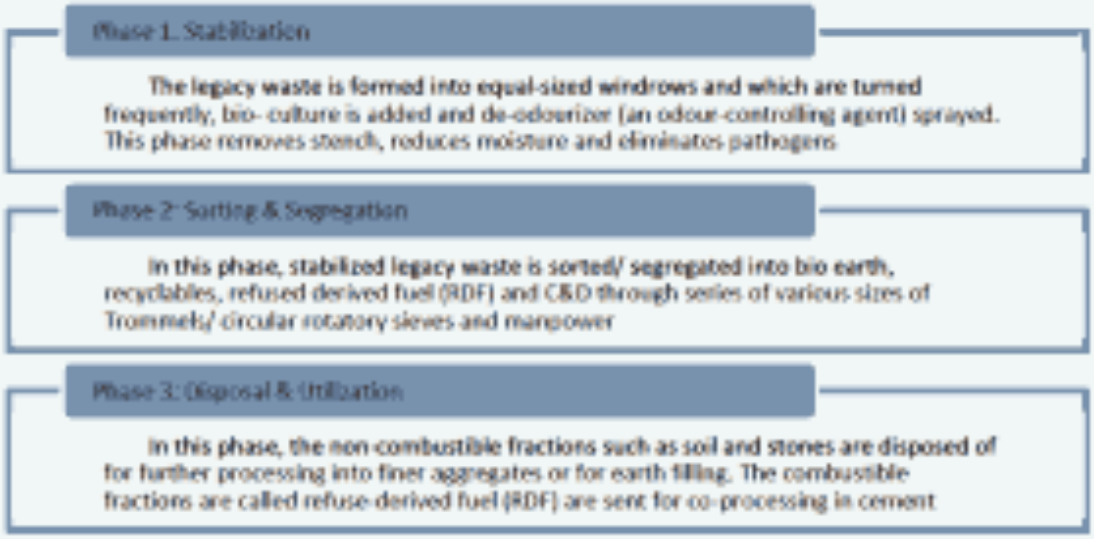
The remediation of existing unmanaged municipal waste dumpsites has emerged as a crucial necessity for Urban Local Bodies (ULBs) in India. The adoption of unscientific and unplanned waste disposal methods in non-engineered landfills has given rise to significant environmental challenges. These issues encompass soil and groundwater contamination, unregulated emissions of landfill gases into the atmosphere, and the heightened risk of exposure to disease vectors and scavengers. As a result, addressing and reclaiming such dumpsites has become a priority to mitigate these adverse environmental impacts.The Hon'ble NGT seized with these problems across the country has ordered that the respective authorities to remedy this at the earliest.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically visible manner.

Remediation of waste dumpsite is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

- Environment Enhancement - reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.

- Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
- Land - Dumpsite land becomes available for utilizing same for the establishment of other Waste Management Facilities.
- Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels



For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- Baseline study of heavy metals; subsurface soils and water; rainfall; soil type; surface hydrology; topography; wind direction etc. Shall be studied prior to bioremediation.
- Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows:

## 7.1 Bio-Mining – Reclamation/Recovery of Land

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bioremediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

| | |
|---|---|
| Salient Features | • Maximum land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>• Ensures long-term sustainability and environmentally sound treatment of legacy waste and also present lucrative revenue-generating opportunities.<br>• Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>• Compliance to SWM Rules and NGT orders.<br>• Improvement in aesthetics and quality of life & health. |
| Applicability | • The ownership is well defined.<br>• Working space is available in the dumpsite.<br>• Linkage for utilization by-products is available |

## 7.2 Capping Without Land Recovery

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas.<br>• Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years |

| | |
|---|---|
| | • Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep- rooted vegetation.<br>• SWM rules 2016 do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | • Simple & robust, least expensive method among various available technologies |

### 7.3 Capping with Partial Land Recovery

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bioremediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can be linked to relevant buyers and the inert material will be capped over lower footprints, with well-designed slopes to prevent further degradation of the environment.

The top layer of capped material may also be provided with gas collection wells and pipes to trap the methane and the collected gasses are typically passed through an oxidation layer of passive venting or flared. If the gas quantity is substantial then, power generation may be a possibility. The capped area should have drains to collect the surface water flow as well as any leachate that may be generated. Such leachate are collected and treated in leachate treatment plants.

The reclaimed land may be covered with loamy soil that has plants with high transpiration rates. The plants do not permit the ingress of water into the soil thereby reducing the possibility of leachate generation. The plants and soil microbes also behave as oxidation layer. The soil is compacted and maintained with gentle slopes with 1 to 3. Contour drains may be provided to divert the water away from the soil thereby preventing ponding of water. The reclaimed land may be covered with solar panels to generate renewable energy during the period of observation following the post closure.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>• Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>• Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |

| | |
|---|---|
| Applicability | ● Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>● Lack of linkage for disposal of inert<br>● Recovery land for public use is not a priority |

## 7.4 Selection of Remediation Option

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for maximum land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Moreover, as per Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping

However, after the bioremediation municipality wants to use the land for setting up of Material Collection Facility and Resource Recovery Facility. Hence backfilling of the site with boulders and inert are planned.

For the execution of dumpsite bio-mining two strategies can be adopted.

- *Insitu biomining*: Here the biomining is carried out within the premises of the dumpsite after clearing the waste and reaching the original ground level or in a land adjoining the dumpsite. The advantage is that only the finished products are moved out of the premises, inerts may be used for gradation and filling up low lying areas within the site, or in a newly developed sanitary landfill. This is quite economical when legacy waste quantities are significant. The possibility of gaseous emissions, noise and odour and formation of leachate exist as the processing takes place at the site. The location would remain affected for the time till all waste is processed.
- *Ex Situ biomining:* In small dumpsites, or where the area is a constraint, the entire waste is excavated and taken away to an alternate location for processing. The work in the dumpsite can be completed quickly and the disturbance due to the excavation can be minimized. The cost of transportation of the whole waste adds to the cost of bio mining. But since the process plant can serve multiple locations, economies of scale may be achieved and may also compensate for the added transport cost.

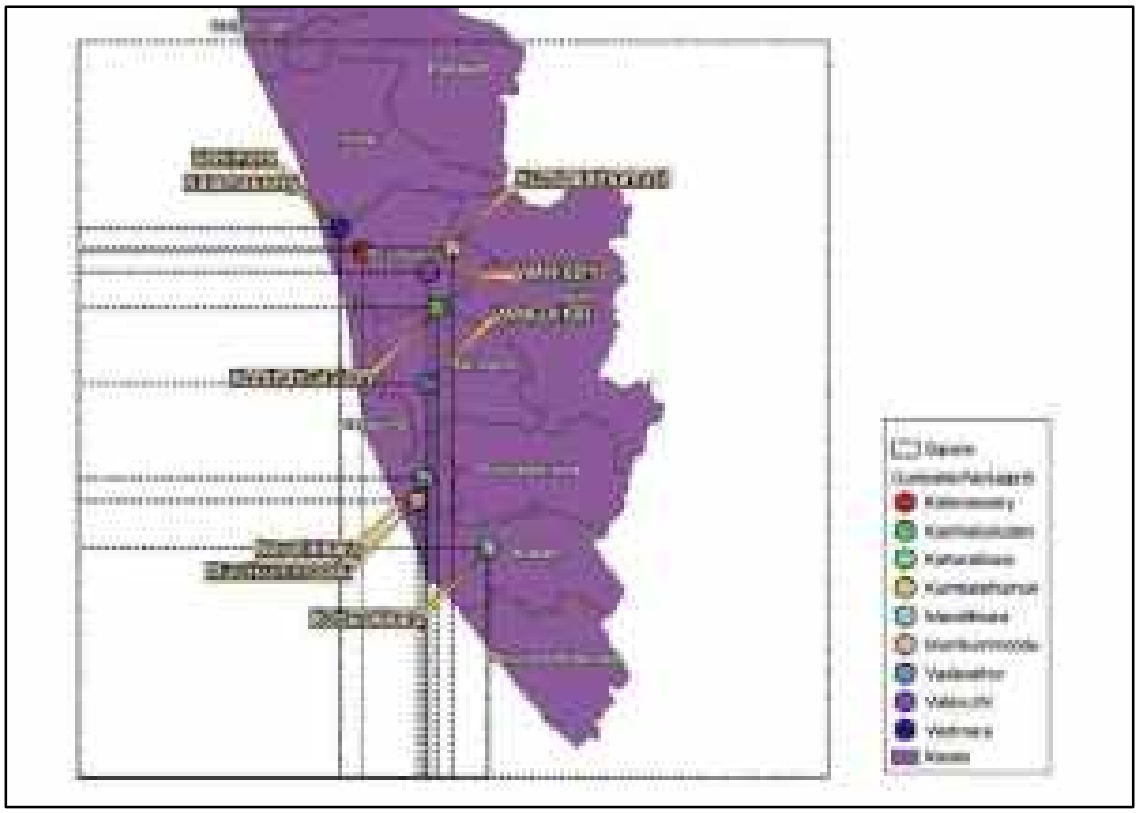


**Figure 7.1 Location of Other Dumpsites nearby**

## 8.0 Technical Description of the Selected Option

### 8.1 Methodology

The legacy waste dumpsite reclamation through bio-mining with recovery of land.

Phase 1: stabilization

Phase 2: sorting & segregation

Phase 3: disposal & utilization

Phase 4: Back filling of inerts/ soil enricher

## 8.2 Selection of Machineries

The type of machinery, capacity and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type machinery available for the bio mining are as follows:

- Stationary screening machinery and
- Mobile/compact machinery

### 8.2.1 Stationary Screening Machinery

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen, and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process
- Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

### 8.2.2 Mobile/Compact Screening Machinery

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation

***Structure***: The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity

***Screening Mechanism***: The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

***Separation System***: Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

***Treatment Process***: In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

***Transport***: Quick and easy folding of conveyor helps in quick setup time.

***Discharge height***: Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, stationary trammel machine shall be the optimum screening machinery.

## 8.3 System Requirements

The following are the infrastructural facilities required for setting up of machineries and equipment in biomining of a dumpsite: These are required irrespective of the option of in-situ or ex-situ processing.

- Fencing and secure entrance gate
- Security and reception office
- Weighing bridge
- Records room
- Laboratory
- Medical room
- Workers' area
- Parking for vehicles (heavy earth equipment, trucks, etc.) with tire washing facility.
- Administrative building
- Fire control unit
- Toilet–bath complex, with personnel protection equipment (PPE) storage room)
- Overhead water tank
- Leachate collection and treatment unit
- Environmental monitoring unit
- Segregation and processing area
- Temporary storage area for rejects, domestic hazardous waste and sanitary waste
- Material storage area
- Waste drying and windrow area.
- DG set

The total area required is about 900 sqm in an in situ biomining activity. Temporary construction power at 440V needs to be obtained from KSEB. This can be easily availed as there is an existing electrical infrastructure passing through the site. A 440V, 125KVA needs to be established for the project. Water storage tanks needs to be provided for the duration of the project. The water may be supplied by tankers. Labour will reside in Koothatukulam and commute daily to the site, hence no labour sheds are envisaged during this project. The requirements are only indicative, and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards.

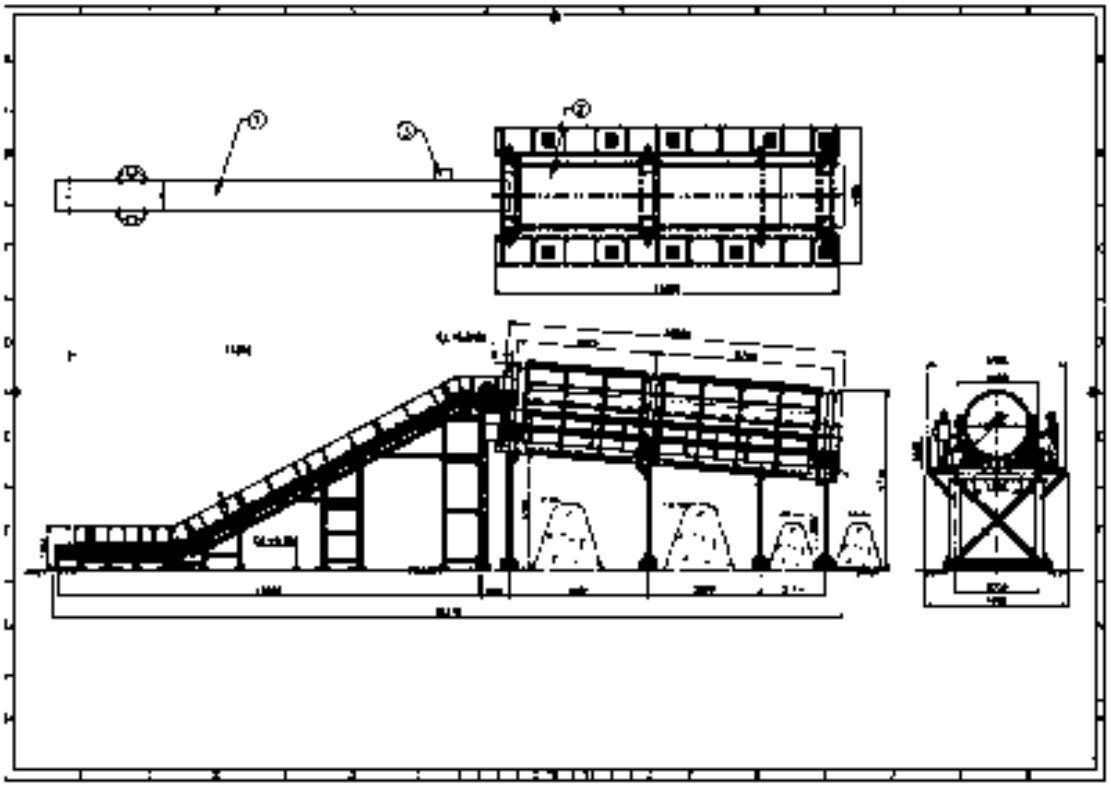

**Figure 8.1 Schematic of the Segregation System**

## 8.4 Site Reclamation Requirement

As detailed under section 6 the Koothattukulam Dumpsite has a waste spread of Approx 29.757cents of land with a max of waste dump height 0.8 m above the ground level. Estimated volume of waste above the ground level is: 899.56 Cum which will be around 944.52 MT. *(source: Topographical survey result for the Koothattukulam Dumpsite conducted in the year 2023)*

In the borehole investigation it was asserted that the depth of the waste column below ground level is 3 m and the quantity of waste below ground level is estimated at 1173.63 Cum as detailed under section 6. *(source: Borehole investigation survey conducted by KSWMP through Matter Labs for the Koothattukulam Dumpsite on June 2023)*

Since the ULB intends to use the land recovered after bioremediation, backfilling of the soil enricher and inert material obtained after the biomining is proposed.

# 9 Scope of Disposal Including Location of Disposal for RDF, Bio Soils, Inert

## 9.1 Utilization of By Products

The details of the utilization of aggregates/by–products screened out by processing of the stabilized legacy waste are provided in the table below:

**Table 9.1 By Product Composition**

| By-products | Percentage Composition (%) | Quantity Cum | Utilization/Linkage/Usage |
|---|---|---|---|
| RDF | 9.38 | 194.51 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. |
| Recyclable | 0.76 | 15.49 | Recyclables will be sold to authorized recyclers |
| Inert | 82.94 | 1719.39 | Can be utilized for filling at the site itself |
| Compost Soil Enricher | 6.92 | 143.73 | Can be used as a soil enricher and given to farmers. The same cannot be sold as fertilizer unless it is enriched with carbon content to meet the standards suggested by FCO for city compost |
| Total | 100 | 2073.12 | |

RDF / SCF consists largely of combustible components which are shredded into a uniform size, in order to produce a homogenous material which can be used as substitute for fossil fuels in e.g. cement plants, lime plants, coal fired power plants or as reduction agent in steel furnaces. The calorific value of the RDF should be higher than 1500 kcal/kg for use in cement plants.

The RDF once dried and shredded, can be compacted and carried for disposal to RDF power plants or cement factories which can use this material in their kiln for co-processing. The cement industries/RDF plants will consider accepting this material if the calorific value confirms to the specifications for SCF/RDF. However, there may not be any financial value to the supplier or to the ULB as this is more for the disposal of RDF rather than a revenue-making stream.

The nearest cement industry that can accept the RDF from Koothattukulam City is located near Trichy, Tamil Nadu at a distance approx. 360 kms from the Dumpsite site. The other sites are at Karnataka, Tamil Nadu are between 300 km to 1074kms, while cements plants at Andhra are at 740 km to 900 kms.

**Table 9.2 Distance to potential RDF / SCF users**

| Name of the cement plant | Location | State | Distance from Kochi (KM) |
|---|---|---|---|
| Dalmia Bharath | Ariyalur | Tamilnadu | 458 |
| Dalmia Bharath | Dalmiapuram | Tamilnadu | 424 |
| ACC | Wadi | Karnataka | 1,075 |
| Chettinad | Karikazhi | Tamilnadu | 315 |
| Chettinad | Kallur | Tamilnadu | 386 |
| Dalmia Bharath | Belagavi | Karnataka | 956 |
| JK | Muddapur | Karnataka | 965 |
| Dalmia Bharath | Kadapa | Karnataka | 739 |
| Bharathi VICAT | Kalburgi | Karnataka | 1,074 |

| | | | |
|---|---|---|---|
| JSW | Kurnool | Andhra Pradesh | 901 |
| Bharathi VICAT | Kadapa | Andhra Pradesh | 739 |
| Ultratech | Tadipatri | Andhra Pradesh | 815 |
| Zuari | Yerraguntla | Andhra Pradesh | 877 |

Based on the chemical analysis the waste material has less than as suggested by the Fertiliser Control Order (FCO). The screened compost materials having size less than 4 mm shall be heaped to form windrows, the leachate (if any) from excavation shall be dried by solar exposure. The materials shall be tested for carbon content and NPK values during execution of works, the materials may be sold to farmers depending on the test outcomes. If the compost materials are not meeting with the standards, the same shall be used as soil enricher for refilling within the site itself along with inert.

Inert is a course fraction received from the landfill mining of MSW. It consists of stones, construction debris, ceramics etc. This is helpful in backfilling in the site or can be used as a subgrade material for highways, low land filling.

## 10. Estimated Project Cost

The details of the estimated cost for bio-mining - recovery of land by remediating legacy waste dumpsite is provided in the table below:

**Table 10.1 Details of Estimated Project Cost**

| Sl. No. | Activity | Rate/ m3 | Quantity (m3) | Amount (INR) |
|---|---|---|---|---|
| 1 | **Bio-mining Operations** | | | |
| a | Processing the Waste | [redacted] | [redacted] | [redacted] |
| 2 | **Disposal Cost** | | | |
| a | Disposal of RDF | [redacted] | [redacted] | [redacted] |
| b | Disposal of Compost/ Soil enricher | [redacted] | [redacted] | [redacted] |
| c | Sale of recyclables | [redacted] | [redacted] | [redacted] |
| d | Disposal of Inert | [redacted] | [redacted] | [redacted] |
| | Total (1+2) | | | [redacted] |
| | E & S Safeguards from ESIA | | | [redacted] |
| | Contractors Profit and Overheads at 15% | | | [redacted] |
| | Net Cost | | | [redacted] |
| | Average Cost Index for Kerala based on DSR 2018 is –1.35 at present. Considering the same, the Grand Total | | | [redacted] |
| | Cost per m3 | | | [redacted] |

### 10.1 Revenue from the Project

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by sale Bio earth waste, organic compost, RDF and recyclables etc. But due to the following reasons mentioned below no revenue from the project is considered:

- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at free cost and transportation cost also not borne by the cement industries.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable.

### 10.2 Funding for Project

The estimated cost of INR [redacted] for the project Dumpsite Remediation. The sources and funding pattern is given below:

**Table 10.2 Sources of funds in Crores**

| Sl No | Item wise funding pattern | | | |
|---|---|---|---|---|
| | Item | External (70%) (INR) | State Govt. (30%) (INR) | Total Cost (INR) |
| 1 | Dumpsite remediation for the Koothattukulam | [redacted] | [redacted] | [redacted] |

### 11.0 Project Implementation Plan

Koothattukulam Municipality intends to complete this project as early as possible. However, considering the time required for mobilisation, installation, sieving and handling recoverable etc, a time frame of about 05 - 06 months is considered.

### 11.1 Timeline

The broad timeline for the execution of this project is given below. Considering that there could be halts in the project due to various factors like rain and fire incidents, among others, a one-month buffer period is provided.

**Table 11.1 Project Timeline**

| TIMELINE CHART FOR EXECUTION | | | | | | | |
|---|---|---|---|---|---|---|---|
| **Sl. No.** | **Task Name** | **M 1** | **M 2** | **M 3** | **M 4** | **M 5** | **M 6** |
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries, Hiring & Installation of Machineries, Electrical Works | ■ | ■ | ■ | ■ | ■ | ■ |
| 3 | Excavation of Legacy Waste | | ■ | ■ | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | ■ | ■ | | |
| 5 | Windrow Formation & Spraying of Bio culture | | | | ■ | ■ | |
| 6 | Sieving Operations | | | | | ■ | ■ |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | ■ | ■ |
| 8 | Project Closure Activities:<br>Levelling of Reclaimed Land using Bio-soil<br>Handover the site to the ULB<br>Closure Report Submission to ULB, | | | | | | ■ |

## 11.2 Contract Model

Execution Method:

Design, Own, Operate and disposal/Management of by-products/aggregates with -zero residues and optimum land recovery. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

Working Model

- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for to the Contractor for biomining.
- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- ULB shall facilitate the disposal/Utilization of By-products and contractor is responsibility for disposal of RDF, recyclables and aggregates

# 12 Benefits of the Project

The project benefits of dumpsite remediation at Koothattukulam are;

- Reclamation of Land: An area of 29 cents will be reclaimed which can be used for resetting SWM facilities of ULB
- Environmental Protection: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity
- Health Improvement: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- Enhanced Water Quality: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to safe drinking water.
- Aesthetic and Social Benefits: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- Operational & Life cycle Aspects - Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through a bio-mining process.

## 13. Conclusion

- The activities of the bio-mining will be commenced from Nov 2023 to Mar 2024. An area of **29.75 cents** will be reclaimed and will be used for setting up other solid waste management facilities in future.
- Optimum land will be reclaimed and recovered through the biomining process, and this will by ensuring environmental safeguards.
- For the optimum screening of the **2073.18 m3** of legacy waste, mobile / compact screening machinery shall be used.
- Favourable site conditions for bio-mining:
  - Optimum width (3.5 m) of the road is available for movement of the vehicles.
  - Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
  - water supply via tankers is available at the dumpsite.
- The project activity requires "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, NGT orders, KSPCB norms, World Bank guidelines and KSWMP ESMF and other regulatory rules & norms Environmental & Social safeguards:
  - The project attracts E2 Environmental category based on the project activities and status of the environment baseline.
  - Site specific Environmental Assessment and Environmental Management Plan has been developed.
  - The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is Rs [redacted]

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Town ward-15, Koothattukulam, Ernakulam district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 23rd May 2023. During the site visit, it was observed that the dumpsite is situated within a walk-able distance to the bus stand of the town. There are a few houses situated around the dumpsite with a small stream next to the dumpsite. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 06th June 2023 and was completed on 08th June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

## 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along with Mr. Ajit Kumar Nayan and Mr. Ravi Kumar of IPE Global during the fourth week of May 2023, in order to collect the information regarding the site prior to mobilizing the equipment for drilling.

The location of the dumpsite is situated within a walk able distance from bus stand. There are a few houses situated around the dumpsite with a small stream next to the dumpsite.

**Figure 1** : Location of the borehole drilled at the dumpsite.

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and cleaning out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste in the landfill.

### 4.2 Drilling equipment

Mechanical rotary drilling machine was used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Extraction of Cores:**

The core samples were extracted from the core barrels in a manner to prevent disturbances to the core. All the pieces of cores were sequentially numbered from top to bottom. Arrows indicating the lower end of the piece are marked on each core. Rock classification in terms of weathering and state of fractures and strength is carried out in the following manner. Tabulations given in below explain it briefly.

**Table 1: Rock Classification**

| Terms | Description | Grade |
|---|---|---|
| Fresh | No visible sign of rock material weathering; perhaps slight discoloration on Minor discontinuity surfaces. | I |
| Slightly Weathered | Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discoloured by weathering. | II |
| Moderately Weathered | Less than half of the rock material is decomposed or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as core stones. | III |
| Highly Weathered | More than half of the rock material is decomposed or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as core stones | IV |
| Disintegrated Rock | All rock material is decomposed and / or disintegrated to soil. The original mass structure is still largely intact. | V |
| Residual Soil | All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported. | VI |

-As per IS 4464-1985 (Reaffirmed 2004)

It should be understood that all grades of weathering may not be seen in a given rock mass and that in some cases a particular grade may be present to a very small extent. Distribution of the various weathering grades of rock material in the rock mass may be related to the porosity of the rock material and the presence of open discontinuities of all types in the rock mass.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log the commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing are presented in **Appendix II**.

**Table 1: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |
|---|---|---|---|
| 1 | Soil | Grain-Size Analysis | IS: 2720(Part-4)-1985 |
| 2 | | Atterberg's Limit | IS: 2720(Part-5)-1976 |
| 3 | | MDD\OMC(Light Compaction) | IS:2720(Part-7)-1980 |

**Figure 2 :** Laboratory tests performed at MatterLab.

## 6 SUMMARY

The geotechnical investigation of the original ground below the waste at the dumpsite in Town ward-15, Koothattukulam, Ernakulam district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 7.5m (3.00 in waste and 4.0m in the ground). SPT, collection of undisturbed soil samples and collection of rock samples from cutting were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT, undisturbed soil samples and rock samples.

Based on the investigations carried out, it is observed that below the dumped waste, a 1.5m thick clay with sand layer is present, followed by a 1.5m thick layer of clay which is restin on slightly weathered light greyish biotite gneiss with an core recovery of 54% for the depth of cutting of 1.0m. The tests mentioned in the above table were performed on the samples in the laboratory following the respective codes to obtain the necessary parameters. The laboratory results on samples obtained from the site are appended in **Appendix II**.

Contour Map – Koothattukulam

Proposed Operation Plan

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the contractor to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

## 1. Introduction

Social safeguard aspects during dump site remediation mainly focusing on meaningful stakeholder engagement, understanding stakeholder's risk perception, and restoring them to a safe and environmentally sustainable state. It involves a series of systematic social actions which include social inclusion, effective labour management, prevention of gender violence during the process, successive rehabilitation of the affected people and reduction of health risk of the host community. The remediation process of Koothattukulam municipal dumpsite has been included in the World Bank supported KSWMP project. This chapter addresses the current situation of the dumpsite, potential possible social impacts due to the implementation of the project, recent fire incidents, remediation efforts, the quantity of legacy waste, the dumpsite's location within the solid waste management facility, and the complaints received from nearby communities.

## 2. Koothattukulam Municipality- Brief Profile

**Figure 2.1 Koothattukulam Municipality**

Koothattukulam is a town and Municipality situated in Muvattupuzha Taluk, towards the southeast corner of Ernakulam district in Kerala, South India. It lies at the junction of three districts Ernakulam, Kottayam, and Idukki

The following are the basic details of the ULB:

- Area -23.18 sq.km
- No. of wards: 25
- Population (2011): 17253
- Population (2022): 18208
- Population density (2011): 744
- No. of Households (2022): 5075

## 3. Profile of Dumpsite

Koothattukulam dumpsite is located at 0.65 km from the centre of Koothattukulam town in south-east side and encompasses a total area of approximately 0.40 acres of land. Out of this, 0.29 acres of land is covered with solid waste. The dumps site is not very far from human settlement. The coordinates of the dumpsite are 9°51'49.2" N & 76°35'27.3" E. It is in ward no. 15 of the municipality. Koothattukulam municipality holds the ownership of the dumpsite.

Dumping was started 30 years back approximately and stopped in 2017. Currently, the quantity of waste dumped at this site is about 2073.63 cum. As of now 60 % of the area is covered with solid waste. The legacy waste present at site is about 0.8 m above and 3 m below from the existing ground level. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues.

**Table 3.1 Dumpsite Profile**

| | |
|---|---|
| 1. Location of the sub-project | Koothattukulam |
| 2. GPS coordinate of the Site | LAT 9.863805, LONG. 76.591078 |
| 3. Name of the sub-project | Dump site remediation |
| 4. Name of ULB | Koothattukulam |
| 5. District | Ernakulam |
| 6. Taluk | Muvattupuzha |
| 7. Total population in the ULB | 17529 |
| 8. Proposed dumpsite area (in acres) | 0.40 |
| 9. Land use and other details | Land use: MSW dumpsite- currently not in use which needs to be cleared by Municipality for expanding the existing MCF for better use.<br>Adjacent Land Use: It is accessed through a 3m wide Pocket Road. A Fire station, a veterinary and a beverages outlet are within 200 meters of the dumpsite. However, it should be noted that a functioning Cattle Market is located close to the site.<br>Ownership details: Koothattukulam Municipality, Government Land<br>Ward: 15, Town ward |

## 4. Socio economic baseline of Host community

11 families are residing within 200m radius of the dump site. These families are coming under lower middle-class category. Vulnerability mapping of Host community

The following vulnerable data are collected during the transect walk conducted at site

**Table 4.1 Vulnerability Map Details of host community families**

| Sl. No | Particulars | Number |
|---|---|---|
| 1 | Number of Senior citizens residing Near dumpsite | 5 |
| 2 | Number of single women staying near the dumpsite | 3 |
| 3 | Number of persons with disabilities | 2 |
| 4 | Number of persons with severe disease | 0 |
| 5 | Number of persons with respiratory issues | 1 |
| 6 | Number of Kids below 5 years old | 8 |

## 5. Data Collection Tools

### a. Social Screening

Social screening was conducted using the social and tribal screening checklist in accordance with the requirements of the ESMF. It has been observed that the only anticipated risk is associated with labour, with no other adverse social impacts on dwellings, land, labor, livelihood, or community resources of the host and other vulnerable communities. The assessment of the social screening indicates that the remediation of the dumpsite can have a positive impact on the living conditions of the host community.

### b. Transect walk

A transect walk was conducted in and around the dumpsite on 06/06/2023. The aim of transect walk was to identify the potential social impacts of the project, issues of land availability, any adverse impacts and elicit necessary community participation in the program. A team of experts from Technical Support Consultancy, District Project Management Consultancy, and the District Project Management Unit, along with Standing Committee Chairperson, Ward Councilor, Health Supervisor of ULB, PIU, and influential persons at the locality participated in the transect walk.

The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions, and systems by observing, asking, listening, looking and producing a transect diagram. Information collected can

be used to reveal land use practices, hazards, and vulnerabilities to inform disaster mitigation and water management.

.

*Figure 5.1 Transect Walk Map*

### c. Focused Group Discussion

A preliminary discussion was conducted on 20/10/2023 in the municipal hall with the families and representatives from the nearby institutions to identify their concerns about the remediation process. The dumpsite remediation process, benefits of the remediation were discussed during the meeting and addressed all the doubts and concerns of the host community during the stakeholder meeting.

## 6. Site specific Observations from Transect walk and social screening

Major findings identified during the screening process are given below.

- There is a MCF and RRF working inside the boundary of the Dumpsite.
- 22 HKS workers were deployed in MCF and RRF for SWM activities.
- A fire station, veterinary hospital and a beverage outlet are situated within 200 meters. A Weekly cattle market is- also functioning adjacent to the site, it is sharing the same compound wall.
- Land acquisition or land loss is not applicable here for the execution of the work.
- There are no scheduled tribes, rag pickers living near to the dumpsite.
- There is no requirement for government, forest, or private land acquisition for the dumpsite remediation project. The currently designated plot has space for the transportation or mobilization of construction materials
- The access road to the dump site is having only 3m width.

## 7. Stakeholder Analysis

Social safeguard aspects during dump site remediation are mainly focusing on meaningful stakeholder engagement, understanding stakeholder's risk perception, and restoring them to a safe and environmentally sustainable state. The remediation process requires collaboration of the following stakeholders.

**Table 7.1 Stake Holders**

| Sl. No. | Stakeholders | Roles of the Stakeholders W.R.T Remediation Process |
|---|---|---|
| **Service Providers** | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like PCB, KSEB, KWA, Fire station, Police Station, Thaluk Hospital etc. | To deliver necessary approvals and provide necessary services during emergency if required during remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | KSWMP-DPMU | Monitoring and Evaluation |
| 5 | TSC/PMC | Technical support and Supervision |
| 6 | Contractor | Execution of the Remediation process |
| 7 | Rag Pickers | Participation of informal sector to strengthen the collection process to prevent further dumping |
| 8 | Scrap dealers | Informal participation in NBD waste management to prevent further dumping after remediation |
| 9 | End recyclers | Process the inert and legacy waste safely after remediation |
| **Affected Community** | | |
| 1 | 22 HKS workers working in the MCF and RRF daily on shift basis | Support and cooperation for the remediation process |
| 2 | 11 families residing in the 200 m radius of the dumpsite | Support and cooperation for the remediation process |
| 3 | Labors of contractor/Agency at site | Execution of work timely by strictly following Labour Management plan and Preventive GBV Action plan |

| | | |
|---|---|---|
| 4 | Staffs of the fire station, Veterinary hospital and the beverage outlet are situated within 200 meters | Cooperating with the remediation process |
| 5 | Staffs and Customers of weekly market place which is situated adjacent to the site and shared the same compound wall of the dumpsite. | Cooperating with the remediation process |

## 8. Positive social impacts after remediation.

### a) Enhanced quality of life

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing nearby the dumpsite, the project can contribute to an improved sense of well-being. Also it results to a clean and hygienic work environment for the workers engaged in MCF and RRF.

### b) Livelihood and employment of vulnerable community

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

### c) Economic opportunities

After remediating the site, the Municipality is planning to enhance the capacity of the MCF and RRF to process more non biodegradable waste and to set up a centralized waste management unit to process the biodegradable waste. These projects will create more job opportunities to the people who are looking for employment in waste management sector. Remediation creates new opportunities for economic development in the area. The cleaned-up land can potentially be used for new construction, commercial development, or recreational activities. Remediation process will help to increase property values for surrounding residents.

### d) Access to service

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the exiting site.

## 9. Expected Risk/Impact identified

- During the remediation process, the current activities of the dumpsite may be stopped, and it may result livelihood loss to the SWM workers.
- As a result of remediation process, the health and safety of the nearby 11 households may get negatively affected.
- GBV issues may happen due to labour influx.

## 10. Suggestions/recommendations

- Effective FGD'S should be conducted with the host community, political leaders, community influencers, ULB councilors, members of action council regarding the remediation process and the benefits of dumpsite remediation.
- Visiting similar project site with the selected members from the host community will be helpful to create a positive thinking about remediation process among the local people.
- ULB must identify a suitable land or facility to relocate of the MCF and RRF units during remediation period.
- Arrangements shall be made for proper fencing and Noise barriers to safeguards the 11 households which are located within the 200m radius of the dumpsite.
- Public access towards the dumpsite should be restricted during the execution of the project.
- Adequate health and safety measures to be provided to the contractor to his labours during the process.
- A project-level grievance redressal mechanism will be instituted to receive and facilitate the resolution of stakeholders' concerns and grievances. Awareness campaigns about the Grievance Redressal Mechanism (GRM) will be conducted through Information, Education, and Communication (IEC) activities for the community and Urban Local Body (ULB) functionaries
- Proper capacity building is essential for municipal councilors, health wing officials, SWM workers of the Urban Local Body (ULB), and other functionaries involved in the operation and management of this project.
- It is recommended to install essential information/warning boards at site.
- Ensure safe gender friendly toilet facilities at the dumpsite
- Prior information shall be given to Fire station, Police station and nearby Govt hospital about the process to get immediate service in the case of emergency.

## Scoping of Social Impact Assessment and required Action plans

All the social risks were identified through the social screening and Transect walk conducted at site. Considering the social impact assessment, certain action plans have been formulated to be followed at site

- **Labour Management Plan**

Maximum of 12 labours are expected to be engaged in remediation process at a time. A detailed labour Management plan has been formulated and to be followed at site by the contractor.

- **Labour Influx Management Plan**

Since 11 families are residing in 200 m Households there are chances of influx issues. A detailed labour Influx Management plan has been formulated and to be followed at site by the contractor. The plan is attached as Annexure.

- **Preventive GBV Action plan**

Since there is a proximity to households, it is required to prepare and follow an action plan by the contractor and labours to prevent GBV incidents. A detailed GBV action plan has been formulated and followed at site. The plan is attached as Annexure.

- **Citizen Engagement Plan**

  There will not expect much protest from the local community. Still a Citizen Engagement Plan has been prepared to avail maximum cooperation from the nearby families and employees of nearby institutions. The pan has been prepared and attached as Annexure.

As per the detailed assessment of potential social risk during the remediation process, the identification from social screening with screening checklist, transect walk and focus group discussion indicates that there will be a chance of temporary loss of livelihood of SWM workers in the existing MCF and RRF located in the same site. A detailed impact assessment shall be conducted by the TSC, and Livelihood Action Plan will be prepared accordingly.

It is identified that land acquisition is not required as sufficient land is available.

## 11. Conclusion

The Social Screening and Transect Walk helped to analyze and identify the potential social impacts on host community related to the remediation of the dump site. There will not be any adverse social impacts on any valuable community, tribes, dwellings, land and community resources of host communities. It is observed that limited space is available at site for proper vehicular movement and machinery installation related to the remediation process. So the MCF will have to be shifted to any other suitable space while executing the work. No other specific social risks are identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process at the site. Since there is not much risk with respect to the social and economic conditions of the host communities, the dumpsite can be classified into “Moderate Risk” Category.

## Annexure-1

# Citizen Engagement Plan

### 1. Stakeholder Identification

As part of social safeguard initiatives for the Bioremediation of dumpsite at Koothattukulam, the social experts of TSC, DPMC and DPMU conducted interactive meetings with local community and functionaries of Koothattukulam Municipality and PIU team. A detailed list of primary and secondary stakeholders is prepared based on these exercises.

**Waste Generators**

Since the dump site has been officially closed for the last 3 years, the waste generators in Koothattukulam Municipality do not have any stake in the programme at present. But 11 families staying close to the Dump site and the employees of the nearby institutions such as from the Veterinary Hospital, Fire Station, Beverage Outlet and the workers in the cattle market are the primary stakeholders.

**Service Providers**

For the successful completion of the bioremediation project, service of many people, agencies and departments are to be ensured by proper advocacy and networking initiatives. Following is the list of service providers identified through stakeholder analyses and their expected role/responsibility in the project.

| SL No | Stakeholder | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 1 | Municipal Council | Providing ground support and Monitoring |
| | Officials/staff members of the Municipality | Administrative supports and support for the monitoring of the process |
| 1 | Govt institutions like PCB, KSEB, KWA, and health department | To deliver necessary approvals and provide services for the remediation purpose |
| 3 | KSWMP | Monitoring and Evaluation |
| 4 | TSC/PMC | Technical support and supervision |
| 5 | Contractor | Execution of the Remediation process |
| 6 | Service providers/HKS of the Municipality | Proper collection, segregation and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the in future |
| 7 | Labors of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |

| | | |
|---|---|---|
| 8 | Waste Generator in the Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 9 | End recyclers | Process the inert and legacy waste safely after remediation |
| 10 | Media | Create an enabling environment for the successful completion of the project through positive reporting by the media. |
| 11 | Police | Ensure law and order in the area, if required |
| 12 | Fire and safety | Extend assistance in case of an emergency. |

## 2. Need of the plan

Citizen engagement as part of the proposed bioremediation of Koothattukulam dumpsite aims to facilitate two-way communication between the project and its stakeholders in order to make better informed decisions that are of value to the residents of the Municipality. Such an engagement will certainly pave the way for better implementation of the project, and it will ensure public participation in trouble shooting at all the stages of the implementation of the project.

## 3. Objective of the plan

The citizen engagement plan for the proposed dump site remediation is prepared with following objectives.

- To create a conducive environment for the smooth implementation of the proposed bioremediation of the dumpsite by promoting constructive dialogues between the project and its stakeholders.
- To ensure stakeholder participation in the planning, implementation, and monitoring of the project.
- To suggest appropriate activities with a monitoring plan and an expected budget for engaging the stakeholders with the motive of enhancing their ownership in the project through increased participation.

## 4. Stakeholder concern

### 4.1 Waste Generators

The waste generators of Koothattukulam Municipality, who were dumping the waste on the site, solely dropped it and depends on other approaches for waste management. The existing dump on the site is now the concern of the host community for the prevailing environmental and social problems facing them. The remediation work may create some discomfort to the 11 families residing near to the site. This can be managed through proper orientation and proper awareness generation.

### 4.2 Service Providers

Major concerns of the service providers which has to be addressed by the citizen's engagement plan can be summarized as follows.

- The policy makers and decision leaders of the Municipality are not aware about the urgency and importance of remediating the dumpsite. Hence there is an apathy observed among the councilors and officials to the project. Their improved involvement through proper sensitization is essential to the effective implementation.

- SWM related Service providers/HKS of the should be trained and motivated for proper timely collection, segregation and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the future.

## 5. Community/citizen Awareness

- Orientation meeting and focused group discussions with host community
- Organize exposure visit to any of the site where the remediation process completed successfully. Members from the primary stakeholders and ULB council may be participated in the exposure visit.
- Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency.

## 6. Awareness to Service providers

- Sensitization on the bio-remediation activity is to be conducted for the Municipal Council and officials prior to the commencement of the actual bio-remediation process.
- Meeting with Contractor to understand their plan of operations/ labors involvement/timeline etc.
- Orientation to the Service providers/HKS of the Municipality
- Sensitize the local and district level police officials on the proposed bio remediation in the dumpsite and anticipated issues and action required.

## 7. Citizen Engagement Plan Matrix

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Awareness on Project activities | | | |
| 2 | To facilitate timely support from the ULB and avoid delays in decision making. | To establish transparency and building confidence in the project commitments to ULB elected members and officials. | Sensitization on the bio-remediation activity is to be conducted for the Municipal Council and officials prior to the commencement of the actual bio-remediation process. | Contractor/TSC |

| | | | | |
|---|---|---|---|---|
| 3 | To create awareness to the 11 families of host community) about the proposed bio remediation activities and safeguard measures to be adopted | To establish transparency and build confidence in the project commitments to the host community. | Sensitization meeting to host community | Contractor/TSC |
| 4 | To facilitate and establish problem solving mechanism at dumpsite site level | To facilitate host community participation in the Bio remediation activity and establish a mechanism to solve the issues raised at the site level at the earliest and avoid any delay and interruptions. | Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency. | Contractor/TSC |
| 5 | Understand the actual operational plans ( Time of operations, Machineries involved , No of workers and labour details, action to be taken for dust, odour and sound pollution, Vehicle movements etc. for mitigation measures to be planned. | To inform actual plan of operations to the host community and prevent any social and environmental issues and plan mitigation measures | Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc. | Contractor/TSC |
| 6 | Confidence building measures in the host community to create community participation and generate positive attitudes for bio mining activities. | To avoid delays and completion of remediation activity as planned | Organize exposure visit for the host community and ULB council members | Contractor/TSC |

| | | | | |
|---|---|---|---|---|
| 7 | To facilitate proper collection, segregation and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the in future | To safeguard the environment, promote a healthy society, and implement measures for climate-resilient activities. | Orientation to the Service providers/HKS Municipality | Contractor/TSC |
| 8 | To secure support from the line department and prevent delays in decision-making. | To avoid delays and completion of remediation activity as planned | Issue based one to one meeting with Govt institutions like PCB,KSEB,KWA, Health Department | Contractor/TSC |
| 9 | To garner public support and ensure the smooth implementation of bioremediation activities | To raise awareness about the positive impact within the community and dispel any doubts regarding the remediation process. | Orientation to the Media persons on the proposed remediation in the dumpsite. | Contractor/TSC |
| 10 | To ensure peaceful and smooth bio remediation activity and prevent any law and enforcement issue | To prevent unrest and social issues | Sensitize the local and district level police officials on the proposed bio remediation and anticipated issues and action required | Contractor/TSC |
| 11 | Making aware of labours of the contractor about the Laboour management Plan and GBV action plan to be followed at the site | To prevent violations in the action plans | Interactive session with Labours | Contractor/TSC |

**8. Budget**

| S. No | Activity | Specification | Quantity | Cost |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activity is to be conducted for the Municipal Council and officials prior to the commencement of the actual bio-remediation process | Half day Programme for the Councilors and Health Staff | 1 | [redacted] |
| 2 | Sensitization meeting to host community | Half day Program at site | 2 | [redacted] |
| 3 | Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency. | Committee formation | 1 | [redacted] |
| 4 | Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc. | One to one interaction | As required | [redacted] |
| 5 | Organize exposure to the members representing the host community families, employees of nearby institutions and council members | Exposure visit to Alappuzha Sajivothapuram site | 15 participants-1programme | [redacted] |
| 6 | Orientation to the Service providers/HKS of Municipality | Half day programme | 2 | [redacted] |
| 7 | Issue based one to one meeting with Govt institutions like PCB,KSEB,KWA, Health Department | One to one | As required | [redacted] |
| 8 | Orientation to the Media persons on the proposed remediation work | Half day programme | 1 | [redacted] |
| 9 | Sensitize the local and district level police officials on the proposed bio remediation and anticipated issues and action required | One to one interaction | As required | [redacted] |
| 10 | Orientation to Labours deputed by the contractor about the LMP and GBV Action plans | Half day program | 1 | [redacted] |
| | | | **Total** | **Rs.** [redacted] |

**Annexure-2**

# Preventive GBV Action Plan

## 1. Sub project information

Bio Remediation of existing dumpsite in ward -15 of Koothattukulam Municipality

### 1.1 Details of labors

The project is under pre planning stage. ULB has to finalize contactor/Agency for Remediation. So the exact number of Labors are not available. But approximately we can expect maximum of 12 labors

| | |
|---|---|
| Total number of labors | : 12 (Approx.) |
| Category of labors (Age/sex/gender) | : Not available |
| Data of migrant labors, if any | : Not available |

## 2. GBV Issues likely to be identified at site

1. Issues against female workers at site
2. Lack of safe and Gender friendly toilets at work sites
3. Disparity in work and wages based on gender
4. Threat of GBV or Sexual Exploitation Abuse (SEA) incidents to female members of the host community

## 3. Activities under GBV Action plan

1. **Formation of Internal Complaints Committee**
   The committee should be Presided by a senior women and more than half of the total Committee members should be women. There should be an external member who has experience in dealing with issues related to women. Preferably a Social Worker /Advocate/NGO Representative.

**Placing of ICC informatory board at Work site**

| Insert Logos of KSWMP,WB,AIIB | | | |
|---|---|---|---|
| **Project Name (KERALA SOLID WASTE MANAGEMENT PROJECT)** | | | |
| **Sub Project Name:** | | | |
| **Internal Complaints Committee** | | | |
| Sl.No | Name | Designation | Contact Number |
| | | | |
| | | | |
| | | | |
| **EMERGENCY CONTACT NUMBER** | | | |

**2.Gender Sensitization trainings for Labors**

The Project expect around 12 labours will be employed in a day and women participation in the labor force is limited, even the project is taking precaution to protect and prevent any GBV incidence at the site. Taking into consideration all these aspects, the project plan to conduct a half day sensitization program in the following subjects, viz. the type of GBV, the action to be taken by the victim, the laws and the support organizations which extend support to the victim of GVB and the role of ICC and their contact details etc.

**3. Sensitization for female host community members**

The citizen engagement plan has proposed an activity of host community meeting in which the importance and expected social risk of GBV will be discussed and the mitigation measures inbuilt in the project will be elaborated to the host community members especially to the women.

**4. Allocation of Gender friendly and safe toilet facilities for women**

Project has taken special care to arrange a separate toilet, wash and rest facility for female workers to protect their privacy and safety, and the same has to be arranged by the contractor.

**5. Keeping of wage register at site to restrict wage disparity based on gender**

The project actively opposes gender-based wage disparity at any site funded under the KSWMP-supported SWM project. To ensure gender parity in various aspects such as wages, division of labor, and facilities, an appropriate monitoring mechanism, such as a wage register, should be maintained for the scrutiny of the project implementers.

**6. Details of GBV Service Providers identified**

The government of Kerala has constituted a help desk under Kudumbashree to support or to prevent and extend support to the GBV victims, and their details are given below.

Kudumbashree Snehitha Gender Help Desk
Contact Number – 0484-2428745
Toll free number - 180042555678

**Preventive GBV Implementation plan Matrix**

| Sl No | Activity | Timeline | Primary Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Formation of Internal complaint committee | Pre-Construction Phase. | Contractor/ULB | TSC |
| 2 | Placing of ICC informatory Board at worksite | Pre-Construction Phase. | Contractor | TSC |
| 3 | Gender sensitization Training to labors | During Construction | Contractor/TSC | DPMU |
| 4 | Group Discussion with female host community members | Pre-Construction Phase. | Contractor/TSC | DPMU |
| 5 | Ensuring Gender friendly and safe toilet facilities | Construction stage | Contractor | TSC |
| 6 | Keeping Wage Register at site | Construction stage | Contractor | TSC |

**Budget**

| Sl No | Particulars | Cost |
|---|---|---|
| 1 | Placing of ICC informatory board at site | [redacted] |
| 2 | Gender sensitization trainings to labor | [redacted] |
| 3 | FGD among female host community members | [redacted] |
| | **Total Cost** | [redacted] |

**Monitoring plan**

| Activity | Monitoring Indicators | Means of Monitoring | Reporting Period | Responsibility |
|---|---|---|---|---|
| Formation of Internal complaint committee | Minutes of Meeting/Bye Law of Committee/Reports | Verification of Minutes of Meeting and Reports | 15 days after commencement of work | DPMU |
| Placing of ICC informatory Board at worksite | Photos of Board placed | Physical verification | 15 days after the commencement of work | DPMU |
| Gender sensitization Training to labors | Attendance and Photographs | Verification of Documents | 5 days after the commencement of work | DPMU |
| FGD among Female host community members | Attendance and Photographs | Verification of Documents | 5 days after the commencement of work | DPMU |
| Ensuring Gender Friendly and safe toilet Facilities | Gender friendly signage's, Condition of latches, Floor Condition, Status of Flush | Physical verification | Before Commencement of work | DPMU |
| Keeping Wage Register at site | Photographs | Verification of Register | 5 days after the commencement of work | DPMU |

**Annexure-3**

# Labour Management Plan

## 1. INTRODUCTION

1.1 PROJECT TITLE:

Project for the remediation of dumpsite at ward 15 owned by Koothattukulam Municipality

1.3 PROJECT AREA

The Dumpsite of Koothattukulam Municipality is situated in ward 15 of the municipality, covering an area of .29 acres.

## 2. SCOPE AND STRUCTURE OF THE LABOUR MANAGEMENT PLAN

The scope of the LMP shall be as outlined in the World Bank's ESMF. The engagement will be planned as an integral part of the project's social assessment and project design and implementation. This document has 10 chapters. This chapter viz., chapter 1 served as introduction. Scope and structure of LMP is provided in chapter 2. An overview of labour use in the project is presented in chapter 3. Key potential labour risks are listed in chapter 4. Legislative framework governing labour employment in India/Kerala is discussed in chapter 5. Implementation Arrangements, policies and procedures follow in the subsequent chapter. Grievance redressal mechanism, contractor management are presented in the last chapters.

## 3. OVERVIEW OF LABOUR USE ON THE PROJECT

3.1 Details of Labours

The proposed remediation process requires following category and number labors

| Sl.No | Equipment | Category of labors | Required No.of labors |
|---|---|---|---|
| 1 | One trommel | Labours for waste segregated purpose | 5 |
| 2 | One excavator | Operator | 1 |
| 3 | One JCB | Operator | 1 |
| 4 | Two small tippers | drivers | 2 |
| | | Helpers | 2 |
| 5 | | Supervisor | 1 |

| | |
|---|---|
| **Total Labours** | 12 |

## 4. ASSESSMENT OF KEY POTENTIAL LABOUR RISKS

4.1 Project Activities:

The bioremediation of the dumpsite includes the following activities;

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement
- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

4.2 Key Labour Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.
- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female SWM workers are engaged.

- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form workers organizations, etc.
- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

## 5. BRIEF OVERVIEW OF LABOUR LEGISLATION: TERMS AND CONDITIONS

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |

| | | |
|---|---|---|
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10. | Industrial Disputes Act 1947: | the Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

## 6. RESPONSIBILITY MAPPING

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring labourers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing labourers, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with disabilities, migrant

workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the labourers. The ULB will actively monitor the contractor's compliance with legal and welfare requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

## 8. CODE OF CONDUCT

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured;

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favors or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)
- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favors, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code

- No retaliation against workers who report violations of the Code, if that report is made in good faith.

## 9. SYSTEMATIZING THE CODE OF CONDUCT

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

## 10. TRANSPARENCY IN CONTRACT SPECIFIC TERMS AND CONDITIONS

All contracts must contain

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism

## LABOUR MANAGEMENT PLAN MATRIX

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on.<br><br>To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board<br><br>One notice board | As soon as the work is started.<br><br>Do | Photographs of the notice board where the license is displayed.<br><br>do | Contractor |

| | | | | |
|---|---|---|---|---|
| To conduct pre- employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the construction period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |

| | | | | |
|---|---|---|---|---|
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. Female members should be minimum 50%. ) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act<br>2. The Employee Compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act<br>5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity Benefit Act | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |

| | | | | |
|---|---|---|---|---|
| Conduct HIV/AIDS awareness programs | As per requirement | Once in six months | Reports, photographs etc | Contractor |
| All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of licence ids to be collected | PIU |
| All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only after procurement of third-party insurance to the vehicle | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

## SUMMARY

### Introduction

The Koothuparamba municipality has an area of 16.76 Sq.km with 28 wards. The Solid waste generated from Koothuparamba ULB is 13.26 TPD. In Koothuparamba ULB there is an existing dumpsite at Ward 5 Palaparamba. Koothuparamba ULB did not possess a designated landfill site as mandated by the Solid Waste Management Rules of 2016. Consequently, unsegregated waste was disposed of in an unscientific manner. In order to promote a healthy and sustainable environment, it is imperative to undertake the remediation of the dumpsite.

### Subproject Description

The Biomining and Bioremediation at the Koothuparamba ULB dumpsite is proposed as part of the Kerala Solid Waste Management Project (KSWMP) with support from the World Bank and the Asian Infrastructure Investment Bank. The dumpsite situated in Ward 5 Palaparamba, covers a total area of 0.98 acres and contains a legacy waste quantity of 12,625.27 tons. The waste at the site is approximately 50 years old, with dumping activities started in 1973 and. Initially, the dumpsite served as a trenching ground for the disposal of sewage from pit latrines. The total volume of waste accumulated is approximately 15,102 cubic meters, and the dumpsite spans across an area of 0.98 acres.

- Status of Subproject Development at the time of EIA

The access road to the dumpsite is facilitated by a 5-meter-wide approach road in good condition, located in Palaparamba stretch. But premises internal roads are not in good condition. And within the premises, there is a operational MCF, RRF and organic waste composter units (windrow composting unit and vermin-composting unit).

- Technical Aspects

Following a comprehensive evaluation, the method or technique of Bio-mining with a goal of achieving 100% land reclamation and recovery is found to be the most suitable rem ediation approach, ensuring long-term sustainability and environmentally responsible treatment of legacy waste, leading to the complete remediation of the dumpsite. Based on the Feasibility

and site conditions, Mobile trommel machinery would be the most suitable option for for such a small site at Palaparamba. Koothuparamba. The optimal time frame for conducting the Biomining Process would be from December to April Months, a period characterized by lower rainfall levels as per climate data.

**Application of Regulatory and Guidance Framework**

In accordance with the SWM Rules of 2016, the selection of an appropriate method or technique for remediating a dumpsite should be determined through a feasibility study that considertechnical, financial and Environmental aspects complying with regulatory requirements (KSPCB/NGT). The formulation of the subproject adhered to the State/National and World Bank safeguards policies, both in its planning phase and will continue to do so during the implementation and monitoring stages. This commitment to compliance will be upheld by the ULB during the Project period.

**Baseline Environmental Scenario**

A detailed environmental baseline study was conducted for analyzing quality of air, groundwater, surface water, noise levels, and leachate characteristics. The preliminary Environmental Screening [Annexure -1] and the detailed assessment showed that this sub project falls under “E2” category. (Please note that suggestive environmental categorization of dumpsite biomining / bioremediation as per EMF for KSWMP is E1. However, considering the very small extent of the dumpsite, absence of any sensitive environmental feature in or around the site, short biomining period, and the overall positive impacts of the proposed development post mitigation measures; this is categorized as E2. At this stage, locations for disposal of biomined wastes is unknown, the subproject would be recategorized if the locations are near any sensitive areas. In case the biomining is clubbed with other multiple sites also, the overall categorization would be reconsidered)

An analysis has been conducted at the site to review and comprehend the physiography, climate, soil, cultural heritage, ecology, and biodiversity of the dumpsite. This assessment aims to identify potential impacts on the environment, human health, and biodiversity.

Additionally, a traffic assessment has been performed to analyze traffic patterns and movements during the project's implementation phase.

**Terrestrial Ecology:**

The site is situated outside of a forested region. The nearest Forests/Protected Areas, known as Kannavam Range Forest, are located approximately 12.4 kilometers away. Various indigenous flora and fauna species commonly inhabit the vicinity of the site.

*Dalbergia sissoo (sonokeling (Indian Rosewood)), Cinnamomum cassia (cassia) Pycnonotus cafer (*Red-vented Bulbul), *Acridotheres tristis (*common myna*), Ictinaetus malaiensis (*Black Eagle), *Eutropis carinata (*Brahminy Skink), *Funambulus tristriatus* (Jungle palm squirrel), *Artocarpus heterophyllus (Tree), Cyathula prostrate (Herb), Aporosa cardiosperma (Shrub). Ailanthus sp. (*Tree), and *Areca catechu (Tree),*

The species listed were not classified as Critically Endangered by IUCN. (International Union for Conservation of Nature)

**Air Quality:**

Air monitoring was conducted continuously for a 24-hour duration at all sites, and the obtained results were meticulously analyzed against the National Ambient Air Quality Standards of 2009. It is noteworthy that all measured pollutants' concentrations were found to be well within the permissible limits. Furthermore, no presence of hazardous or toxic gases was detected during the monitoring process.

**Water Quality:**

The monitoring of water quality was carried out at 3 locations for Ground water & 1 Location for Surface Water.

Groundwater samples were collected from three distinct locations, each within a radius of 200 meters from residences. The analysis of these samples revealed that all parameters examined fall within acceptable limits, with the exception of pH levels.

Surface water assessment indicates that the Anjarakandy River is located approximately 3.5 kilometers from the site. There is no connectivity for the leachate pathway to reach the river. Surface water sample had been taken nearby pond which is not connected with river.

**Noise Level:**

Sample for noise level monitoring were collected within the dumpsite to assess the current ambient noise levels. The results indicate that the noise levels observed are comfortably within the permissible limits. However, it shall be noted that there is no activity currently on site. And noise levels are expected to increase with biomining activity.

**Assessment of Risks/Impacts and Proposed Mitigation measures and Monitoring**

The anticipated impacts of the interventions proposed have been analyzed in detail and mitigation measures proposed. The Environmental Impact Assessment (EIA) and Social Impact Assessment (SIA) documents, which assess the potential environmental and social impacts of the proposed project, serve to identify potential risks, formulate mitigation measures and ensure compliance with environmental and social standards regulations. This dumpsite remediation project comprises an overview of the current environmental conditions within the project area. Furthermore, the report delineates the environmental baseline data, Disaster Management Plan, identification of sensitive receptors and a Fire Risk Assessment. Key environmental risks include leachate and storm water from the site impacting the nearby areas, odour (including gas), visual blight, flies & pests, storage and disposal of retrieved materials, fire, accidents & other disasters, and health and safety of workers. Possible future dumping of wastes after biomining is also a concern. Mitigation and management measures for these in line with mitigation hierarchy are included in the EMP.

Proposed mitigation measures are designed to address environmental and social impacts effectively, with the goal of minimizing negative consequences while maximizing positive outcomes. Additionally, this report encompasses an Environmental Management Plan (EMP) and a Social Management Plan (SMP), providing detailed strategies for the management of the project's environmental and social facets.

In addition, a detailed Environment Monitoring Plan and Social Monitoring Plan will outline the monitoring procedures to assess the efficiency of mitigation measures and guarantee adherence to environmental and social standards. To ensure seamless and timely execution, the dumpsite remediation subproject report also includes an Environmental and Social Budget. This ensures a sustainable and responsible bio-mining process that prioritizes the protection of the environment and the well-being of nearby communities throughout the waste remediation process.

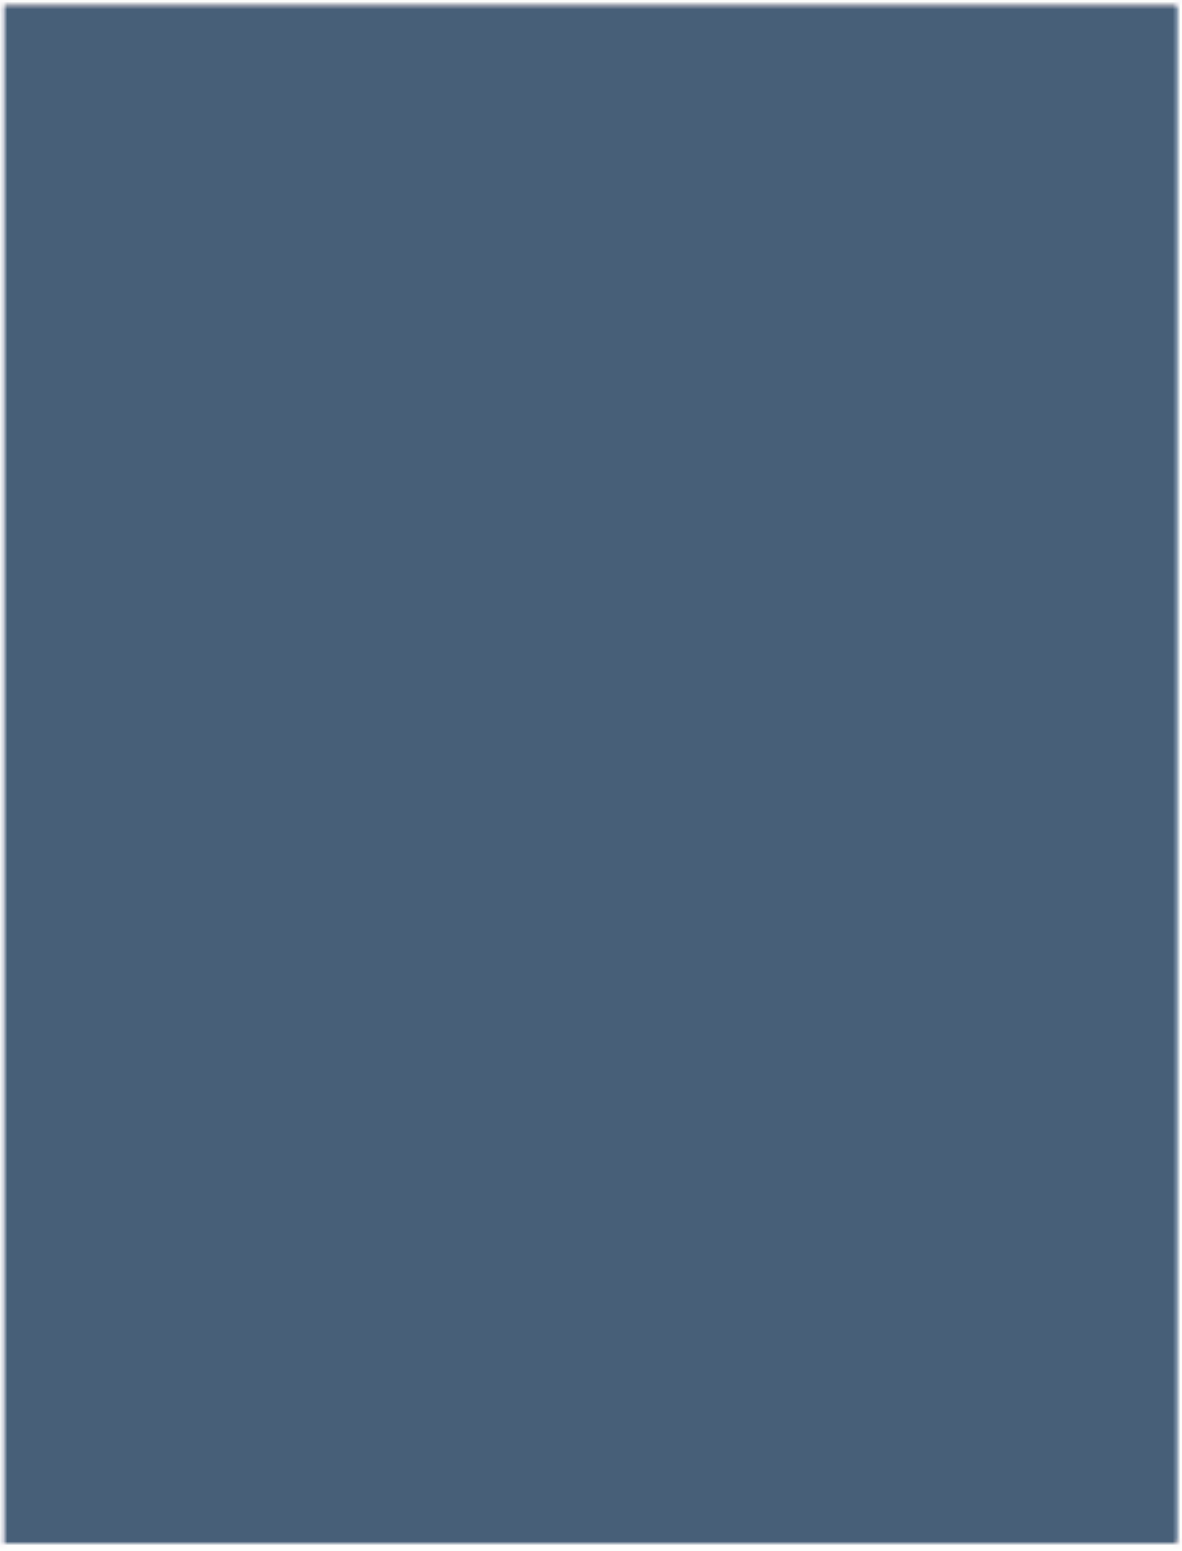
**Implementation Mechanism & Budget**

The Bio-mining project, with the objective of achieving 100% land recovery, will be carried out exclusively through an outsourcing model. The biomining process will be conducted separately at each site. The bio-earth and coarse fraction segregated during the time of remediation are proposed to be used for filling low lying areas or can be used for agricultural land, after ensuring the desirable quality. If the land is found to be contaminated, proper remedial measures will be followed before utilizing for future facilities. The recyclables will be handed over to the authorized recyclers and the RDF is proposed to be handed over to the cement factories/boilers. The land will be restored to its pre-waste dumping condition, necessitating the complete removal of all legacy waste until it reaches the original land surface. Following the completion of the bio-mining process, the machinery and vehicles belonging to the implementing agency must be vacated within 7 days. The reclaimed land, free of any encumbrances, will then be transferred to the Urban Local Body (ULB).

The total budget proposed for environmental and social budget is [redacted]/- and including the social budget of [redacted]/-.

**Consultation & Disclosure**

A transect walk was also carried out to assess the social and-environmental characteristics in the vicinity of the dumpsite. To understand the social dynamics, demographic profile, livelihood patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community, a transect walk was carried out on 03.06.2023,



(Attendees – 12 nos) which was crucial for developing effective dumpsite remediation strategies that align with their priorities. The findings and recommendation of the transect walk is shown in the following table.

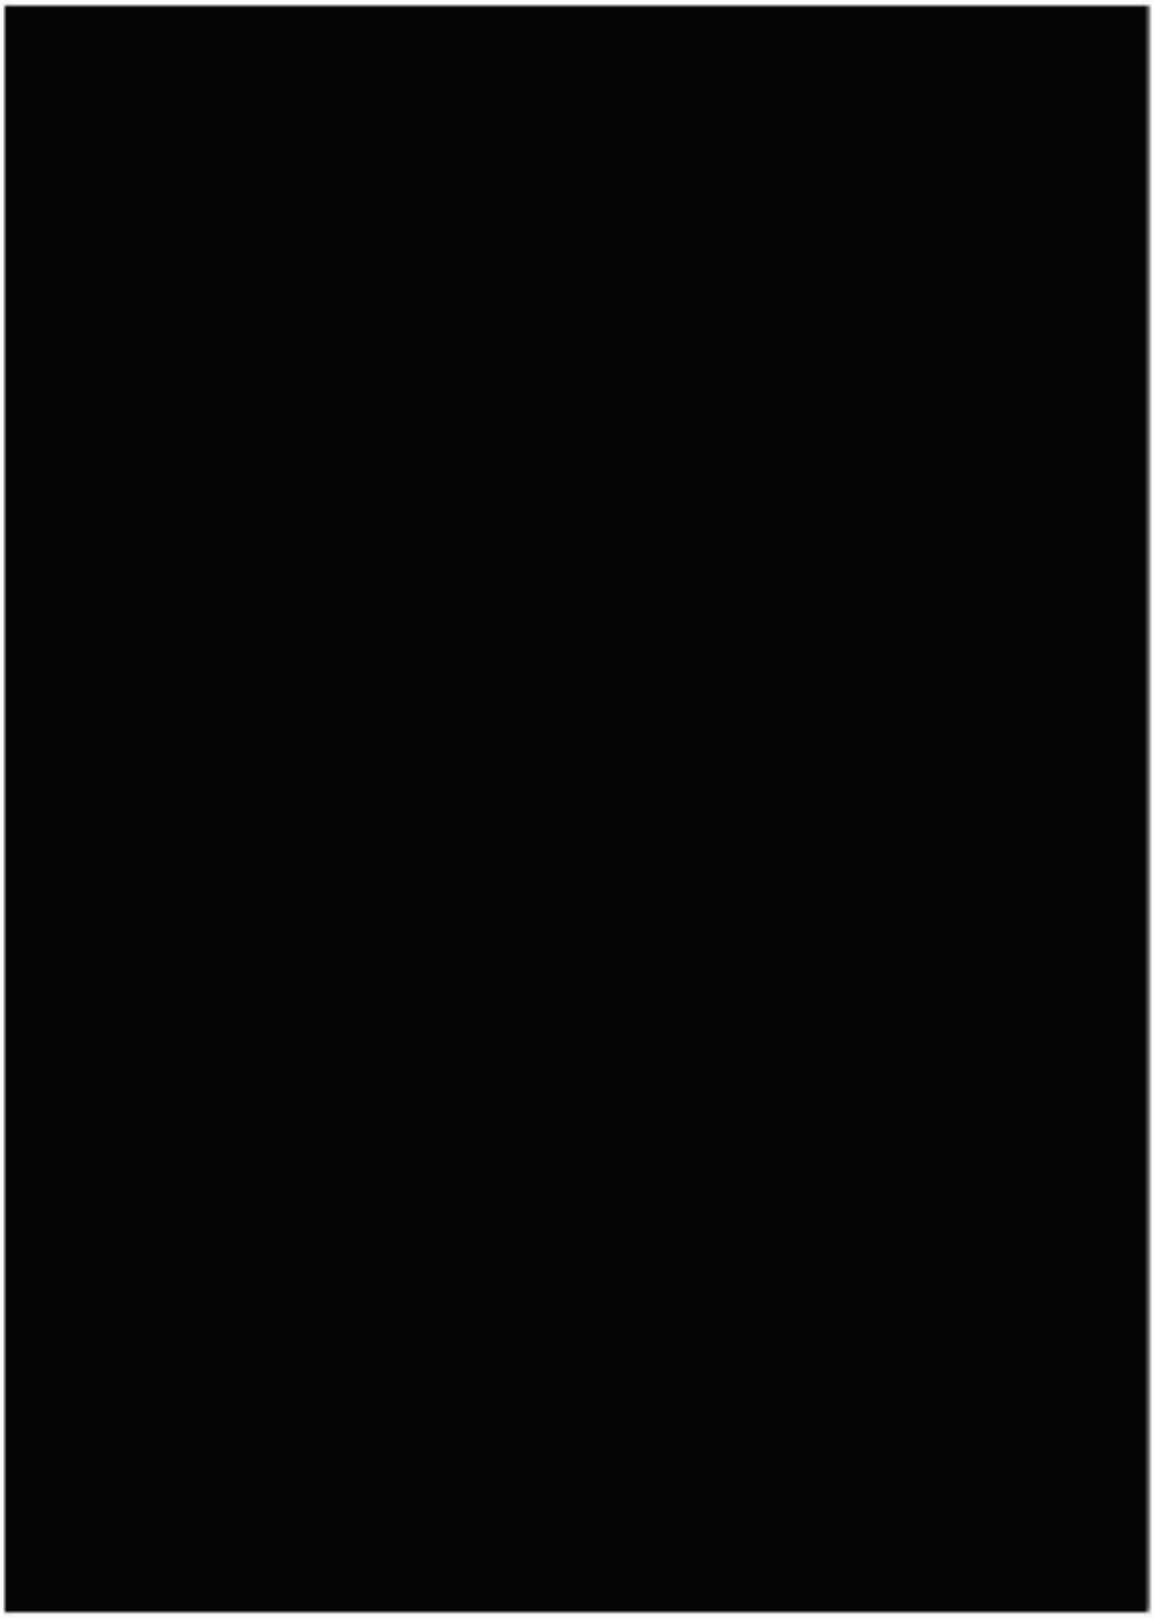


*Table 1 Findings and recommendation of the transect walk*

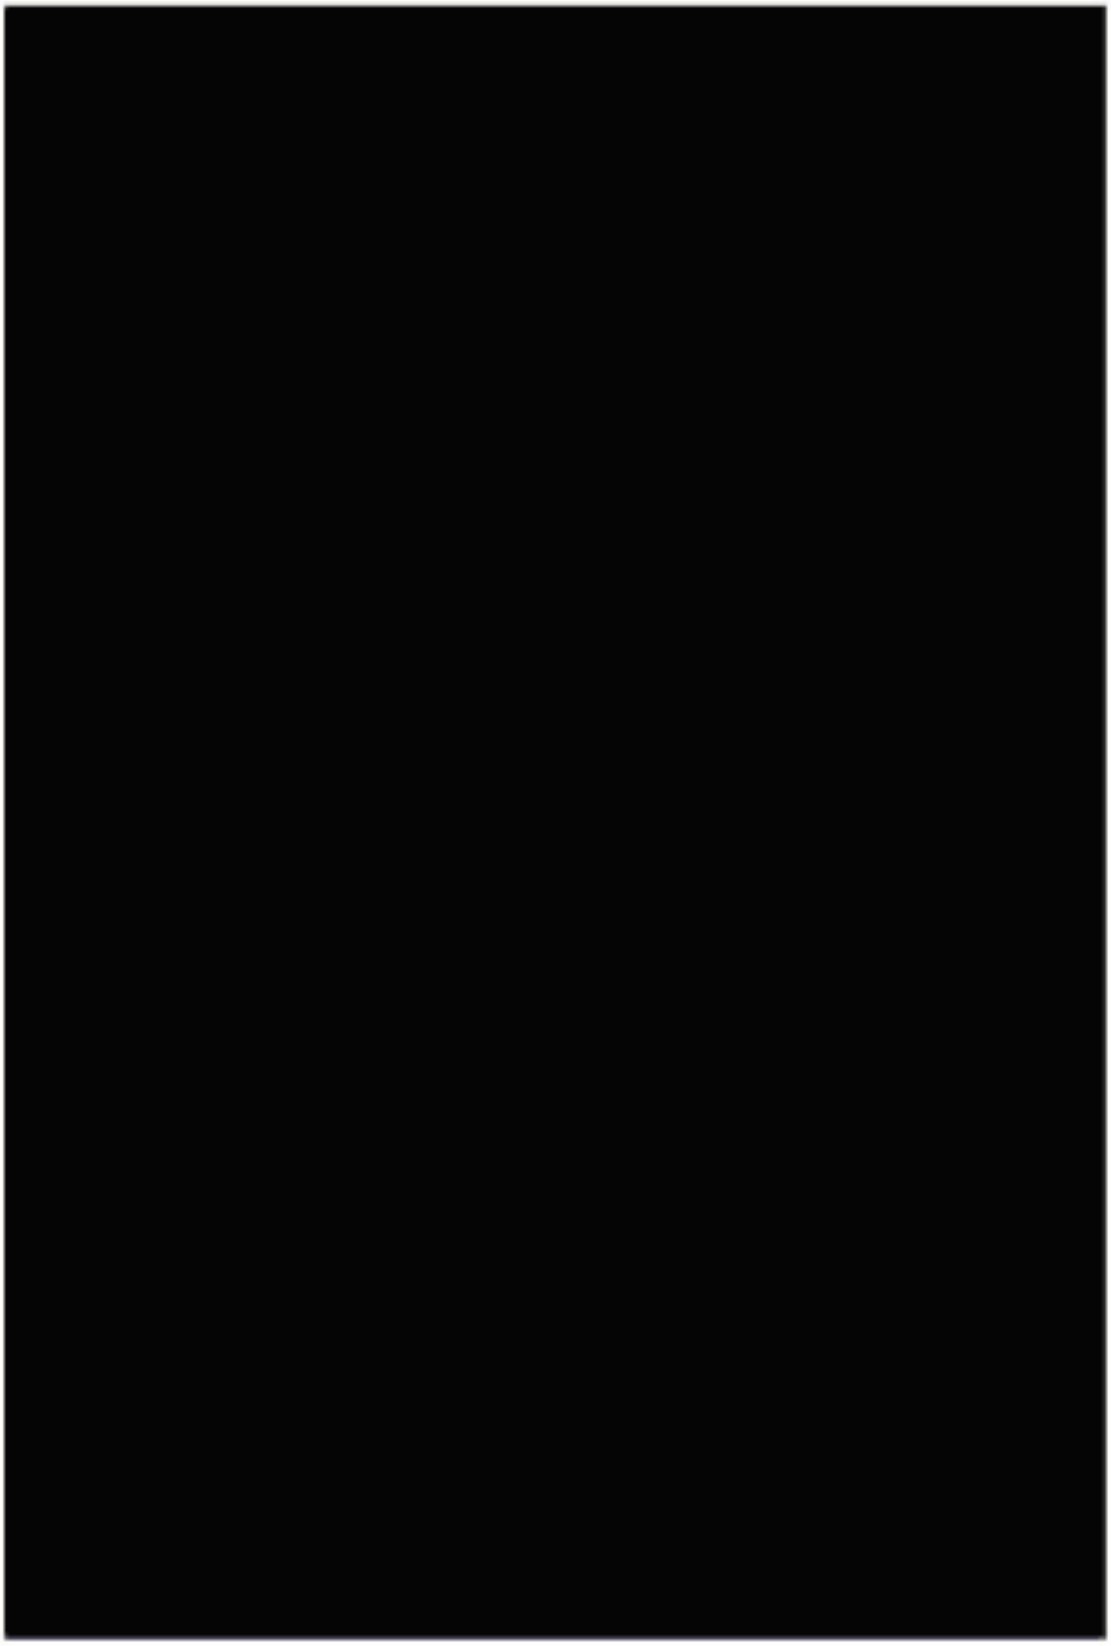
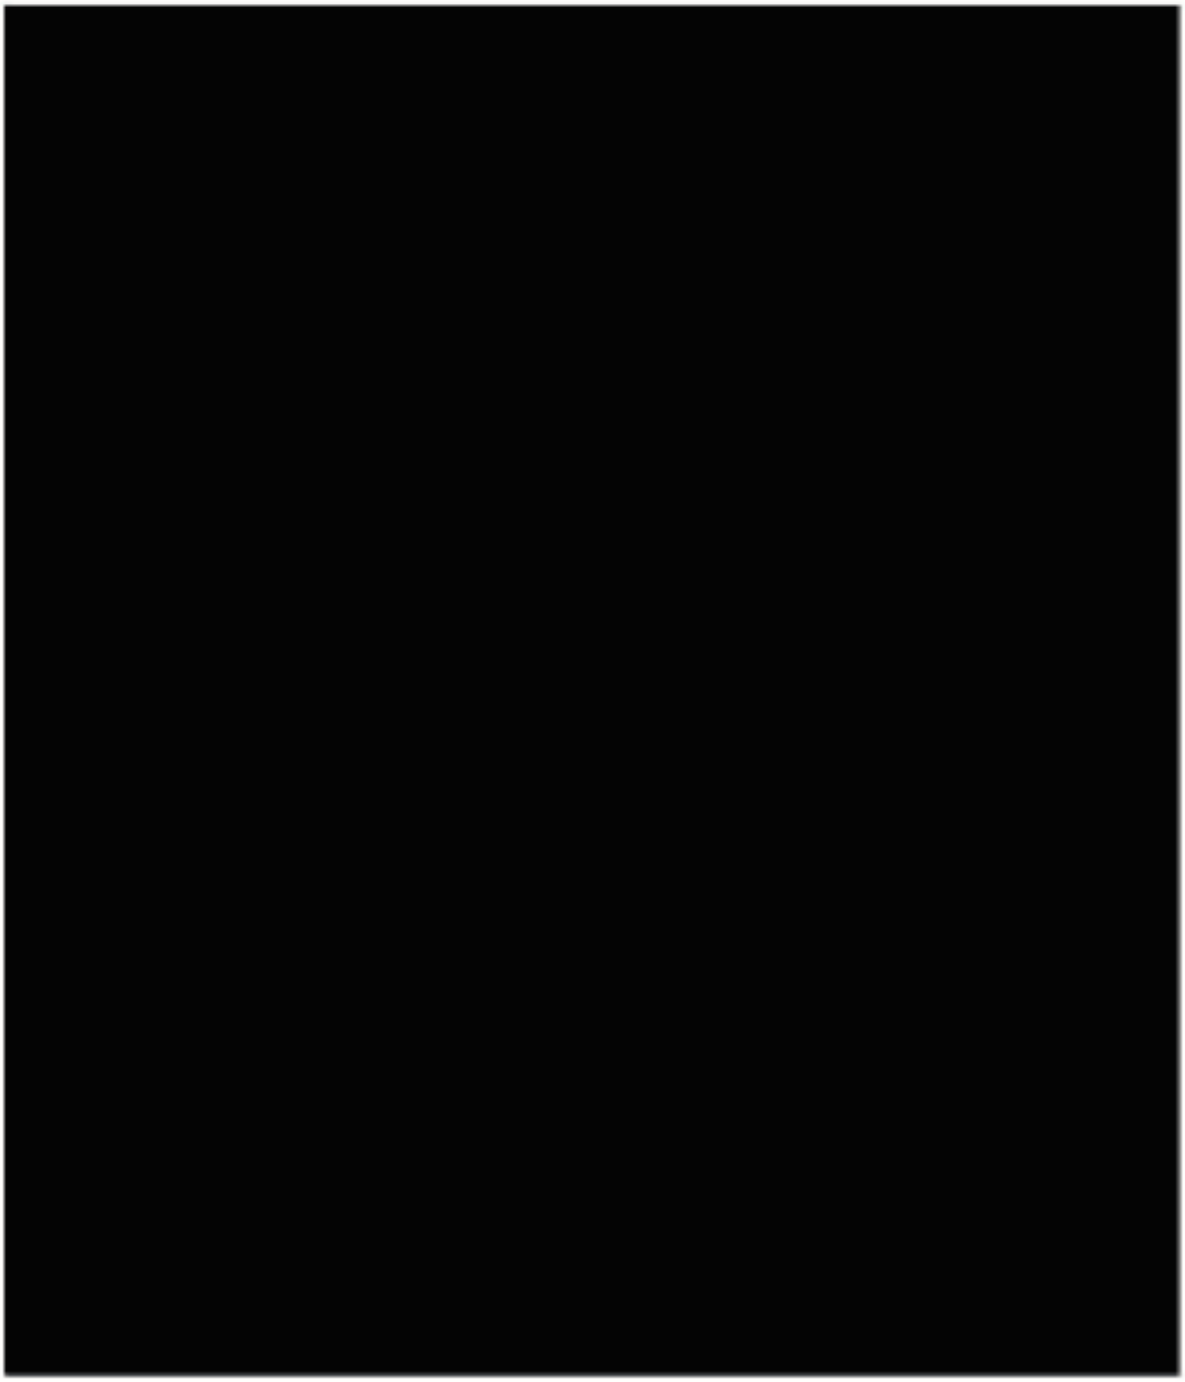


| S.No | Social risks | Findings and Recommendations |
|---|---|---|
| 1 | Presence of 20households and one other public utilities near (200m) the dumpsite. | a. Free movement of the residents needs to be ensured<br>b. Working hours of public utilities including shops and establishments may be restricted, that should not affect the livelihoods of the workers attached to these facilities |
| 2 | Sound pollution, health issues and foul smell most affects 20 families residing very close to the site (200m). | GRM cell under the ULB needs to be made operational. Stress management including counseling services to be ensured |
| 3 | Health risk of vulnerable groups residing near to the site which includes patients with breathing issues, pregnant women, PWDs, cancer patients, children below the age of two and elderly above the age of seventy-five. | Health issues may aggregate duringwork operations.<br>These factors should be considered strongly especially for all vulnerable groups |



***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

## Summary [Malayalam]

# 1. INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake biomining of multiple Legacy Waste Dumpsites in various districts. As per the Feasibility Study and methodology statement for implementing the subproject, proposed dumpsites for biomining are grouped into a single cluster. It is expected that one single contractor bids for one Cluster. However, bidding modality is yet to be finalized- whether as a single or multiple.

## 1.2 The rationale for the Proposed Sub-Project

Palaparamba dumpsite in Koothuparamba ULB at ward no.5 has a total waste quantity of 15,102 Tons, spreading over 0.98 acres. The site is located between Lat- 11°50'10.6"N and Long - 75°34'19.2"E and has an elevation of MSL +38 (m). During the monsoon season, the positioning of the dumpsite causes legacy waste to flow downhill affecting nearby residential areas. Koothuparamba ULB proposes biomining and bioremediation of the Palaparamba legacy waste dumpsite site under KSWMP supported by the World Bank and Feasibility Report has been prepared for this subproject. Considering the environmental and social impacts associated with legacy dumpsite biomining and bioremediation, it is proposed to

undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

### 1.3 Objectives and scope of Environmental& Social Impact Assessment (ESIA)

***Environmental Categorisation and Assessment:***

As per indicative categorization for dumpsite biomining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (4.87 acres) and waste spread (0.98 acres) and absence of environmentally sensitive features around, this sub-project is individually considered as E2, and EIA is prepared accordingly. Required monitoring and analysis will be carried out considering the possible impacts.

***Social Impact Assessment:***

Under this category social impact assessment is also a key factor to be considered. Accordingly, detailed assessment of the environmental and social impacts was carried out.

### 1.4 Proposed sub project details

*Table 2 Proposed Sub Project Details*

| Description | Details |
|---|---|
| Name of ULB | Koothuparamba |
| District | Kannur |
| Taluk | Thalassery |
| Total present population in the ULB | 34,501 |
| Name of the sub-project | Dumpsite Remediation at Palaparamba |
| Location of the sub-project | Koothuparamba ULB, Ward 5, Palaparamba |
| Total dumpsite area (in acres) | 4.89 |
| Total waste accumulated area (in acres) | 0.98 |
| GPS Co-ordinate of the Site | Latitude:11°50'10.6"N<br>Longitude:75°34'19.2"E |
| Legacy waste quantity | 15,102 cu.m |

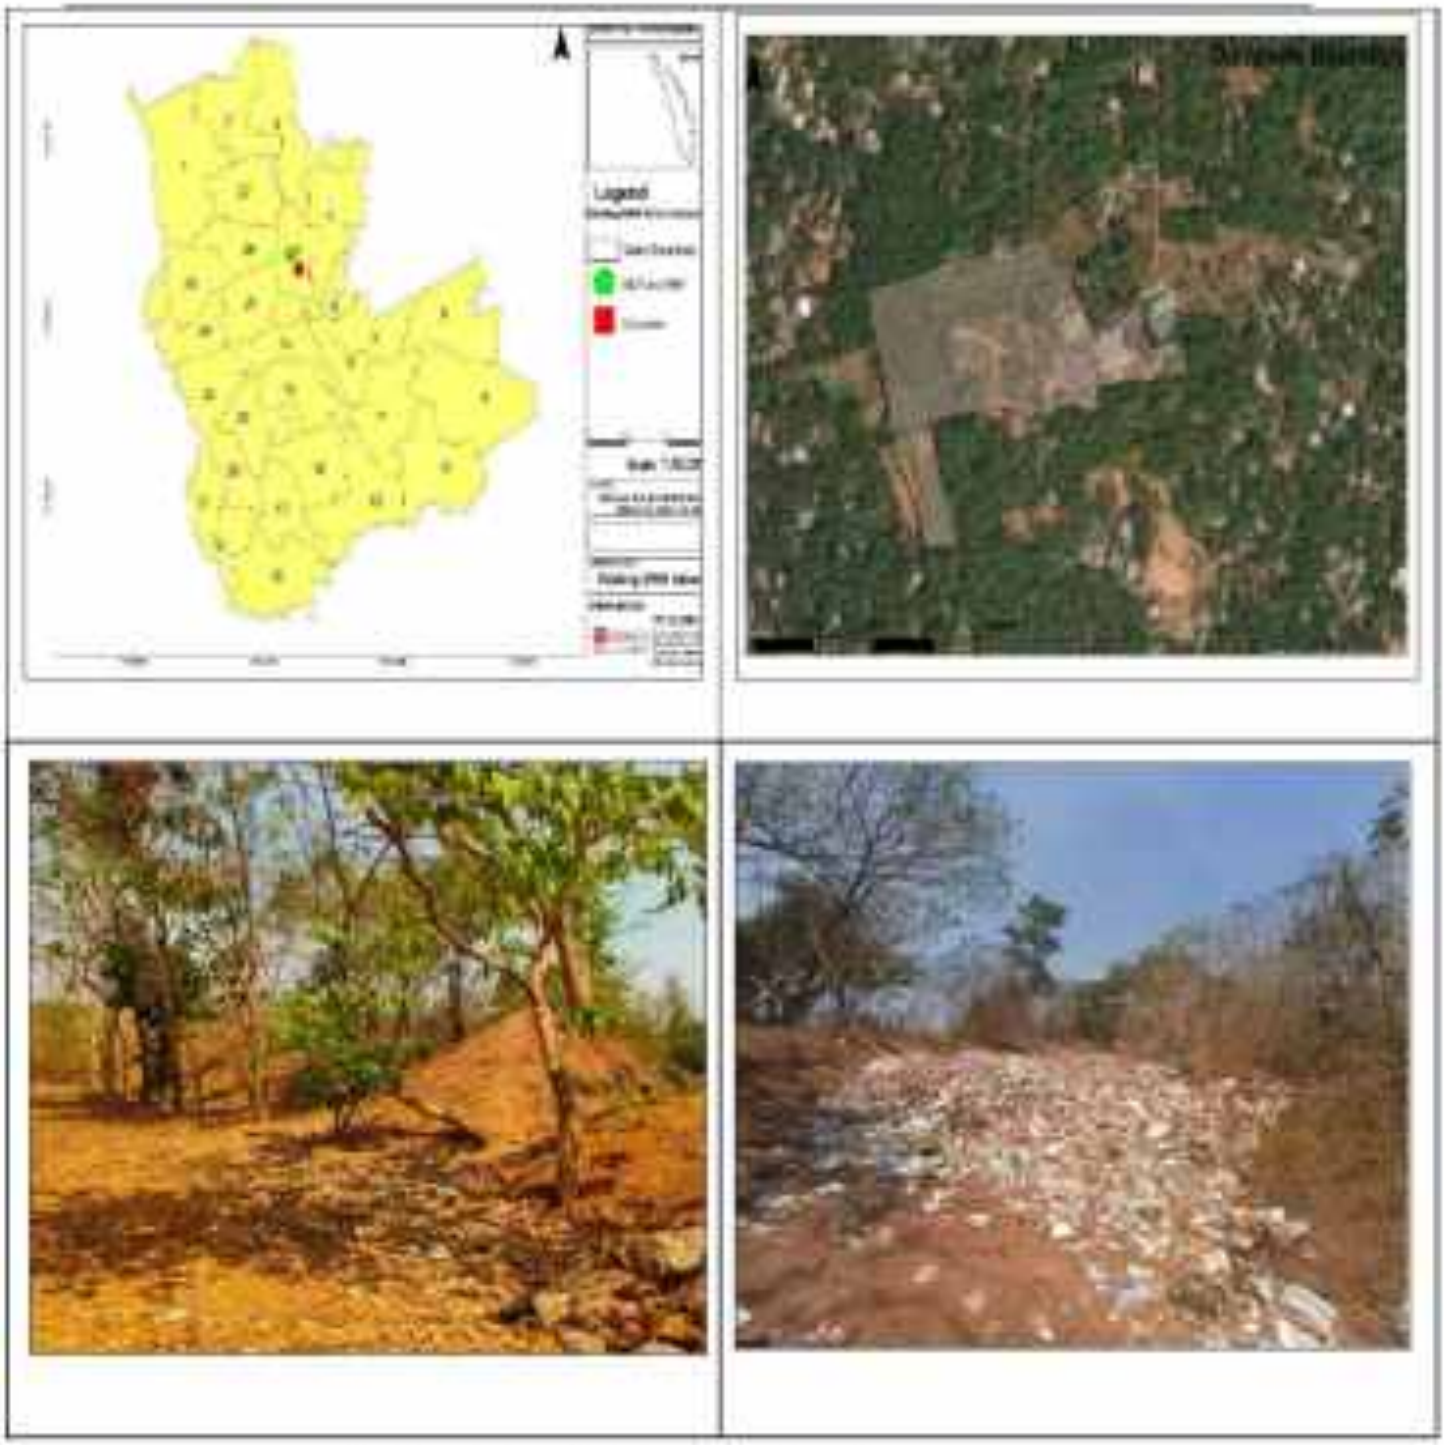


*Figure 1 Location of Koothuparamba dumpsite*

The technology proposed is Bio mining and the valuable fractions other than the bio earth & course fraction obtained from this process will be sold to authorized recyclers. The various phases in the biomining process (as per Legacy Waste biomining Guidelines of CPCB) are shown below.

*Table 3 Phases of Biomining*

| Phases of Bio-mining | |
|---|---|
| **Phase 1:** Stabilization | The legacy waste is formed into equal-sized windrows and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| **Phase 2:** Sorting & Segregation | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/circular rotatory sieves and manpower. |
| **Phase 3:** Disposal & Utilization | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |

**1.5 Site Management Plan**

The plan aims to minimize potential adverse impacts on sensitive receptors while maximizing the recovery of valuable resources and promoting site restoration.

Mobile machineries will be used for biomining of Koothuparamba dumpsite and they do not require a separate area for erection. The waste will be excavated and directly fed into mobile screeners for processing. This approach minimizes the need for additional infrastructure and optimizes the efficiency for the biomining process. The proposed plan is as follows

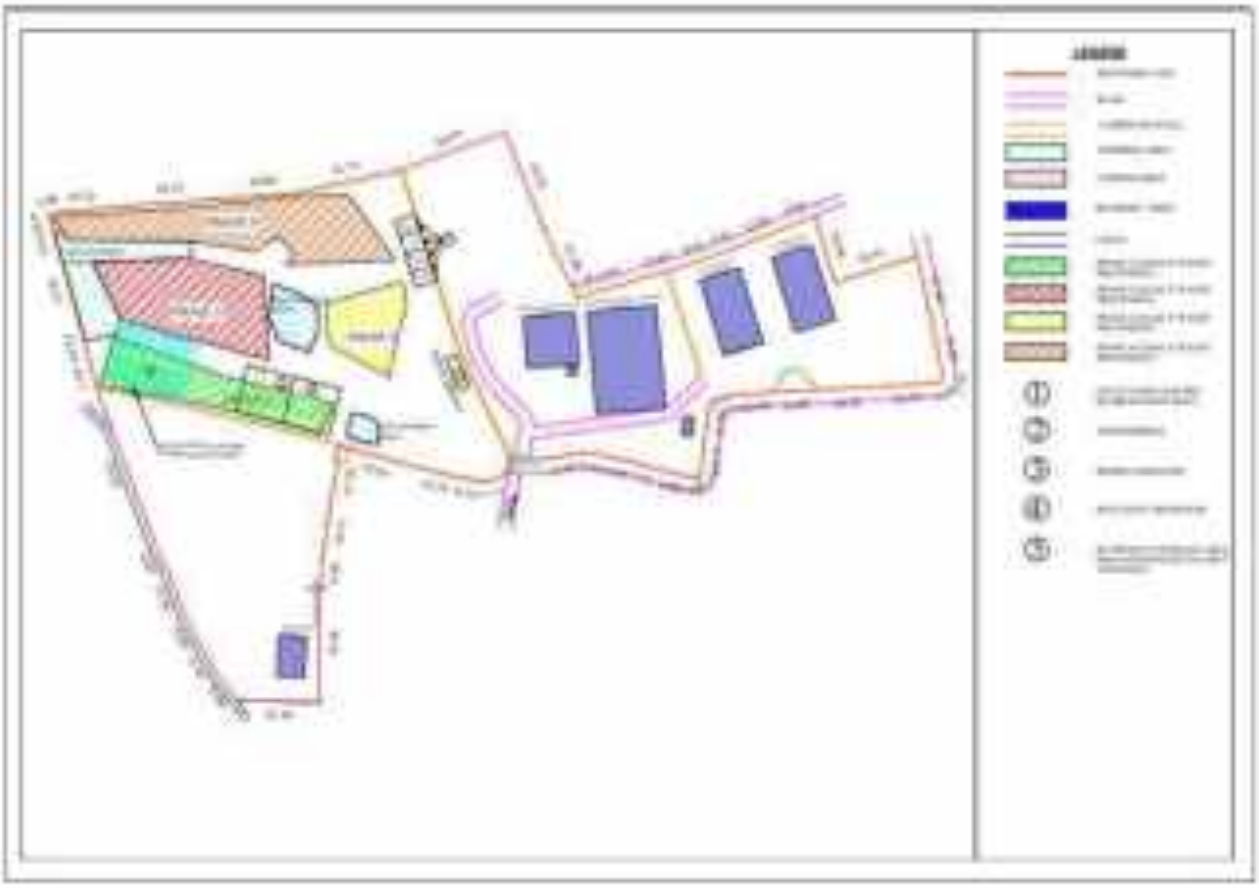

*Figure 2.Site Management Plan for Keezhuparumba*

## 1.6 Structure of the report

*Table 4 Structure of the report*

| Chapter | Structure |
|---|---|
| 1 | Introduction |
| 2 | Policy and Regulatory Framework |
| 3 | Environment and Social baseline |
| 4 | Analysis of Alternatives (technology and site) |
| 5 | Assessment of Environmental and Social Risks and Impacts |
| 6 | Environmental and Social Management and Monitoring Plan |
| 7 | Institutional Arrangements |
| 8 | Public consultation and Information Disclosure |

## 2.1 National, State Legislations and Technical Guidelines related to environmental and social aspect of dumpsite remediation

*Table 5 Applicable rules and regulations for Kaathuparambu dumpsite remediation*

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| 1 | The Motor Vehicle Act. 1988 | All vehicles used for installation and operation will need to comply with the provisions of this act and should have valid Pollution Under Control Certificate. |
| 2 | Authorization from PCB for storing Hazardous material like diesel for DG sets as per Hazardous and Other Wastes (Management & Trans boundary Movement) Rules, 2016 | Hazardous waste (used oil from DG Sets) is likely to be generated during the erection and operation stage. Hence, authorization under the purview of the rule shall be requiring. |
| 3 | Labour Act. | Occupational safety and health administration. |
| 4 | Solid Waste Management Rules, 2016 (MSW Rules) | To operate the mobile Bio mining plant, it is necessary to follow the existing MSW rules. |
| 5 | The Water (Prevention and Control of Pollution) Act, 1974 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 6 | The Air (Prevention and Control of Pollution) Act. 1981 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 7 | safety of the workers as per the ILO Convention No. 62 | Safety aspects |
| 8 | NOC from fire department | Safety aspects |
| 9 | Tree felling permission:<br>If felling of trees as defined in Kerala Preservation of Trees Act, 1986 | If any tree needs to be cut or replanted concerned permission is required from Forest Dept. Government of Kerala. The ULB will take the necessary permission. |
| 10 | NGT guidelines upto date | Relevant to the subproject to be considered for the successful implementation of the project. |

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| 11 | Building and Other Construction Workers (Welfare Cess Act) 1996, | Discusses Health and Safety and environmental aspects associated with construction and allied works |
| Other Applicable Rules | | |
| 12 | Solid Waste Management Rules, 2016 (SWM Rules) | |
| 13 | Plastic waste Management Rules, 2016 | |
| 14 | Construction & Demolition, Waste Management Rules, 2016 | |
| 15 | Batteries (Management and Handling) Rules, 2001 | |
| 16 | E-Waste (Management) Rules, 2016 | |
| 17 | SBM-Urban Advisory on Landfill Reclamation, CPHEEO, June 2020. | |
| 18 | Kerala Municipality Act, 1994 & Rules | |
| 19 | Hazardous & Other Wastes (Management And Transboundary Movement) Rules, 2016 | |
| 20 | The Operational Policies (Safeguards) of the World Bank and the Environmental and Social Management Framework | |
| 21 | Bio-medical Waste (Management & Handling) Rules, 1998 | |

## 2.2The World Bank Safeguards Policies

*Table 6 World Bank Safeguard Policies*

| S.No. | WB Policy | Safeguard policy applicable | Description |
|---|---|---|---|
| 1 | Environmental Assessment (OP/BP 4.01) | Yes | The project has potential impacts and pose risks to various environmental factors during the implementation phase. Consequently, this policy is implemented, necessitating a structured approach to safeguard management for risk mitigation in alignment with regulatory requirements, and Environmental and Social Management Framework (ESMF). |
| 2 | Natural Habitats (OP/BP 4.04) | Yes | Though the project will not support any activities that involve conversion or degradation of natural habitats; but in turn by improving SWM in ULBs; ensure their long-term sustenance by preventing |

| S.No. | WB Policy | Safeguard policy applicable | Description |
|---|---|---|---|
| | | | impacts due to waste, leachate, and landfill gas generation. |
| 3 | Pest Management (OP 4.09) | Yes | Considering the possible pest related issues as the project deals with wastes and improvements to dump sites, OP 4.09 Pest Management is triggered. As per this policy the banned pesticides/insecticides listed by the Nation / State and the World Health Organization (WHO) should not be used in the project, and as much as possible Integrated Pest Management Options shall be followed |
| 4 | Physical Cultural Resources [PCR] (OP 4.11) | Yes | The proposed project will not support any activities that could potentially harm nearby cultural heritage, archaeological sites and physical resources valuable to the community |

### 3.1 Project location of the site

The Koothuparamaba municipality has a dumpsite situated in Ward 5 at Palaparamba, with GPS coordinates Latitude:11°50'10.6"N, Longitude:75°34'19.2"E. The total quantity of legacy waste is 15,102 cum. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes.

*Table 7 Sensitive Receptor around the Dumpsite*

| S.No | Sensitive Receptors | Distance |
|---|---|---|
| 1 | Residential buildings | 20 households are located within 200 m radius of the dumpsite |
| 2 | Educational institutions such as Govt. HSS-Koothuparamba. | 730.00 m |
| 3 | Nearest pond | 180.00 m |
| 4 | Anjarakandy river | 3.5 Km |

### 3.2 Methodology for Environmental Baseline studies

Baseline Study in ESIA process usually includes data collection and analysis on various aspects of the project area, such as: Physical Environment (e.g., topography, geology, soil, water, air quality, and climate). Biological Environment (e.g., flora and fauna, habitat, biodiversity, and ecological processes). The overall methodology of ESIA

1) Scoping, Environmental Screening, Exclusion and Categorization
2) Environmental Baseline study like analysis of Air, Water, Soil and Noise/Vibration and impacts on biodiversity, workers and people around
3) Environmental Impact Assessment
4) Avoidance of adverse impacts, minimization, mitigation, and management measures
5) Environmental Management Plan (EMP)
6) Environmental Monitoring Plan (EMoP)
7) Budget for implementation of EMP and EMoP

The below table indicates the environmental attributes and frequency of monitoring

*Table 8 Environmental Attributes*

| S.No | Attributes | Parameters | Latitude & Longitude | No. of sampling locations | Frequency of monitoring / Data collection |
|---|---|---|---|---|---|
| 1 | Meteorology | Temperature humidity and rainfall | - | Study area | Data collected from IMD |
| 2 | Ambient air quality | $PM_{10}$, $PM_{2.5}$, $SO_2$, $NO_2$, VOCs | A1 – 11°50'10.14 "N, 75°34'18.95"E A2 – 11°50'10.14"N, 75°34'17.45"E | 2 | 24 hourly samples |
| 3 | Noise levels | Noise levels in dB(A) Leq | 11°50'10.27"N, 75°34'18.95"E | 1 | Once |
| 4 | Surface water quality | Physical, chemical and biological parameters including pH, temperature, turbidity, magnesium hardness, total alkalinity, chlorides, sulphates, fluoride, Copper, DO, BOD, COD, salinity, Zinc, Lead, Arsenic. | 11°50'08.06"N, 75°34'23.08"E | 1 | Once |

| S.No | Attributes | Parameters | Latitude & Longitude | No. of sampling locations | Frequency of monitoring / Data collection |
|---|---|---|---|---|---|

### 3.3 Existing Facilities on site and Environmental Audit

There is a functional MCF, RRF and organic composter units (Windrow Composting and Vermi-composting) for dry and wet waste present on a part of the Palaparamba dumpsite, Koothuparamba.

The MCF, RRF and composting units are not supported under KSWMP under this subproject. However, an environmental audit of the facility is important as this is an associated facility to which organic waste treatment mechanisms and some recyclables may be channelized to and is situated at the same site and might be impacted by the booming activities.

*Table 9 Environmental Audit of MCF, RRF and Organic waste treatment facilities*

| 5 | Socio Economic Aspects | About 20 households residing within the 200m vicinity who are from middle-income and low-income group families. The primary information on socio-economic profiles is collected from the ULB documents and through field visits. Families residing near to the dumpsite, in the vicinity of 200m, fall in different socio income groups. Out of the total households, 5 HH falls under MIG, and the remaining 15 HH falls under LIG.<br>Currently, there is no system in place for leachate drains or management because biodegradable waste was not dumped at site. However, during biomining activities, provisions for drains and leachate management will be established. | The dumpsite remediation process is anticipated to pose social risks, including pollution of food and beverages in nearby establishments and potential health issues for local residents, workers, Labourers, and students. A Social Management Plan, based on social screening and transect walk findings, is essential to mitigate these risks. Furthermore, the proposed remediation will have a positive impact on nearby residents, as it will lead to the removal of legacy waste, improving both environmental and social conditions. |
| 6 | Land use, Development | Surrounding landuses are mostly residential. The working MCF, RRF and two units of organic waste composter are | Odour, leachate and visual impacts on the surrounding landuses |

|---|---|---|---|
| | Pattern and Key Projects | available at site. There are no structural damages in this building. | (residential, employees of industries and shopkeepers) and MCF, RRF and two units of organic waste composter. |
| 7 | **Infrastructure and Services** | | |
| 7.1 | Traffic and Transportation | A detailed incremental load by vehicles during the operation phase is assessed and given under the traffic assessment report. Through assessment it is identified additional 9.4 trucks/day will be the traffic load due to the activity. | The implementing agency shall ensure staggering of the traffic movements from site considering peak hours/school timings. Also, nighttime vehicular movements can be implemented More accurate information shall be available once Contractor is being onboarded. EIA to be updated by the contractor based on his work plan |
| 7.2 | Water Supply<br>a) Surface water<br>b) Ground Water | A) Surface water: Anjarakandi river is 3.5km from the site. There is no water connectivity from the site to river.<br>Sample collected from 1 site nearby pond with the aerial distance of 180 m and results found – all parameters are well within limits except BoD.<br>B) Ground Water collected from 3 different locations (Residences within 200m radius)– all parameters are well within limits except for pH. | Site Drainage & leachate Impacts due to of biomining activity (esp during any seasonal rain) is important with respect to nearby soil & water environment |
| 7.3 | Drainage, Sewerage and Sanitation | Region has an unplanned network of drains eventually leading to - Anjarakandi River and there is no water connectivity from the site to river<br>Leachate samples collected at site, showed BOD value exceeding the limit and all other parameters were within limits | |

| S No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| 7.4 | Air Quality | Air Samples collected from 2 locations within the dumpsite and results found to be well within the permissible Limits. | |
| 7.5 | Noise Level | Noise Level monitoring samples collected within the dumpsite in order to identify the present noise level and results found well within permissible limit | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity |

### 3.5Description of Environmental Parameters

Under this baseline environmental attributes are arrived at after analysis of samples taken from the dumpsite and surroundings viz ground water, surface water, Noise level and air.

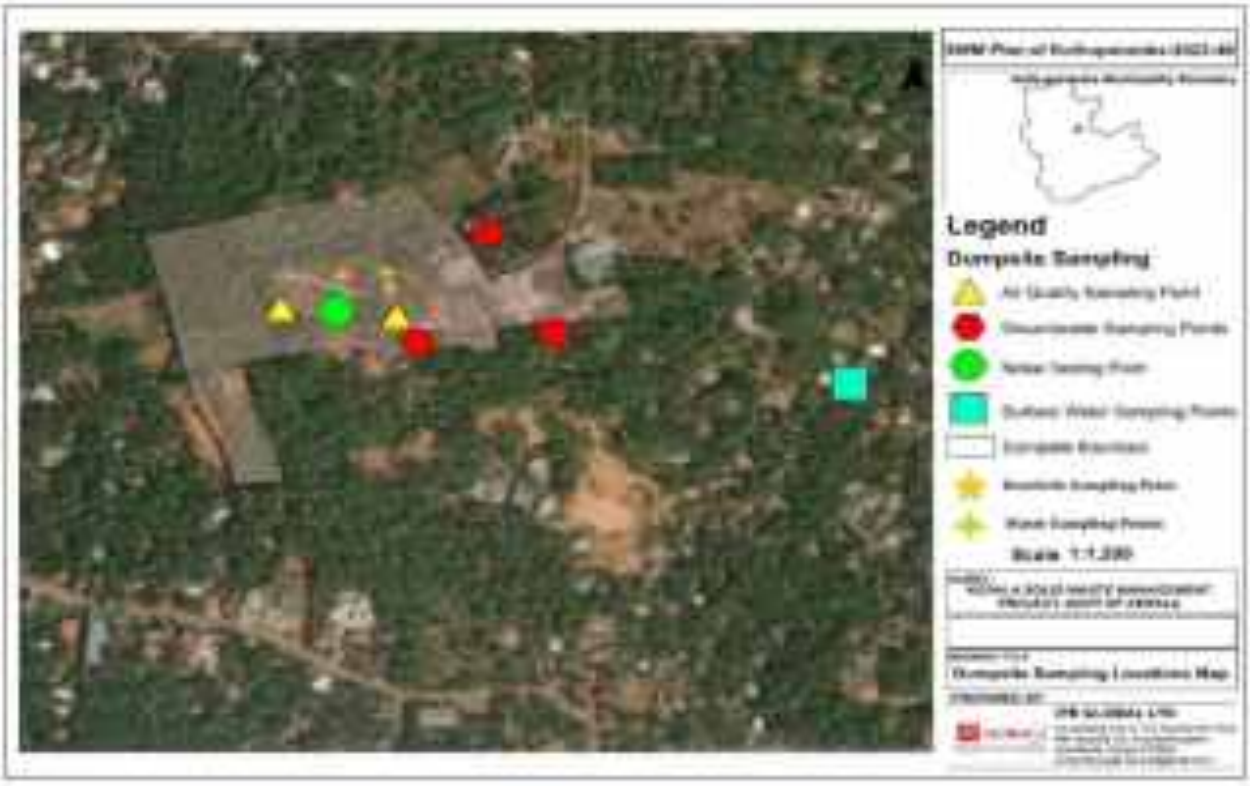

*Figure 3 Sampling location indication*

The map showing sampling locations and the analysis with observations are given below

**Distance of the sampling locations**

*Table 11 Distance of Sampling locations*

| S.No. | Description | Direction | From Centre of the dumpsite(m) | From Boundary of the dumpsite (m) |
|---|---|---|---|---|
| 1 | Surface Water | East | 450 | 180 |
| 2 | Ground water-1 | Centre | Within the boundary | |
| 3 | Ground water-2 | North | 158 | 20 |
| 4 | Ground water-3 | South | 200 | 10 m |
| **Note:** Air and Noise Monitoring are monitored inside the Yard | | | | |

**3.6 Identification of sampling location:**

*Table 12 Identification of sampling location*

| S.No | Description | Place identified | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Inside the dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind rose data, the air sampling sites were fixed at two locations inside the premises. |
| 2 | Noise (1 Location) | Inside the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. The adjacent MCF, RRF and organic processing units. |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite [stream] | Considering the sites geographical features, it is situated in a predominantly flat terrain, But Both North and south direction possesses a probable risk of leachate runoff, which could result in the contamination of soil. But it never end up with surface water . |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain, But Both North and south direction possesses a probable risk of |

| S.No | Description | Place identified | Justification |
|---|---|---|---|
| | | | leachate runoff, which could result in the contamination of ground water.<br>Based on the possible infiltration and slope direction the ground water samples were collected and the two samples were collected from outside the dumpsite boundary and one sampling location was inside the dumpsite(and two from well and one from borewell). |

### 3.7 Sampling Methodology

*Table 13 Sampling methodology*

| S.No | Description | Method |
|---|---|---|
| 1 | Air sampling | Calibrated High Volume Sampler, Calibrated rotameter & calibrated Dry gas maters and sampling locations selected based on wind rose and impacts on surrounding land uses. |
| 2 | Noise | Calibrated sound level meter and sampling locations selected based on highest noise level on site and impacts on surroundings |
| 3 | Ground water | Water collected in polyethylene and sampling locations selected based on leachate and run off flow and impacts on surroundings |
| 4 | Surface water | Water collected in polyethylene bottles and sampling locations selected based on leachate and run off flow and impacts on surrounding surface water bodies and drains (line sources of pollution) used be communities |
| NOTE: Sampling Photographs added as Annexure-C in the FR report | | |

### 3.8 Site Connectivity

The Palapparamba dump site is located in Ward No. 5 of Koothuparamba Municipality. The site is at a distance of 2 km from the State Highway 30. The access road of 500m is of 6-meter width.

### 3.9 Traffic Assessment

Traffic assessment refers to the process of evaluating and analyzing the flow of vehicles, pedestrians, and other modes of transportation on roadways, intersections, or specific areas. This assessment helps in understanding current traffic conditions, identifying potential issues, and developing appropriate strategies to improve traffic flow, safety, and efficiency.

**Traffic Load**

The access road to dumpsite is Koothuparamba road which is 6 m width. Considering 90 days of operation phase the trips are planned and the inward & outward of the vehicle to be made during off peak hours.

To promote safety and avoid traffic congestion, it is recommended to impose restrictions on the movement of vehicles used for the Biomining process. These restrictions should be enforced one hour prior to the commencement of school hours and one hour after the conclusion of school activities.

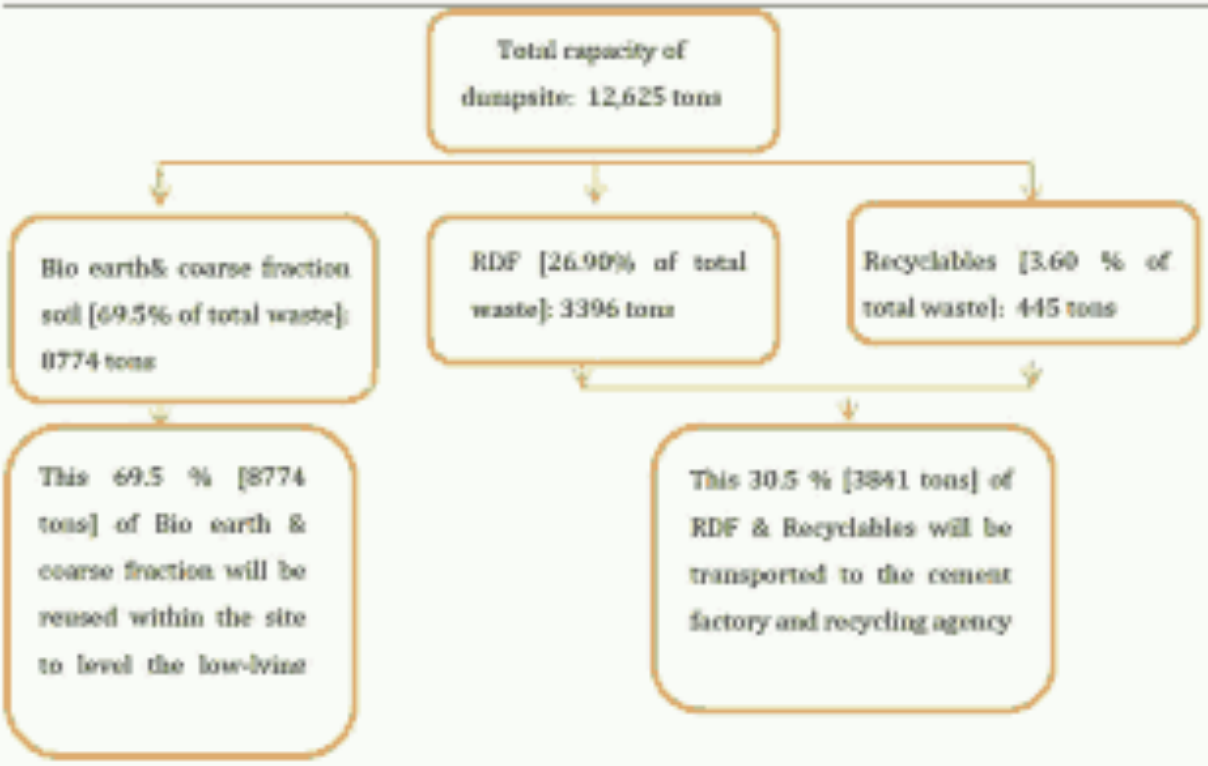

*Figure 4 Traffic load increment due to proposed project*

*Table 14Truck Capacity*

| S. No | Materials | % of Materials | Weight of each material(tons) | Vehicle Type | Max Capacity of load carrying Truck (tons) | No.of Trips |
|---|---|---|---|---|---|---|
| 1 | RDF | 26.9 | 3396 | 12 Wheeler Dumper | 18 | 189 |
| 2 | Glass | 1.65 | 208 | 12 Wheeler Dumper | 25 | 8 |
| 3 | Rubber | 0.51 | 64 | 10 Wheeler Dumper | 8 | 8 |

| | | | | | | |
|---|---|---|---|---|---|---|

| **Total Weight** | | | **3914** | **Total No.of Trips** | | **328** |

*Table 15 Total Trips Planned*

| S.No. | Materials | Total Trip | Total Days for Disposal | Trip/Day | Remarks |
|---|---|---|---|---|---|
| 1 | RDF | 189 | 90 | 2 | Two Trips per day |
| 2 | Glass | 8 | 90 | 0.1 | Ten days once one trip |
| 3 | Rubber&Footwear | 8 | 90 | 0.1 | Ten days once one trip |
| 4 | Metals | 123 | 90 | 2 | Two Trip Per day |

## 4. ANALYSIS OF ALTERNATIVES

### 4.1 Alternative 1: No project (without project scenario)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevents further contamination of site.

If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows

1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.

2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.

3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.

4.Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the local ecosystem, disrupting natural habitats and potentially causing long-term ecological imbalances.

5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

### 4.2 Alternative 2: Mode of execution / Management Alternative

Regarding the execution strategy, the outcomes of a Transect walk have substantiated the impracticality of waste transfer between Urban Local Bodies (ULBs). As a result, the imperative is for the waste remediation procedure to take place on the premises, allowing only the byproducts to be considered for potential transfer.

The logistical aspects of arranging machinery and designating storage space for these byproducts will hinge upon the extent of land available. At the outset, the existing underutilized, MCF, RRF and organic waste treatment facilities may be considered to cater to the initial storage requirements after improvement, which will, in turn, be known whether the contractor will use this facility for storage. Budget provision is provided in the FR for such arrangements.

## 4.3 Technology Alternative

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/bi-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

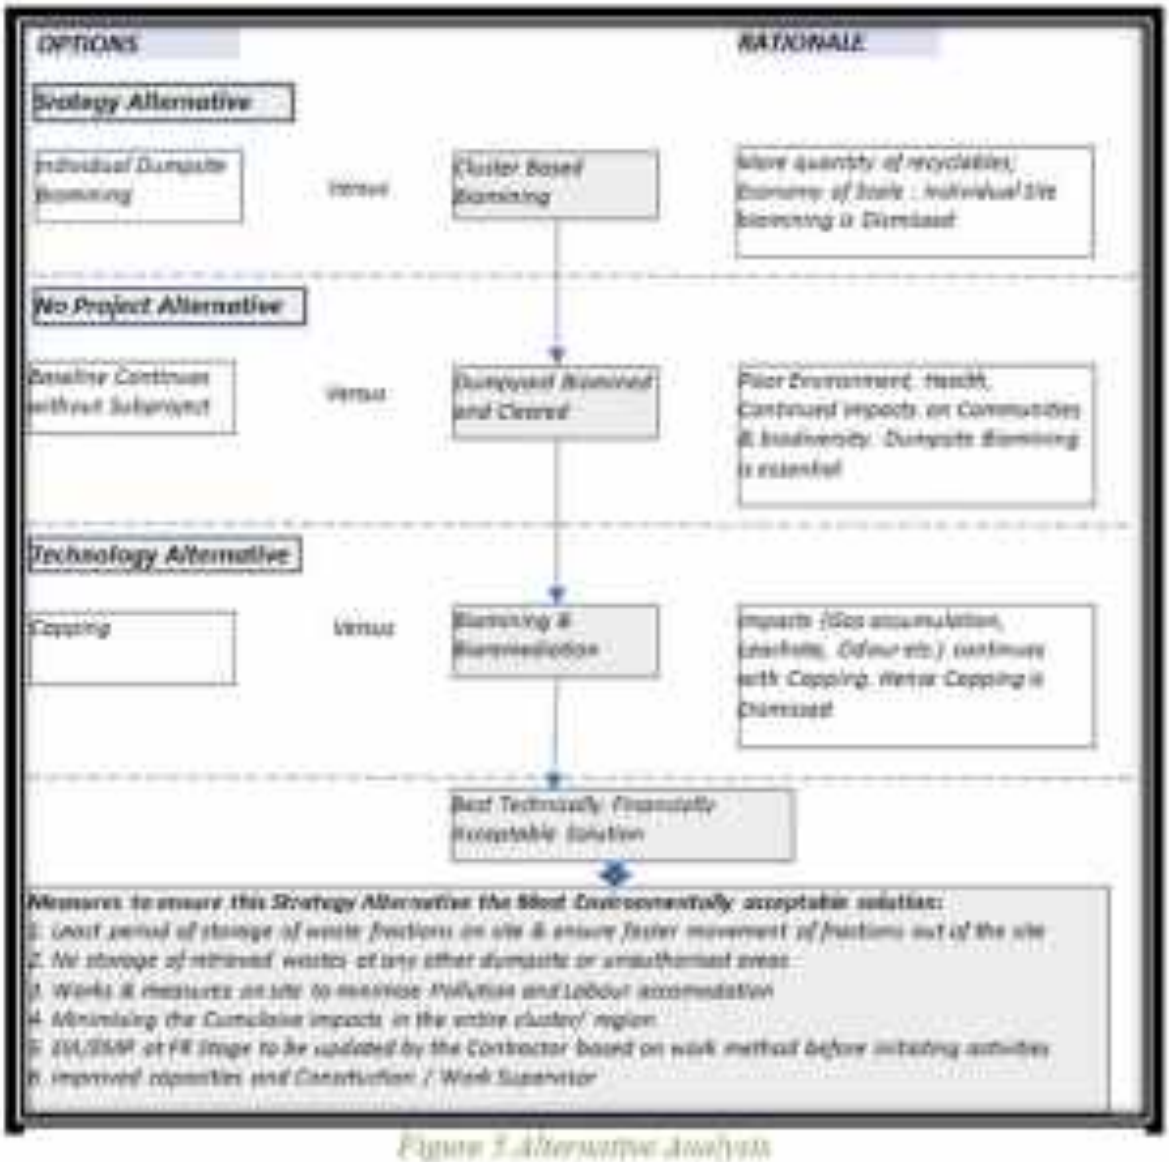

*Figure 3 Alternative Analysis*

## 5. ASSESSMENT OF ENVIRONMNETAL AND SOCIAL RISK IMPACTS

Biomining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, biomining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition, cumulative impacts of simultaneous biomining of multiple such legacy waste sites on the environment is important. Especially with respect to

- Drainage and leachate flow into regional waterbodies (Esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,
- Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,
- Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and
- Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

## 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Koothuparamba dumpsite.

### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Biomining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table 1 - Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity However, magnitude of cumulative impacts of various dumpsite remediation might be High.

*Table 16Aspects for Determining the Magnitude of Impacts*

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site | Within program boundary (but cumulative impact of various | A specific location within program component or site |

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| | | boundaries or local area | dumpsite biomining activities will be on larger extent) | boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| **Likelihood of potential impacts occurring** | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

**NOTE:** Anticipated Project Duration – 5 to 6 months

### 5.1.2 Sensitivity of Receptor

The dumpsite is surrounded by residential buildings and some commercial establishment, during the time of site assessment the experts observed, some sensitive receptors within 500m from the site. Namely some industries (like brick manufacturing industry), shops (like car washing service centre) and households. The project's lies near residences, within a 200-meter radius, and its potential air, odour, fire, noise, vibration, ground water impact on over 20 families (100 people) over a duration of 5 to 6 months. The sensitivity of these receptors is High.

### 5.1.3 Significance of the impact

- Significance if the impact is high as it would even result in community resistance to biomining and bioremediation.

Since the project operational time 5 to 6 months, then the magnitude of the negative impact can be considered as small and medium sensitivity. In other hand magnitude of the positive impact, after the biomining of the existing land can be used for the recreational park for the public use.

### 5.2 Cumulative Impacts in the Region / Cluster

The impacts that may arise due to clustering of different dumpsites. The following impacts could result from the clustering while implementation, requiring thorough assessment.

1. If a sensitive environmental component (River, mangrove, wetland, etc.) is served by the leachate/drainage from one or more nearby dumpsites, the impacts can be regional.
2. Presence of other projects outside KSWMP; existing or forthcoming landfills, transfer stations or those considered under Track one investments may together create a cumulative impact with this activity.
4. Impact of vehicular movement from various subprojects on biomining of dumpsites may have cumulative impacts on air, odour, traffic issues, and pollution incase of spills/accidents/emergencies due clustering approach.
5. Storage of materials if any at common sites, impacts during rains, floods/emergencies in multiple sites of same water/air shed

However, such impacts will be known only based on final work plan, location and schedule for disposal of Legacy Waste once Contractor is on board. The need to update EIA/EMP based on this will be included in the Bid & Contract Documents.

**Source-Pathway-Receptor Analysis**

**A) Source**: The source of contamination is the legacy waste remaining and being deposited at the Palaparamba closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is 50 years old, as dumping had started in year 1973 and the dumpsite is open and live dumpsite. Initially the dumpsite was acting as a trenching ground, depositing sewage from pit latrines. The total waste volume is 15,102 cum with the dumpsite spread over 0.98 ha and rises to a height of approximately 5.5 m from the base. Waste is seen 4 m above ground level and 1.5m below ground level. In addition to the landfill gas and leachate, material spill over the land in the compound and windblown dust and litter are also considered as sources of contamination.

**B) Pathways**: The following pathways for migration of contaminants have been identified: ***Wind***- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards low laying area acts as a pathway for the uncovered waste to flow into the unlined drainage canal along the boundary to low laying side, which runs through the residential areas.

***Lateritic Soil:*** The lateritic soil acts as a pathway for transport of leachate to the groundwater and for uptake of contaminated surface run-off.

***Leachate:*** The leachate flows with groundwater and acts as the pathway. Surface water Contaminants like run-off from the dumpsite, leachate and windblown dust and litter that

reach nearby surface water bodies like canals, rivers and streams are further transported by surface waters and in this case the surface water acts as the pathway.

**Receptors:**

Receptors are air, surface water and ground water. For drinking purpose, they mainly use municipal water supply. (nearby Households, industries and shops within 200 m), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the residences and people involved in industrial activity and shops. As the dump is not contaminated, remediation would improve the pollution scenario provided the bio-earth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from biomining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after biomining activity, activities in biomined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post biomining activity.

### 5.2.1 Impacts on Air Environment

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCF, RRF and Organic Waste Treatment units in this case), nearby communities of Ward 5.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.

- When the legacy site is opened, existing gases would get emitted. Further, any delay / unexpected stoppage of biomining activity, might further the process of gas formation depending on waste composition, odour and fire risks. In the case of Palapparamba, since the analysis of wastes shows calorific value of 2000 for combustibles with around 3.75% plastics (include MLP/SUP also) and 3.64% cloth rags, it's well combustible; and the risk of fire is high during summers and incidents

### 5.2.2 Impacts on Water Environment

**Groundwater**

- Post and pre-monsoon water levels are 5.6 and 7.15 mbgl. Borehole data indicates waste upto depth of 5.5m with hard lateritic strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. With the slope of the ground of the dumpsite, this tends to get accumulated at low-lying gradients. High BOD levels of the drain and ground water wells around are indicative leachate and runoff pollution. Oozing & Pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during biomining to prevent ground water contamination.
- Leachate samples: BOD, COD, TDS, E.coli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution.
- Borehole data: Dump below water table; impacts on water resources, wells nearby
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There is no parameters exceeding the permissible limits for heavy metals.

**Surface water**

- The dumpsite experienced flooding during 2018 floods. The site is at a higher elevation, and hence no submergence was experienced at the site during the floods.

The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas.

- There are no surface waterbodies near the site, except pond within180 m distance.
- At North and South directions, (end direction) there are residential households and mixed vegetation are seen. The leachate from the site may flows through natural slope which endsin residential areas. It is important to contain and treat leachate from the proposed biomining activities on site. Treated leachate may be recirculated or used for other purposes.

### 5.2.3 Impacts on Land/Soil

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as biomining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.
- Spillover of activities to nearby road, and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste biomining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.
- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Palappramba, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Palappramba does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while biomining,

same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste),Feb 2019) and World Bank EHS Guidelines. A plan shall be auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

- Wherever fuel, combustibles and retrieved waste is stored, it shall be on impervious surface, at appropriate elevation, protection against rains, flooding (such as cut off drains, berms etc.), wind and fly / pest menace (screens, green cover etc), intruders (compound wall existing at Palappramba), watch and ward, lighting, remote monitoring measures etc). Risk of fire, dust and leachate contamination shall be well assessed by the contractor. Emergency Action Plan shall be prepared and mitigation measures shall be updated based on work plan/DPR, and implemented. Communities shall be made aware of works and advice to follow measures such as use of fly/dust covers/nets on wells etc.
- Of the waste samples analysed, 50 to 60 percent comprises of Bio earth; 30% being <4.75mm size; C/N ratio (15:01) indicating slight unpleasant odour (high Nitrogen; releasing ammonia) less than that suitable for good compost.

### 5.2.4 Impacts due to Noise and Vibrations

Various machines vehicles and activities contribute to noise and vibration on and off site. This includes vehicles carrying recyclables, operation of JCB, and other machines, diesel generator sets, motors on site, etc. In addition, activities on the site and in relation to the existing MCFs such as vehicles transporting the dry waste from households to MCF, loading / unloading of collected waste materials, and workers activities on site would add to noise and vibration. Impacts include disturbance to fauna flora on site, health impacts on communities around due to exposure to large volume of sound.

### 5.2.5 Other impacts on Biodiversity - Fauna/Flora

- There are no sensitive biodiversity areas within 10 km of the site. However, since the project involves transport of wastes, it is important to consider the impact beyond

the project boundaries. Depending on the contractors plan for disposal of retrieved waste fractions, EIA shall be updated for biodiversity impacts.

- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke effects
- Disturbance to other fauna and flora on site: SWM activities onsite including those related to MCF and RRF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available Biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species listed by IUCN.

### 5.2.6 Other impacts on Workers and Communities

- Contaminants in soil and water: Direct or indirect contact with polluted soil or water by neighboring water users. Additionally, because of their locations, recovered lands are subsequently used as parks, or for SWM facilities or office spaces etc. This may pose risk of bioaccumulation of metals which can constitute a health risk. Also impacts on buildings due to gaseous emissions, risk of fire etc if used after clearing.
- Health Risks: One of the primary health risks of dumps is the spreading of diseases - diarrhea, hepatitis etc. The ways such infection can be spread are numerous but are often related to direct contact with the waste (e.g., clinical waste, fecal matter) by scavengers and other unauthorized persons being on the site. The other main pathway is by vectors such as, foraging animals, rats, birds, flies and mosquitoes etc. - Flies, mosquitoes, rodents, crows, pigeons, pest menace on site, for workers & communities & their assets (such as wells) due to exposure of putrefied wastes
- Impacts if separate common site/s or a site among these dumpsites is chosen to store wastes from other dumps till it is disposed, or as transfer stations or for common

processing of certain fractions: Such activities would result in Air, odor, dust, noise, water, vibration, flora, fauna, communities around the new site. There is also risk of contamination due to newly placed wastes, and pollution impacts and disturbances to communities due to works/activities on this site. Such sites and activities shall be avoided, and if quintessential for the project, be carefully chosen and approved only after thorough discussions with KSPCB, and all stakeholders. An assessment of their sensitivity and appropriateness shall be undertaken considering the environmental risks. They shall be audited and assessed for existing and future environmental impacts of such activities and mitigation shall be implemented. However, details on such sites shall be known only based on the final schema of implementation proposed by the contractor. Hence, the Contractor shall update EIA based on this before starting any activity on site.

- OHS impacts: Infectious wastes, fecal matter, clinical wastes and sharps; batteries, e-waste and possible bursting; Hazardous wastes like asbestos and other chemicals dumped; pesticides/insecticides, inoculum storage, handling and use on wastes/land leading to diarrhea, hepatitis, insect & reptile bites, interactions with foraging animals like rats, dogs, cattle, vector (mosquitoes, flies etc) transmitted diseases etc.
- This activity would result in large influx of workers from the region. Worker facilities in the labour Camp if any, & site are important, as the density of population is high in Kerala. It is important that camp sites are not set up in the land to be remediated. Periodic health checkups (once a week) are very important as the work involves handling of waste. It is important to also provide periodic health checkup and co-ordination with local Primary Health Center/Central Health Services for medical camps for residents, schools and others during the biomining period.
- Risk of Fire during biomining and due to retrieved material storage; possible Burning of retrieved materials; storage and use of firewood for various purposes, fuel for vehicles. The smoke from burning solid waste can result in respiratory complaints, dizziness, and headaches in the short-term, as well as potentially more serious diseases such as cancers and heart disease in the long term.

- Impacts of other site development works shall be well assessed, EIA/EMP updated, and mitigation measures included in Project costs and implemented by the contractor/ULB (whoever is responsible as per FR/Final Bid document).

### 5.2.7 Visual impacts, Noise, Odour, Vibrations

- Odour & impacts on workers and communities during biomining, storage and Transport are key determinants of community agreement to the activity. Such odour would attract flies and vectors in large numbers, who may also contaminate the food, and water sources of nearby communities. It is important to minimize odor emission as guided by the CPCB Guidelines on Legacy Waste Biomining, 2019. also provide periodic health checkup and co-ordination with local PHC/CHS for medical camps for residents, schools and others during the biomining period.
- Visual impacts of the waste being dug up, screened ad heaped/stored is not appealing. It is important to mask this appropriately.

### 5.2.8 Traffic Impacts

- Impacts due to new access road construction/upgradation. Access road to the site is unpaved and slushy during rains. It is important to minimize temporary pollution due to increased movement men, and materials from and to the site during biomining activity and beyond as it is proposed to store material on site including air and noise pollution, access restrictions to properties nearby, and vehicular conflicts
- Large vehicles moving in and out of the site carrying materials, tools, equipment & pedestrian/worker -vehicular conflicts; increased traffic on roads, large equipments & vehicles, noise, air pollution: vehicle emissions, DG sets
- Vehicles, equipment's not adhering to pollution standards

### 5.2.9 Other Impacts on existing or proposed activities on site/s

- There may be approvals from various agencies for biomining activities and associated facilities; depending on utilities and uses on site. & associated activities. These permits shall be obtained prior to initiating activities on site.

- Impacts of biomining on existing facilities on site such as MRF, MCF, composting yard etc (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post biomining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped & impacts if this is dumped elsewhere or not processed. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health &Safety impacts on workers, communities. Also forward linkages are considered as associated facilities/linked activities. Impacts of Transportation of these fractions (traffic increase, odor, leachate, dust) impacts during rains & emergencies, and its handling, storage at the identified locations, reuse etc. shall be mitigated.

## 6.1 Scope of Environmental Management & Monitoring Plan

An Environmental Management Plan (EMP) is a comprehensive strategy designed to manage and mitigate the impacts of activities on humans and the environment, particularly concerning air, water, soil, land, and biodiversity.

## 6.2 Environmental Management Plan

The detailed anticipated impacts and corresponding mitigation measures/management of the impacts are given below

*Table 17 Impacts & mitigation measures on Planning and installation phase*

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| *A* | | **Planning and Pre-Construction Stage** | | |
| *1* | | *Planning for biomining facility* | | |
| 1 | Biomining & Bioremediation Plan & Capacities | • Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / biomined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these biomined material in line wit the agreements with such facility owners and National, State regulations and WB EHS<br>• Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate management Plan.<br>• The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers<br>• Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU/ ULB |
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public. | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>• To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>• Grading shall be performed where necessary to provide a neat appearance | | |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality, odor, water contamination due to leachate, health and safety impacts of the people working in the site assessment* | • Carry out site assessments as per Guidelines for Biomining of Legacy waste Dumpsites of CPCB<br>• Consider safe biomining & gas / leachate generation from existing capped portion of the site<br>• Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>• Provision of appropriate PPE's to the team undertaking the site assessments<br>• Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>• Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>• Plan for machinery operated which will be operated by skilled operators at all times.<br>• Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>• Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | TSC, ULB, Contractor | SPMU/DPMU/ ULB |
| 4 | Absence / Delay in Permissions for Developing the biomining facility and associated works as per National regulations | • Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations including for associated infrastructure, DG Sets, Consent to Establish, and other licenses including those as per Labour Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes | • Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions | Contractor and or ULB depending on | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *(Air Pollution) and Visual Blight due to excavation* | • Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>• PPEs to be used by workers<br>• Awareness to communities & suggest to use PPEs | agreement on bidding mechanism/DPR | |
| 6 | Material sourcing, transport, and stacking of construction materials *(Occupational Health and Safety issues and Air noise pollution)* | • Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>• Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of Labourers on-site and Labour camp if any<br>• Materials shall be sourced only from approved quarries<br>• Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>• The driver should be with required license and follow speed regulations<br>• Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>• Material transport and unloading activities should not result in noise disturbance to locals and should be during day time<br>• Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>• Provide vehicle wheel wash area on site<br>• Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves<br>• Proper rest area on site shall be provided with water, first aid, toilets | Contractor | SPMU/DPMU/ ULB |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | • Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>• Nearby health center shall be informed about the Labour camp & appropriate medical checkup shall be arranged periodically<br>• Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>• It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with land owners wherever the labour is accommodated | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Camp must not be provided in an area prone to Hazards<br>• Camp should be adequately at higher plinth levels to prevent water intrusion<br>• Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>• Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>• The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>• (Refer ECOP section 06 and section 11 of EMF for KSWMP) | | |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. especially in case of providing support facilities *(Impacts on Fauna / Flora)* | • Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in biomining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>• Identify appropriate government site to avoid land acquisition and resettlement impacts<br>• Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences (20 no's near South side of the site), slope (towards south east) other landuses | Contractor | SPMU/DPMU/ ULB |
| 9 | Contamination of groundwater due to leaching, Leachate parameters; BOD, COD, TDS, Ecoli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | • During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>• Depending on the contractors plan for biomining of the capped area on site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ ULB |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust | • Movement routes of vehicles to be planned to avoid key fauna/flora on site such as *Alleorhus sp.*(Tree) &*Funambulus tristriatus* ( Jungle Palm Squirrel) | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | smoke – burning, trampling/machinery | • Leachate collection & storage/treatment and recirculation shall be planned to avoid imparts on flora, fauna | | |
| 11 | Nuisance hazards to neighboring areas | • Ensure proper design and adequate compound wall; high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements<br>• In case of waste mound and site edges are sliding or unsafe: provide engineered retention walls. | Contractor | SPMU/DPMU/ ULB |
| 12 | Treatment & Disposal of wastes and rejects | • Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & inert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Biosarth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>• Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| **II** | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| | **Implementation of biomining of the dumpsite** | | | |
| 1 | Impact due to the vehicular movement<br>*(Air and noise environment & Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | • Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>• All vehicles and machinery should obtain Pollution Under Control Certificates<br>• HORN PROHIBITION signpost to be erected.<br>• Rumble strips/speed breaker to be provided on access roads.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>• Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>• Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements. | Contractor, ULB | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Avoid heavy vehicle movement through Koothuparamba roads during peak hours 7 a.m to 10 a.m mention school hrs / peak hrs and during important period / festivals when people use the road to access temple<br>• Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | | |
| 2 | Impact due to the use of heavy vehicle and equipment<br>*(Air and Noise environment)* | • Mixing equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>• Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>• Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>• Labour to be provided masks / PPEs.<br>• Construction / Biomining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighboring sensitive land uses<br>• Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>  ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>  ▪ Using modern, well-maintained and regularly serviced vehicles.<br>  ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>  ▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>• Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>• As Palapparamba dumpsite has sensitive receptors and settlement areas within 150m of it, noisy works shall be stopped from 22:00 to 06:00.<br>• Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>• Avoid noisy activities/machines nearby residential area of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>• Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities *(water environment)* | • Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>• Vehicle washing or maintenance near water bodies are to be avoided.<br>• Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ ULB |
| 4 | Leachate and Runoff from biomining activities *(Soil contamination and groundwater contamination)* | • Provide site cut off drain around the site to divert off stormwater from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>• Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>• Ensure stormwater drains will lead to drain outlets (along the south east boundary of the site) on roads adjoining the dump yard<br>• Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area.<br>• Provide proper treatment of leachate and stormwater that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by biomining activities like excavation and waste segregation and stabilization<br>• The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>• The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>• Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>• Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism | Contractor | SPMU/DPMU/ ULB |

| S.No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>• Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | | |
| 5 | Soil decontamination from accumulated waste levels *(Impact on leachate, odor)* | • Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bio-culture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>• Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>• Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU/ ULB |
| 6 | Excavation of waste from the waste mound *(Health and safety impacts)* | • The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>• Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>• Machinery operated for excavation should be operated by skilled operators at all times.<br>• Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>• Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>• In case of the waste mound and site edges are sliding or unsafe, provide engineered retention walls or string boundaries.<br>• When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | Contractor | SPMU/DPMU/ ULB |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles | • All vehicles shall carry only approved load of weight<br>• Regular cleaning of roads & drains and removal of spills if any.<br>• All waste transport vehicles shall be covered and movement shall be during non-peak hours. | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *(Air, Odour nuisances; spills and littering impacts on Air, Water, Land)* | • Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>• Adopt required measures as per CPCB guidelines, and site specific safety requirements. | | |
| 8 | Spreading and compaction of waste<br>*(Safety)* | • Follow technical details in line with CPCB Guidelines<br>• The active working face should be minimized as much as practical an appropriate size is about 2 to 3 times the width of the compactor vehicle.<br>• Waste should be spread and compacted in layers not greater than 0.6m [2ft.] after compaction.<br>• Compaction of the waste should be on a slope of about 20-30% as guided via the permissible levels and worked from the bottom of the slope to the top | Contractor | SPMU/DPMU/ ULB |
| 9 | Occupational health and safety impacts of the workers during the biomining & construction of support facilities:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, biocultures or wastes etc. by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | • Avoid direct & double handling of wastes through avoidance measures(suitable planning & equipments), engineering controls & use PPEs<br>• Work area & Labour camps shall be provided with First Aid and other related activities.<br>• Emergency Preparedness plans shall be prepared and implemented for all manpower working centers and its field extension centers.<br>• An Environment Health & Safety policy shall be prepared and implemented<br>• Adequate manpower shall be provided & manager & staff shall listen and act upon the manpower related grievances.<br>• Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles<br>• Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed without slip, trip, fall especially on waste, leachate or trenches<br>• Proper training will be provided regarding the maintenance of health<br>• Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper handwash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>• First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>• Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health | Contractor, ULB | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | checkups. Arrange daily health checkup for workers working on waste heaps<br>• Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>• Measures such as deferred timings and stretch break to be adopted<br>• Secure all installations from unauthorized intrusion and accident risks;<br>• Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every days start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipments, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>• EHS specialist with adequate experience & third party supervision are important for biomining activity<br>• Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>• Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>• Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas;<br>• Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>• Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br>• Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near those.In close proximity to this location, there is a transformer. Disallow worker exposure to | | |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>• All workers shall be registered as per prevalent Labour laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>• Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractors person/insurance agent<br>• While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>• While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>• Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>• A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>• No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor<br>• All work related to working at heights will be undertaken only during the daytime when sufficient sunlight is available;<br>• Use of temporary fall protection measures and outer edges of any elevated work surfaces, such as handrails and toe boards to prevent materials from being dislodged will be done;<br>• All excavation activities to be conducted in supervision of the site contractor;<br>• Proper signage and lights to be provided in all work or activity areas & work permit system to be ensured.<br>• All records on emergencies, accidents, workers & their duty schedule, important site events, waste storage & disposal etc shall be maintained on site. All accidents including Indicative, Serious and Severe accidents to be recorded. All severe & serious accidents to be reported to the Bank & procedures followed for root cause analysis & Corrective Action Plans prepared and implemented, as per Banks Incident Reporting Tool | | |
| 10 | Risk of fire due to conditions leading to spontaneous combustion | • Follow CPCB Directions (May 26, 2022) Directions under Section 5 of EP Act (1986) – for Implementation of SWM Rules 2016 – regdg Fire Incidents at MSW Dumpsites (https://cpcb.nic.in/openpdffile.php?id=UHVibGljYXRpb25zaWxlLzEwNDRfMTY1NTE2 | Contractor, ULB | SPMU/DPMU |

| | *(Air environment, disturbance to communities and workers, health impacts, safety issues)* | MzkzN19tZWRpYXBobiRvMzYxMi5uc2GV=) LSGD Kerala Government GO on Fire Safety of MRF, MCFs (for the MRF on site if used for storage of wastes)and other Regulations, guidelines applicable<br>• Divide the site & plan for work in each area/quadrant as per work plan & prepare fire safety plan & emergency response plan in line with EIA Annexure 3; and National/State regulations & WB EHS<br>• Examine the site everyday by experienced Fire Safety / OHS personnel for any smokes<br>• Avoid conditions that can lead to spontaneous combustion such as:<br>○ Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard<br>○ Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.<br>• Design the facility for access by firefighting equipment, including clear aisles among waste heaps or work areas and access to adequate water supply.<br>• Ensure workers are briefed of fire hazard & its management<br>• No unauthorized entry shall be permitted to the site; including of workers during holidays, night time, or hours other than normal work hours under the supervision of site engineer / supervisor. Fencing and barricades with proper signage boards indicating "trespassers not allowed"<br>• The following activities should be implemented to prevent fires from occurring at the facility<br>○ adequate fire-fighting equipment should be made available on-site and stored in an accessible manner.<br>○ all operating staff should be trained and able to manage fire outbreaks at any part of the facility.<br>○ clear signage should be established to inform workers and the public that flammable liquids are not permitted on the site. This should be reinforced by advice to customers at the gatehouse and inspection of loads at the organic reception area.<br>○ Approved quantities of combustible contaminants that have been separated (such as tires and plastic bottles) should be stockpiled in small piles or windrows.<br>○ all fuels or flammable solvents for operational use should be stored in an appropriately ventilated and secure store (at appropriate height). This store should be located away from the blooming, storage, and processing areas.<br>○ all flammable liquids should be stored within a bund that can hold 110% of the | | |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | volume of the flammable liquids stored there so that any release of raw or burning fuel cannot cause a fire in the combustible organics present on the site or have an impact on contaminating stormwater.<br>• The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented throughout the biomining activity in line with National State regulations, guidelines and international good practices<br>• Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.<br>• Contain all local smokes/small fires inside the dump asap. Fire brigade help shall e sought on all smokes/fires outside the dump asap<br>• Ash from fires to be contained at the earliest within the site using bunds or screens, rather than allowing to disturb nearby receptors. Early clearing and disposal of such ash at TSDF to be ensured.<br>• Provide contact details of Fire Department & ambulance other essential emergency services on site & ensure training to the workers by such service providers | | |
| 11 | Construction of new facilities in retrieved land | • The excavated site shall be protected from any dumping during or after the biomining activity and shall be reserved for SWM activities in line with SWM Rules 2016<br>• Any new facility under ICSWMP to be constructed on the retrieved land, shall follow EMF procedures & National State regulations | ULB | SPMU/DPMU |
| 12 | Pest / Vermin Control & Visual impacts<br>(Odour, flies, rodent / other pest menaces) | • Regular cleaning and approved pest control measures to be adopted; preferably in coordination with Health section of ULB & local Health Center<br>• Communities around shall be made aware of possible pest menace & ULB shall support those in need with required pest management measures and offered health checkups<br>• Biopesticides / biological control shall be followed. However, biopesticides, or bio cultures used shall be tested to ensure the presence of no banned chemicals or hazardous materials<br>• Banned pesticides/insecticides shall not be used.<br>• Workers shall be made aware of storage and use of pest control measures and PPEs to be used<br>• Visual blight to be curtailed by screens, proper lighting, housekeeping, leachate management | Contractor, ULB | DPMU, SPMU |
| 13 | Odour nuisance | • Waste with a strong odor to be covered immediately they are emptied from vehicles.<br>• Control and manage leachate treatment to minimize odor. | Contractor, ULB | DPMU, SPMU |

| S.No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Provide buffers screens to curtail odor from reaching surrounding communities especially to North side of site.<br>• Using natural deodorizers such as lemongrass, eucalyptus etc. and planting fragrant flowering plants around the site to mask odor. | | |
| 14 | Storage, Collection, Transport, Treatment & Disposal of wastes and rejects | • Storage, Collection, Treatment, treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste<br>• Storage, Collection, Transport, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc); & adequate protection shall be made to prevent such impacts even during rains / disasters<br>• Waste handling shall be inline with existing regulations & guidelines & avoid health & safety impacts<br>• No material is allowed to remain on site after the contract period<br>• Adequate fire safety arrangements & awareness & training to workers shall be ensured on site & at disposal / treatment areas for wastes in discussion with Local Fire Brigade to prevent any fire on legacy waste site or retrieved & stored wastes or that is transported<br>• Vehicles movement shall be tracked by ULB to ensure disposal of material/rejects/inerts in designated or agreed area & are in line with schedule; using GPS.<br>• Given that the access road is used by the public, it is imperative to implement the required safety precautions and environmental protection measures when transporting the waste. | Contractor, ULB | DPMU, SPMU |
| 15 | Other activities | • No activity other than biomining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>• If existing MCF shall be used for sorting biomining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after biomining works shall be after proper cleaning / washing & disposal of all rejects/inerts & tools to ensure good housekeeping & no H&S impacts<br>• If existing MCF shall be used by the ULB for storing dry wastes from Town, during biomining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 16 | Energy Efficiency & Water Use efficiency | • All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & biomining / construction techniques<br>• Landscaping & green belts to use local / indigenous plants & trees | Contractor | ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Waste water and Leachate to be treated & recycled/reused | | |
| C | **Future Site Usage (EMP shall be updated in line with EMF & used if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Biomining, but of the future facility operator & ULB** | | | |
| 1 | Future use of the biomined site: Green Park, MCF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | • ULB to ensure that the site will not be used for future dumping.<br>• Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around.<br>• ULB shall plan the future use of the site shall be in consultation with the communities.<br>• Phase 1 Environmental Assessment to be carried out. EA for existing facilities & EIA for proposed development in line with EMF in case this is proposed to be developed under KSWMP<br>• All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment & nuisance to biodiversity, communities, Health impacts)* | • The movement route shall be scheduled for each vehicle.<br>• Enforce speed limits applicable and make drivers aware of this<br>• Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule; preferably using GPS<br>• Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles<br>• Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards<br>• Proper lubrication shall be provided to minimize squeaking noise due to friction<br>• Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br>• The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public<br>• Traffic will be managed at the site by providing adequate space for parking of vehicles<br>• Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design<br>• No waste or material shall be disposed in any place other than the designated area; including water bodies, courts/forests, or sensitive areas. | Future Facility operator | ULB |
| 3 | Exhaust emissions<br>*(Air impacts)* | • No idling of vehicles on site.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed | Future Facility operator | ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 4 | Plying of vehicles through kutcha / unsurfaced roads and idling<br>*(Air pollution: SPM, CO, CO2)* | • Vehicle movement shall be well planned – through topped roads. In case of necessity to move through Kutcha roads, ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Future Facility operator | ULB |
| 5 | Odor<br>*(Nuisance, Air)* | • Daily soil covers to compacted wastes to manage odors.<br>• Waste with a strong odor to be covered immediately they are emptied from delivery vehicles;<br>• Control and manage leachate treatment plant to minimize odor.<br>• Adhere to air quality regulations with quarterly air quality monitoring Maintenance of the buffer zone and protective berms<br>• Provide buffers screens to curtail odor from reaching surrounding communities | Future Facility operator | ULB |
| 6 | Impact on the ambient noise quality during the operations<br>*(Noise, nuisance to sensitive receptors, health impacts)* | • Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines;<br>• Using modern, well-maintained and regularly serviced vehicles;<br>• Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>• Provision of earmuffs and ear protection to workers and employees in high noise areas | Future Facility operator | ULB |
| 7 | Occupational health and safety impacts of the workers:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | • All OHS and CHS measures to be followed in line with applicable regulations, guidance<br>• Workers & communities shall be made aware of OHS, CHS risks and impacts & mitigation measures adopted<br>• Emergency management plan to be prepared & followed<br>• Workers shall be appropriately trained or OHS during construction & Operation of all future facilities | Future Facility operator | ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 8 | Pest / Vermin Control (Odour, flies, rodent / other pest menaces) | • Regular cleaning and approved pest control measures to be adopted<br>• Biopesticides / biological control shall be followed<br>• Banned pesticides/insecticides shall not be used.<br>• Workers shall be made aware of storage and use of pest control measures and PPEs to be used | Future Facility operator | ULB |
| 9 | Fire Safety | • The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations, guidelines and international good practices | Future Facility Operator | ULB |
| 10 | Energy Efficiency & Water Use efficiency | • All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & construction techniques<br>• Landscaping & green belts to use local / indigenous plants & trees<br>• Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

**Disposal phase of By-products from Bio-mining process**

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within specified time mentioned as per the bid documents, penalties will be imposed on the contractor as mentioned in bid document.

## 6.3 Emergency & Disaster Management Plan
## Hazards Associated with Dumpsite Activities

The Disaster Management Act, 2005 mandates every Government Department to prepare, review and update Disaster Management Plan

### 6.3.1 Identified Emergency Situations

*Table 18 Hazards associated with Dumpsite Activity*

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| As per World Bank EHS Guidelines | |
| Waste Storage | Regular visual inspection of all waste storage collection and storage areas for evidence of accidental releases |
| Waste Segregation | Regular audits of waste segregation and collection practices |
| Monitoring records for hazardous waste collected,stored, or shipped should include | **1. Material Identification:**<br>- Name and identification number of the hazardous material(s) present in the waste.<br><br>**2. Physical State:**<br>- Indicates whether the waste is in a solid, liquid, gaseous form, or a combination of these.<br><br>**3. Quantity:**<br>- Specifies the amount of hazardous waste, typically measured in kilograms or liters, or by the number of containers.<br><br>**4. Waste Shipment Tracking:**<br>- Documentation tracking details include:<br>- Quantity and type of hazardous waste.<br>- Dates of dispatch, transportation, and receipt.<br>- Records of the originator, receiver, and transporter involved in the waste shipment.<br><br>**5. Handling and Treatment:** |

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| | - Describes the method and date of various actions taken with the hazardous waste, such as storing, repacking, treating, or disposing of it at the facility.<br>- Cross-referenced with specific manifest document numbers relevant to the hazardous waste.<br><br>**6. Location within Facility:**<br>- Specifies the specific locations within the facility where the hazardous waste is stored or processed.<br>- Includes information about the quantity of waste at each location. |
| Falls and Slips at the dumpsite<br>Slippery surfaces or uneven surfaces and poor access to work areas climbing on and off plant. | Tidy workplace by maintaining good housekeeping. Handholds wherever necessary and clear/ safe access to work areas with proper PPE to the persons working at the site. |
| Fire Hazard<br>Fire risk may occur due to the following<br>Storage of flammable liquids / Gas like LPG, Diesel<br>Any combustible materials<br>Sparks<br>Open flames<br>Absence of Fire hydrant network may lead to major fire accident | Combustible/flammable materials should be properly managed and stored/used. Fire extinguishers and Fire hydrant Network with reserve water (As per NFPA Code) should be made available. Emergency Plan in case of fire. |
| Absence of Personal Protective Equipment Lack of adequate footwear, Helmets, hearing/ eye protection, gloves & goggles may lead to injuries and death. | Proper footwear, Helmets, hearing/ eye protection, gloves & goggles should be given to the workers at the dumpsite. Proper training should be given to the workers on the use of PPE. |
| Electrical Hazard<br>Electric wires if any damaged<br>Poorly insulated<br>During temporary repairs | Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit. |

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| Circuits overloaded may lead to major accident | |
| Ladders<br>Risk may occur due to the following<br>Not secured against dislodgement<br>Defective ladders<br>Not sufficient length<br>Incorrectly placed | Ladder risk can be mitigated by the following<br>Secured against movement or footed<br>Ladders in good condition<br>Regular inspection<br>Ladder should be extended one (1 m) meter above platform to avoid injuries |
| Excavations<br>Risk may occur due to the following<br>Trench collapse<br>Gas emission | Risk can be mitigated by the following<br>Soil stability should be known before excavation<br>No water accumulation<br>V500 mask should be used at the in order to counter the gas emission.<br>Emergency Plan |
| Defective or wrong Hand Tools<br>Wrong/defective tool may end up with injuries to the workers using the tool | Right tool for the job should be used properly and it should be in good condition |
| Accidents due to vehicular movement<br><br>Vehicle movement inside the site | Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents |
| Noise Hazard<br>Noise levels over 85 decibels would cause trouble to the people working at the site | Noise Levels should be maintained below 85 decibels and with proper protection |
| Falling Material<br>Fall during carrying/Lifting of waste and materials from overhead work areas. | Risk can be mitigated by the following<br>Use of hard hats.<br>Person operating the Jcb/machine must be provided with walkie talkie/hand signals to know about the clearance |
| Visitors Presence at site<br>Insufficient fencing may lead to attract pedestrians to enter the site. | Fencing and barricades with proper signage boards indicating pedestrians not allowed |

### 6.3.2 Proposed Organizational Structure for Disaster Management

The Organizational structure for the Disaster management contains the following team members.

**Emergency Response Team:**

A response team needs to be set in assistance with a senior executive (Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

Incident controller would be reporting to the Site Controller. Incident Controller organizes a team responsible for controlling the incidents with the personnel under his control.

Shift In-charge would be the reporting officer, who would bring the incidence to the notice of the Incidence Controller and Site Controller.

Emergency Coordinators would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.

*Figure 6 Organizational Structure for the Disaster Management Team*

### 6.3.3 Emergency Response Facilities

Emergency Control Center – with access for emergency shutdown procedures, duties and contact details of key personnel and government agencies, emergency equipment, etc.

- Assembly Point – with minimum facilities for safety and rescue
- Emergency Power Supply – connected with diesel generator, flame proof emergency lamps, etc.
- Fire Fighting Facilities – first aid fire-fighting equipment, fire alarms, etc.
- Location of Wind Stock – located at appropriate location to indicate the direction of wind for emergency escape
- Emergency Medical Facilities – Stretchers, gas masks, general first aid, emergency control room, breathing apparatus, other emergency medical equipment, ambulance. The medical centre should display poster for treating burns and first aid. Some medicines and facilities to be kept in the medical centre are suggested.

**Health and Safety Measure for the workers**

All workmen employed in working conditions will be provided with adequate personal safety equipment as applicable to the work lies:

- Safety shoes
- Safety Helmets
- Hand gloves
- Ear muffs

**Monitoring Plan**

The considerations in an emergency planning include the following:

- Identification and assessment of hazards and risks
- Hazard consequences analysis
- Alarm and communication procedures

- Identification and equipping emergency control centre identify assembly, rescue points, medical facilities
- Emergency preparedness plan, procedure, steps to be taken before during and after emergency
- Formulation of plan and emergency sources
- Training rehearsal, evaluation and updating the plan
- Machinery should be examined regularly
- Medical examination for every employee shall be examined by doctors at least 3 months in a calendar. Health register should be maintained by the individual industry coming in the project site

**Emergency Action Plan for Fire**

In case of Fire the immediate plan of action will be "RACE" that stands:

R - Rescue: When you discover a fire, rescue people in immediate danger if you can do so without endangering yourself.

A - Alarm: Sound the alarm by pulling a fire pull station and call fire station, from a safe distance, notify security of precise location of fire

C - Confine: if possible

E - Evacuate: Evacuate the place

Immediately informed the response team. Response team moves to the point of fire and take all necessary steps to stop the fire. If the fire is not controllable and spreads then the manager in charge should inform the district authorities and call for external help. Complete an Incident/Accident Report within 24 hours.

Firefighting system is proposed to prevent and control fire outbreaks for the project. The firefighting system will consist of portable fire extinguishers, hose reel, wet riser, yard hydrant, automatic sprinkler system, and manual fire alarm system.

**Emergency Action Plan for Electric Fire**

- Disconnect the affected areas electric supply
- If fire is small scale than $NAHCO_3$ or Sand will be effective.
- Attempt to extinguish fire with the help of $CO_2$ based extinguisher

Action Plan of on-site Emergency Plan

- The action plan considered is given as follows:
- To constitute Disaster Management Committee under senior officer not below the rank of General Manager
- To identify potential hazards areas in the layout map
- To predict degree of burns and distance of the risk zone by using model
- To evacuate the area within risk zone
- To localize the emergency and if possible, eliminate it
- To minimize the effects of accidents on people and property
- To take remedial measures in the quickest possible time to contain the incident and control it with minimum damage
- To mobilize the internal resource and utilize them in the most effective way
- To get help from the local community and government official to supplement internal manpower and resources
- To minimize the damage in other sections
- To keep the required emergency equipment in stock at right places and ensure that they are in working condition
- To keep the concerned personnel fully trained in the use of emergency equipment
- To give immediate warning to the surrounding localities in case of emergency situation arising
- To mobilize transport and medical treatment of the injured
- To educate the public in the surrounding village regarding hazards
- To arrange treatment of causalities
- To safe guard the people
- To identify the causalities and communicate to persons known to them
- To render necessary help to concerned
- To rehabilitate area affected

**Urban Floods:**

Floods are extreme events, usually triggered by extreme precipitation (river/inland floods) and/or storms (coastal floods). If these rainfalls exceed the retention capacity of the basins, drainage speed and volume, it causes floods.

**Different Types of Flooding:**

1) Localized flooding due to inadequate drainage;

2) Flooding due to overflows from River, where settlements have taken place in the flood plains.

**Stakeholders in Disaster Management:**

The policy also systematizes a frame work of operation for the following set of stakeholders that play key roles in disaster management.

- Kerala State Disaster Management Authority
- State and Central Government Departments
- District Disaster Management Authorities
- Local authorities including Municipal Corporations/Municipalities, District/Block/Grama Panchayaths, Taluk/Village Officers etc.
- Voluntary and Civil Society Organizations
- Red Cross, multilateral aid agencies and U.N agencies
- Community – Village Disaster Management Committees / Task Forces
- Public sector Undertakings
- Private sector undertakings
- Army, Navy, Air Force, Coast guard, Airport Authority, National Disaster Response Force etc.

**6.4Environmental Monitoring Plan**

Monitoring at a dumpsite site is carried out in four physical zones as follows:

i. On and within the dumpsite
ii. In the unsaturated subsurface zone beneath and around the dumpsite
iii. In the groundwater (saturated) zone beneath and around the dumpsite

iv. In the atmosphere/local air above and around the dumpsite

The Environmental Monitoring Program involves the following:

- Conducting survey and sampling program.
- Analysis of samples and data / information collected, and interpretation of data and information.
- Preparation of reports for submitting to management and statutory authorities.
- Environmental monitoring is carried throughout the project operation to detect changes in the key environment quality parameters, which can be attributed to the project.

The results of the monitoring program used to evaluate the following.

- Extent and severity of the environmental impacts against the predicted impacts
- Performance of the environmental protection measures or compliance with pertinent rules and regulations.

### 6.4.1 Air Environment

The potential sources of air pollution from the dumpsite include vehicular movement, emission of dust from biomining activities & wastes retrieved and stacked, and passive leakage of landfill gas from the disposal site. Other important contributor is odour emissions from the existing legacy site disturbed. Monitoring of the air environment will be carried out during the operational phase in and around the project site.

### 6.4.2 Noise Environment

The operations shall induce noise due to operations of transport trucks (men & material), JCB loaders and other types of machinery required at the dumpsite for moving wastes, screening, stacking, turning etc, and the biomining activity per se. Monitoring of ambient noise levels and also the exposure of the workers to that environment is essential.

### 6.4.3 Water Environment

Water quality to be monitored during the operational phase. The monitoring frequency needs to be increased if higher concentrations are expected. Both groundwater regime and

surface water domain is anticipated to be most-affected, through leachate contamination. Therefore, surface water will be periodically monitored for the parameters particularly the heavy metals and the hazardous chemicals

### 6.4.4 Land Environment

The soil in the neighboring areas will be analyzed for the relevant parameters. The land environment also includes developing a green belt.

The details of Environmental Monitoring Programs are given below:

*Table 19 Environmental Monitoring Parameters*

| Environmental components | Locations | Frequency | Parameters |
|---|---|---|---|
| Ambient Air quality | Nearby habitations and downward locations | Quarterly [1 sample] | $PM_{10}$, $PM_{2.5}$, NOx, CH4, CO, Ammonia |
| Noise | Within the site | Monthly | Noise levels |
| Ground and Surface water | Ground water from the nearest well and streams or river | Quarterly | IS 10500:2012 drinking water parameter if required |
| Accidental release | Chemical, oil and fuel spills | Daily | Nil |
| Health safety Hazards | Medical records, documentation of injuries and accidents, Health and safety assessments | Monthly | Health and safety survey |
| Leachate | 1 point per leachate pond | Quarterly | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD |

| Environmental components | Locations | Frequency | Parameters |
|---|---|---|---|
| | | | • Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins |

In case of any deviation from FR, this would be updated and mitigation monitoring measures would be revisited. Currently the location of disposal of biomined material, or type of transport of biomined material is unknown & hence, these impacts & mitigation, monitoring requirements will be updated & implemented by the Contractor. This aspect should be made a Bid condition.

### 6.5 Environmental & Social Safeguard Budget

The details of Environmental Budget for Implementation and Supervision of Environmental Management Plan (EMP) is given below:

*Table 20 Environmental & Social Safeguard Budget*

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| | **Environmental Safeguards** | | | | |
| 1 | Deodorizer equipment (power sprayer) | Only Once | [redacted] | [redacted] | [redacted] |
| 2 | Green Net (Approx., 280 m Length – Height – 3 m) and installation charges | Based on requirement | [redacted] | [redacted] | [redacted] |

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| 3 | Spillage Kit | Only Once | [redacted] | [redacted] | [redacted] |
| 4 | Monitoring of Environmental parameters [Air, Ground water, Surface water, Noise, Soil and Leachate] Actual Noise abatement, odour management, dust management measures to be included in DPR cost | Quarterly, first six months by contractor and next two years by ULB | [redacted] | [redacted] | [redacted] |
| 5 | Gas monitoring to check the gas accumulation at the dumpsite | Gas monitoring should be conducted at least twice a day for about 7 consecutive days | [redacted] | [redacted] | [redacted] |
| 6 | Personal protective equipment | Entire Process | [redacted] | [redacted] | [redacted] |
| 7 | Training on capacity building | Entire Process | [redacted] | [redacted] | [redacted] |
| 8 | Leachate Management (Full costs included in DPR. This is only for incidental mitigation of odur, leaks, spillage, flies etc.) | Entire Process | [redacted] | [redacted] | [redacted] |

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| 9 | Site Access Road Improvisation | One time | [redacted] | [redacted] | [redacted] |
| | **Social Safeguards** | | | | |
| 10 | Overall Budget for Social Safeguards | | [redacted] | [redacted] | [redacted] |
| **TOTAL (actual costs for works involved for mitigation measures are to be included by the contractor in DPR costs based on his work method. This is only indicative cost for incidental mitigation & management measures. EHS in Labour camp also not included here; but shall be included by the contractor based on his work plan as this is combined with multiple other dumpsite biomining works)** | | | | | [redacted] |

## 7. INSTITUTIONAL ARRANGEMENTS

### 7.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of Terms of Reference (ToR) for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation.

The Support Organization will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level.

The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The

PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU.

### 7.2 Capacity Building

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is a long-term, continuing process, in which all stakeholders participate.The dumpsite remediation requires the following capacity building programmes;

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for ULB officials includes elected representatives, municipal officials.

**Importance of Capacity Building**

Capacity building is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

### 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – https://kswmp.org/grievances/grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward

level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

A municipal level GRM committee is required to constitute during the subproject implementation. It will help to solve the issues locally. The Municipal Chairperson, Ward Councillor, Municipal Secretary, community representatives, contractor, social workers, subject expert etc are the proposed members in the committee. The municipality can include more members if required.

## 8. PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

"Public Consultation" refers to the process by which the concerns of local affected persons and others who have plausible stake in the environmental impacts of the project or activity are ascertained with a view to taking into account all the material concerns in the project or activity design as appropriate.

The proposal is to remediate the existing site in order to protect the environment and human health of the nearby area. The summary of the document will be made available in the website, which will also be featured in a newspaper advertisement in Malayalam language for public disclosure.

### 8.1 Consultation Meeting

In connection with the dumpsite remediation, a consultation meeting was conducted on 03.06.2023. Stakeholders from different social entities participated in the consultation meeting followed by a transect walk. Political and local leaders, Kudumbashree members, Municipal ward councilors, HKS, officials from DPMU, ULB, PIU and TSC participated.

In the meeting, SWM Engineer explained about the proposed dumpsite remediation activities with a positive note on how the remediation activities beneficial to the local community. The local residents extended whole support from the local people for the dumpsite remediation activities. Further, a detailed description on dumpsite remediation was given by the Social and Communication expert, DPMU. Participants expressed their concerns regarding the proposed project activities and its implementation modalities. The participants were happy that the lifelong bad image of 'trenching ground' would get removed since it was highly a stigmatized usage.

### 8.2 Outcome of the meeting

A transect walk was carried out followed by the meeting with the participation of stakeholders. The participants, after the meeting and interactions, extended support for the dumpsite remediation activity. The meeting also discussed various aspects of dumpsite remediation in detail including the possible social and environmental issues that may affect their routine life as well as the free movement during the time of operation.

### 8.3 Information and Education and Communication (IEC) Plan

| IEC Plan for dumpsite remediation - Koothuparamba | | | | |
|---|---|---|---|---|
| **Programme** | **Methodology** | **Topic** | **Responsibility** | **Monitoring** |
| **Sensitization/ Awareness programme** | Meetingwithallconcernedstakeholder'swithpriornotificationtodiscussaboutheprocessandremediationmethods | Process of dumpsite remediation Developing as a Recreational Park | Contractor | TSC/DPMU /DPMC |
| **Cautionary notification boards** | About vehicle movement and the transit of waste | precautionary measures should the general public take. | Contractor | TSC/DPMU /DPMC |

**Conclusion**

The dumpsite remediation activity at Koothuparamba municipality falls under moderate social risks. However, a set of risk mitigation activities are mentioned in the scoping of social management plan to overcome the identified risks and its negative impacts. Formation and regular meeting of GRM & stakeholder's committee, awareness generation counseling for the aggrieved parties, gender sensitization, legal awareness, providing safety are the major mitigation measures. This proposal is made to reduce the social risk associated with dumpsite remediation and to minimize the negative social impacts.

**Annexure 1 – Environmental Screening**
**Environmental Screening**

**Sub Project Details**

| Name of Subproject: | Dumpsite Remediation |
|---|---|
| Sub project Components: | Dumpsite Remediation |
| Subproject Location (City / Town/ Village with ward numbers): | Koothuparambu ULB, Ward 5 Palaparamba,Kannur District. |

**Stage 1: Exclusion List**

| Sl.No | Non-permissible Activities |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016 (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible) |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |
| The project does not fall under the above conditions as mentioned under exclusion list | |

**Stage 2: Environmental Screening Checklist**

| Project Details | | |
|---|---|---|
| S.No | Components | Details |
| 1 | Project Components | Dumpsite Remediation |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non- | • Biomining of dumpsite |

| Project Details | | |
|---|---|---|
| S.No | Components | Details |
| | biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities / associated facilities) | |
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination) Site Survey No:/s (attach map) with ownership details, Geographical co-ordinates of the site location [including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | Latitude:11°50'10.6"N<br>Longitude:75°34'19.2"E<br>Land ownership: Koothuparamba Municipality.<br>Land use: Public and Semi Public.<br>Door no. MCF: 5/209G; RRF 5/209F; Windrow composting: 5/209E<br><br>Disaster Zone: It falls under Zone III (Moderate) |

| 5 | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | Operational phase – 0.5 KL/day |
| 6 | Power Required and Source of Power | Demand load for the proposed equipment during the remediation process will be made available by DG sets |

**Baseline Environmental Conditions**

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| 1<br><br>(i) | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | No | The project site is not located near any Critically Vulnerable Coastal Areas (CVCAs), Eco sensitive Areas (ESAs) |

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| | Critically Vulnerable Coastal Areas (CVCAs), Eco sensitive Areas (ESAs) | | | |
| (ii) | Cultural Heritage site, protected monuments - listed by ASI/State | | No | The project site is not located near any cultural Heritage or protected monuments as listed by ASI/state |
| (iii) | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species? If yes, which is the area? | | No | The project site is not located near Natural Forests / Protected Areas / Bio-Reserves |
| (iv) | Other Wetlands/ Mangrove/ Estuarine Region | | No | The project site is not located near any Wetlands/ Mangrove/ Estuarine Region |
| (v) | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | No | The project site is not located near any Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves<br>There is a river Anjarakandy which is located at an Aerial distance of 3.5 km away from the site |
| (vi) | Other Sensitive Environmental Components listed in EMF | | No | No other sensitive environmental components listed in EMF exist nearby the project site |
| (vii) | Drinking water source, upstream and downstream uses of rivers, etc | | No | No river source is resorted for drinking water use |
| (viii) | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | No | The sea is located 13 km (Aerial Distance) from the project site |
| (ix) | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | Yes | | a. **Nearest Habitation-** 20 Houses are located within 200 m radius of the dumpsite<br>b. **Religious Place-** Temple (Noonjiyil Bhagavathi Sthanam) is located at an |

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| | | | | aerial distance of 170 m away from unit<br>c. **School** – Koothuparamba High School is located at an aerial distance of 730 m<br>d. **Hospital** – Cimhans Hospital is located at an aerial distance of 750 m<br>e. **Tourist Places** – Areekkal waterfalls is located at an aerial distance of 10.5 km<br>f. **Airport** – Kannur International Airport is located at an aerial distance of 9.5 km |
| 2 | Is the site in Critical / Over Exploited Ground Water Block. Provide the level of the groundwater table | | No | Site falls under semi-critical block |
| 3 | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | | No | The site does not fall under major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion<br>There may be chance of fire due to the following<br>1. Fire breaking due to high temperature<br>2. Electrical short circuit due to poor maintenance.<br>3. Smoking in the premises near the waste storage.<br>4. Burning of the waste by unauthorized persons<br>5. Keeping highly flammable materials like, cooking gas, kerosene, match boxes, etc. |

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| | | | | 6. Not having provision for proper fire/smoke detecting system. |
| 4 | Describe the type of soil and vegetation on site | Yes | | Laterite and red soil is predominantly available and few trees are present inside the site |
| 5 | Is the site present in the flood plains as recorded in the last 100 years. Provide the HFL level of the site/region | | No | The sea is located 13 km (Aerial Distance) from the project site |
| 6 | Existing pollution/contamination or degradation on site | Yes | | Dumpsite located in Koothuparamba ULB is the existing contaminationand detailed under section 3.11 |
| 7 | Any other remark on baseline condition | | No | There is no other remark on baseline condition |

**Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils**

| S.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Total extend of land to be covered/built | Yes | | 0.98 acres where waste is dumped |
| 2 | Total extend of land where the waste will bedumped openly / or expected to get contaminated by waste or leachate/material storage | | No | Nil |
| 3 | Extend of Land to be remediated | Yes | | 0.98 acres where waste is dumped |
| 4 | Extend of land expected to be under green belt | Yes | | Will be under the scope of contractor |
| | Proposed project cause the following on Land / Soil: | | | |
| (i) | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | No | There will be no major impact other than the operational phase as this project is remediation project. During operational phase the anticipated impacts are |

| | | | | |
|---|---|---|---|---|
| | | | | identified and mitigation measures are provided |
| (ii) | Substantial removal of Top Soil (mention area in sqm) | | No | NA |
| (iii) | Any degradation of land / eco-systems expected due to the project? | | No | There will be no Land degradation instead it will be a remediation of land from further contamination |
| (iv) | Loss or impacts on Cultural/heritage areas/properties | | No | There will be no loss or impacts on Cultural/heritage areas /properties |
| (v) | Does the project activity involve cutting and filling/ blasting etc? | | No | The project does not involve cutting and filling/ blasting as the building is existing. |
| (vi) | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | Yes | | The project will have physical change in a positive way by clearing the waste dumped into vacant land |
| (vii) | Will the project involve any quarrying/ mining etc.? | | No | The project does not involve any quarrying/ mining |
| (viii) | Will the project / any of its component contaminate or pollute the Land? | | No | Presently there is contamination and due to the project activity, the further contamination shall be eliminated and natural system shall be restored |
| (ix) | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | No | There will be no negative impact due to the proposed project |
| (x) | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | No | There will be no negative impact due to the proposed project |

| S.No | Impacts on Air and Noise Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | Yes | | It will be minimal and adequate mitigation measures will be taken to reduce the impact. |
| 2 | Will the project cause or increase pollution due to GHG emissions? | | No | Nil |
| 3 | Will the project cause or increase odour nuisance? | Yes | | The Biomining project will be create odour nuisance but it is temporary and once the process is completed there will be no odour nuisance. |
| 4 | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | Yes | | There may be chance for any release of toxic gases or potential fire outbreaks which will be mitigated through proper mitigation plan. |
| 5 | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | Yes | | The Biomining project will create increase in noise level but it is temporary and once the process is completed there will be no noise |

| Sl.No | Impacts on Water Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 2 | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact |

| | | | | |
|---|---|---|---|---|
| | | | | with the surface or ground water |
| 3 | Chances of Pollution of Water bodies / groundwater wells, nearby or downstream | | No | There will not be any chance of pollution of water bodies / groundwater wells, nearby or downstream |
| 4 | Will the activities proposed at the site(s) hinder natural drainage | | No | The activities proposed at the site will not hinder natural drainage and the proposed activity will improve the natural pathway without any obstacles. |
| 5 | Will the activities proposed at the site(s) decrease permeability /rainwater percolation | | No | The activities proposed at the site will not decrease permeability /rainwater percolation |

| S.No | Impacts on Bio diversity & Host Communities | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project necessitates cutting of Trees /Loss of Vegetation | | No | There will be no cutting of trees /no loss of vegetation due to this project |
| 2 | Will the project necessitate substantial removal of Top Soil (mention area in sqm) | | No | There will be no Substantial removal of Top Soil.<br>During the excavation of waste there is a slight chance of the top soil to get removed and the same will be mitigated with byproduct (bio earth) of this activity |
| 3 | Any degradation of land / eco-systems expected due to the project? | | No | There will be no degradation of land / eco-systems expected due to the project activity. Also, the proposed activity will |

| | | | | |
|---|---|---|---|---|
| | | | | protect the land from further contamination |
| 4 | Will the project result in Health & Safety Risks in the neighborhood including the release of toxic gases, leachate, accident risks | | No | There may be chance of accidental risks due to leachate and toxic gases, which will mitigated by proper lined leachate drain and PPE kits |
| 5 | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | | Yes | There will be no major impact. During operational phase there will be noise pollution due to movement of vehicles which will be curtailed by adopting mitigation measures. |
| 6 | Potential disruption to common property,accessibility, traffic disruptions, conflicts, or disruption to the local community within the subproject area? | | Yes | There will be no major impact. During operational phase there will be slight increase in traffic due to movement of vehicles which will be mitigated by adopting movement of vehicles during off peak hours. |

**Project Categorization and Need for Safeguards Instruments**

| **Project category** | E1 ☐ E2 E ✓ ☐ |
|---|---|
| **Key Reasons** | During screening, it has found that the proposed subproject is moderately causing impact to the base line environment, land/ soil / water /noise environment, biodiversity or to the community. Hence it is categorized as E2. |
| **Safeguards Instruments Required** | a) E1: Project-specific EIA (impact assessment considering the project details & location) by Independent Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities) |

| | |
|---|---|
| | b) E2: Project-specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>c) E3: signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities |

| Status | Agency / Official | Name, Signature with Date and Seal |

| **Prepared by** | PIU or ULB (project in charge) | |
| | Environmental Engineer | |
| **Checked, categorised as __ (E1, E2, E3) & ToR issued by:** | DESDU / SESDU | |
| | Environmental Specialist | |

**Annexure 2 – Fire and Risk Assessment**

A fire and risk assessment is a systematic evaluation of potential fire hazards and associated risks within a particular environment or premises. The assessment aims to identify potential fire hazards, assess the level of risk they pose, and recommend measures to mitigate or manage those risks effectively. Fire and risk assessments are essential for ensuring the safety of the workers, protecting property, and complying with fire safety regulations.

The existing legacy waste dumpsite, occupying about 0.98 acres in ward 5 Palaparamba, aims to fully reclaim the land for future development. Bio-mining, a technique chosen after careful evaluation will be used to recover the land and ensure sustainable and environmentally friendly treatment of the waste. The process will yield various by-products, which require immediate attention to prevent fire hazards.

The by-products and their intended use are as follows:

1. The bio earth & Coarse fraction (8774 tons) waste will be utilized for the development of the reclaimed legacy waste dumpsite as a green park/facility.
2. Refused derived fuel (RDF) of 3396 tonswill be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the process.
3. Recyclables of 445 tons will be sold to authorized recyclers

The RDF by-product& recyclables, totaling around 3841 tons, poses a potential fire risk and requires proper handling. To mitigate the risk, a storage and disposal process spanning 3 to 4 months has been devised. During this period, the contractor will implement various protective measures to prevent the possibility of a fire outbreak.These following measures are important for preventing fires, ensuring the safety of workers and nearby communities, and minimizing risks to the environment and property.

**Pre-Construction/Planning Stage:**

1. Fire Safety and Emergency Plan: Develop a comprehensive fire safety plan and emergency response plan to address potential fire incidents.
2. Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard.

3. Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.
4. Fire Equipment: Ensure that the site is equipped with fire extinguishers.

**Storage of Waste & RDF:**

**Fire Standards and Facilities:** Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.

Below equipment and their required quantities should be strategically positioned according to the site's specifications.

- Fire extinguisher (A, B, C powder): It will be used to immediately put off fire caused by wood, Paper and textiles, flammable liquids and flammable gases. Commonly can be placed anywhere inside the site
- Fire extinguisher (Foam spray): Mainly used to put off the fire caused by flammable liquids. It should be placed in diesel storage area, lubricant storage area and DG sets.
- Fire extinguisher ($Co_2$): Mainly used to put off the fire caused by Electrical short circuit. It should be placed near the control panel room/operation room.
- Fire bucket filled with sand: It should be placed near the diesel storage area

To ensure rapid response in case of a fire, it's essential to have a water tanker filled with water, equipped with a fire-fighting hose, readily accessible along with the portable motor. The presence of this equipped water tanker ensures timely and effective action during fire emergencies.

The following points to be considered for assessing the fire risk and procedure to mitigate it.

1. Identification of Fire Hazards: The first step involves identifying potential fire hazards in the premises. These hazards could include sources of ignition (e.g., electrical equipment), combustible materials (e.g., flammable liquids, paper, cardboard), and other factors that could contribute to the outbreak of a fire.

2. Assessment of Risk: Once the hazards are identified, the next step is to assess the level of risk associated with each hazard. This involves evaluating the likelihood of a fire occurring and the potential consequences if a fire were to break out.
3. Escape Routes: Since operational phase occurs in an open environment, the need for conventional escape routes in the event of a fire emergency may not be required.
4. Fire Safety Measures: The assessment reviews existing fire safety measures in place, such as fire alarms, fire fighting equipment, and fire suppression systems. Proper assembly point is required in case of fire break out
5. Emergency Procedures: The assessment evaluates the effectiveness of emergency procedures and evacuation plans in the event of a fire, ensuring that workers can safely evacuate the premises.
6. Fire Training and Awareness: The assessment considers the level of fire safety training provided to workers and the awareness of fire hazards and evacuation procedures.
7. Record-Keeping: Detailed records of the assessment process, findings, and recommended actions are maintained for future reference and regulatory compliance.
8. Recommendations: Based on the assessment, the fire risk assessor provides recommendations for improving fire safety, which may include installing additional fire safety equipment, conducting training programmes, or implementing any changes to reduce fire risks.
9. Review and Updates: Fire and risk assessments should be regularly reviewed and updated to account for any changes in the premises or regulations.

Fire and risk assessments play a crucial role in preventing fires and minimizing their impact if they occur. They are particularly important for dumpsites and other places with a higher risk of fire hazards to ensure the safety and well-being of workers.

NOTE : The major assessments had been referred based on the EMF Vol-II Part A – Indicative EMP

**Annexure 3 –Checklist for screening of dumpsites for potential landfill/ processing facility**

| Name of the contact person from ULB-Phone number and email Address | Koothuparamba |
|---|---|

| S.No. | Item | Norm | Information |
|---|---|---|---|
| 1 | Land ownership (including that required for approach road) (inline with revenue records)(supporting data to be provided as annex) | | Koothuparamba, Municipality |
| 2 | Name of the location of site and Map of the site (include as an annex) | | Palaparamba,Koothuparamba |
| 3 | GPS coordinates of site | | Latitude: 11°50'10.6"N<br>Longitude: 75°34'19.2"E |
| 4 | Is there a Pollution Control Board permit for dumping /SWM activity? | | Yes |
| 5 | Is there a notified no development zone or buffer or green belt around the dump? | | No |
| 6 | Possible area to be kept as buffer green belt around (within /outside the site for purchase) | | Not available |
| | **Site Selection Criteria - give distances, wherever applicable** | | |
| 7 | Groundwater (m below liner bottom) | 2m | No |
| 8 | Private water sources (well etc.)- distance from site boundary (to beadjudged based on approx. distances during screening exercise) | 100 m (river) | No |
| | | 200 m (Pond) | No |
| | | 30 m (Local Canal) | No |

| | | | |
|---|---|---|---|
| 9 | Env. Sensitive Areas/ Wetlands | Not Permitted | No |
| 10 | Site having Rare and Endangered Species | Not Permitted | No |
| 11 | Site should not be within Protected/Reserve Forests | Not Permitted | Site is Not within the Protected/ Reserve Forests |
| 12 | Residential Development within prescribed buffer zone of 200 m | Not Permitted | Yes. Local Residents nearby Dumpsite within 200 m |
| 13 | Perennial Stream within site | Not Permitted | No |
| 14 | Airport | 20 Km | Yes. Airport is located an aerial distance of 9.5 km |

| S.No | Item | Norm | Information |
|---|---|---|---|
| 15 | Distance to the nearest village in the predominant wind (m)direction | | Palaparamba |
| 16 | Flood prone site | | No |
| 17 | Accessibility - Road access for heavy vehicles | | No |
| | i. Starting point of the access road | | No |
| | ii. length and width of the access road | | No |
| | iii. Current condition of the access road (visual assessment) | | No |

| S.No. | Site Description | | |
|---|---|---|---|
| 18 | Is the site that/stopping to nearby uses | | High Land |
| 19 | Soil base-soft soil/murum,soft rock etc | | Hard Laterite & red soil |
| 20 | Direction of Leachate flow out of the site, if any | | All the existing waste are caped on 2012 |

| | | | |
|---|---|---|---|
| 21 | Other uses within the dumpsite(recycling yard, compost pad etc) | | Existing MCF,RRF, Composting building and new windrow provision available |
| 22 | Boundary conditions-walls/fence/what land uses along boundary | | Compound wall |
| 23 | Year since the dump site is existing | | 1973 |
| 24 | Is the dumping Operation Ongoing | | Still waste is dumping at dumpsite. |
| 25 | Any underground utilty/gas line etc near the site | | No |
| 26 | Existing power supply,water supply,electric poles going through/over/in the site etc. | | Yes. Bore well is inside the compound wall. |
| 27 | Are there pools of leachate ,rat and fly infestations, domestic animals roaming freely, odours, dust, vermin and birds, waste being burnt at dumpsites or families of scavangers picking through the wastes | | No |

| Geography and Climatic aspects | | | |
|---|---|---|---|
| 28 | Average annual rain fall | | 3471 mm |
| 29 | Duration of rainfall | | May to August |
| 30 | Whether any incidents of flooding reported at site/other hazards | | |
| | i. No | | |
| | ii. Very Rare | | Very Rare |

| | | | |
|---|---|---|---|
| | iii. Some times | | |
| | iv. Frequent | | |
| 31 | Any geological fault | | No |
| Waste Characteristics | | | |
| 32 | Characteristics of the dumps, such as the height and area, characteristics of solid waste based on visual inspection and degree of compaction (subjective), and any details of variability of wastes within the site | | The dumpsite began its waste disposal operations in 1973, and in 2012, the waste was capped. Currently, they are depositing waste in a nearby separate pit. |
| 33 | Type of waste (MSW/HW) (subjective assessment based on visual inspection) | | MSW |
| | i. 100% MSW | | |
| | ii. 75% MSW +25% (domestic and/ or biomedical/ HW/EW) | | Yes |
| | iii. 50% MSW +50% (domestic and/ or biomedical /HW/EW) | | |
| | iv. > 50% (domestic and/ or biomedical /HW/EW) | | |
| 34 | Expected waste contamination (visual check of ground water, littering, dust pollution, Smell/odour, Is the ground water being used for drinking purpose) | | Ground water not used for drinking. |

| | | | |
|---|---|---|---|
| 35 | How much quantum of fresh waste is dumped everyday? | | No |

| General Information | | | |
|---|---|---|---|
| 36 | Any reported Environmental and health impacts of existing dump (from ULB eg-media report or complaint) | | No |
| 37 | Any ongoing litigation or disputes related to site usage | | No |
| 38 | Potential for mining decomposed organic materials (compost from the existing dumps (By visual inspection) | | No |
| 39 | Presence of ragpickers and approx.how many? Male/Female and age group | | Not available as on visit time. But as per SWM data file 12rag pickers |
| 40 | Number of sensitive receptors close to dumpsite (approx.200 m which is buffer zone criteria) (mention distance to closest residence, social profile of the people, school, religious structure, wetland, forest, river, canal, Eco sensitive area, well, lake/pond) | | Nearby river within 3.5 km. Govt HS School within 730 m. |
| 41 | Available open / clean space in the dump yard which can used to develop a treatment facility till such time the dump is cleaned, and land is recovered (percentage of land available for use) | | Yes |

| | | | |
|---|---|---|---|
| 42 | Space / covered shed (which may be renovated to house segregation & storage facility) | | No |
| 43 | Estimated time for dumpsite capping/ mining/ remediation. Does it fall within the project lifetime? | | 100 days |
| 44 | Possible Range of solutions: rehabilitate existing open dumps through landfill mining where the resource recovery might serve as a source of energy, recycle and reuse of metals, plastic and glass ware, use of compost as fertilizer for agriculture and as a cover material for future landfills, etc. | | RDF materials can be processed and used for cement kilns. |
| 45 | Is dumpsite remediation likely to benefit in regaining a suitable site for an engineered landfill cell or for setting up any other waste management facility? If yes, what could be set up? | | There is a demand for the establishment of new MRF. |
| 46 | Likely area of the site which can be salvaged for future use More than 70%, 50-70%, 30-50%, Less than 30% | | 50 %. |

| Upstream Linkages required | | | |
|---|---|---|---|
| 47 | Stop the waste coming to the site or delineate a separate area for proper processing of waste. | | Dumping of waste to be stopped |
| 48 | Intention of anchor ULB (where the site is located) to allow the facility to be used as a regional facility, with | | After thorough stakeholder consultation, the |

| | | | |
|---|---|---|---|
| | other ULBs falling in the cluster, on a cost sharing basis. | | recommendation is to process the waste at a standalone site. |
| Downstream Linkages required | | | |
| 49 | Off-take of all the products coming out of the biomining - Plastic & RDF - cement factories, soil/bio-earth - farmers or gardens, inert - SLF/closure | | Forward linkage for the RDF yet to be finalized |
| 50 | Any wastewater treatment facility whether available within 10 km where leachate can be transported for treatment. | | No |
| Other Information | | | |

## Annexure 4 Occupational Health and Safety

Occupational Health and Safety Risk Assessment for Dumpsite Remediation is as follows

### 1. Introduction:

The purpose of this Occupational Health and Safety (OHS) Risk Assessment is to identify, assess, and mitigate potential hazards and risks associated with the implementation of a Biomining project for dumpsite remediation. Biomining is a sustainable and environmentally friendly method used for the disposal of dumped waste and reclamation of land.

### 2. Scope:

This risk assessment focuses on the occupational health and safety aspects of the Biomining process for dumpsite remediation. It covers the potential hazards and risks that workers may encounter during site preparation, Biomining operations, and waste disposal activities. The assessment will also outline control measures to minimize or eliminate these risks.

### 3. Hazard Identification:

Biomining process identifies potential hazards, which include but are not limited to:

a. Chemical Hazards: Exposure to hazardous chemicals present in the dumpsite waste and chemicals used in the Biomining process.

b. Biological Hazards: Potential health risks associated with the presence of pathogens, disease-causing microorganisms, and vectors within the waste. These hazards can arise from the decomposition of organic matter, the presence of infectious materials, and the attraction of disease-carrying organisms such as rodents, insects, and other vermin.

c. Physical Hazards: Potential for slips, trips, and falls on uneven terrain or during equipment operation.

d. Mechanical Hazards: Risks associated with operating and maintaining heavy machinery.

e. Ergonomic Hazards: Strain and injuries related to improper handling of equipment or materials.

f. Environmental Hazards: Adverse effects on air and water quality during the Biomining process.

**4. Risk Assessment:** The risk assessment will categorize the identified hazards based on their severity and likelihood of occurrence. Each hazard will be evaluated using a risk matrix to determine the level of risk and priority for mitigation.

### 5. Risk Mitigation Measures:

To ensure the safety of personnel involved in the Biomining project, the following risk mitigation measures will be implemented:

a. Engineering Controls:

- Regular maintenance and inspection of machinery to prevent mechanical failures.

- Providing appropriate personal protective equipment (PPE) to workers.

b. Administrative Controls:

- Developing standard operating procedures (SOPs) for Biomining operations.

- Implementing a comprehensive training program for all personnel involved in the project.

- Scheduling regular breaks and rotation of tasks to minimize fatigue.

c. Environmental Monitoring:

- Regular monitoring of air and water quality to ensure compliance with safety standards.

- Establishing emergency response protocols in case of any unexpected environmental events.

d. Emergency Preparedness:

- Developing and practicing emergency response plans for potential accidents or incidents.

- Providing workers with first-aid training and easily accessible medical facilities.

e. Personal Protective Equipment (PPE):

- Mandating the use of appropriate PPE, such as respirators, gloves, safety goggles, and protective clothing.

**6. Worker Health Surveillance:**

Implementing a health surveillance program to regularly monitor the health of workers involved in the Biomining project. This may include medical examinations and assessments to detect any health issues related to exposure during the remediation process.

The work site to be equipped with first aid and the contractor must have tie-up with nearest primary health center/ medical facility for the welfare of the Labours.

**7. Training and Education:**

Conducting comprehensive training and educational programs for workers and supervisors to raise awareness of potential hazards, proper handling of equipment, and the correct use of PPE.

## 8. Conclusion:

By proactively identifying potential hazards, assessing risks, and implementing appropriate control measures, this Occupational Health and Safety Risk Assessment aims to ensure the safe and successful execution of the dumpsite remediation Project through Biomining. Continuous monitoring and improvement will be essential throughout the project to maintain a safe work environment.

## EXECUTIVE SUMMARY

Koothuparamba Municipality is one of the rapidly developing urban local bodies in Kannur district. Even though the ULB has an excellent practice of waste management, the primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing the dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Consequently, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project for the remediation of legacy waste dumpsites in all the ULBs. As part of the project, the existing dumpsite at Koothuparamba, ward 05, Palaparamba was proposed for remediation.

The Koothuparamba municipality has an area of 16.76 sq.km with 28 wards. The municipality, with the financial and technical support of KSWMP, has taken up steps to remediate the existing legacy waste dumpsite located in around 0.986 acres of land inward 05, Palaparamba and to recover land for future developmental activities. The Palaparamba dumpsite was used for dumping municipal solid waste from the year 1973. The local residents are demanding to remediate the legacy dumpsite and to utilize the remediated land for social cause. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes.

To assess the quantity & composition of legacy waste & also evaluate the environmental baseline of the dumpsite, samples from representative locations were collected and analyzed for various parameters viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Groundwater and Surface Water. As part of the study, detailed site investigations were carried out for; – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical and Environmental Analysis by M/s Poluchem Laboratories. From the results of the investigations, it was found that the waste was seen upto a depth of 5.5m. The total estimated quantity of legacy waste is around 15102 $m^3$ considering the density of the material to be 0.836 tons/cum the total quantity of waste disposed before conducting the survey is estimated as (12625.27 tons).

As per the SWM Rules 2016, selection of an applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out, and based on the results, remediation can be done by a) Capping without land recovery, b) Bio-mining – reclamation/recovery of land and c) capping with partial land recovery. The selection of technology shall also depend on the available resources viz., manpower, machineries, money, and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by- products. Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite.

Copyright © 2023. KSWMP| All rights reserved.

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, mobile/compact screening machineries shall be optimum for processing the legacy waste of 15102 $m^3$ within the stipulated timeline of 31st March 2024.

Environmental & Social safeguards: The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project attracts moderate social risks based on the social mapping, transect walk and consultation with the people living around the proposed project site to assess the problems associated with the legacy waste dumpsite and the impact during the execution of the project.

By-products utilization/forward linkages/Usage

1. The approximate quantity of bio earth (7173.43$m^3$) & C&D (3322.44$m^3$) waste will be utilized for the development of the reclaimed legacy waste dumpsite as a Recreational Park/facility.
2. Refused derived fuel (RDF) of 4062.44 $m^3$ will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the process.
3. Recyclables of 543.67 $m^3$ will be sold to authorized recyclers.

The activities of bio-mining will be commenced from Dec 2023 and are expected to end by Mar 2024. An area of 0.986 acres (0.399 Ha) will be reclaimed and will be developed into a recreational park based on the ULB decision for public use. Total cost of the project is [redacted]/-. The cost per $m^3$ for processing and disposal of the legacy waste is [redacted]/-.

## 1. INTRODUCTION

Koothuparamba Municipality stands as a swiftly advancing urban local body within the Kannur district. Even though the ULB has an excellent practice of waste management, the primary environmental issue currently faced by the municipal authorities revolves around a longstanding existing legacy waste dumpsite. It has a long history of more than three decades of continuous dumping of both bio- and non-biodegradable wastes. Though the waste dumping activity has been stopped, the dumpsite remains as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Improper management of such sites pose significant environmental, social, and economic challenges for the communities and ecosystems in the vicinity.

In view of the environmental and social issues connected with dumpsites, the SWM Rules 2016, directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the remediation projects of legacy waste dumpsites in all the ULBs. As part of the project, the existing dumpsite of Koothuparamba, ward 05, Palaparamba was proposed for remediation.

For arriving at a methodology for remediating the legacy waste in the dumpsites, as per the Project Implementation Manual, a feasibility study outlining the technical, economic, and socio-environmental factors has been carried out. As a result of the feasibility study that involved detailed field investigations & assessment, and market sounding, the method proposed for remediation of legacy waste dumpsite is biomining, which will ensure long-term sustainability and environmentally sound treatment, which is found technically feasible, economically viable, and socially acceptable. The details of various steps involved in the feasibility study are described in the following sections. `

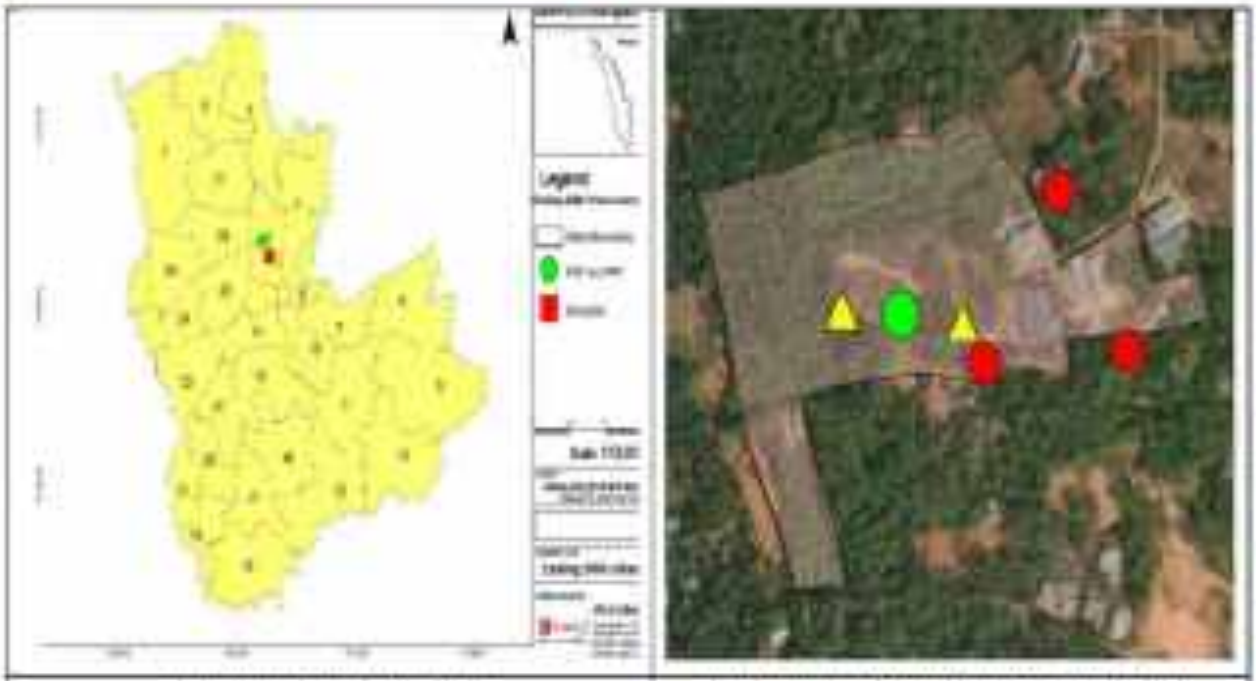
## 2. GENERAL DESCRIPTION ABOUT PROJECT

Koothuparamba municipality has an area of 16.76 sq.km with 28 wards. Solid waste generated from 9602 households and 1758 institutions including commercial establishments is 13.21 TPD. The municipality intends to strengthen and enhance the existing treatment facilities of the biodegradable & non-biodegradable waste system at household, institutional and community level for effective management of the solid waste generated, and also remediation of existing legacy waste dumpsite.



The Palaparamba dumpsite was used for dumping of solid waste from the year 1973. The local residents are in demand for remediating the legacy dumpsite and to utilize the remediated land for social cause.

The legacy waste is spread over an area of 0.986 acres with an average height of 4.5 m. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. The municipality intends to remediate the existing legacy waste dumpsite for the recovery of land and develop the same into a recreational park for the public use after assessed the suitability of the soil as per applicable standards. The details of the legacy waste dumpsite are provided below:

*Table 1 Dumpsite Details*

| Name of ULB | Koothuparamba |
|---|---|
| District | Kannur |
| Taluk | Thalassery |
| Location | Ward 05, Palaparamba,Koothuparamba. |
| GPS Co-ordinate of the Site | Lat: 11° 50' 10.14''N, Long: 75° 34' 18.959" E |
| Total dumpsite area (in acres) | 4 Acre 81.69 Cents |
| Legacy waste spread (in acres) | 0.986 |

# 3. LOCATION, DEMOGRAPHY, ACCESS, LAND-USE, WATER TABLE AND CLIMATE OF THE ULB

## 3.1 LOCATION

Koothuparamba municipality lies at 11°50'10.14''N, 75°34'18.959''E, located in Thalaserry Taluk of Kannur District with an area of 16.76 km$^2$, comprising 28 (Nos) administrative wards. The dumpsite located in the ward 05, Koothuparamba. It is situated about 68 km to the north of Kozhikode City and approximately 22 km to the south of Kannur City. Koothuparamba is surrounded by mattanur on the North, Panoor on the South, Iritty on the East, and Arabian Sea on the West. Location map of Koothuparamba is given below.

*Figure 2 Location of Koothuparamba Dumpsite*

## 3.2 POPULATION, DENSITY AND LITERACY RATE

As of the 2011 Census of India, Koothuparamba had a population of 34,501 with a decadal growth rate of 6.12 % with males constituting 16,560 (48%) of the population and females 17,940 (52%). The population of ULB in 2021 was 34,501, considering the decadal growth rate of 6.12 %. The

Copyright © 2023. KSWMP| All rights reserved.

density is around 1800 persons/sq.km. The sex ratio is 1054 females for 1000 males against the state average of 1084.

The literacy rate of Koothuparamba city is 96.76 %, which is higher than the state average of 94.00 %. In Koothuparamba, the male literacy rate is around 98.1 % while female literacy rate is 95.6%.

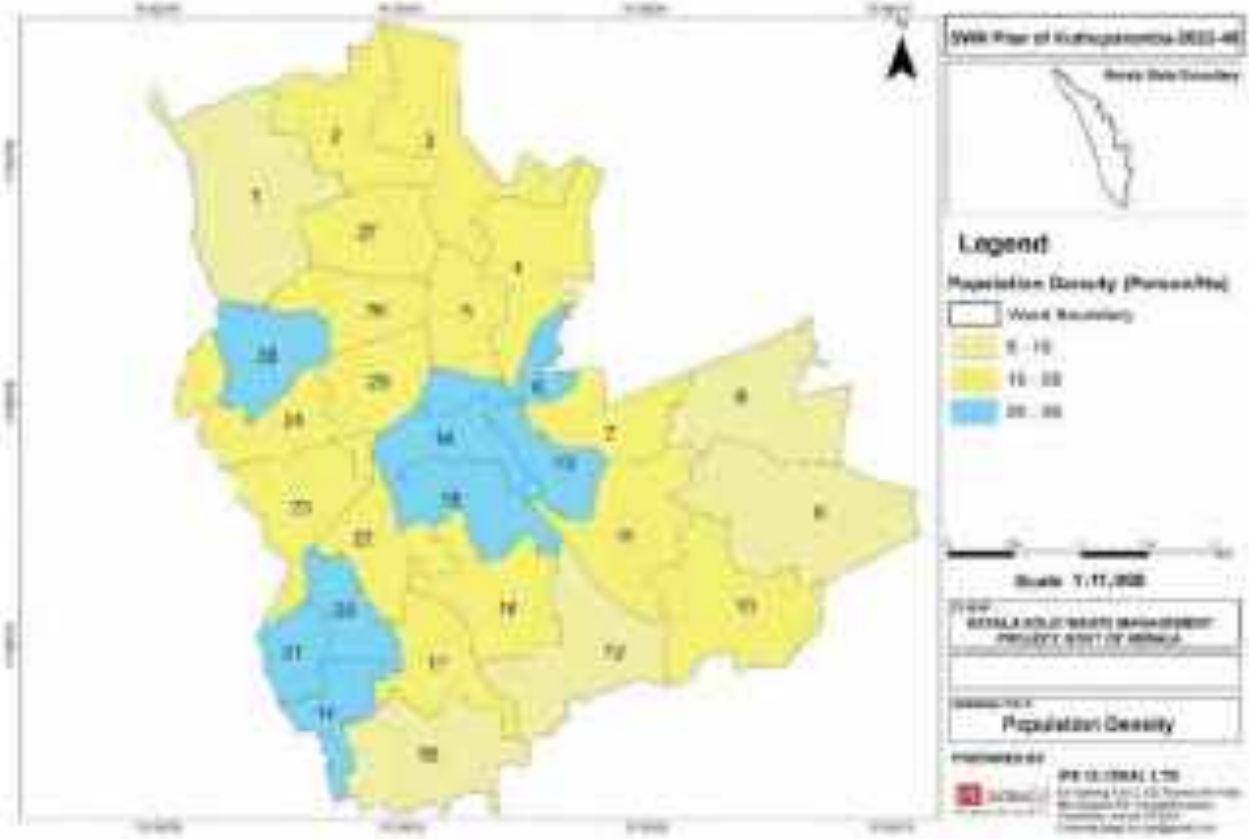

*Figure 3 Ward Wise Population Density (Person/ha)*

## 3.3 LAND USE

The Koothuparamba municipality has a total area of 16.76 Sq. km. The study area's land use has been assessed through satellite data interpretation and confirmed during on-site visits. The primary findings regarding the Koothuparamba

The land use indices of Koothuparamba municipality are shown in below figure.

*Table 2 Land Use Indices*

| Description | Area (in sq.km.) | Land Use % |
|---|---|---|
| Residential | 10.66 | 64 |
| Institutional | 0.54 | 3 |
| Agricultural | 4.51 | 27 |
| Recreational and Open Space | 0.02 | 0 |

| **Total** | **16.76** | **100** |

Source: Master Plan for Koothuparamba town 2031(draft)

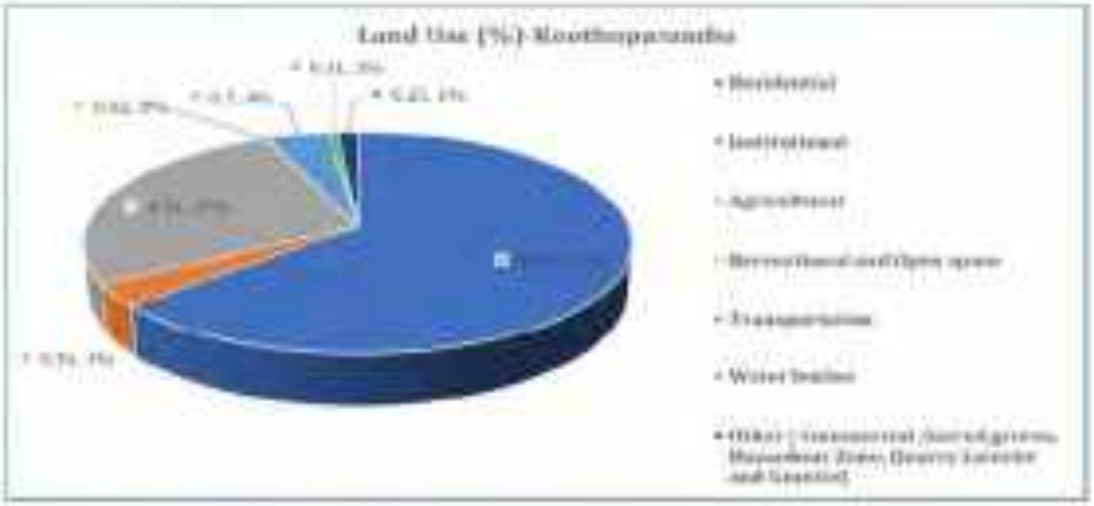

*Figure 4 Land Use Plan of Koothuparamba Dumpsite*

## 3.4 TRANSPORTATION CORRIDOR

*Table 3 Transportation corridor details*

| Mode | Details |
|---|---|
| Road | Koothuparamba town is a major junction connected by two state highways and a major district road to Wayanad. There are two state highways passing through the town, namely SH-30 (Thalassery – Coorg inter-state highway) and SH-38 (Kannur – Kozhikode road). These two roads act as major corridors of the town and possess good connectivity. Considerable volume of traffic from Karnataka passes through the town. In addition to this, other district roads and municipal roads exist within the town. |
| Train | There is no railway line, with the nearest railway stations is Thalaserry (14 Km from Koothuparamba). |
| Air | The nearest international airports are situated at Kannur (15 km away). |

Copyright © 2023 KSWMP | All rights reserved

### 3.5 TOPOGRAPHY

Based on altitude, the terrain is classified into three; low land, midland and highland.

*Table 4 Topographical Land Details*

| Altitude | Details |
|---|---|
| Low land | The Land lying between 0 to 7.5m from MSL is treated as low land. The lowland is the coastal land of Koothuparamba. |
| Midland | Land lying between 7.5m to 75m from MSL is treated as midland. Majority of the land area in Koothuparamba is midland. |
| Highland | There is no high land region in Koothuparamba |

The average elevation of the Koothuparamba is 38 m and falls under the midland category which can be seen from the figure below.

*Figure 5 Topographic Map*

Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope on southeast direction possesses a potential risk of leachate runoff, which could result in the contamination of surface water on thatside of the site.

### 3.6 CLIMATIC CONDITION

#### 3.6.1 TEMPERATURE & RAINFALL

Koothuparamba Municipality falls in the tropical to sub- tropical climatic region and dominant feature is the monsoon. The maximum temperature varies between 26.4°C and 31.50°C and minimum temperature varies from 21°C to 25°C. The maximum monthly rainfall is 1031 mm and the annual rainfall is 3586 mm.

### Table 5 Temperature & Rainfall Data

| Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Year |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Average high °C | 30 | 30.9 | 31.5 | 30.9 | 29.7 | 27 | 26.4 | 26.6 | 27.6 | 28 | 28.8 | 29.3 | 28.8 |
| Average low °C | 21.2 | 22.2 | 23.9 | 25 | 24.9 | 23.8 | 23.2 | 23.1 | 23.1 | 23.2 | 22.7 | 21.5 | 23.1 |
| Average precipitation mm | 7 | 6 | 26 | 109 | 264 | 695 | 640 | 427 | 249 | 279 | 121 | 33 | 2868 |

*Source: Climate-Data.org*

According to the Rainfall Data, the most favorable working period spans from December to March due to the lower precipitation levels.

## 3.7 FLOOD ZONE

According to the 2022 Flood Probability Report published by the Kerala State Disaster Management Authority, the Koothuparamba municipality has an area of 0.31 square kilometers (1.85% of the total area of 16.76 square kilometers) that is susceptible to flooding, with a peak elevation of 1.48 meters.

## 3.8 EARTHQUAKE ZONE

The Bureau of Indian Standards (BIS) has grouped the country into four seismic zones viz. zones II, III, IV and V as detailed in the Map below. The Kerala state falls under Seismic Zone 3.

## 3.9 COASTAL REGULATION ZONE

As per the Coastal Regulation Zone (CRZ) notification 2011 and further amendment in CRZ notification 2019, the Koothuparamba legacy dumpsite does not fall under the CRZ zone.

## 3.10 GROUND WATER LEVEL

The details of groundwater level during pre-monsoon and post-monsoon, and the average fluctuation is provided in the table below.

### Table 6 Details of Ground Water level

| Pre-monsoon (m) | Post-monsoon (m) | Avg. Fluctuation (m) |
|---|---|---|
| 7.15 | 5.60 | 1.55 |

# 4. DETAILED DESCRIPTION OF THE DUMPSITE

## 4.1 PHYSICAL FEATURE OF THE SITE

The total expanse of the dumpsite measures approximately 4.81 acres, with a portion of 0.98 acres being occupied by legacy waste. The average elevation of this legacy dumpsite is 5.5 meters. This historical waste repository is situated at geographical coordinates Lat: 11° 50'10.14'' N, Long: 75°34'18.959'' E in the region known as Palapparamba (ward-5), within the Koothuparamba district of Kannur.

At present, the Municipality's solitary dumpsite is located within the Palaparamba Area of Koothaparamba. Specifically positioned within ward No. 5, this site encompasses the Recycling and Recovery Facility (RRF) spanning 276 sqm, the Material Collection Facility (MCF) covering 276 sqm, the Windrow Composting Unit spanning 612.57sqm, and the Vermi-compost Unit 228.68 sqm. The Solid Waste Management Plan for Koothuparamba also outlines the proposed inclusion of an additional Material Collection Facility (MCF) of area 138.56 sqm.

The dumpsite is enclosed by a well-constructed compound wall, ensuring clear demarcation from the adjacent MRF, RRF, Windrow Composting Unit, and Vermi-compost Unit.

## 4.2 INFORMATION ON SITE MANAGEMENT

The Palapparamba dumpsite has served as a repository for solid waste disposal since 1973, spanning a period of over 50 years. This site remains operational and actively receives waste deposits. On a daily basis, it accumulates approximately 1.5 tons of mixed waste. The site is organized into three trenches, and over time, four capping procedures have been conducted to cover and secure waste deposits. The most recent capping operation was carried out in 2013.

## 4.3 SITE HISTORY INCLUDING PUBLIC PROTEST

In 2008, a protest emerged in response to the disposal of human excreta at a designated dumpsite. The situation gained further prominence in 2011 when leachate from the dumpsite infiltrated wells located in proximity to the adjacent residential areas, consequently intensifying the ongoing protests. By 2013, the municipality decided to address the issue by implementing waste capping measures.

## 4.4 DIRECTIONS FROM AUTHORITIES LIKE NGT, PCB, ETC.

### 4.4.1 NGT DIRECTIONS & ORDERS

The National Green Tribunal (NGT) has set norms and guidelines (O.A. No. 606/2018) to address legacy waste accumulated at long-operating dumpsites, to mitigate environmental and health hazards. The norms focus on closure and remediation of dumpsites, waste segregation and treatment using appropriate technologies, conducting Environmental Impact Assessments (EIAs), implementing land use planning and zoning regulations, monitoring and compliance measures, and promoting public participation and awareness regarding legacy waste management. These guidelines aim to stabilize dumpsites, prevent further pollution, and involve communities in decision-making and risk education.

Copyright © 2023. KSWMP| All rights reserved.

### 4.4.2 LOCAL SELF GOVERNMENT DEPARTMENT - GUIDELINES

The remediation of dumpsites is further directed by Honorable NGT in its order OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. Remediation of Legacy Waste Dumpsites through Bioremediation - G.O.(Rt)No.2629/2022/LSGD Dated, Thiruvananthapuram, 29-10- 2022

### 4.4.3 KSPCB - GUIDELINES FOR DUMPSITE REMEDIATION

The Kerala State Pollution Control Board (KSPCB) has established guidelines (PCB/HO/SEE2/Model City/Kozhikode corporation/2019 dated 09/09/2021) for dumpsite remediation to address the environmental and health impacts of waste disposal. The recommended steps include conducting a site assessment, developing a remediation plan based on risk assessment, selecting appropriate remediation technologies, implementing remediation activities under supervision, verifying the success of remediation, and ensuring long-term management and monitoring of the site. By following these guidelines, the KSPCB aims to mitigate the adverse effects of waste disposal, protect the environment, and safeguard public health.

### 4.4.4 CPCB GUIDELINES

Hon'ble NGT warned that due to incremental growth of Municipal Solid Waste (MSW), these MSW dumps are converting into virtual mountains. Hon'ble NGT further directed that every city/town should adhere to clause 'J' of Schedule–I (capping is not the first option for environmentally safe legacy waste management) of SWM Rules, 2016. Finally, Hon'ble NGT directed CPCB to propose Standard Operating Procedure (SOP) for implementation of Bio-mining and Bioremediation of legacy solid waste.

### 4.4.5 SWACHH BHARAT MISSION (SBM) ADVISORY

The advisory on dumpsite bioremediation addresses the challenges of legacy waste and promotes sustainable waste management practices and emphasizes the importance of dumpsite bioremediation as a sustainable solution for managing legacy waste. By adopting these guidelines, municipalities can address the environmental and health risks associated with dumpsites and promote a cleaner and healthier living environment for communities.

### 4.4.6 CENTRAL PUBLIC HEALTH AND ENVIRONMENTAL ENGINEERING ORGANIZATION (CPHEEO) GUIDELINES

The guidelines aim to provide a comprehensive approach to remediate dumpsites in a safe and environmentally sustainable manner. Key points from the guidelines include conducting site assessments, segregating waste, and implementing engineering and biological measures to control contamination, treating leachate to prevent groundwater contamination, and conducting post-remediation monitoring. These guidelines are crucial to ensure effective and environmentally sound dumpsite remediation that protects public health and the environment.

# 5 SCOPE OF WORK

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Koothuparamba includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (land recovery – Biomining, Capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the Environmental Management Framework – Vol II Part A.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Baseline assessment, impact & risk assessment, mitigations measures and Environmental Management & monitoring plan and its budget.
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport, Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 OBJECTIVES:

- To remediate the legacy waste dumpsite of approximately 12,625 Tons by 31st March 2024.
- To reclaim the legacy waste dump area and to develop recreational park facilities, thereby eliminating the chances of dump fires, leachate generation, and foul odor.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.
- To increase nearby real estate/social value and benefit the citizens.

# 6 COMPOSITION, CHARACTERISTICS OF LEGACY WASTE AND ITS IMPACTS

## 6.1 DETAILED INVESTIGATION STRATEGY

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below;

- ✓ Bore hole upto a depth of 9 m and collection of 3 (nos) samples from the soil at interval of 1.5 m
- ✓ Waste analysis viz., leachate sample from 1 (nos) locations and physical analysis from 2 (nos) location, and chemical analysis from 1 (nos) location.
- ✓ Environmental baseline analysis surface water 1 (nos) location and ground water samples from 3 (nos) location (Well Water Samples -1 up gradient, 2 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location

## 6.2 DETAILED INVESTIGATIONS

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

*Table 7 Investigation details*

| S.No | Parameters | Sampling Nos. |
|---|---|---|
| 1 | Geotechnical Investigation | |
| A | Boreholes up to 10m depth (as per CPHEEO Manual) | 1 |
| B | Permeability test- (as per CPHEEO Manual) standard penetration test SPT and collection of undisturbed samples - Soil Investigation - Classification, gradation, Atterberg's limit, Bulk density, dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, strength, compressibility (vertically-3 samples per borehole) | 1 |
| 2 | Waste & Environmental Analysis | |
| A | Leachate Analysis (TCLP usepa 1311) (SCHEDULE II of SWM rules, 2016), Suspended solids, Dissolved solids (inorganic),pH, Ammonical nitrogen (as N), Total Kjeldahl nitrogen (as N), BOD, COD, Arsenic (as As), Mercury, Lead, Cadmium, Copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds | 1 |
| B | Physical Analysis of waste (As per CPHEEO manual) including Density, Bulk Density, Moisture Content, Size of waste Constituents, Calorific Value | 2 |
| C | Chemical Analysis of waste/soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), total Carbon, C/N ratio, calorific value, Bio-chemical - biodegradable factor | 1 |
| D | Ground Water (Well Water Samples -1 up gradient, 2 down gradient) - (shallow and deep wells): pH, Colour, EC, Turbidity, SS, TDS, TOC, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, | 3 |

Copyright © 2023 KSWMP| All rights reserved

| | | |
|---|---|---|
| | TKN, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total Coliforms (IS 10500 – 2012) | |
| E | Surface Water (pH, Colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, TKN, Total Alkalinity, Total hardness, Ecoli and Total Coliforms (IS 10500 – 2012) | 1 |
| F | Ambient Air Quality (Sulphur Dioxide (So2), Nitrogen Dioxide (No2), Particulate Matter 2.5, Particulate Matter 10, Ozone (O3), Lead (Pb), Carbon Monoxide (CO), Ammonia (NH3), Benzene (C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise Level (E(p)Rules) for 24 hours | 1 |
| Note: Detailed Technical Investigations conducted as per PIM | | |

## 6.3 METHODOLOGY OF SAMPLING

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed sampling methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

*Table 8 Details of sampling location*

| S.No | Description | Sampling location | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Within the dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind-rose data the air sampling location fixed at two locations |
| | | Dumpsite entry point | |
| 2 | Noise (1 Location) | Within the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite (stream) | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope on northeast direction possesses a potential risk of leachate runoff, which could result in the contamination of surface water on that particular side of the site. So, the location of surface water is taken on the northeast direction. |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope (SE). The |

Copyright © 2023 KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| | | | infiltration of leachate which could result in the contamination of ground water.<br>Based on the possible infiltration and slope direction, two ground water samples are collected in the east direction and one of the west direction |
| 5 | Bore Hole (1 Location) | Within the dumpsite area | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 6 | Legacy Waste | Within the dumpsite area | Not Applicable |

### *Table 9 Direction and Distance of the sampling location*

| S.No. | Description | Direction | From Dumpsite (m) | From Boundary (m) |
|---|---|---|---|---|
| 1 | Surface Water | Southeast | 450 | 180 |
| 2 | Ground water-1 | Centre | Within the boundary | |
| 3 | Ground water-2 | Northeast | 158 | 20 |
| 4 | Ground water-3 | Southeast | 200 | 7 |
| Note: Air and Noise Monitoring are monitored inside the dumpsite | | | | |

### *Table 10 Quantity of sampling & location*

| S. No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 11.8361316° E -75.57723916°<br>Location -2: 11.836167 ° °E -75.571933 ° |

### 6.4 ANALYSIS AND INTERPRETATION OF EXPLORATORY DATA

As part of the feasibility study, Technical Support Consultants (IPE Global Ltd) has entrusted the geotechnical investigation & Environmental baseline assessment to M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Polluchem Laboratories (P) Ltd respectively.

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 16th May 2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 17th May 2023 and was completed on 23rd May 2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 06th June 2023 by M/s Polluchem Laboratories (P) Ltd. The lab analysis reports were submitted by the investigation agencies to TSC. The lab analysis reports are provided in Annexures – A & B

#### 6.4.1 GEOTECHNICAL EXPLORATORY DETAILS

For assessing the depth of legacy waste and contamination of the soil below the legacy waste, bore hole samples were collected using rotary drill. The exploratory data of the bore hole revealed a maximum depth of 5.5 m of waste followed by 3.50m of soil. Lateritic rock was encountered below the soil stratum. The Geotechnical investigation was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. The details of the exploratory data of the bore hole is provided below.

*Table 11 Exploratory Data of Bore Log*

| S. No | Borehole location | Total Depth of the Borehole (m) | Depth of Soil (m) | Depth of Legacy Waste (m) | Remarks |
|---|---|---|---|---|---|
| 1 | N- 11.83609 °<br>E -75.572326 ° | 9 | 3.5 | 5.5 | Lab Analysis Report provided in Annexure A |

Note: Bore hole terminated at the depth of 9.0m below ground level due to Laterite rock

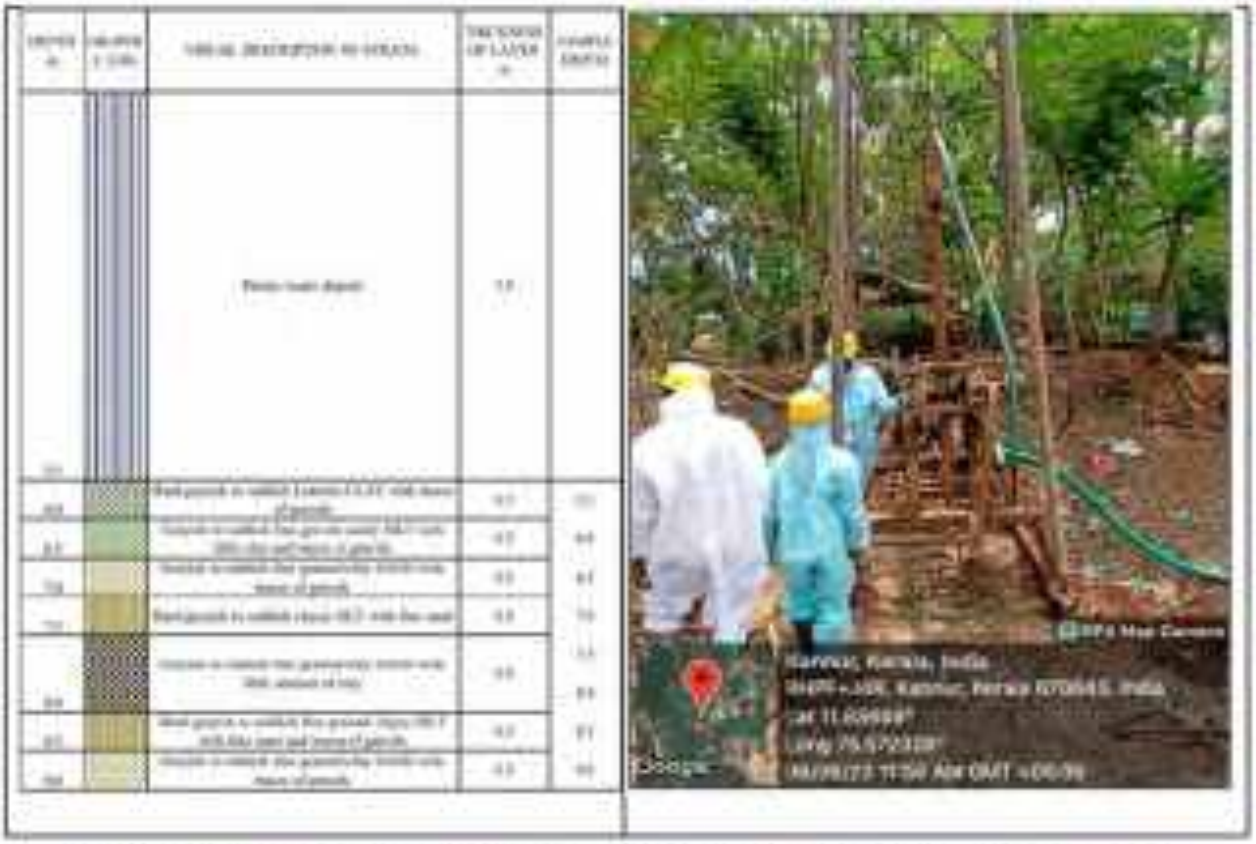

*Figure 7 Dumpsite Legacy Waste Depth Indication and Surveying*

### 6.4.2 ESTIMATED TOTAL QUANTITY OF WASTE

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). The details of the estimated total quantity of waste are provided below:

*Table 12 Quantity of waste above and below the ground level*

| Level | Volume of Legacy Waste (m3) | Density of Waste (t/m³) | Total Quantity of Waste (T) | Remarks |
|---|---|---|---|---|
| Above and Below the Ground | 15302 | 0.826 | 12625.27 | *As per the Contour Survey Report by IILM |

*Table 13 Estimated total quantity of waste*

| Estimated total quantity of waste | |
|---|---|
| Total Quantity of Legacy Waste ($m^3$) | 15,102 |
| Total Quantity of Legacy Waste (T) | 12,625.27 |
| Total Quantity of Legacy Waste (T) Approximately | 12625 |

Copyright © 2023. KSWMP| All rights reserved.

### 6.4.3 LEGACY WASTE CHARACTERIZATION

The characteristics of the legacy waste were assessed by collecting 2 samples of 25 kg from 2 (nos) locations within the dumpsite. The legacy waste samples were collected on 06th June 2023 by M/s Polluchem Laboratories (P) Ltd. The assessment of waste characteristics was done based on the results of the analysis. The details of the characteristics viz., composition, physical & chemical characteristics, heavy metals, and estimated quantity of by-products are provided in the tables below:

| S. No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 11.836111°, E -75.577233°<br>Location -2: 11.836167°, E -75.571933° |

**Physical Composition:**

**By-Products:**

*Table 18 By Product*

| By-Products | Bio Earth | C&D Waste | RDF | Recyclable |
|---|---|---|---|---|
| Percentage (%) | 47.5% | 22% | 26.9% | 3.6 % |
| Quantity (tons) | 7173.45 | 3322.44 | 4062.44 | 543.67 |

6.4.4 ENVIRONMENTAL BASELINE

The environmental baseline was assessed from the analytical results of air, surface &groundwater, noise and leachate from the location as mentioned in the section 6.3. The samples were collected

Copyright © 2023 [illegible] All rights reserved

on 06th June 2023 by M/s Polluchem Laboratories (P) Ltd. The Environmental baseline was analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the tables below:

**Surface Water Analysis:**

*Table 19 Surface Water Analysis*

| Parameters | Test method | Result | Limit as per IS-2296 | |
|---|---|---|---|---|
| | | | Class A | Class C |
| pH | IS 3025 (P) 11 – 1983RA2017 | 6.12 | 6.5 – 8.5 | 6.0-9.0 |
| Color | IS 3025 (P) 04 – 1983RA2017 | 6 Hazen Unit | 10 Hazen Unit | 10 Hazen Unit |
| Turbidity | IS 3025 (P) 10 – 1984RA2017 | 1.1 NTU | -- | -- |
| Electrical Conductivity | IS 3025 (P) 14 – 1984RA2013 | 134 µS/cm | ---- | -- |

| Total Arsenic as As | IS 3025 (P) 37-1988 RA2014 | BDL(MDL-0.01 mg/l) | 0.2 mg/l |

| Location | Inference |
|---|---|
| 1 | The analysis reveals that all the parameters fall within the acceptable limit except BoD, which is higher than the allowable limit, indicating that the leachate is containing biological contents. |

## 6.5 RISK ASSESSMENT

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and pathogens. Proper containment and management of leachate are essential to prevent water pollution.

Copyright © 2023 KSWMP| All rights reserved

The analysis of surface water reveals that all the parameters are within the acceptable limit, except it is slightly acidic and the dissolved oxygen content is less than prescribed limit, so also the BoD is greater than the allowable limit. Indicating that the water is contains organic load.

### *Table 24 Risk Assessment - Surface Water*

| Risk Assessment | |
|---|---|
| Source | Legacy Waste Dumpsite |
| Pollutant | Leachate from Dumpsite – BoD higher than the acceptable limits |
| Pathway | Water / Run off |
| Receptor | Humans, Animals, Aquatic life and flora & fauna |
| Risk | High BoD indicates the water is highly polluted and it is harmful to ecosystems as fish and other aquatic life may suffocate in oxygen-depleted waters. Also, it will contain more pathogens and make the water unfit for human and animals. |

**Groundwater**: Pollutants from dumpsites can infiltrate into the underlying groundwater, if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources and ecosystems. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

The analysis of ground water samples at three different locations reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 6.84 @ G-1, 5.51 @ G-2 and 6.50 @ G-3 location which is in acidic range and harmful to health also make the water not fit for any industrial purpose as it is more corrosive.

*Table 25 Risk Assessment - Ground water*

### *Table 25 Risk Assessment- Ground Water*

| Risk Assessment | |
|---|---|
| Source | Legacy Waste Dumpsite |
| Pollutant | Leachate from Dumpsite – pH is acidic in nature |
| Pathway | Water, Soil |
| Receptor | Humans, Animals and flora & fauna |
| Risk | **Possible risks to Human health**<br>• diarrhoea<br>• Nausea and Vomiting<br>• Abdominal Pain<br>• Weakness<br>• Shortness of Breath<br><br>**Possible risks to Animals**<br>Animals when intake waters with pH acidic in nature it affect the health of the animals.<br><br>**Possible risks to flora** |

Copyright © 2023 KSWMP | All rights reserved

| Risk Assessment | |
|---|---|
| | It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increases the availability of some elements to toxic levels, particularly aluminium and manganese. |

**Air:** Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens etc.

### *Table 26 Risk Assessment - Air*

| Risk Assessment | |
|---|---|
| Source | Legacy Waste Dumpsite |
| Pollutant | Within the limits |
| Pathway | Air |
| Receptor | Humans, Animals and flora & fauna |
| Risk | No anticipated Risks |

**Soil:** Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

### *Table 27 Risk Assessment – Soil*

| Risk Assessment | |
|---|---|
| Source | Legacy Waste Dumpsite |
| Pollutant | Heavy metals etc. |
| Pathway | Soil |
| Receptor | Humans, Animals and flora & fauna |
| Risk | **Possible risks to Human health**<br>Soils if contain substances such as heavy metals, which may be toxic to humans, can pass those substances on to humans through crop uptake, leading to unsafe foods.<br>**Possible risks to Animals**<br>When farm animals consume the plants grown from contaminated soil it affects the health of animals in later stage.<br>**Possible risks to flora**<br>Soil pollution may alter plant metabolism and reduce crop yields and cause trees and plants that may absorb soil contaminants to pass them up the food chain. |

Copyright © 2023 KSWMP | All rights reserved

**Bioaccumulation in Biota:** Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. Contaminated soil or water can be taken up by plants, and these plants may then be consumed by animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the ecological balance and minimizing the exposure of organisms to contaminated environments.

*Table 28 Risk Assessment – Bio-accumulation in Biota*

| Risk Assessment | |
|---|---|
| Source | Legacy Waste Dumpsite |
| Pollutant | Leachate and gas emission from Dumpsite |
| Pathway | Air, water and soil |
| Receptor | Humans, Animals and flora & fauna |
| Risk | Possible risks to Human health, Animals and flora & fauna:<br>Accumulation of contaminants in plants and animals indirectly through food chain affects human health. |

# 7 EVALUATION OF REMEDIATION TECHNIQUES

Although the term "legacy waste" has not been defined in any official government document in India, it typically refers to aged municipal solid waste in landfills or dumpsites. There is no information on how old waste must be in order to qualify tobe called legacy waste. These legacy dumpsites are creating various irreversible environmental/health/livelihood hazards. The major sources of pollution are:

- ✓ Puddles of leachate flowing through the adjacent area and reaching the water table long-term issues of greenhouse gas emissions
- ✓ Surface water and groundwater pollution due to erosion and seepage
- ✓ Dumpsite fires
- ✓ Due to the faster urban development and increased waste generation per capita and mismanagement of generated waste.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

**Remediation of legacy waste dumpsite**

Remediation is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

1. Uplift of the environment- reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.
2. Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in growth of nearby city
3. Land - Dumpsite land becomes available for public use or for setting up SWM facility on the reclaimed land.
4. Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled, or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels.

For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- ✓ A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- ✓ Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- ✓ History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.

Copyright © 2023. KSWMP| All rights reserved.

- ✓ Baseline study of heavy metals in surface;
- ✓ water, rainfall, soil type, surface hydrology, topography, wind directionetc. shall be studied before and after bioremediation.
- ✓ Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows

## 7.1 BIO-MINING – RECLAMATION/RECOVERY OF LAND

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

*Table 29 Phase of Bio-minning*

| Phases of Bio-mining | |
|---|---|
| Phase 1: Stabilization | The legacy waste is formed into equal-sized windrows, and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| Phase 2: Sorting & Segregation | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/circular rotatory sieves and manpower. |
| Phase 3: Disposal & Utilization | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |
| Salient Aspects | land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>Compliance to SWM Rules and NGT orders.<br>Improvement in aesthetics and quality of life & health. |
| Applicability | The ownership is well defined.<br>Working space is available in the dumpsite.<br>Linkage for utilization by-products is available |

Copyright © 2023 KSWMP| All rights reserved

## 7.2 CAPPING WITHOUT LAND RECOVERY

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| Salient Aspects | The capped area becomes a green space and can be developed into parks/recreational areas.<br>Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) atleast 15 years.<br>Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep-rooted vegetation. Recurring expenditure will be incurred for regular maintenance.<br>On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio-mining as environmentally safe and the most preferable approaches to dumpsite remediation<br>SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | Capping could be a solution for legacy waste where bio-mining is not possible because of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for utilization/ disposal of segregated components<br>Lack of working space & resources |

## 7.3 CAPPING WITH PARTIAL LAND RECOVERY

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can be linked to relevant buyers and the inert material will be capped to prevent further degradation of the environment.

| | |
|---|---|
| Salient Aspects | The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |
| Applicability | Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for disposal of inert<br>Recovery land for public use is not a priority |

Copyright © 2023. KSWMP | All rights reserved.

## 7.4 SELECTION OF REMEDIATION OPTION

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. It may be noted that the bio-earth and C&D material which will be recovered by remediation is proposed to be used for development of the reclaimed legacy waste dumpsite as recreational park/facility (for site development work/ profiling). The bio-earth and C&D material recovered will be subjected to bi-weekly sampling and conform to the parameters mentioned in Schedule II of SWM Rules 2016 before using the material. Considering the same, there won't be any leachate generation using this material. There won't be any capping done and hence the question of erosion etc. doesn't arise.

**Salient parameters for opting the Bio-mining – reclamation/recovery of land.**

1. Based on the assessment from the chemical analysis report from the M/s. Polluchem, all the heavy metals are within the permissible limits as prescribed by the regulatory authorities Soil is free of contamination viz., heavy metals, chemical and other toxic substances.
2. Land recovery, increase in value of land and available for public use/setting of SWM facility with immediate effect. An area of 0.98 acres will be reclaimed through bio-mining
3. Adequate downstream linkages for the management/disposal waste viz., Bio-earth and C&D waste will be utilized for development of the reclaimed legacy dumpsite as recreational park/facility, recyclables will be sold to the authorized recyclers & will be collected from the project site and RDF will be sent to Cement industries for co-processing viz., as supplement to the conventional fuel.
4. By products/aggregates generated from the process can be used as alternative construction material (after processing), fuel and recyclables.
5. The Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping.

Copyright © 2023. KSWMP| All rights reserved.

# 8 TECHNICAL DESCRIPTION OF THE SELECTED OPTION

## 8.1 METHODOLOGY

The legacy waste dumpsite reclamation through bio-mining with recovery of land involves Phase 1: stabilization, Phase 2: sorting & segregation and Phase 3: disposal & utilization

The type of machinery, capacity and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type machinery available for the bio mining are as follows:

1. Stationary screening machinery
2. Mobile/compact machinery.

### 8.1.1 STATIONARY SCREENING MACHINERY

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- ✓ Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- ✓ Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- ✓ Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process.

Copyright © 2023. KSWMP | All rights reserved.

- ✓ Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- ✓ Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- ✓ Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

Source: DCC Infra., Gurugram Site

Salient Features of Stationary Screening Machinery:

- Land requirement high for setting of machinery and processing area.
- Erection, Installation and Commissioning is time consuming
- Cost Intensive – CAPEX & OPEX high
- Electrical Power Intensive and Consumption is high
- Breakdown of the Machinery is high, onsite technicians should be available.
- Manpower – skilled & unskilled Intensive
- Suitable for quantity more than 2,00,000 ton of legacy waste.
- Less suitability for reuse of the machinery/screenings for more than one site/location.

### 8.1.2 MOBILE/COMPACT SCREENING MACHINERY

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation.

Copyright © 2023. KSWMP| All rights reserved.

**Structure:** The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity.

**Screening Mechanism:** The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

**Separation System:** Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

**Treatment Process:**In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

**Transport:** Quick and easy folding of conveyor helps in quick setup time.

**Discharge height:** Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages.

*Figure 9 Compact Screening Machinery*

*Source: Kleemann Mobile Screens (Piranna, Ahamadabad Site)*

Copyright © 2023. KSWMP| All rights reserved.

**Salient Features of Mobile/Compact Screening Machinery:**

- Full Mobility: Plants are fully mobile like excavator. Plants can be moved across the most difficult of surfaces and terrain and can accommodate the most inaccessible locations.
- Quick Set up time: Track-Mobile plants can normally be set-up within 1 hour, as it normally does not require additional conveyors, feed hopper to link separate machines, thus increasing machine utilization.
- Versatility: Track-Mobile plants can be operated independently or in combination of two or three stage screening depending upon user requirements.
- No Civil works required: Plants do not require any civil works, can be erected & shifted quickly. Thus offer quicker return on investment.
- Manpower requirement is less.

## 8.2 SELECTION OF MACHINERIES

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, mobile / compact screening shall be the optimum screening machinery for the Koothuparamba Dumpsite. The 12,625.27 tons legacy waste can be remediated within the stipulated time by NGT i.e. 31st March 2024

**Salient parameters for opting the Mobile/Compact screeners.**

1. Sorting/segregation of the stabilized legacy waste of 15,102 $m^3$/ 12,625.27 Tons within the stipulated timeline of 31st March 2024.
2. The remediation process will be guided by National, State Regulations & EIA/EMP in line with KSWMP ESMF.
3. Salient Features of Mobile/Compact Screening Machinery – details are in the section 8.1.2

## 8.3 SYSTEM REQUIREMENTS

### 8.3.1 CAPACITY SIZING OF MOBILE COMPACT SCREENER

The capacity of the Mobile compact screener is assessed as **100 TPH** considering the physical site conditions including quantity & characteristics of legacy waste and stipulated timeline for optimum land reclamation by **31st March 2024.** The calculation shown is only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards. The details of plant capacity sizing are provided in the table below:

*Table 30 Capacity Sizing of Mobile Compact Screener*

| Description | Quantity |
|---|---|
| Quantity of waste (Tons) | 12625.27 |
| Mobilization and site preparation (days) | 60 |

Copyright © 2023 KSWMP| All rights reserved

| Description | Quantity |
|---|---|
| Weekends & Holidays | 20 |
| Rainy Days | 20 |
| Break downs (Days) | 15 |
| No of days (Dec 2023 - Mar 2024) | 75 |
| Effective processing days | 25 |
| Processing per day (Tons) | 505 |
| Capacity of the Plant - Considering working 8 hrs/day | 94 |
| Proposed Capacity of plant TPH | 100 |

### 8.3.2 MACHINERIES & VEHICLES

Detailed assessment of quantity (nos) of machinery, vehicles, auxiliary items required for effective processing of the legacy waste are provided in the Annexure – E. The summary of machineries and vehicles requirements are provided in the table below:

*Table 31 Machineries and Vehicles*

| S. No. | Description | Quantity(Nos) | Remarks |
|---|---|---|---|
| 1 | Mobile Trommel @ 100 TPH | 1 | Detailed Specifications are provided at Annexure –F |
| 2 | Baling Machine @ 50 TPD | 1 | |
| 3 | Ballistic Separator @ 30 TPH | 1 | |
| 4 | Magnetic Separator | 1 | |
| 5 | Front End Loader @ Bucket Capacity 1Cum | 2 | |
| 6 | Chain Mounted Excavator @ Bucket Capacity 1.1 Cum | 2 | |
| 7 | Weighing bridge - 40 Ton | 1 | |
| 8 | Tipper @ 8 Cum | 5 | |
| 9 | Tractor - Trolley shift of Materials | 1 | |
| 10 | Tractor -Trolley Water Tanker | 1 | |
| 12 | Mechanical Sprayer | 2 | |
| 13 | Office - Portable cabin (1 Nos.) | 1 | |
| 14 | GPS (5 Nos.) & Tracking System (1 Nos.) | 5 | |
| 15 | CCTV System (Cameras 5 Nos.) | 5 | |
| 16 | Fire Safety System - Fire Extinguisher ABC type 4 Kg/cm2 | 10 | |

Note: Considering the size of the site, it is required that the contractor liaisons with the Fire Department and deploys a fire tender at the site during the period of the contract works to manage any fire incident as part of Fire Safety Plan.

Copyright © 2023. KSWMP| All rights reserved.

## 8.4 OPERATIONS AND MAINTENANCE

### 8.4.1 MANPOWER:

Detailed assessment manpower required for effective processing of the legacy waste are provided in the Annexure – I. The summary of manpower required are provided in the table below:

*Table 32 Manpower Details*

| S. No | Manpower | Nos. |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental, Social and Health & Safety (ESHS) Officer | 1 |
| 3 | Security (3 X 8 Hrs) | 3 |
| 4 | Operations Supervisor & Accountant | 2 |
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 2 |
| 8 | Labors near Screening machinery | 4 |
| 9 | Labors at Baling facility | 2 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 11 |

### 8.4.2 ELECTRICAL POWER:

*Table 33 Electrical Power Details*

| Machineries | Required Electrical Load (KW) | Working Hr. | Total Units (KW-Hr) |
|---|---|---|---|
| Baling Machine | 5 | 4 | 20 |
| Ballistic Separator | 15 | 6 | 90 |
| Magnetic Separator | 5 | 6 | 30 |
| Weigh bridge | 5 | 6 | 30 |
| Total | 30 | | 170 |

### 8.4.3 FUEL/DIESEL FOR VEHICLES:

*Table 34 Fuel/Diesel for Vehicle*

| Description | Liters per Day |
|---|---|
| Fuel - Diesel Mobile Trommel (12 liters/hour) | 96 |

Copyright © 2023. KSWMP | All rights reserved.

### 8.4.4 WATER REQUIREMENTS:

The Water requirement in site will be fulfilled by the piped water supply and storage of water tank of 5000 liters capacity is already available at the dumpsite.

*Table 35 Water Requirement at Dumpsite*

| Description | Liters per Day |
|---|---|
| Water required for workers and other uses. | 5000 Liters Per Day |
| (Source – Municipality water Supply) | |

***Note:** The calculation shown above is only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and guidelines as per tender. The responsibility of availing necessary power and water connection shall be with the contractor as condition precedent before starting the work.*

*Further, considering the size of the site, it is required that the contractor liaisons with the Fire Department and deploys a fire tender team at the site during the period of the contract works to manage any fire incident as part of Fire Safety Plan. Alternatively, general SOPs for fire safety detailed herewith are to be followed:*

a) *Fire Fighting System including fire hydrant, pressure pumps, 5000 Ltr (min) water storage, adequate hose reel and fire extinguishers to be provided at site.*
b) *Alternate source of power (DG)*
c) *Manual Fire Alarm System with evacuation plan*
d) *Regular check, maintenance of equipment's for firefighting (before initiating work and then at interval of 1 months thereof)*
e) *Training to all men. (Before initiating work and then at interval of 3 months thereof).*
f) *Maintaining fire line while storage of material (RDF). RDF to not exceed 10% of total estimated waste at site at any given time.*
g) *Any other requirement in consultation with local Fire & Rescue Services office.*

Copyright © 2023 KSWMP| All rights reserved

# 9 SCOPE OF DISPOSAL INCLUDING LOCATION OF DISPOSAL FOR RDF, BIO SOILS, C & D WASTE, AND OTHERS AS PER LOCAL DEMANDS

## 9.1 UTILIZATION OF BY PRODUCTS

The details of the utilization of aggregates/by-products screened out by processing of the stabilized legacy waste are provided in the table below

*Table 36 Utilization RDF, Bio-soils, C&D Waste*

| S.No | Component | Quantity (Cu.m) | Utilization/Linkage/Usage |
|---|---|---|---|
| 1 | Bio earth and C&D Waste | 10496 | The bio earth and C&D and quantity 15102.00 cu.m waste will be utilized for development of the reclaimed legacy waste dumpsite as recreational park/facility. |
| 2 | RDF | 4062.44 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. Currently theindicativenearest location for the RDF disposal is atDalmia Cements, Trichy which has the necessary infrastructure for co-processing of RDF. |
| 3 | Recyclables & others | 543.67 | Recyclables will be sold to CKCL/recyclers authorized by KSPCB/CPCB. |
| Note: The contractors engaged in bio-mining will be responsible for ensuring this disposal of Bio Earth, RDF, recyclables, and others. | | | |

Copyright © 2023 KSWMP| All rights reserved

## 10 ESTIMATED PROJECT COST

The details of the estimated cost for bio-mining - recovery of land by remediating legacy waste dumpsite is provided in the table below:

*Table 37 Details of Estimated Project Cost*

| Estimate for Dumpsite remediation considering Forward Linkage | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Sr. No. | Activity | Details | Rate/ m3 | Cost Index @ 1.35 * A | COP @ 1.15 * B | Round off (INR) | Qty (m3) | Amount (Rs) |
| | | | A | B | C | | | |
| 1 | Remediation/ Biomining | Rate adopted from Calculation from Suchitwa Mission (DSR 2018 including baling) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 2 | Transportation of RDF | The average distance to cement factories works out to be 400 km. [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 3 | Disposal of recyclable | Considering that the recyclable will be sold at [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 4 | Disposal of Inert | Considering the disposal cost of [redacted] (market rate) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 5 | Disposal of Compost / Soil enricher | Considering the disposal cost of [redacted] (market rate) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| | | | | | | | | [redacted] |
| | Environmental & Social Safeguard estimated amount for the implementation and monitoring | | | | | | | [redacted] |
| | Grand Total | | | | | | | [redacted] |
| | | | | | | | | |

## 10.1 REVENUE FROM THE PROJECT

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- Bio earth & C&D waste will be utilized within the remediated dumpsite as filler material for development of recreational park.
- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at no cost whereas transportation cost is required to be borne by the contractor sending the RDF to the cement factory/ WtE facility.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable.

## 10.2 FUNDING FOR PROJECT

The estimated cost of [redacted]/- for the project Dumpsite Remediation which equals to [redacted]/- per $m^3$. The sources and funding pattern is given below:

*Table 38 Funding for the Project*

| Item | External (70%) Rs. | State Govt. (30%) Rs. | Total cost Rs |
|---|---|---|---|
| **Bioremediation** | [redacted] | [redacted] | [redacted] |

Copyright © 2023 KSWMP| All rights reserved

# 11 PROJECT IMPLEMENTATION PLAN

## 11.1 PROPOSED OPERATIONAL PLAN

The bioremediation of Koothuparamba dumpsite will be done with the land recovery and will be executed through an outsourcing model. The proposed operational plan is provided at the Annexure - I

## 11.2 TIMELINE

In compliance with the National Green Tribunal (NGT) orders, it is mandatory to remediate all dumpsites in Kerala by March 2024. To ensure timely completion and compliance with the deadline, timeline for the implementation of project is provided below.

| S No | Description | Time frame |
|---|---|---|
| 1 | Start date | 01/12/2023 |
| 2 | End date | 31/03/2024 |

## 11.3 CONTRACT MODEL

**Execution Method:**

- Item Rate Contract and disposal/Management of by-products/aggregates with land recovery and redevelopment of the site with inert/ soil enricher. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

**Working Model:**

- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for setting up the plant to the Contractor.
- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- Contractor is responsible for disposal of RDF, recyclables, and aggregates

Copyright © 2023 [illegible] | All rights reserved

## 12 BENEFITS OF THE PROJECT

Remediation of legacy waste dumpsite in the Koothuparamba leads to the following anticipated benefits:

- **Reclamation of Land**: An area of 0.986 acres will be reclaimed and can be developed into a recreational park for public use or utilized as SWM facilities. A contamination assessment is to be carried out before any public use project is taken up at the location.
- **Environmental Protection**: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity. The project shall arrest GHG emissions from the legacy dumpsite.
- **Health Improvement**: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- **Enhanced Water Quality**: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to the safe drinking water.
- **Aesthetic and Social Benefits**: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- **Operational & Life cycle Aspects**

Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through bio-mining process.

- **Employment**

During remediation& post- remediation period, requirement of un-skilled labor will be fulfilled by s local sourcing.

Copyright © 2023. KSWMP| All rights reserved.

# 13 CONCLUSION

- The activities of the bio-mining will be commenced from Dec 2023 to Mar 2024. An area of 0.986 acres will be reclaimed and will be developed into a recreational park for public use after contamination assessment.
- Through the process of bio mining the dumpsite, complete land reclamation and recovery, while prioritizing environmental safeguards. This means that the land will be reclaimed and put to use.
- Considering site conditions and quantum, screening of the 15102 $m^3$ of legacy waste, mobile / compact screening machinery will be preferred.
- Favorable site conditions for bio-mining:
    1. Optimum width of the road is available for movement of the vehicles.
    2. Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
    3. Piped water supply and storage of water tank 5000 liters are available at the dumpsite.
    4. At the dumpsite plot, a vacant land parcel of approx. 0.20 acres is available for the installation of auxiliary infrastructures, supporting conditions movement of processing machinery and vehicles.
- The project activity requires to obtained "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- By-products utilization/forward linkages/Usage
    1. The bio earth & C&D quantity of 7173.45 $m^3$& 3322.44 $m^3$respectively is proposed to be utilized after testing for the contamination for development of the reclaimed land as recreational park/facility. The contraction shall level the site in consultation with the PIU/TSC/DPMU.
    2. Refused derived fuel (RDF) of 4062.44 $m^3$ will be to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the processes. The indicative location of cement plant is Dalmia Cements, Trichy.
    3. Recyclables of 543.67 $m^3$ will be sold to CKCL /Private recyclers authorized by KSPCB/CPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, NGT orders, KSPCB norms, CPCB guidelines and KSWMP ESMF and other regulatory rules & norms.
- Environmental & Social safeguards:
    1. The project attracts E2 Environmental category based on the Environmental Screening and Exclusions mentioned in the Environmental and Social Framework Guidelines.
    2. Site specific Environmental Assessment and Environmental Management Plan has been developed.
    3. The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is [redacted]/- (INR [redacted]). The cost per $m^3$ for processing and disposal of the legacy waste is Rs. [redacted]/- per $m^3$.

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Pallaparamba, Koothuparamba, Kannur district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 19th May 2023. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 06th June 2023 and was completed on 07th June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

# 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along with Mr. Kamal Kishore Jha of IPE Global during the third week of May 2023, in order to collect the information regarding the site prior to mobilising the equipment for drilling, .

**Figure 1** : Location of the borehole drilled at the dumpsite

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste at the dumpsite.

### 4.2 Drilling equipment

Mechanical rigs of rotary drilling machine were used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log the commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing are presented in **Appendix II**.

**Table 1: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |
|---|---|---|---|
| 1 | Soil | Grain-Size Analysis | IS: 2720(Part-4)-1985 |

## 6 SUMMARY

The geotechnical examination on the soil samples collected after boring through the waste at the dumpsite at Pallaparamba, Koothuparamba, Kannur was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was bored using a rotary drilling method. The maximum depth of investigation was 9.0 m (5.5 m in waste and 3.5 m in the ground). SPT and collection of undisturbed samples were carried out at regular intervals. Various laboratory tests were carried out on the SPT and undisturbed soil samples.

Based on the investigations carried out, it was observed that the original ground below the waste comprises of a Lateritic soil with SPT N-value of 37 at 5.5 m, 35 at 7.0 m and refusal at 8.5 m from the start of the borehole. The tests mentioned in the above table were performed on the samples in the laboratory following the respective codes to obtain the necessary parameters. The laboratory results on samples obtained from the site are appended in **Appendix II**.

# Annexure I

# Proposed Operational Plan

## Proposed Operational Plan

The project of the Bio-mining with land recovery will be implemented through 100% outsourcing model. The detailed operations of land recovery is provided below:

### 1. Project Kick-off

The existing legacy waste dumpsite should be visited jointly by representative of implementation agency, officials ULB and experts of PMU/PMC & TSC for the following

- ✓ For assessment of ***As –Is Situation*** of local settings viz., human settlement & environmental settings etc.,
- ✓ For validation of profile, quantity & physical characterization of legacy waste.
- ✓ Available services viz., electrical power, source of water and access road etc.,
- ✓ For ground truthing the sampling locations of baseline environmental parameter, locations where monitoring will conduct during operation phase and post reclamation phase
- ✓ For sensitizing/awareness of the upcoming the project activity to the stakeholders within the vicinity of the dumpsite.
- ✓ For understanding the sensitive of environmental & social aspects/social considerations viz., educational institutions, religious places and settlements settings.
- ✓ For ensuring that the implementation agency understands and to complies with all local and national regulations related to project activities.

### 2. Site Management Plan

The position of the machineries and other auxiliary machineries/equipment's in-line with the defined process of bio-mining with land recovery play imperative role in effective implementation of the project activities.

A detailed site management plan is prepared including the details of excavation & pre stabilization area in phases (1 to 4), machineries, weigh bridge, area allocation for by-products storage, vehicle parking area and position of CCTV cameras. The detailed site Management plan is provided below.

### 3. Site Preparation

The portion of the legacy waste dumpsite will be clear vegetation and leveling the area to create a stable & level platform for positioning of bio-mining machineries/equipment's and for processing of legacy waste.

### 4. Procurement of Machinery & Vehicles and Equipment's

An indicative list of Machineries &Vehicles and equipment's are proposed to for effective processing the quantity of existing legacy waste in-tune to the timeline of NGT orders. The indicative list of the Machinery & Vehicles and equipment's are provided in the Section 8.3.2

### 5. Mobilization of Manpower

For effective management of the project activities, an indicative list manpower provided in the Section 8.4.1 shall be required.

### 6. Statutory Approvals

The implementation agency is responsible for obtaining all required permission/consent/approvals from the competent authorities. The ULB/DPMU/DPMC will only facilities implementation agency in obtaining the approvals etc. The indicative list of statutory approvals required for the project is provided below.

a. Site Authorization from KSPCB in conforming to SWM Rules 2016 and Consent to Establish/Operate KSPCB.
b. Dept. of mining and geology
c. Necessary permission for storage of process materials and chemicals
d. NOC from Dept. of Fire and Rescue
e. Segregated Hazardous waste disposal arrangement (eg: KEIL Ambalmedu, Kochi)
f. NOC from Heritage/Archeology if the site is in regulated zone of heritage/protected building

g. Any other statutory approvals/ permissions

## 7. Establishment of forward linkages

The By-products from the bio-mining process/operations viz., Bio earth/ C&D waste (Inert), RDF and Recyclables will be stored in the designated place (as indicated in the site management plan) within the dumpsite. The contractor is responsible for management/establishment of forward linkages. Utilization of Bio earth/C&D (inert) may be finalized in consultation with ULB. An indicative forward linkage is provided in the Section 9.1. The compost should conform to Schedule II of SWM Rules 2016, and RDF should conform to the Guidelines on Usage of RDF in various Industries issued by MoHUA. Bi-weekly sampling will be carried out to confirm the same.

**Bio-mining operations**

- Step-1 – Waste Stabilization

The initial step involves the use of a front-end loader to excavate the legacy waste, allowing for the leachate to dry out through exposure to solar radiation and for the removal of trapped methane from the heap. To ensure the decomposition of biodegradable waste such as discarded food, fruits, flowers, and garden waste, proper aeration is necessary to prevent the generation of leachate and odors. The top layer of the legacy waste, approximately 150 mm in depth, is repeatedly loosened using the front-end loader. Additionally, the waste is lightly mist-sprayed with bio-cultures to manage odors and disperse decomposing microbes throughout the waste. The loosened legacy waste forms windrows.

- Step-2 – Windrow Formation

The second step involves creating windrows of the legacy waste using backhoe. Composting bio-cultures are added to accelerate decomposition and generate biological heat within the waste, aiding in drying it out and reducing its volume. These windrows are turned every 3 days to ensure proper biological treatment and moisture loss. After 1-2weeks, when the heaps have reached a suitable consistency for screening, the material is weighed and transferred to a Mobile Trommel, which consists of rotating cylinders with different-sized perforations.

- Step-3 – Sorting and Segregation by Mobile Trommel

The third step is to move stabilized waste to mobile trommel to get 3 different sizes of fractions

- ✓ Fraction 1 – (minus 30 mm) – Bio Soil/earth -Used for side development/ filling.
- ✓ Fraction 2 – (30-80) mm – Mixed fraction – Plastics with C&D (send to Ballistic Separator)
- ✓ Fraction 3 – (80 +) mm – Mixed fraction – (send to Ballistic Separator)

The Fraction-2 & Fraction-3 (30-80) mm & (80 +) mm is required to move for further separation process through ballistic separator.

- Step-4 – By - products - C&D materials

In the fourth step, the fraction-2 and fraction-3 are sorted into three types based on their shape and weight heavy and rolling fraction (referred to as 3D) - C&D Material, light fraction (referred to as 2D) - RDF, and the sieved fraction (or under-screen fine fraction) - Plastic.

- Step-5 – Byproducts – RDF

In the fifth step, the RDF sorted by the ballistic separator (30TPH) is moved to the baling machine (50TPD) for packaging the RDF fractions. The baled RDF is then transported to Cement plants via a weigh bridge (30Tons), where a co-processing facility is available.

i) Monitoring & Supervising Mechanism

Supervision and monitoring during dumpsite remediation by TSC/PIU/DPMU

## 9. Record keeping and Reporting

i. The Implementation agency shall maintain a record of the daily processed legacy waste and also keep proper record of all the recovered and disposed of materials.

ii. The Implementation agency shall maintain authorized weigh bridge records at the point of receipt by end designated agency. A consolidated weigh bridge records certified by the Plant Manager/competent authority of the authorized Cement plant/ WtE or such units certifying the total RDF received from the Project is a valid proof of compliance.

iii. The Implementation agency shall maintain all the statutory records, as per SWM Rules, 2016, and also conditions stipulated in Site Authorization/Consent to Establish/Operate by KSPCB if any, KSWMP/WB requirements and other project relevance statutory requirements.

iv. The site shall be operated in CCTV surveillance with data storage of entire contract period. For CCTV surveillance High-Definition IP based cameras in adequate numbers. As per the requirement of the ULB/KSWMP link with mobile compatibility may be provided for online monitoring of the project activities.

v. The vehicles engaged for the project activities shall be equipped with Vehicles Tracking System (VTS) by equipping with GPS and online monitoring system.

## 10. Land recovery/project closure

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the bidder to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

Annexure-J

# LSGD GUIDELINES FOR REMEDIATION OF LEGACY WASTE DUMPSITES THROUGH BIOREMEDIATION

# GOVERNMENT OF KERALA

## Abstract

Local Self Government Department - Guidelines for Remediation of Legacy Waste Dumpsites through Bio Remediation - orders issued.

## DEPARTMENT

G.O.(Rt)No.2629/2022/LSGD Dated,Thiruvananthapuram, 29-10-2022

Read 1 Letter No. 2683/C2/2022/SM dated 16.09.2022 from Executive Director Suchitwa Mission.

## ORDER

As per the letter read above, Executive Director, Suchitwa Mission had submitted draft guidelines for implementation of project for remediation of Legacy Waste Dumpsites through Bio Remediation.

2) Government have examined the matter in detail and are pleased to approve the guidelines enclosed herewith for implementation of project for reclamation of legacy waste dumpsites through bio remediation.

(By order of the Governor)
SHIBI ABRAHAM
DEPUTY SECRETARY

**ലെഗസി മാ**ലിന്യ **നിർമ്മാർ**ജന പദ്ധതികളു**ടെ നിർവ്വഹ**ണ ഉദ്യോഗ**സ്ഥ**ൻ

- ലെഗസി മാലിന്യ നിർമാർജന പദ്ധതികളുടെ നിർവ്വഹണ ഉദ്യോഗസ്ഥൻ തദ്ദേശ സ്വയംഭരണ സ്ഥാപനത്തിന്റെ എഞ്ചിനീയർ ആയിരിക്കും

നിർമ്മാർജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യ നിക്ഷേപങ്ങളുടെ അളവ തിട്ടപ്പെടുത്തൽ

- പൊതുവായി, നിർമ്മാർജ്ജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യത്തിന്റെ അളവ (ക്യൂബിക മീറ്ററിൽ) ടോട്ടൽ സ്റ്റേഷൻ സർവേയിലൂടെ കണ്ടെത്താവുന്നതാണ. എന്നാൽ ടോട്ടൽ സ്റ്റേഷൻ സർവേ സാധ്യമല്ലാത്ത സാഹചര്യത്തിൽ, ഒരു ലക്ഷം ക്യൂബിക മീറ്റർ വ്യാപ്തിയിൽ കൂടുതലുള്ള വലിയ ഡംപസൈറ്റുകളുടെ കാര്യത്തിൽ ഡ്രോൺ സർവ്വേ രീതി സ്വീകരിക്കാവുന്നതാണ.

- ആവശ്യമുള്ള പക്ഷം, പുറമെയുള്ള സർവേ ഏജൻസികളെ നിശ്ചിത നടപടിക്രമങ്ങൾ പാലിച്ച ഇതിനായി ഏർപ്പെടുത്താവുന്നതും, അതിനുള്ള ചെലവ ലഭ്യമായ ഫണ്ടിൽ നിന്ന തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം വഹിക്കേണ്ടതുമാണ.

- സൈറ്റിന്റെ കോണ്ടൂർ മാപ്പ തയ്യാറാക്കേണ്ടതും ആയത തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ പരിശോധിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

എസ്റ്റിമേറ്റ തയ്യാറാക്കലും പദ്ധതി രൂപീകരണവും

- സൈറ്റിന്റെ നിലവിലെ അവസ്ഥ, മാലിന്യത്തിന്റെ സ്വഭാവം/തരം, മാലിന്യ നിക്ഷേപത്തിന്റെ കാലയളവ, മറ്റ അടിസ്ഥാന വിശദാംശങ്ങൾ എന്നിവയെക്കുറിച്ചുള്ള വിശദമായ റിപ്പോർട്ട അനുബന്ധം- I ൽ നൽകിയിരിക്കുന്ന പ്രൊഫോർമയിൽ തയ്യാറാക്കേണ്ടതാണ

- അനുബന്ധം-II ൽ നൽകിയിരിക്കുന്ന സ്പെസിഫിക്കേഷനും ഡാറ്റയും അനുസരിച്ച ബയോമൈനിംഗ മുഖേന പ്രവൃത്തി നടപ്പിലാക്കുന്നതിന എസ്റ്റിമേറ്റ തയ്യാറാക്കേണ്ടതാണ.

- പ്രൊപ്പോസൽ തയ്യാറാക്കുന്നതിന്റെ ഭാഗമായി പ്രസ്തുത പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള എല്ലാത്തരം ചെലവുകളും പരിഗണിക്കേണ്ടതാണ.

- വാർഷിക പദ്ധതിയുടെ ഭാഗമായി പ്രോജക്ട ഏറ്റെടുക്കേണ്ടതും ലഭ്യമായ സ്രോതസ്സുകളിൽ നിന്നും ഫണ്ട വകയിരുത്തേണ്ടതുമാണ.

സാങ്കേതിക അനുമതി

നിലവിലുള്ള സാമ്പത്തിക അധികാരങ്ങൾ അനുസരിച്ച തദ്ദേശ സ്വയംഭരണ വകുപ്പ(ലോക്കൽ ഇൻഫ്രാസ്ട്രക്ച്ചർ & എഞ്ചിനീയറിംഗ വിങ) ലെ ബന്ധപ്പെട്ട എഞ്ചിനീയർ പ്രോജക്ടിന സാങ്കേതിക അനുമതി നൽകുകയും മാനദണ്ഡങ്ങൾ പാലിക്കുന്നതിനായി ചീഫ ടെക്നിക്കൽ എക്സാമിനർക്ക (ഫിനാൻസ വിംഗ) ആവശ്യമായ റിപ്പോർട്ടിംഗ ഉറപ്പാക്കുകയും ചെയ്യേണ്ടതാണ.

തദ്ദേശ സ്വയംഭരണ സ്ഥാപനങ്ങൾ ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ/ഭൂമികൾ വീണ്ടെക്കുന്നതിനുള്ള പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള നടപടി ക്രമങ്ങൾ

ടെൻഡറിംഗ

- ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ വീണ്ടെടുക്കുന്നതിനുള്ള പ്രവൃത്തിയുടെ വിശദമായ സ്കോപ്പ ഓഫ വർക്ക, നിബന്ധനകളും വ്യവസ്ഥകളും മുതലായവ വ്യക്തമായി പരാമർശിക്കുന്ന 'ടു കവർ ബിഡ്സ താല്പര്യപത്രം'(Request for Proposa - wo Cover Bd) തയ്യാറാക്കേണ്ടതും ആയത നടപടിക്രമങ്ങൾ പാലിച്ച പ്രസിദ്ധീകരിക്കുകയും ചെയ്യേണ്ടതാണ.

- കേന്ദ്ര പാർപ്പിട-നഗരകാര്യ മന്ത്രാലയവും (MoHUA) സെൻട്രൽ പബ്ലിക ഹെൽത്ത & എൻവയോൺമെന്റൽ എഞ്ചിനീയറിംഗ ഓർഗനൈസേഷനും (CPHEEO) ചേർന്ന പ്രസിദ്ധീകരിച്ച "സ്വച്ഛ ഭാരത മിഷൻ (അർബൻ)-അഡ്വൈസറി ഓൺ ലാൻഡ്ഫിൽ റിക്ലമേഷൻ" ൽ നൽകിയിരിക്കുന്ന മാർഗ്ഗനിർദ്ദേശങ്ങളെ

അടിസ്ഥാനമാക്കി RFP-യിലെ വ്യവസ്ഥകൾ/യോഗ്യതാ മാനദണ്ഡങ്ങൾ നിശ്ചയിക്കാവുന്നതാണ.

- കേന്ദ്ര മലിനീകരണ നിയന്ത്രണ ബോർഡ പുറപ്പെടുവിച്ച "ഗൈഡലൈൻസ ഫോർ ഡിസ്പോസൽ ഓഫ ലെഗസി വേസ്റ്റ (ഓൾഡ മുനിസിപ്പൽ സോളിഡ വേസ്റ്റ) " പ്രകാരം ലെഗസി മാലിന്യ നിക്ഷേപങ്ങൾ നിർമ്മാർജ്ജനം ചെയ്യേണ്ടതാണെന്ന നിബന്ധന പ്രവൃത്തിയുടെ 'സ്കോപ്പ ഓഫ വർക്കിൽ' ഉൾപ്പെടുത്തുന്നുണ്ടെന്ന ഉറപ്പ വരുത്തേണ്ടതാണ.

- ലഭ്യമാകുന്ന ടെക്നിക്കൽ ബിഡ്സുകൾ പരിശോധിച്ച വിലയിരുത്തേണ്ടതും സാങ്കേതിക യോഗ്യത നേടുന്ന ബിഡ്ഡർമാരെ ബിഡ/ടെൻഡർ അംഗീകാരത്തിന്റെ തുടർ ഘട്ടത്തിനായി ഷോർട്ടലിസ്റ്റ ചെയ്യേണ്ടതുമാണ. ടെക്നിക്കൽ ബിഡ്സുകളുടെ മൂല്യനിർണ്ണയം നടത്തുന്നതിനായി താഴെപ്പറയുന്ന അംഗങ്ങളെ ഉൾപ്പെടുത്തി തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതിക സമിതി രൂപീകരിക്കേണ്ടതാണ;

    - സെക്രട്ടറി
    - LSGD (LID & EW) എഞ്ചിനീയർ
    - ഹെൽത്ത വിഭാഗം ഉദ്യോഗസ്ഥൻ (നഗര തദ്ദേശ സ്ഥാപനങ്ങളുടെ കാര്യത്തിൽ)
    - ജില്ലാ ശുചിത്വ മിഷനിൽ നിന്നുള്ള സാങ്കേതിക വിദഗ്ധൻ
    - ജില്ലാ മലിനീകരണ നിയന്ത്രണ ബോർഡിന്റെ പ്രതിനിധി
    - അക്കാദമിക സ്ഥാപനങ്ങളിൽ നിന്നുള്ള മറ്റ വിദഗ്ധർ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതികമായി ഷോർട്ടലിസ്റ്റ ചെയ്ത ബിഡഡർമാരുടെ ഫിനാൻഷ്യൽ ബിഡ്സുകൾ തുറക്കേണ്ടതും നടപടിക്രമങ്ങളും മാനദണ്ഡങ്ങളും പാലിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

- തിരഞ്ഞെടുത്ത കരാറുകാരന/ഏജൻസിക്ക ലെറ്റർ ഓഫ അവാർഡ (L O A) നൽകുകയും കരാറിൽ ഏർപ്പെടേണ്ടതുമാണ.

നിർവ്വഹണം, മേൽനോട്ടം, ബില്ലുകൾ തയ്യാറാക്കൽ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയറും മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങളുടെ നിരീക്ഷണ ചുമതലയുള്ള ഉദ്യോഗസ്ഥനും അടങ്ങുന്ന ഒരു മേൽനോട്ട സമിതി (Superv s on Commttee) രൂപീകരിക്കേണ്ടതാണ

- R F P ഡോകുമെന്റിലും കരാറിലും ഉൾപ്പെടുത്തിയിട്ടുള്ള 'സ്കോപ്പ ഓഫ വർക്ക' കരാറുകാരൻ കൃത്യമായി പാലിക്കുന്നുണ്ടോ എന്ന നിരീക്ഷിക്കുന്നതിനായി തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം മേൽനോട്ട സമിതിയെ ചുമതലപ്പെടുത്തേണ്ടതാണ.

- പ്രസ്തുത പ്രവൃത്തി 'സ്കോപ്പ ഓഫ വർക്കിൽ' നിഷ്കർഷിക്കുന്ന പ്രകാരമാണോ നടപ്പിലാക്കുന്നതെന്ന മേൽനോട്ട സമിതി കൃത്യമായും പരിശോധിക്കുകയും നിരീക്ഷിക്കുകയും ചെയ്യേണ്ടതാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ കരാറുകാരന/ ഏജൻസിയ്ക്ക സൈറ്റ ഹാൻഡ ഓവർ ചെയ്ത നൽകേണ്ടതും പ്രവൃത്തി നടപ്പിലാക്കുന്നതിനുള്ള/ നിർവഹിക്കുന്നതിനുള്ള പിന്തുണ നൽകുകയും ചെയ്യേണ്ടതാണ.

- മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങൾ നിരീക്ഷിക്കുന്നതിന്റെ ചുമതലയുള്ള ഉദ്യോഗസ്ഥൻ പ്രസ്തുത പ്രവൃത്തിയിൽ ഉൾപ്പെടുന്ന മാലിന്യ പരിപാലനവുമായി ബന്ധപ്പെട്ട പ്രവർത്തനങ്ങളായ വിൻട്രോ ഫോർമേഷൻ, മാലിന്യം

തരംതിരിക്കൽ, മലിനീകരണ നിയന്ത്രണ മുൻകരുതലുകളും ആരോഗ്യപരമായ കാര്യങ്ങളും ഉറപ്പുവരുത്തൽ എന്നിവയ്ക്ക മേൽനോട്ടം വഹിക്കേണ്ടതും കരാറുകാരന/ഏജൻസിക്ക മേൽനോട്ട സമിതി മുഖേന ആവശ്യമായ നിർദ്ദേശങ്ങൾ നൽകേണ്ടതുമാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ എംബുക്കിൽ 'ഇനിഷ്യൽ', 'ഇന്റർമീഡിയറ്റ്', 'ഫൈനൽ' ലെവലുകൾ എന്നിവ എടുത്ത അളവുകൾ രേഖപ്പെടുത്തേണ്ടതും, തദ്ദേശ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- കരാറിൽ വിശദമാക്കിയിട്ടുള്ള ജോലിയുടെ വിവിധ ഘട്ടങ്ങൾ പൂർത്തിയാക്കിയ ശേഷം കരാറുകാരൻ/ഏജൻസി ക്ലെയിം ചെയ്യുന്ന പ്രവൃത്തിയുടെ വർക്ക ബില്ലുകൾ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ തയ്യാറാക്കേണ്ടതും തദ്ദേശ സ്വയംഭരണ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- <u>GUIDELINES FOR IMPLEMENTATION OF PROJECTS FOR RECLAMATION OF LEGACY WASTE DUMPSITES THROUGH BIO REMEDIATION (BIO MINING AND MANAGEMENT OF RECOVERABLES AND REJECTS)</u>

As per the provisions of Solid Waste Management Rules 2016, local bodies are mandated to remediate legacy waste dumpsites and reclaim the land based on the guidelines issued by CPCB. Remediation of legacy dumpsites involves various activities such as assessment of the nature and quantity of waste to be remediated, excavation works to open the dumps, screening and sorting to segregate the waste fractions, reuse and sale/marketing of recovered materials, scientific disposal of rejects as per the norms. The remediation of dumpsites is further directed by Honorable NGT in its order on OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. However, the progress of implementation of such projects has not been satisfactory so far. One of the main reasons is that there is a lack of clarity in the procedures to be followed for legacy waste remediation projects right from the approval of the project to the mode of execution (including sale and disposal of recovered materials) by LSGIs since the nature of such projects is not similar to the general public construction/civil works. Also, the nature, quality and quantity of material that can be recovered from an existing legacy dumpsite cannot be accurately predetermined without opening up such dumpsites and hence it is not practical to prepare a workable estimate for the same like other public works . In order to tackle these issues, Swachh Bharat Mission(Urban) and CPHEEO have issued an "Advisory on Landfill reclamation", and suitable provisions of this advisory can be adopted for the State of Kerala. In these circumstances, the Government has examined this matter in detail, and the following guidelines are issued for the implementation of projects for remediation of legacy dumpsites by Local Self Government Institutions.

**<u>Standards, guidelines and advisories to be followed</u>**

- "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" issued by Central Pollution Control Board
- "SBM-U Advisory on Landfill Reclamation" published by MoHUA and

CPHEEO

- Guidelines issued by Government of Kerala in this regard from time to time

**Models for implementing legacy waste dumpsite remediation by LSGI's**

- 100% outsourced model (As per "SBM -U Advisory on Landfill Reclamation" published byMoHUA and CPHEEO)

**Implementing officer for legacy waste dumpsite remediation projects**

The implementing officer for legacy waste remediation shall be the Engineer of the LSGI

**Quantification of legacy waste to be remediated**

- The volume of legacy waste (in m3) to be remediated shall be generally assessed through Total Station Survey. If a total station survey is not feasible, a drone survey may be adopted for large dumpsites having a volume of more than 1 (One) Lakh m3.
- If required, external survey agencies may be engaged following laid down procedures and the cost for the same shall be met by LSGI from available funds.
- Contour mapping of the site shall be prepared and approved by the Engineer of the LSG

**Project Cost Estimation and Formulation by LSGI**

- Detailed report regarding the site conditions, nature of dump, history of dumping and other basic details shall be prepared in the format given in **Annexure - I**
- The estimate for biomining shall be prepared as per the specification and data given in
  - **Annexure -II**
- The overall cost for the implementation of the project shall be considered as part of the proposal.
- Project shall be taken up as per annual projects and funds from available sources shall be ear marked

**Technical Sanction**

- Technical sanction for the project shall be issued by the concerned Engineer in LSGD (LID & EW) as per the existing financial powers and necessary reporting to the Chief Technical Examiner (Finance Wing) may be ensured for compliance as per norms

**Implementation steps for remediation of legacy waste dumpsites by LSGIs**

**Tendering**

- Request for Proposals (RFPs-Two cover bid) clearly mentioning the scope of work, terms and conditions for reclamation of legacy waste dump sites shall be prepared and published as per laid down procedures.
- Conditions/eligibility criteria in the RFP shall be fixed based on the guidelines given in"**SBM-U Advisory on Landfill Reclamation"** published by MoHUA and CPHEEO
- It shall be ensured to mention in the scope of work that remediation of legacy waste dumpsites shall be undertaken as per the **"Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)"** issued by Central Pollution Control Board.
- The technical proposals received should be evaluated and technically qualified bidders shortlisted for further stage of bid approval. A Technical committee shall be formed at LSGI level for evaluation of the technical bids with the following members;
    - Secretary
    - LSGD (LID & EW) Engineer
    - Health Official (in the case of Urban local bodies)
    - Technical expert from District Suchitwa Mission
    - Representative from District Pollution Control Board
    - Other experts from academic institutions if any
- Financial bids of the technically shortlisted firms should be opened at LSGI level and approved as per procedures and norms
- Letter of Award (LoA) is to be issued to the selected contractor agency and agreement executed

**Execution, Supervision and preparation of bills**

- LSGI shall constitute a supervision committee consisting of LSGI Engineer and the officer in charge of monitoring waste management activity
    - LSGI shall authorise the supervision committee to monitor that the contractor correctly follows the scope of work included in the RFP document and agreement
- The supervision committee shall inspect and monitor that the work is being carried out as per the scope defined.
- LSGI Engineer shall hand over the site and provide support for execution of work at the site by the contractor/agency
- The officer in charge of monitoring waste management shall oversee the waste management related activities such as formation of windrows, segregation of waste into various streams,ensuring pollution control measures and health matters involved in the project and shall give direction to the contractor/agency through the supervision committee.

- LSGI Engineer shall measure, record quantities by taking initial, intermediate and final levels in M-book and Check measurements shall be done by the officials of LSGD (LID & EW) as per the powers vested with in the Local Self Government Department.
- LSGI Engineer shall prepare the work bills claimed by the contractor/agency after completing stages of work detailed in the agreement and check measurement shall be made by the officials of LSGD (LID & EW) as per the powers vested within Local Self Government Department.

# 1. Introduction

Social safeguarding is paramount during dumpsite remediation, with a strong emphasis on engaging with stakeholders, understanding their risk perceptions, and restoring sites to a safe and environmentally sustainable state. This involves a series of systematic social actions, including social inclusion, effective labor management, prevention of gender-based violence, rehabilitation of affected individuals, and reducing health risks for the surrounding community. The World Bank-supported KSWM Project has incorporated the bio-mining process for the Palaparamba dumpsite in Kuthuparamba.

## 1.1 Profile of ULB

Kuthuparamba is a municipality in Kannur district of Kerala. It's located about 24 km southeast of Kannur and 14 km east of Thalassery. Kuthuparamba was part of Kottayam dynasty under the reign of Pazhassi Raja in the medieval period. Since the British captured Kuthuparamba area, the area fell under British rule was formed as Kottayam taluk. Thalassery – Coorg road which was made by the British for sending troops to Mysore also plays an important role in the history of Kuthuparamba. The town was formed as Panchayat in the year 1939 by fixing Kuthuparamba revenue village as its boundary. Kuthuparamba was established as a Municipality in 1990. Kuthuparamba Municipality with an area of 16.76 square kilometers.

| Socio Economic Profile | |
|---|---|
| Name of District | Kannur |
| Total Population | 34198 |
| Total Male Population | 16396 |
| Total Female Population | 17802 |
| Total Scheduled Castes Population | 431 |
| Total Scheduled Castes Male Population | 200 |
| Total Scheduled Castes Female Population | 231 |
| Total Scheduled Tribes Population | 13 |
| Total Scheduled Tribes Male Population | 5 |
| Total Scheduled Tribes Female Population | 8 |

*Table 1 Socio Economic Profile*

Social safeguard aspects during dump site remediation mainly focusing on meaningful stakeholder engagement, understanding stakeholder's risk perception, and restoring them to a safe and environmentally sustainable state. It involves a series of systematic social actions which include social inclusion, effective labor management, and prevention of gender violence during the process, successive rehabilitation of the affected people and reduction of health risk of the host community. The bio mining process of Kuthuparamba municipal dumpsite has been included in the World Bank supported KSWMP project.

### 1.2 Profile of Dumpsite

The bio mining process of Kuthuparamba municipal dumpsite is included in the World Bank-supported Kerala Solid Waste Management Project (KSWMP) project. The dumpsite, which is in Palapparamba, ward No. 5 of the municipality, has been functional for many years and has a land area of 0.98 acres owned by the ULB.The waste at the site is approximately 50 years old, with dumping activities started in 1973 and since then, the site has been used for any dumping purposes. And it stopped in 2013 due to public protest. Twenty households are staying within 200 meters from the dumpsite.

The site is at 1 km from Thalassery-Mysore Road. The information on socio-economic profile is being gathered adopting different social tools including transect walk and Key Informants Interview (KII). The participants for the exercise include ward councilors, Kudumbashree members, HKS members etc. The RRF and MCF units are functioning in the compound of the dumpsite.

### 1.3 Socio economic baseline of host community

It is identified that there are 20 households situated within 200 meters from the dumpsite. They are engaged with various agricultural and allied sectors, service sector and construction work sectors. In the premises of the dumpsite, has a windrow compost unit, RRF, and MCF buildings are existing. The windrow compost unit is waiting for inauguration. The MCF and RRF buildings are in use. These units are managed by 4 workers including one woman. The dumpsite has sufficient road access and thus there will not be any disruption to the nearby households. No public facilities, properties or commercial establishments are existing near to the dumpsite. There are no scheduled tribes, rag pickers and other vulnerable communities living near the dumpsite.

### 1.4 Vulnerability mapping of host community

| Sl.No | Particulars | Number |
|---|---|---|
| 1 | Number of Senior citizen residing Near dumpsite | 10 |
| 2 | Number of single women staying near the dumpsite | NIL |
| 3 | Number of persons with disabilities | NIL |
| 4 | Number of person with severe disease | NIL |

| | | |
|---|---|---|
| 5 | Number of persons with respiratory issues | 2 |
| 6 | Number of Kids | 6 |

### 1.5 Stakeholder Analysis

Twenty households reside within 200 meters of the dumpsite. No inventory of Kudumbashree/ Haritha Karma Sena is located at the dumpsites. Building of a windrow compost unit constructed near to the dumpsite, but it is yet to be inaugurated. MCF and RRF buildings are also in the compound of the dumpsite, about 50m away from the dumpsite. These facilities are separated with a compound wall. The livelihood of the 4 persons working in the MCF and RRF may not be affected during the time of bioremediation. Municipality started the construction of the agriculture office, just outside of the dumpsite premises. No other public utilities or facilities are present near the dump site. Rag pickers do not reside within 200 meters of the site, Since the site is currently not in use for waste disposal, so no protest/ agitation from the side of the general public. The proposed project activity did not impact any vulnerable communities.

| **Sl. No** | **Stakeholders** | **Roles of the stakeholders w.r.t remediation process** |
|---|---|---|
| Service Providers | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like PCB,KSEB,KWA etc | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | DPMU | Monitoring and Evaluation |
| 5 | TSC/PMC | Technical support and consultation |
| 6 | Contractor | Execution of the Remediation process |
| 7 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| Community | | |

| | | |
|---|---|---|
| 8 | 23 Workers in the RRF, MCF and | Support and cooperation for the remediation process |
| 9 | Members of 20 HHs in the 200 m radius of the dumpsite | Support and cooperation for the remediation process |
| 11 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| | | |
| 12 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 15 | End recyclers | Process the inert and legacy waste safely after remediation |

*Table 2 Stakeholder Analysis*

# 2. Output of Social screening

## 2.1 Social Screening Checklist

Social screening of the dumpsite remediation to understand the social impacts and other social issues, by a joint team of DPMU, DPMC, TSC and PIU, was carried out on 19.01.2023 using a social screening checklist. Social screening was done to identify the potential social risks anticipated during dumpsite remediation. Site is not situated in a densely populated area. However, around 20 houses exist within 200 meters. The social screening has been conducted with a social screening checklist to identify the potential social risks. Major findings during the screening process are shown below

- The dumpsite is in an isolated hilly area.
- MCF and RRF buildings are situated near to the dumpsite. The units are managed by 4 workers. A windrow compost unit is constructed but to be inaugurated. The dumpsite remains near ten houses within 200 m distance.
- There will not be any adverse social impacts on dwellings, land, and community resources of host communities.
- There are no scheduled tribes, rag pickers living near the dumpsite.
- Since there is not much risk with respect to the social and economic conditions of the host communities, the dumpsite can be categorized into "Moderate Risk".

## 2.2 Transect walk

A transect walk was conducted on 3rd June 2023. Twelve persons actively participated in the transect walk. Residents, HKS, municipal workers, Kudumbashree members and project officials were the participants. Gathered a consultation meeting and social map prepared with the support of participants followed by the transect walk through a predetermined route.

RRF and MCF units are functional in the compound of the dumpsite. These units are approximately 50m from the dumping area. But it is This unit is operated by four individuals from the Ibrahim agency, which is working as registered recyclers

The presence of rag pickers is not found in the dumpsite; vulnerable groups are also not found. The project does not affect land or livelihood of any individual in the area. The transect walk was useful to understand the social risk and social impacts to prepare the mitigation plans and strategies.

## 1.1 Stakeholder Consultation meeting

A stakeholder consultation meeting in connection with the Palapparamba dumpsite was conducted on 4.7.2023 in the municipality. The Municipal Health Standing Committee Chairperson chaired the meeting. Councillors, political leaders, Kudumbashree members, HKS members, ward

convener, KSWMP project officials, etc participated in the meeting. The agenda of the meeting was the procedures of dumpsite remediation and realizing the concerns of the community.

The Municipal Chairperson emphasized the need for dumpsite remediation and available assistance from the government. The dumpsite is already closed. But the accumulated legacy waste, till the closure, is there and the menace of dumpsite can be removed only after the bio-mining process. Chairperson added, the dumpsite remediation is possible with the effective use of available funds and technical support. The ward councilor extended the support of the people residing near the dumpsite. The Kudumbashree members and ward convener raised a concern of dumping of waste again in the remediated land. The project officials intimated in the meeting that the technical processes started and hopefully the subproject can tender before the end of 2023. They briefly explained about the process and positive impacts of dumpsite remediation.

The output of the meeting: The concerns of the community will be taken up before the commencement of work. The maintenance of BDW facilities and livelihood of workers during the bio-mining process will be taken care of. The community extended their support to the remediation.

### 2.3 Key informants Interviews

As part of the assessment, they conducted key informants' interviews (KIIs) in the affected communities and gathered data on socio-economic conditions, health status, waste management practices, and opinion on the proposed remediation project to develop suitable and adequate mitigation plans.

KIIs has conducted in the dumpsite with 1. ward councilor and 2. Clean City Manager. A predefined schedule used to gather information from the informants. Open ended questions with sub questions and clarifications during the interview was productive. Data regarding the history and emergence of dumpsite, people's protest, issues like flees and odour and views regarding people's concerns and expectations, etc are delivered during the interview.

### 2.4 Findings of Social Screening:

1) Land acquisition or land loss is not applicable here for the execution of the work.
2) There are no scheduled tribes, rag pickers living near the dumpsite.
3) Since there is not much risk with respect to the social and economic conditions of the host communities, the dumpsite can be categorized into "Moderate Risk".
4) There will not be any adverse social impacts on dwellings, land, labour, livelihood, and community resources of host communities.
5) Solid waste dumping stopped, and capping was done by the recommendation of IIT madras in the year 2013

## 2.5 General observations

The status of the dumpsite is inactive. The menace of waste can be totally removed by the proposed bio-mining process. The positive outcome of the subprojects brings the support of the nearby community. But the community strongly opposes any plan to make the site again a waste management location.

## 2.6 Expected Positive Social impacts after remediation

### 2.6.1 Enhanced quality of life

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing around the dumpsite, the project can contribute to an improved sense of well-being. Livelihood and employment of vulnerable community

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

### 2.6.2 Economic opportunities

After remediating the site, the Municipality is planning to enhance the capacity of the MCF and RRF to process more non-biodegradable waste and to set up a centralized waste management unit to process the biodegradable waste. These projects will create more job opportunities to the people who are looking for employment in the waste management sector. Remediation creates new opportunities for economic development in the area. The cleaned-up land can potentially be used for new construction, commercial development, or recreational activities. Remediation process will help to increase property values for surrounding residents.

### 2.6.3 Access to service

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the existing site.

### 2.6.4 Land availability

The dumpsite is not situated near the residential area. Living near a waste dump site can significantly impact the quality of life for residents. The removal of these sites can improve the aesthetics of the area, reduce odor and noise pollution, and increase property values for surrounding residents.

# 3. Scoping of Social Impact Assessment

All the social risks were identified through the social screening and Transect walk conducted at site. Since there are families and institutions in the proximity of the dumpsite, below shown action plans have been formulated to be followed at site

## 3.1 Labour Management Plan

An average of 30 laborers are expected to be engaged in the remediation process at a time. A detailed labour Management plan has been prepared and attached as Annexure.

## 3.2 Labour Influx Management Plan

Since 20 families are residing in 200 m Households there are chances of influx issues. A detailed labour Influx Management plan has been prepared and attached as Annexure.

## 3.3 Preventive GBV Action plan

Since an MCF, RRF and Bio waste processing units are functioning inside the dumpsite and close proximity to households there is a high chance of occurrence of GBV incidents. A detailed GBV action plan has been prepared and attached as Annexure.

## 3.4 Citizen Engagement Plan

Being a socially sensitive area with past protest history, public protest might have happened during the execution period of the project. A detailed citizen engagement plan has been prepared and attached as Annexure.

## 3.5 Livelihood Action Plan

Four workers are engaged in the MCF and RRF facilities. The WIndrow compost unit is yet to be started. MCF/RFF facilities are approximately 50m from the waste accumulated area. No livelihood loss can be expected as an impact of dumpsite remediation.

The assessment of potential social risk during the remediation process and the identification from social screening with screening checklist, transect walk and focus group discussion indicates that there will not be any impact on the livelihood of the community and service providers.

It is identified that land acquisition is not required as sufficient land is available.

# 4. Required Action plans

## 4.1 Labour Management Plan

### 4.1.1 Details of Labors

The proposed remediation process at Palapparamba, requires following category and number labors

| No | Manpower | No |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental, Social and Health & Safety (ESHS) Officer | 1 |
| 3 | Security (3 X 8 Hrs) | 3 |
| 4 | Operations Supervisor & Accountant | 2 |
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 2 |
| 8 | Labors near Screening machinery | 4 |
| 9 | Labors at Baling facility | 2 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 11 |
| | **Total** | **30** |

*Table 3 Details of Labours*

#### Working Hours

**8 hours per shift**

#### Type of Engagement

Contract. (Direct workers/contracted workers/daily wage workers/etc)

### 4.1.2 Assessment of key potential labour risks

**Project Activities:**

The bioremediation of the dumpsite at Palapparamba includes the following activities.

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement

- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

### 4.1.3 Key Labor Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.
- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female SWM workers are engaged.
- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form worker's organizations, etc.

- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

### 4.1.4 Brief overview of labour legislation: Terms and Conditions

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |

| Sl No | Applicable Acts | Details |
|---|---|---|
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10. | Industrial Disputes Act 1947: | the Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

*Table 4 labour legislation*

### 4.1.5 Responsibility Mapping

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring laborers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing laborers, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the laborers. The ULB will actively monitor the contractor's compliance with legal and welfare

requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

### 4.1.6 Code of Conduct

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured;

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favours or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)
- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favours, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)

- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

### 4.1.7 Systematizing the code of conduct

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

### 4.1.8 Transparency in contract specific terms and conditions

All contracts must contain;

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism

### 4.1.9 Labour Management plan matrix

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| labour force deployed. (By the Contractor) | | | | |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on. | One notice board | As soon as the work is started. | Photographs of the notice board where the license is displayed. | Contractor |
| To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board | do | do | |
| To conduct pre- employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the construction period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. Female members should be minimum 50%. ) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act<br>2. The Employee Compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act<br>5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity Benefit Act | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| Conduct HIV/AIDS awareness programs | As per requirement | Once in six months | Reports, photographs etc | Contractor |
| All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of licence ids to be collected | PIU |
| All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only after procurement of third- | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| | party insurance to the vehicle | | | |

### 4.2 Labour Influx Management Plan

An average of 30 laborers will be engaged in the dumpsite remediation process. The labour influx matrix is given in the below table

| Risk | Mitigation Measures | Implementation responsibility | Monitoring indicators | Monitoring responsibility |
|---|---|---|---|---|
| Social and Community wellbeing | Joint Meeting with the community by ULB officials and Elected members | Contractor/PIU | • Risk identification report<br>• Proposed action/mitigation plan<br>• Action taken report/progress report<br>• | TSC/DPMU |
| Economic and Livelihood Issues | Skilled /Unskilled jobs for the Community embers in the sub-project | Contractor/PIU | • Risk identification report<br>• Proposed action/mitigation plan<br>• Action taken report/progress report | TSC/DPMU |
| Accommodation /labour camp | • Ensure basic amenities are provided to the laborers (Toilets, Water, Kitchen facilities etc)<br>• Daily briefing to the laborers | Contractor | • Risk identification report<br>• Proposed action/mitigation plan<br>• List of facilities in labour camp<br>• Details of labors | TSC/DPMU |

| Risk | Mitigation Measures | Implementation responsibility | Monitoring indicators | Monitoring responsibility |
|---|---|---|---|---|
| Communicable Diseases | • Access to Medical Check-up<br>• Awareness to the laborers | Contractor | • SOP for prevention of communicable disease and health wellbeing on worksite and labour camp<br>• Report on medical check-up | TSC/DPMU |
| Crimes | • Intimation to the Local police about the camp | Contractor | • Work site complaint register<br>• Number of cases reported, and action taken | TSC/DPMU |
| Child Labour | • Ensure Adhar card of all laborers at the site | Contractor & TSC | • Number of child labour issues reported<br>• Data of labors | ULB/DPMU |
| Gender-based violence, including sexual harassment child abuse and exploitation | • Gender sensitization briefing to the laborers | Contractor/TSC | • Number of cases reported<br>• Action taken report<br>• Number of cases resolved<br>• Time taken for resolving complaints | ULB/DPMU |
| Labour license | Mandatory provisions to be followed | Contractor/PIU | • Number of labors having license | DPMU |

*Table 6 Labour Influx Management Plan*

### 4.3 Preventive GBV Action Plan

GBV Action Plan – matrix

The purpose of the Gender-Based Violence Action Plan in the Kerala Solid Waste Management Project (KSWMP) is to prevent and address gender-based violence (GBV) in all aspects of the project. This includes during the planning, implementation, and monitoring of project activities. The GBV AP is an integral part of the KSWMP's Environmental and Social Management Framework (ESMF). The GBV action plan outlines a number of measures that will be taken to prevent and address gender based violence.

| Action | Tasks | Timeline | Implementing Responsibility | Monitoring Indicators | Monitoring responsibility |
|---|---|---|---|---|---|
| Formation of internal complaints committee | •ULB level ICC will be constituted | Before implementation | ULB | •Minutes and Reports | TSC |
| Map GBV issues | Ensure justice, safety and protection, reasonable wages, care and support, adequate Work space, Avoid Gender discrimination Physical, Sexual , Psycological and socio Economic violence, stress, emotion, conflict, abuse, threatens | During implementation | Contractor/ULB | Issue tracking system in place Feedback report(monthly) | TSC |
| Map GBV service providers and quality assessment of services | •NGOs<br>•Police Station KELSA<br>•Women protection officer<br>•List of Nongovernment and private | Before implementation | TSC | •Directory of service providers<br>•List of key partners<br>•Mapping of roles and responsibilities | TSC |

| Action | Tasks | Timeline | Implementing Responsibility | Monitoring Indicators | Monitoring responsibility |
|---|---|---|---|---|---|
| | agencies providing GBV support<br>• Map local informal grassroot level organizations<br>• Review the quality of services in terms of prevention, protection, rescue, rehabilitation, restoration, reintegration, research, and documentation | | | •Monthly report on quality Assessment | |
| Facilitate GBV awareness and sensitization programs | •Organize sensitization activities<br>•Display sign boards around the project site | During implementation | Contractor/ICC | •Detailed activity plan<br>•Progress reports<br>•Completion report | TSC |
| Create a GBV response and support mechanism | SOP for the actions be followed in terms of any incidents related to GBV will be formed along with ICC. The SOP will detailed the identification of support mechanism and terms of conditions for comply with existing rules and | During implementation | ULB/ICC | •SOP for prevention, protection, and rehabilitation | TSC |

### 4.4 Site Specific Citizen Engagement Plan

#### 4.4.1 Stakeholder identification

As part of social safeguard initiatives for the bioremediation of dumpsites at Palapparamba, Kuthuparamba municipality. The social experts of DPMU, DPMC and TSC conducted brainstorming exercises with local community, municipal officials, and PIU. A detailed list of primary and secondary stakeholders is prepared on the basis of these exercises.

#### 4.4.2 Waste Generators

The dumpsite is located in Palapparamba ward No 5. The dumpsite is located inside the existing common solid waste management facility of the municipality. MCF and RRF units are working and a windrow compost unit is constructed inside the compound of the dumpsite land. But the dumpsite and the facilities are separated with a compound wall.

#### 4.4.3 Service Providers

For the successful completion of the bioremediation sub project, service of many people, agencies and departments are to be ensured by proper advocacy and networking initiatives. Following is the list of service providers identified through stakeholder analyses and their expected role/responsibility in the project

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| Service Providers | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like PCB,KSEB,KWA etc. | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | Contractor | Execution of the Remediation process |
| 5 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| Community | | |

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 6 | 4 labourers are workingin the MCF/RRF units | Support and cooperation for the remediation process |
| 7 | Members of 20 HHs in the 200 m radius of the dumpsite | Support and cooperation for the remediation process |
| 8 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 9 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |

*Table 8 Service Providers*

#### 4.4.4 Need of the plan

Citizen engagement as part of the proposed bioremediation of dumpsite in Kuthuparamba municipality aims to facilitate two-way communication between the project and its stakeholders in order to make better informed decisions. Such an engagement will certainly pave the way for better implementation of the project, and it will ensure public participation in trouble shooting at all the stages of the implementation of the project.

#### 4.4.5 Objective of the plan

The citizen engagement plan for the proposed dump site remediation is prepared with following objectives;

- To create a conducive environment for the smooth implementation of the proposed bioremediation of the dumpsite by promoting constructive dialogues between the project and its stakeholders.
- To ensure stakeholder participation in the planning, implementation, and monitoring of the sub-project.
- To suggest appropriate activities with a monitoring plan and an expected budget for engaging the stakeholders with the motive of enhancing their ownership in the project through increased participation.

#### 4.4.6 Stakeholder concern

**Waste Generators**

The waste collection may get delayed/stopped due the remediation process.

**Service Providers**

Major concerns of the service providers which has to be addressed by the citizen's engagement plan can be summarized as follows;

- Precautions to be taken to avoid the livelihood of workers in the MCF and RRF may get affected.
- SWM related Service providers/HKS of the municipality should be trained and motivated for proper timely collection, segregation and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the future.

### 4.4.7 Activities proposed

Community/citizen Awareness

- Focus group discussions to host community
- Organize exposure visit for the identified members from host community and council members
- Formation of GRM committee to take up any issue raised at site level and help to resolve an emergency.
- Sensitization programs to nearby vendors

Awareness to Service providers

- Sensitization on the bio-remediation activity is to be conducted for the Kuthuparamba Municipal Council and officials prior to the commencement of the actual bio-remediation process.
- Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc.
- Orientation to the Service providers/HKS of Kuthuparamba Municipality
- Sensitization meetings to the local and district level police officials on the proposed bio remediation of dumpsite and anticipated issues and action required.
- Sensitization programs to Fire Force, and PCB regarding dumpsite remediation.
- Orientation regarding the dumpsite remediation process and its benefits to local community

### 4.4.8 Citizen engagement plan

**Citizen Engagement Plan matrix**

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Lack of Awareness on Project activities | Non co-operation of Community/stakeholders | Awareness campaigns /IEC material/ sensitization programs to the stakeholders | ULB/Contractor |
| 2 | Delay in decision making and timely support from the ULB | To establish transparency and building confidence in the project commitments to ULB elected members and officials | Sensitization on the bio-remediation activity for the elected representatives and officials prior to the commencement. | ULB/Contractor |
| 3 | Lack of proper GRM system | Delay in the execution of remediation work | Constitution of GRM Committee to take-up social issues raised at site level | ULB/Contractor |
| 4 | Lack of conducive environment for bioremediation activity | Delay in the execution of remediation work | Sensitisation meetings to various departments | ULB/Contractor |

*Table 9 Citizen Engagement Plan matrix*

### 4.4.9 Monitoring Plan

| S. No | Activity | Means of Communications | Monitoring Indicator | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activities for the Municipal Council and officials | Presentation and group discussion | No of councilors and officials attended | DPMU/DPMC/ TSC |
| 2 | Sensitization meeting to host community | Presentation and group discussion | No of persons attended. | DPMU |

| S. No | Activity | Means of Communications | Monitoring Indicator | Monitoring Responsibility |
|---|---|---|---|---|
| 3 | Formation of GRM committee | Office order/ proceedings on the formation of GRM committee | Office order/ proceedings | DPMU |
| 4 | Orientation to the Service providers/HKS | Presentation and group discussion | No of service providers/HKS attended | ULB/DPMU |
| 5 | One to one meeting district administration, line departments, PCB, KSEB, KWA, Fire & Safety and Police | Presentation | No of one-to-one meeting conducted / no of officials attended | ULB/DPMU |
| 6 | IEC display board | IEC boards | No of IEC developed and displayed | ULB/DPMU |

Table 10 Monitoring Plan

### 4.4.10 Budget

| S. No | Activity | Specification | Quantity / events | Cost |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activities for the Municipal Council and officials prior to the commencement of the work | Half day Program for Councilors and municipal officials | 1 | [redacted] |
| 2 | Sensitization meeting to host community | Half day Program by incorporating all host community members | 2 | [redacted] |
| 3 | Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency. | Committee formation | 1 | [redacted] |
| 4 | Meeting with Contractor to get an understanding of their plan of | One to one interaction | As required | [redacted] |

| S. No | Activity | Specification | Quantity / events | Cost |

# SUMMARY

**INTRODUCTION:** Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. Bio mining and bioremediation of Kumbalathumury dumpsite figures in Cluster 1. The selected dumpsite is Kumbalathumury which is falling under this cluster 1 and is located near Ward no 06 Kothamangalam municipality, Ernakulum District.

**RATIONALE FOR THE PROPOSED SUB-PROJECT:** Kothamangalam ULB proposes bio mining and bioremediation of the Kumbalathumury legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

**PROPOSED SUB-PROJECT DETAILS:** Kothamangalam dumpsite is located at a distance of 6.0 km from the centre of Kothamangalam town in western side and encompasses a total area of 2.6 acres of land. The geographical coordinates of the dumpsite are 10.078930° N & 76.647811° E. The volume of legacy waste to be remediated in the dumpsite is 29,915 Cu.m. The legacy waste is presented about 3.0 m below and 2.5 m above the ground level respectively. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts.

**APPLICABLE NATIONAL, STATE LEGISLATIONS AND TECHNICAL GUIDELINES:** To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed.

**THE WORLD BANK SAFEGUARDS POLICIES, AND KSWMP ESMF**: The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are ensured.

**SUB-PROJECT SCREENING AND ITS CATEGORIZATION:** As per indicative categorization for dumpsite bio mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (2.60 acres) and waste spread (2.13 acres) and environmentally sensitive features around this subproject is individually considered as E2 and EIA is prepared accordingly.

**ENVIRONMENTAL BASELINE:** Physiographically, Kothamangalam in and around topographical features falls under midland category with hilly terrain zone. The favourable time for remediation is between October-2023 to March-2024 non-monsoon period. As per Wind rose, the predominant wind directions are blowing from SW and WSW direction throughout the year. As per the geotechnical investigation, the subgrade soil was encountered at 3.0 m below the waste depth of the dumpsite and the predominant soil is gravelly clay. The dumpsite is surrounded by predominantly of Dry cultivation land use and the same will act as odour attenuation during remediation. The cultural heritage zone near dumpsites is Mar Thoma Cheriyapalli church at a distance of 6.0 Km in SW direction. Hence, no significant physical impact to the heritages sites is envisaged during remediation. The total number of vehicles that will be operational at the dumpsite is 5 numbers per day which increase the traffic load by only 0.1% per hour and reducing the impacts to negligible. As per the district disaster management plan-2015 and flood vulnerability map the dumpsite is not under flood prone zone.

**DESCRIPTION OF ENVIRONMENTAL PARAMETERS:** The analysed air pollution data indicates that the levels are within acceptable limits of NAAQs for all the parameters. The ambient Noise Levels are well within the National Ambient Noise standards for Residential Area for night time however during the day time noise equivalent (55.6 dB (A) was found to be marginally higher than the standards. The ground water quality results indicate that the dumpsite has not caused any major increase of the parameters and the quality parameters are within the IS10500:2011, except the coliforms which are found to be higher than the above said standard. Similarly, the surface water sample shows that it is not largely influenced by the dumpsite as the quality is within the limits of IS 2296, except for BOD which shows a marginal increase in value of about 4.6 mg/l and COD of 8 mg/l. The leachate monitoring data indicates, the TDS is about 1885 mg/l, while the suspended solids is about 180 mg/l. The chlorides are 788 mg/l, while the COD, BOD are 320 mg/l and 110 mg/l respectively.

**SOCIO-ECONOMIC BASELINE:** Kothamangalam Municipality has population of 38,822, literacy rate of 92.95% as per Census 2011. The dump site is situated in the land owned by the Municipality. They have full authority to plan and implement the remediation process in this land. The remediation process will be conducted by an experienced agency decided by the Municipality with the supervision of a ULB level project implementation unit.

**SOCIO-ECONOMIC ENVIRONMENT:** In connection with the dumpsite only one family is residing in an aerial distance of 200 m and the remediation process will not affect them in any way. The remediation process will not affect the socio economic environment in and around the dump site in any way. Within a 200-meter radius of the dumpsite, there are no public utilities or facilities. The site is isolated and located far from habitation and settlements.

**ANALYSIS OF ALTERNATIVES:** After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

**ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS:** Environment: During operational phase (bio-remediation), the main potential nuisances caused by a dump site are fugitive dust, odour, foul gases, smoke from the site (in case of fire), and leachate generation. Birds, vermin, and rodents, littering, noises both from machineries operating at the site and waste collection vehicles. Social: No specific social risk is identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process. It can be overcome by using adequate protective measures properly. In connection with the dumpsite only one family is residing in an aerial distance of 200 m and the remediation process will not affect them in any way.

**ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN:** The management plan proposed are for pre-remediation as well as during remediation stage. The mitigation measures are recommended for impacts from air, noise, water, leachate, health and safety, OH&S aspects. The proposed monitoring plan includes leachate, surface and ground water monitoring for a period of once in three months. The cost of [redacted] is required for implementation and supervision of EMP.

**SOCIAL MANAGEMENT AND MONITORING PLAN:** The social management plan proposed are for pre-remediation as well as during remediation stage. The mitigative measures proposed addressing concern of local community about remediation work, labour management issues, health and safety risks of labours, gender discrimination.

**EMERGENCY PREPAREDNESS PLAN:** The identified emergency situations which may arise from remediation activities are fire risk in summer, occupational health and safety related risks. The

Kothamangalam police station at 3.5 km, Taluk hospital at 4.5 km, Kothamangalam Fire and Rescue station at 5 km are the nearest emergency services. Periodic Compliance monitoring system will be done by the contractor during remediation.

**PUBLIC CONSULTATION AND INFORMATION DISCLOSURE: A** Transect walk was carried out on 06.06.2023 covering the surrounding area of the dump site. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact. Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the process at the site. Site control measures should be enforced to prevent unauthorized personnel into the work site.

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# CHAPTER 1. INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-Lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. There are 19 dumpsites identified for remediation under the Kerala Solid Waste Management Project. Several others have been taken up for remediation directly by the ULBs. Currently, 7 dumpsites considered within the three districts, which are (Ernakulum, Alappuzha and Idukki) falling under Package B are selected by Kerala Solid Waste Management Project (KSWMP) for remediation under the project. One of the selected dumpsite is Kumbalathumury is located near Ward no 06 Kothamangalam municipality, Ernakulum District.

## 1.2 The rationale for the Proposed Sub-Project

Kumbalathumury dumpsite in Kothamangalam ULB at Ward no 06 has a total waste quantity of 29,906 cum, spreading over 2.13 acres. The site is located between Latitude 10.078930° N and Longitude 76.647811° E and has an elevation of MSL +20 (m), with a gentle slope from North West to the south-eastern part. During monsoon season, due to the geography of the site, Leachate from dump waste flows downhill towards southern side of the dry agricultural land. Kothamangalam ULB proposes bio mining and bioremediation of the Kumbalathumury legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Proposed Sub-Project Details

Kothamangalam dumpsite is located at a distance of 6.0 km from the centre of Kothamangalam town in western side and encompasses a total area of approximately 2.6 acres of land, out of this 2.13 acres of land is covered with solid waste. The geographical coordinates of the dumpsite are 10.078930° N & 76.647811° E. It is located in ward no. 6 of the municipality. Kothamangalam municipality holds the ownership of the dumpsite. The South and West direction from the dumpsite is vacant land and the nearest road is Malayinkeezhu- Nadukani Road in the South direction at a distance of 250 m from the dumpsite.

Currently, the quantity of waste dumped at this site is about 29,906 Cu.m above the surface level as per the topographic survey, and 8620 Cu.m below the surface as per geotechnical survey. The legacy waste is presented about 3.0 m below and 2.5 m above the ground level respectively. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues.

### 1.4 Objectives and Scope of the EIA & SIA

As per indicative categorization for dumpsite bio mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (2.60 acres) and waste spread (2.13 acres) and absence of environmentally sensitive features around, this subproject is individually considered as E2 and EIA is prepared accordingly.

The EIA & SIA process involves the identification of the potential environmental and social issues in the project and trying to address them during design interventions. The EIA & SIA further carries out impact prediction and evaluation of residual environmental and social issues of the project. It then goes on to outline the proposed mitigation measures for residual impacts and enhancement measures for positive impacts which the Project will implement.

### 1.5 Structure of the Report

The Consolidated EIA report has been structured into the following Chapters:

- Introduction and Project Description.
- Policy, Legal and Administrative Framework presents a review of the existing Institutions and legislation relevant to the project at the National and the State levels;
- Environmental Assessment Methodology discusses sequence of tasks carried Out in preparing EIA;
- Existing Environmental Scenario presents a consolidated picture of the existing Environmental setting of the project;
- Assessment of Potential Impacts identifies and quantifies the potential impacts on each of the environmental components due to the proposed project development;
- Analysis of Alternatives discusses the criteria for analysis of alternatives of technology for remediation.
- Mitigation Measures presents an elaborate listing of the nature of impacts on each of the environmental components and the avoidance and mitigation measures suggested.
- Public Consultation details the stages and types of public consultations carried out during the project preparation stage and people's perceptions of the project benefits and the Potential impacts;

# CHAPTER 2. POLICY AND REGULATORY FRAMEWORK

## 2.1 Applicable National, State Legislations and Technical Guidelines

**National Environmental Rules and Regulations: -**

To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed. A summary of environmental legislation/regulations relevant to the project is furnished in the following **Table-2.1**.

**TABLE: 2.1 SUMMARY OF ENVIRONMENTAL LEGISLATION/REGULATIONS**

| Sr. No. | Act / Rules | Purpose | Applicable (Yes / No) | Reason for Applicability | Authority |
|---|---|---|---|---|---|
| 1 | Environment Protection Act, 1986 | To protect and improve the overall environment. This is an umbrella Act. | Yes | As all environmental notifications, rules and schedules are issued under this act. | MoEF&CC, CPCB, SPCB |
| 2 | Solid Waste Management Rules, 2016 | To manage collection, transportation, Segregation, Treatment, and disposal of solid wastes (other than Hazardous water, Plastic Waste, Bio Medical waste) | Yes | Dumpsite remediation/bio mining | MoEF&CC, CPCB, SPCB |
| 3 | Air (Prevention and Control of Pollution) Act, 1981 | To control air pollution by controlling emission of air pollutants as per the prescribed standards. | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 21 of Air (Prevention and control of Pollution) Act 1981. | State Pollution Control Board, Kerala |
| 4 | Water Prevention and Control of Pollution) Act, 1974 | To control water pollution by controlling discharge of pollutants as per the prescribed standards | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 25 of this Act. | State Pollution Control Board, Kerala |
| 5 | The Noise Pollution (Regulation and Control) Rules, 2000 & amendments | The standards for noise for day and night have been promulgated by the MoEF&CC for various activities. | Yes | This act will be applicable for all construction equipment deployed at worksite and in operation. | State Pollution Control Board, Kerala |
| 6 | Public Liability and Insurance Act, 1991 | Protection from accidents. | Yes | This act will be applicable for providing immediate relief to the persons affected by accident occurring during work | State Pollution Control Board, Kerala |
| 7 | Central Motor Vehicle Act 1988 | To check vehicular air and noise pollution. | Yes | This rule will be applicable to vehicles deployed for construction activities and construction Machinery. | Motor Vehicle Department |

| | | | | | |
|---|---|---|---|---|---|
| 8 | The Plastic Waste Management Rules, 2016 | For the storage and disposal of plastic wastes through authorized vendors. | Yes | This act will be applicable for the storage and disposal of all the plastic wastes. | State Pollution Control Board, Kerala |
| **Other applicable Rules** | | | | | |
| 9 | Construction & Demolition, Waste Management Rules, 2016 | | | | |
| 10 | Batteries (Management and Handling) Rules, 2001 | | | | |
| 11 | E-Waste (Management) Rules, 2016 | | | | |
| 12 | Kerala Municipality Act, 1994 & Rules | | | | |
| 13 | Hazardous & Other Wastes (Management And Transboundary Movement) Rules, 2016 | | | | |
| 14 | Bio-medical Waste (Management & Handling) Rules, 1998 | | | | |

## Applicable Social and Other Legislation

**Other Legislations applicable to Construction activities under the project**

- Workmen's Compensation Act 1923 (the Act provides for compensation in case of injury by accident arising out of and during the course of employment);
- Payment of Gratuity Act, 1972 (gratuity is payable to an employee under the Act on satisfaction of certain conditions on separation if an employee has completed 5 years);
- Employees PF and Miscellaneous Provision Act 1952 (the Act provides for monthly contributions by the employer plus workers);
- Maternity Benefit Act, 1951 (the Act provides for leave and some other benefits to women employees in case of confinement or miscarriage, etc.);
- The Sexual Harassment of Women at Workplace (Prevention, Prohibition and Redressal) Act, 2013 is introduced to prevent and provide redressal of complaints of sexual harassment.
- The Protection of Women from Domestic Violence Act, 2005 defines domestic violence, describes the powers and duties of protection officers, service providers and lists the procedures for obtaining reliefs.
- Contract Labor (Regulation and Abolition) Act, 1970 (the Act provides for certain welfare measures to be provided by the contractor to contract labour);
- Minimum Wages Act, 1948 (the employer is supposed to pay not less than the Minimum Wages fixed by the Government as per provisions of the Act);
- Payment of Wages Act, 1936 (it lays down as to by what date the wages are to be paid, when it will be paid and what deductions can be made from the wages of the workers);
- Equal Remuneration Act, 1979 (the Act provides for payment of equal wages for work of equal nature to Male and Female workers and not for making discrimination against Female employees);
- Payment of Bonus Act, 1965 (the Act provides for payments of annual bonus subject to a minimum of 83.3% of wages and maximum of 20% of wages);
- Industrial Disputes Act, 1947 (the Act lays down the machinery and procedure for resolution of industrial disputes, in what situations a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing down the establishment);

- Industrial Employment (Standing Orders) Act; 1946 (the Act provides for laying down rules governing the conditions of employment);
- Trade Unions Act, 1926 (the Act lays down the procedure for registration of trade unions of workers and employers. The trade unions registered under the Act have been given certain immunities from civil and criminal liabilities);
- Child Labour (Prohibition and Regulation) Act, 1986 (the Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of child labour is prohibited in Building and Construction Industry);
- Inter-State Migrant Workmen's (Regulation of Employment and Conditions of Service) Act, 1979 (the inter-state migrant workers, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home to the establishment and back, etc.);
- The Building and Other Construction Workers Act (BOCW), 1996 is a social welfare legislation that aims to benefit workers engaged in building and Other Constructions Works.

### 2.2 The World Bank Safeguards Policies, and KSWMP ESMF

The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are summarized in the following table.

**Environmental Codes of Practices (ECoP):** The ECoP's guidelines for environmental management of bio-mining and bio-remediation activities which are seen to be of limited extent of impacts/risk, temporary and reversible, and readily managed with good practices during the implementation. The following key points should be considered.

**Key Points of ECop to be considered:**

- The bio-mining activities and preparatory activities shall follow the "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" published by CPCB in February 2019.

- Bio-mining methods include Tractor Tiller, Trench method, Cone Method, windrow, Thin Layer Method, etc. More appropriate may be the Cone method for legacy waste and window for relatively fresh waste.

- Leachate channelization and treatment facility shall be set up before starting the bio-mining works. Works shall take place only during the non-monsoon period; and there shall be suitable precautions to prevent any rainwater disturbing the operations (like seasonal unexpected rains, storm water, runoffs from other sources).

- Ballistic separator and trommel may be used for screening. Screened fractions into which waste is segregated include RDF, inert, Compost, and C&D wastes.

**Applicable World Bank Operational policies**

OP 4.01 Environmental Assessment Help to ensure the environmental and social soundness and sustainability of investment projects. Support integration of environmental and social aspects of projects in the decision-making process

OP 4.04 Natural Habitats Promote environmentally sustainable development by supporting the protection, conservation, maintenance, and rehabilitation of natural habitats and their functions.

OP 4.09 Pest Management includes training to prevent risk to human beings or animals from Bio-culture, enzymes, insecticides and such formulations used for remediation.

OP 4.11 Physical Cultural Resources (PCR) includes resources of archaeological, paleontological, historical, architectural, religious (including graveyards and burial sites), aesthetic, or other cultural significance. Assist in preserving PCR and in avoiding their destruction or damage.

WB General EHS Guidelines Recommendations of these guidelines would be incorporated in the EMP & SMP and Bidding document for this sub-project.

The Environmental Management Framework (EMF) has been prepared to assist in the screening, assessment, and management of environmental risks of all solid waste management projects at an early stage during the planning and integration, mitigation hierarchy during the subproject design, implementation, and operation. The framework helps provide specific guidance on the policies and procedures to be followed for environmental assessment along with the roles and responsibilities of the implementing agencies.

# CHAPTER 3. ENVIRONMENTAL AND SOCIAL BASELINE

## 3.1 Project Location of the site

Kumbalathumury dumpsite is located at a distance of 6.0 km from the centre of Kothamangalam town in western side and encompasses a total area of approximately 2.60 acres of land, out of this 2.13 acres of land is covered with solid waste. The geographical coordinates of the dumpsite are 10.078930° N & 76.647811° E. The North and South direction from the dumpsite is vacant land and nearest highway is Malayinkeezhu- Nadukani Road in South direction at a distance of 250 m from dumpsite. The google map image showing the location of Kothamangalam dumpsite is shown below in **Figure: 3.1**.

**FIGURE: 3.1 GOOGLE IMAGE SHOWING THE LOCATION OF THE EXISTING DUMPSITE AT KOTHAMANGALAM**

## 3.2. Methodology for Environmental Baseline Studies

The baseline appraisal should consider all aspects of the environment that may be altered by the proposed project. These can be categorized as physical, biological or socioeconomic attributes. The baseline should be based upon the findings of the screening and scoping studies. Surface water, groundwater, air quality, noise, soils, land use, Biodiversity Socio-economic (social), cultural heritage, traffic and transport, etc., provide information on the existing baseline conditions of the site. It is important to re-emphasize that the scope (and detail) of the baseline study should be commensurate with the size and scale of the project and hence the potential changes that the project may have upon the environment and society. The baseline study will typically be developed in three stages:

**Desktop study:** Office-based exercise during which readily available existing information (i.e. that can be used to describe the existing environment) is collected and reviewed to ensure its appropriateness for use within the EIA & SIA;
**Field study:** The stage within which additional data is captured in the field, with the intent of addressing any gaps that have been identified in the existing knowledge base; and
**Reporting stage**: Collation of the captured information into the baseline report.

The below table indicates the environmental attributes and location of monitoring.

**TABLE : 3.1 ENVIRONMENTAL ATTRIBUTES**

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Down wind direction in North East boundary of within the dumpsite.<br>Upwind direction in South West (SW) boundary of the dumpsite | The AAQ locations were chosen based on the Wind rose data obtained for Kothamangalam. The most predominant wind direction are from WSW and South West. |
| 2 | Noise (1 Location) | Ambient Noise level (E(P)) for 24 hours | Within the dumpsite. Distance 15 m from the boundary of MCF. | Most vulnerable point in the site in regards of Noise quality is due to the operation of the MCF and entry and exit of the waste loading and unloading vehicle. Please note that the site is devoid of proximity to any sensitive receptors within a 200 m radial circle . |
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | Surface water sampling location at 15 m distance in Eastern direction. | Surface water sample points are selected based on the water flow from upwards to downwards and for this site, it is from North East to South-west direction. |
| 4 | Ground water (1 Locations) | pH, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | Groundwater sampling location at 330 m distance in South East direction. | |

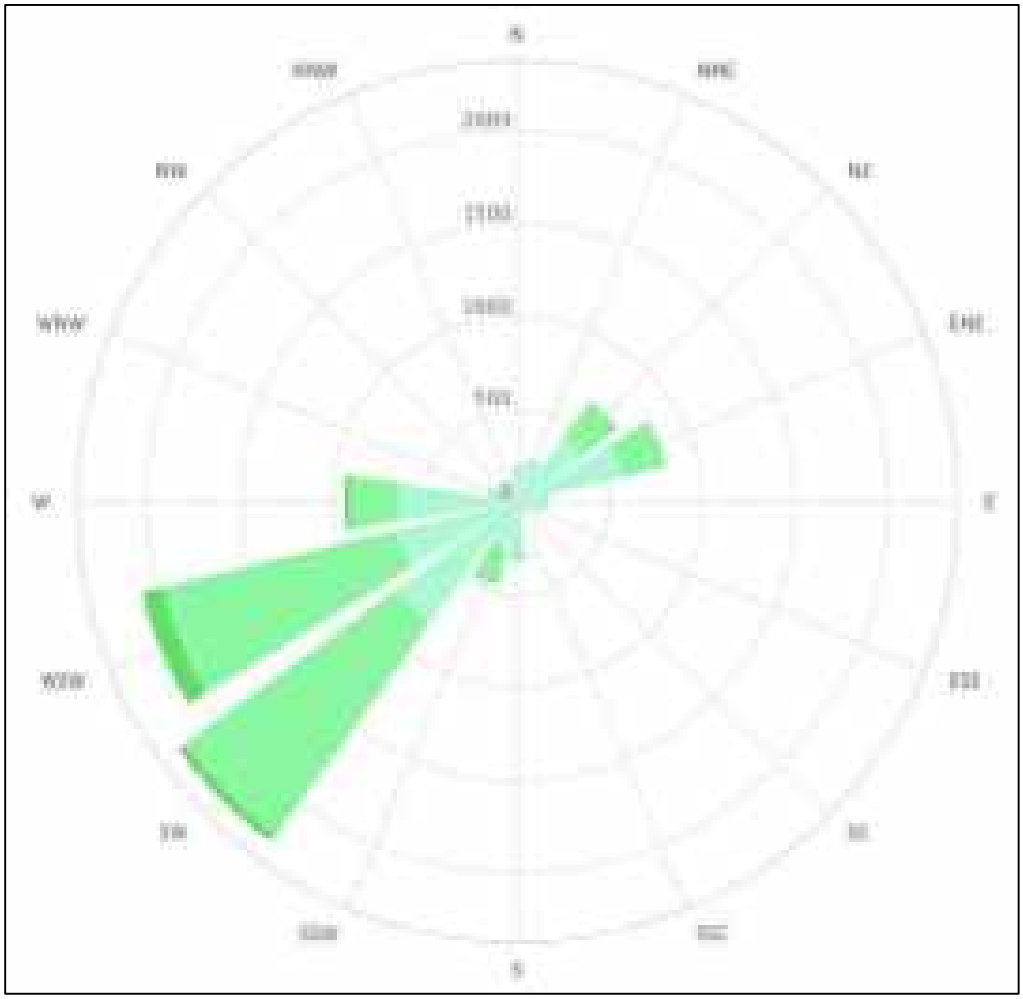
| TABLE : 3.1 ENVIRONMENTAL ATTRIBUTES | | | | |
|---|---|---|---|---|
| **S.No** | **Description** | **Parameters Tested** | **Sampling location** | **Justification** |
| 5 | Bore Hole(1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | Centre of the dumpsite | Volume of legacy wastes were found to be higher in the center part of the dumpsite during investigation. So the bore hole test was performed in the center. |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cynide, Chloride, Fluoride, Phenolic compounds. | East boundary direction within the dumpsite - one point | Based on contour mapping and cross section diagram, the leachate sampling location was identified as North (N)- 915 and East (E) - 975 points. |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | Within the dumpsite at 2 locations. | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. So the two locations were considered for sampling. |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | 1 | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. |

### 3.3 Environmental Audit of the Existing Facilities

Inside the dumping yard, there is a-functional MCF and non-functional RRF for dry waste in the Kumbalathumury dumpsite, both of the facilities are within the same existing building. The MCF/RRF is not supported under KSWMP under this subproject. However, an environmental audit of the facility is important as this may be used as an associated facility to which some

recyclables may be channelized to and is situated at the same site and might be impacted during the bio-mining activities.

| TABLE: ENVIRONMENTAL AUDIT OF EXISTING FACILITIES | | |
|---|---|---|
| **S. No** | **Aspects** | **Remarks** |
| 1 | Structural Characteristics | Area – 423.98 (in Sq. m)<br>Buffer/setback around the MCF – 3 FT<br>Distance from waste pile of dumpsite- 10 m.<br>Roof: (GI Sheet Roof, Good condition)<br>Floor (Cement Floor, Damaged, Renovation proposed under KSWMP)<br>Walls: (Column structure filled with brickwork up to 80 cm and thereafter mesh net till top)<br>Doors & windows: Entrance door and exit door available. No windows since mesh net is given all around. |
| 2 | Functional Characteristics | Activities in the MCF/RRF: Functional MCF and Non-Functional RRF. No machineries functioning now.<br>Materials and condition of stacking: Not organized<br>Activities spilling out onto the dumpsite: Yes<br>Access to the MCF (Common access for MCF/RRF & Dumpsite. Both are in the same premises.)<br>No: of workers – 5 in MCF |
| 3 | Facilities | Parking area-NIL<br>Loading/unloading Area-Yes<br>Storage room & area: No<br>Worker snack/rest areas: No, Proposed under KSWMP Year 1<br>Worker / other washrooms & sewerage: Yes<br>Water supply for Cleaning, Washroom: Yes<br>Greenbelt: NIL |



### 3.4 Physiography and Climate

**Physiography**

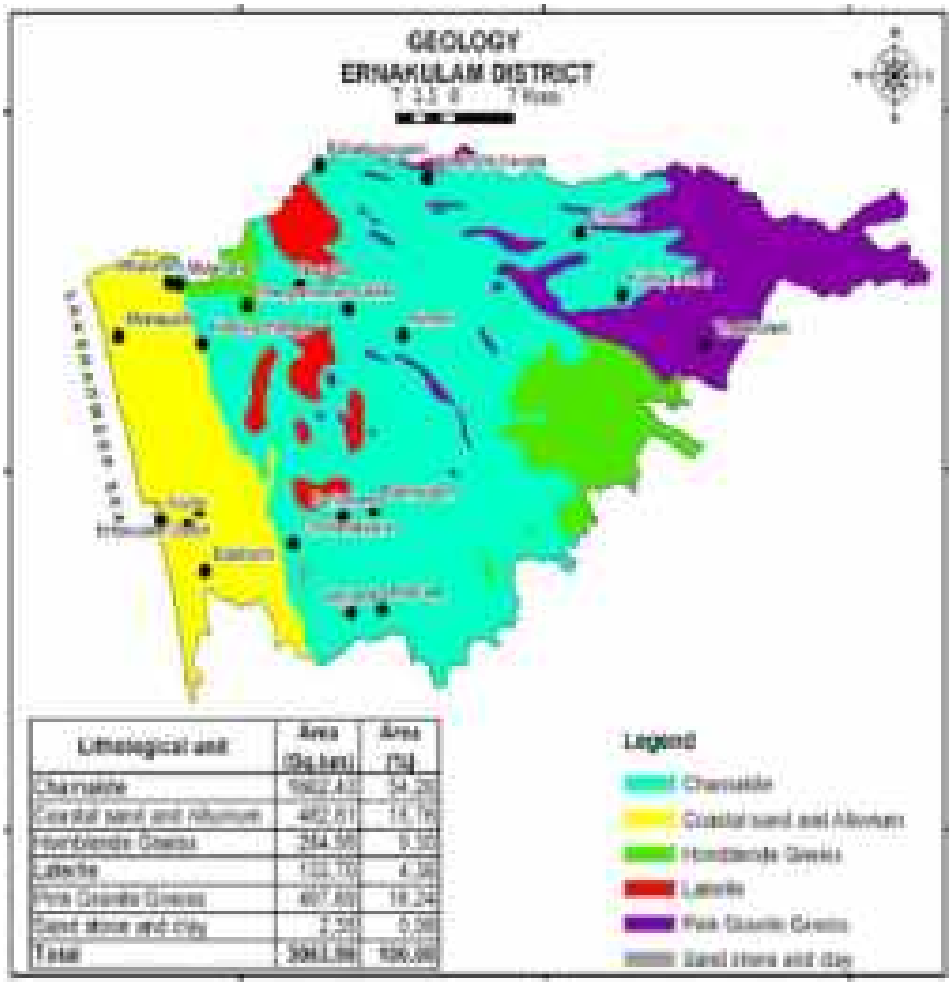
Physiographically, Kothamangalam falls under midland category with hilly terrain zone.

**Climate**

Kothamangalam has a tropical climate. As per Climate-Data.org, the average annual temperature is 27.8 °C in Kothamangalam. Precipitation here average value of 1051 mm. Most of the precipitation here falls in June-July with an average of 206 mm and lowest in February with an average of 15 mm. So, the favourable time for remediation is between October-2023 to March-2024, non-monsoon period. As per wind rose diagram, the most predominant wind directions are blowing from South West (SW) and West South Western (WSW) direction, hence it was being considered for AAQ monitoring location. The wind rose diagram for Kothamangalam is shown in **Figure: 3.2**.

**Source:** meteoblue

**FIGURE: 3.2 WINDROSE DIAGRAM FOR KOTHAMANGALAM**



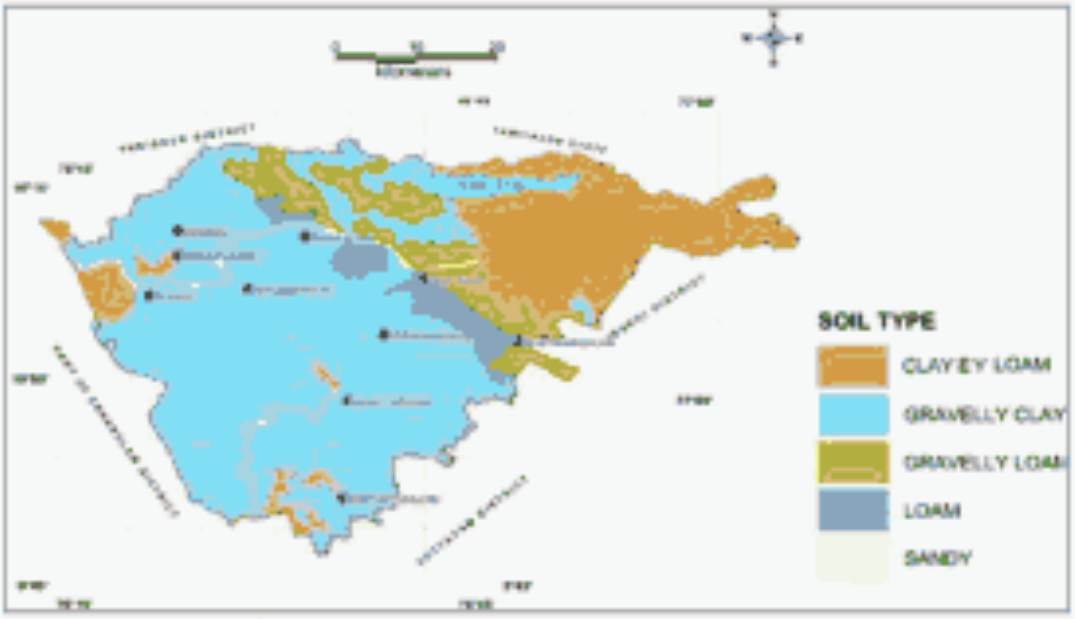
### 3.5 Hydrology, Hydrogeology, and Soil

**Hydrogeology**

The occurrence and movement of groundwater is mainly controlled by factors like physiography, geological setting, etc. As per CGWB, the groundwater table level ranges from 3.5 to 6.5 m below ground level during most of the year 2021-2022.

**Geology**

The geology of Kothamangalam is predominantly of Charnockite group. The geology map of Ernakulum District is shown in **Figure: 3.3.**



| Lithological unit | Area (Sq.km) | Area (%) |
|---|---|---|
| Charnockite | 1062.43 | 54.26 |
| Coastal sand and Alluvium | 462.61 | 14.76 |
| Hornblende Gneiss | 284.56 | 9.08 |
| Laterite | 133.72 | 4.26 |
| Pink Granite Gneiss | 407.63 | 13.24 |
| Sand stone and clay | 7.50 | 0.39 |
| Total | 3068.84 | 100.00 |

**Source:** CGWB, Ernakulum

**FIGURE: 3.3 GEOLOGICAL MAP OF ERNAKULAM DISTRICT**

**Soils**

As per the geotechnical investigation, the soil was encountered at 3.0 m below the waste dump and the predominant soil is gravelly clay. The detailed geotechnical investigation report is enclosed in the FR. The map showing soil type of Ernakulum is shown in **Figure: 3.4**.

**Source:** CGWB, Ernakulam

FIGURE: 3.4 MAP SHOWING SOIL TYPE OF ERNAKULAM DISTRICT

### 3.6 Land Use & Land Cover

The highest percentage of land use and land cover falls under agricultural mix (67%), residential developments (25%), and water bodies (2.9%), and the remaining areas are under other built up land use. The dumpsite is surrounded predominantly by Dry cultivation and the same will act as odour attenuation during remediation. The land use & land cover map of Ernakulam District is shown in **Figure: 3.5**.

**Source:** CGWB, Ernakulam

FIGURE: 3.5 LANDUSE & LANDCOVER MAP OF ERNAKULAM DISTRICT

### 3.7 Cultural Heritage

The cultural heritage zone near dumpsites is Mar Thoma Cheriyapalli church at a distance of 6.0 Km in SW direction. Hence, no significant physical impact to the heritages sites will be envisaged during remediation.

### 3.8 Ecology and Biodiversity

The wild faunal species present near the dumpsite are, mainly dogs, rodents and flies. Also, crow, egrets, and other birds are seen feeding on the wastes. The flora includes shrubs, tubers, and trees.

### 3.9 Site Connectivity

The nearest connectivity is Malayinkeezhu-Nadukani road at 250 m in the South direction to the dumpsite and access road has a width of 3 m.

### 3.10 Natural Disasters

As per the district disaster management plan-2015 and flood vulnerability map the dumpsite is not under flood prone zone.

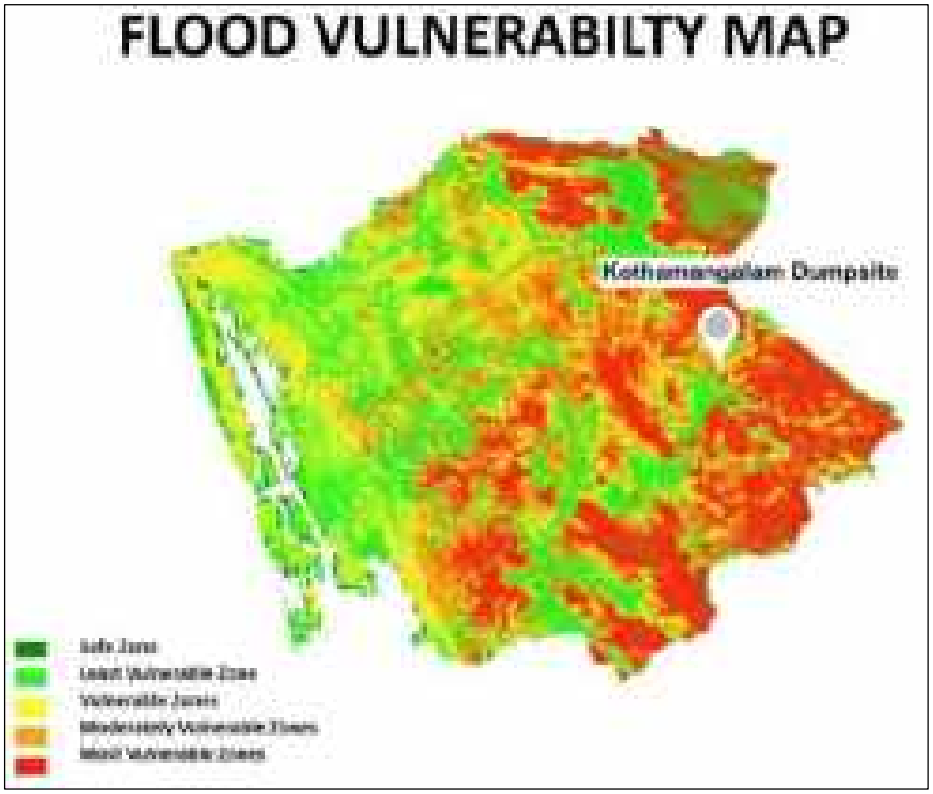


**FIGURE: 3.6 MAP SHOWING FLOOD VULNERABLITY MAP OF ERNAKULAM DISTRICT**

### 3.11 Description of Environmental Parameters

| TABLE- 3.3 DESCRIPTION OF ENVIRONMENTAL BASELINE PARAMETERS | | | |
|---|---|---|---|
| **S No** | **Environmental Aspect** | **Discussion on Baseline Scenario** | **Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject** |
| 1 | Water Source<br>a) Surface water<br>b) Ground Water | A) Surface water: Surface water sampling collected at pond located at 15 m distance in Eastern direction. Surface water sample was collected and the test results showed – all parameters are well within limits except BOD.<br>B) Ground Water collected from 1 location at 330 m distance – all parameters are well within limits except for Coliform. | Site Drainage & leachate Impacts due to bio mining activity (especially during any seasonal rain) is important as far as the nearby soil & water environment are concerned. |
| 1.2 | Leachate | The data indicates that the TDS is about 1885 mg/l, while the suspended solids is about 180 mg/l. The chlorides are 788 mg/l, while the COD, BOD are 320 mg/l and 110 mg/l respectively. The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from the waste. | |
| 1.3 | Air Quality | Air samples were collected from 2 locations within the dumpsite and results found to be well within the permissible limits | |
| 1.4 | Noise Level | Noise Level monitoring samples collected at a distance of 15 m from the MCF boundary of the dumpsite. Noise levels are found to be higher than the National Ambient Noise standards for Residential Area limit during both daytime and night time Leq. | Proper remedial measures for increased noise level shall be ensured by the contractor during bio mining activity. |

# CHAPTER 4. ANALYSIS OF ALTERNATIVES

## 4.1 Alternative 1: No Project Alternative (without Dumpsite Remediation)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.
If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.
1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.
2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.
3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.
4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.
5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

## 4.2 Alternative 2: Mode of Execution / Management Alternative

Kothamangalam Municipality intends to complete the remediation project as earlier. However, considering the time required for mobilization, installation, sieving and handling recoverable etc., a time frame of about six months will be considered. The broad timeline chart for the execution of this project is given below Table – 4.1.

**TABLE – 4.1 TIMELINE CHART FOR EXECUTION**

| S. No. | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
|---|---|---|---|---|---|---|---|
| 1 | Planning & Mobilization | | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries , Hiring & Installation of Machineries, Electrical Works | | | | | | |
| 3 | Excavation of Legacy Waste | | | | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | | | | |
| 5 | Windrow Formation & Spraying of Bio culture | | | | | | |
| 6 | Sieving Operations | | | | | | |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | | |
| 8 | Project Closure Activities:<br>• Levelling of Reclaimed Land using Bio-soil<br>• Handover the available infrastructure at site to the ULB<br>• Closure Report Submission to ULB, | | | | | | |
| 9 | Buffer Period (Rainy Season) | | | | | | |

### 4.3 Alternative 3: Technology Alternatives

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as,

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

# CHAPTER 5. ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS

Bio mining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, bio-mining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition to the below mentioned,

(i) Drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,
(ii) Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,
(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and
(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

## 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 200 m aerial distance of Kumbalathumury dumpsite.

### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Bio-mining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity. However, magnitude of cumulative impacts of various dumpsite remediation might be High.

| TABLE: 5.1 ASPECTS FOR DETERMINING THE MAGNITUDE OF IMPACTS | | | | |
|---|---|---|---|---|
| **Aspects** | **Large** | **Medium** | **Small** | **Negligible** |
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite bio mining activities will be on larger extent) | A specific location within program component or site boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| Likelihood of potential impacts occurring | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

NOTE: Anticipated Project Duration - 5 to 6 months

### 5.1.2 Sensitivity of Receptor

The dumpsite is surrounded by dry cultivation and one residential house. The project site lies near to only one residence within 200-meter radius, during remediation it may cause potential impacts on air, noise, surface water, and ground water that will directly or indirectly affect the family for a duration of 5 to 6 months. The sensitivity of these receptors is Low due to the surrounding dry agriculture land which act as natural barrier against noise and air impacts. In

addition, there is a pond at a distance of 15m from the dumpsite, there is zero chance of runoff and leachate towards the pond during rainy season, due to the natural slope gradient of the landscape. Hence, the sensitivity of this receptor is estimated as Low.

### 5.1.3 Significance of the impact

The significance of the project impact is tabulated below: -

| TABLE: 5.2 SIGNIFICANCE OF THE PROJECT | | | |
|---|---|---|---|
| **Project Details** | **Sensitivity** | **Vulnerability of Resource** | **Importance of Resource** |
| No project Impacts | High | Medium | Medium |
| Project with Bio Remediation (Bio-mining) | Low | Low | Low |

Overall, Bio mining will have a low to medium impact, with more of a positive Impact on the Environment and Human health in the longer term.

**Source-Pathway-Receptor Analysis**

A) Source: The source of contamination is the legacy waste remaining and being deposited at the Kumbalathumury dumpsite, more specifically the landfill gas and leachate get generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is 43 years old, as dumping had started in year 1980 and currently there is no dumping activity in the site. The total waste volume is 29,906 cu. m with the dumpsite spread over 2.13 acres and the legacy waste is presented about 3.0 m above and 2.5 m below from the existing ground level. In addition to the landfill gas and leachate, windblown dust and litter are also considered as sources of contamination.

B) **Pathways:** The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope from North Western direction acts as a pathway for the uncovered waste to flow along the boundary to South Eastern side, which runs through the dry agricultural land.

   The leachate flows with groundwater and acts as the pathway. Surface water contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals and rivers are further transported by surface waters and in this case the surface water acts as the pathway.

**C) Receptors:**

   Receptors are air, surface water and ground water. For drinking purpose, they mainly use municipal water supply at one House within 200 m soil, flora, fauna and humans. In the case, to remediate dumpsite, the most prominent group of receptors are the nearby residences. As the dump is not contaminated by hazardous wastes, remediation would

improve the pollution scenario provided the bio-earth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF in the region. Depending on the locations of end use of fractions retrieved from bio-mining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after bio-mining activity, activities in bio-mined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post bio mining activity.

**5.2 Impacts on Air Environment**

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCF in this case), nearby communities of Ward 06.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.
- When the legacy site is opened, existing gases would get emitted. Further, any delay /unexpected stoppage of bio mining activity, might further aggravate the process of gas formation depending on waste composition, leading to odour and fire risks.

***5.3 Impacts on Water Environment***

**Ground water:**

- The ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. With the slope of the dumpsite, this tends to get accumulated at low-lying gradients and flows into dry agricultural land. Slightly high BOD levels of the drain and ground water wells around are indicative of leachate and runoff pollution. Oozing & pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during bio mining to prevent ground water contamination.
- Leachate samples: BOD, COD, TDS exceeding limits may impact the ground water quality in nearby residences, wells, and long term soil pollution.
- Borehole data: Dump below water table may impact water resources and wells nearby.
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

**Surface water:**

- The dumpsite not experienced any flooding during 2018 floods and the site is not vulnerable to flooding. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas. An abandoned pond is at a distance of 15 m, east direction from the dumpsite.
- Predominant slope is in the South East Direction. At Southeast direction, (end direction) there are dry vegetation. During rainy season leachate from the site flows to dry agricultural land. It is important to contain and treat leachate from the proposed bio

mining activities on site. Treated leachate may be recirculated or used for other purposes.

**5.4 Impact due to Odour**

Dumpsite of organic, or partly organic waste, always results in anaerobic degradation of the waste and consequently, the production of landfill gas, consisting mainly of methane, $H_2S$, Ammonia, and carbon dioxide. If not properly managed the gas can cause odor problems in the neighborhood and since landfill gas is a highly potent greenhouse gas it will also contribute to the increased level of greenhouse gases (GHG) in the atmosphere. Dumpsite gas may also increase the risk of fires or explosions at the landfill site and surroundings.

**5.5 Impact on Noise**

A potential nuisance is a noise from transport of vehicle and machinery operating during remediation phase of the Dumpsite and transports of waste to the Dumpsite. The topography is favorable to attenuate noise to the surroundings. The distance to nearby residential areas is at 10 m with 5 households. Hence, the impact will be higher during remediation to the residents.

**5.6 Impacts on Soil**

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as bio mining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.

- Spillover of activities to nearby road and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste bio mining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.

- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Kumbalathumury, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Kumbalathumury does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while bio mining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste), Feb 2019 and World Bank EHS Guidelines. A plan shall be prepared to auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

**5.7 Other impacts on Biodiversity - Fauna/Flora**

- There are no sensitive biodiversity areas within 10 km of the site. However, since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 42 Km, east from the site, there is a Kothamangalam Forest Range.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora: Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke.
- Disturbance to other fauna and flora on site: onsite activities including those related to MCF and RRF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species identified which are listed by IUCN.

**5.8 Other Impacts on existing or proposed activities on site/s**

- There may be approvals from various agencies for bio mining activities and associated facilities; depending on utilities and uses on site & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of bio mining on existing facilities on site such as MCF, RRF etc. (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post bio mining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped, or if this is dumped elsewhere or not processed, it will lead to health and environmental issues. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health & Safety impacts on workers, communities. Also, forward linkages are considered as associated facilities/linked activities. Impacts of transportation of these fractions (traffic increase, odor, leachate, dust), impacts during rains & emergencies, handling, storage at the identified locations, reuse etc. shall be mitigated.

# CHAPTER 6. ENVIRONMENTAL AND SOCIAL MANAGEMENT AND MONITORING PLAN

## 6.1 Proposed Environmental Management Plan:

The detailed anticipated impacts and corresponding mitigation measures/management of the impacts are given below.

**TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN**

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| ***A*** | **Planning and Pre-Construction Stage** | | | |
| ***1*** | | ***Planning for bio mining facility*** | | |
| 1 | Bio mining & Bioremediation Plan & Capacities | ▪ Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / bio mined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these bio mined material in line with the agreements with such facility owners and National, State regulations and WB EHS<br>▪ Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate Management Plan.<br>▪ The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>▪ Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU/ ULB |
| 2 | Site Access Closure | ▪ The total cessation of dumping in the site will be implemented before any works.<br>▪ All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>▪ The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>▪ To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>▪ Grading shall be performed where necessary to provide a neat appearance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ ULB |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality, odor, water contamination due to* | ▪ Carry out site assessments as per Guidelines for Bio mining of Legacy Waste Dumpsites of CPCB<br>▪ Consider safe bio mining & gas / leachate generation from existing capped portion of the site<br>▪ Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>▪ Provision of appropriate PPE's to the team undertaking the site assessments<br>▪ Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits | TSC, ULB, Contractor | SPMU/DPMU/ ULB |

| | | | | |
|---|---|---|---|---|
| | *leachate, health and safety impacts of the people working in the site assessment* | ▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>▪ Plan for machinery operated which will be operated by skilled operators at all times.<br>▪ Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>▪ Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | | |
| 4 | Absence / Delay in Permissions for Developing the biomining facility and associated works as per National regulations | ▪ Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labor Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes *(Air Pollution) and Visual Blight due to excavation* | ▪ Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>▪ Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>▪ PPEs to be used by workers<br>▪ Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU/ ULB |
| 6 | Material sourcing, transport, and stacking of construction materials *(Occupational Health and Safety issues and Air noise pollution)* | ▪ Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>▪ Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>▪ Materials shall be sourced only from approved quarries<br>▪ Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>▪ The driver should be with required license and follow speed regulations<br>▪ Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>▪ Material transport and unloading activities should not result in noise disturbance to locals and should be during daytime<br>▪ Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>▪ Provide vehicle wheel wash area on site | Contractor | SPMU/DPMU/ ULB |

| | | | | |
|---|---|---|---|---|
| | | ▪ Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves.<br>▪ Proper rest area on site shall be provided with water, first aid, toilets | | |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | ▪ Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>▪ Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>▪ Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>▪ It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with landowners wherever the labour is accommodated<br>▪ Camp must not be provided in an area prone to Hazards<br>▪ Camp should be adequately at higher plinth levels to prevent water intrusion<br>▪ Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>▪ Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female laborers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>▪ The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>(Refer ECOP section 06 and section 11 of EMF for KSWMP) | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. especially in case of providing support facilities *(Impacts on Fauna / Flora)* | ▪ Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in biomining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>▪ Identify appropriate government site to avoid land acquisition and resettlement impacts<br>▪ Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences, slope and other landuses | Contractor | SPMU/DPMU/ ULB |
| 9 | Contamination of groundwater due to leaching. Leachate parameters; BOD, COD, TDS, Ecoli, Heavy metals | ▪ During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>▪ Depending on the contractors plan for biomining of the site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ ULB |

| | | | | |
|---|---|---|---|---|
| | exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | | | |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke burning, trampling/machinery | ▪ Movement routes of vehicles to be planned to avoid key fauna/flora on site<br>▪ Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | | SPMU/DPMU/ ULB |
| 11 | Nuisance hazards to neighboring areas | ▪ Ensure proper design and adequate compound wall; high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements<br>▪ In case of waste mound and site edges are sliding or unsafe; provide engineered retention walls. | Contractor | SPMU/DPMU/ ULB |
| 12 | Treatment & Disposal of wastes and rejects | ▪ Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & intert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Bioearth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>▪ Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| ***B*** | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| **Implementation of biomining of the dumpsite** | | | | |

| | | | | |
|---|---|---|---|---|
| 1 | Impact due to the vehicular movement *(Air and noise environment & Vehiclular - Vehicular & Vehicular - Pedestrian Conflicts)* | ▪ Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>▪ All vehicles and machinery should obtain Pollution Under Control Certificates<br>▪ HORN PROHIBITION signpost to be erected.<br>▪ Rumble strips/speed breaker to be provided on access roads.<br>▪ Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>▪ Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>▪ Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>▪ Avoid heavy vehicle movement through Kumbalathumury road during peak hours 7 a.m to 10 a.m mention: school hrs / peak hrs; and during important period / festivals when people use the road to access temple<br>▪ Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | Contractor, ULB | SPMU/DPMU/ ULB |
| 2 | Impact due to the use of heavy vehicle and equipment *(Air and Noise environment)* | ▪ Mixing equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>▪ Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>▪ Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>▪ Labor to be provided masks / PPEs.<br>▪ Construction / Biomining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spkreading into neighboring sensitive land uses<br>▪ Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>  ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>  ▪ Using modern, well-maintained and regularly serviced vehicles.<br>  ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>  ▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>▪ Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>▪ As Kothamangalam dumpsite has sensitive receptors and settlement areas within 200m of it, noisy works shall be stopped from 22:00 to 06:00.<br>▪ Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum. | Contractor | SPMU/DPMU/ ULB |

| | | | | |
|---|---|---|---|---|
| | | ▪ Avoid noisy activities/machines near South side of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>▪ Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities<br>*(water environment)* | ▪ Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>▪ Vehicle washing or maintenance near water bodies are to be avoided.<br>▪ Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ ULB |
| 4 | Leachate and Runoff from biomining activities<br>*(Soil contamination and groundwater contamination)* | ▪ Provide site cut off drain around the site to divert off stormwater from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>▪ Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>▪ Ensure stormwater drains will lead to drain outlets<br>▪ Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area<br>▪ Provide proper treatment of leachate and stormwater that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by biomining activities like excavation and waste segregation and stabilization<br>▪ The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>▪ The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>▪ Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>▪ Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>▪ Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>▪ Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | Contractor | SPMU/DPMU/ ULB |

| | | | | |
|---|---|---|---|---|
| 5 | Soil decontamination from accumulated waste levels *(Impact on leachate, odor)* | ▪ Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bioculture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>▪ Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>▪ Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU/ ULB |
| 6 | Excavation of waste from the waste mound *(Health and safety impacts)* | ▪ The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>▪ Machinery operated for excavation should be operated by skilled operators at all times.<br>▪ Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>▪ Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>▪ In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>▪ When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | Contractor | SPMU/DPMU/ ULB |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles *(Air, Odour nuisances; spills and littering impacts on Air, Water, Land)* | ▪ All vehicles shall carry only approved load of weight<br>▪ Regular cleaning of roads & drains and removal of spills if any.<br>▪ All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>▪ Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>▪ Adopt required measures as per CPCB guidelines, and site specific safety requirements. | Contractor | SPMU/DPMU/ ULB |
| 8 | Occupational health and safety impacts of the workers during the biomining & construction of support facilities: | ▪ Avoid direct & double handling of wastes through avoidance measures(suitable planning & equipments), engineering controls & use PPEs<br>▪ Work area & Labour camps shall be provided with First Aid and other related activities.<br>▪ Emergency Preparedness plans shall be prepared and implemented for all manpower working centers and its field extension centers.<br>▪ An Environment Health & Safety policy shall be prepared and implemented<br>▪ Adequate manpower shall be provided & manager & staff shall listen and act upon the manpower related | Contractor, ULB | SPMU/DPMU/ ULB |

| | | | | |
|---|---|---|---|---|
| | • Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, biocultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | grievances.<br>▪ Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles<br>▪ Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed without slip, trip, fall especially on waste, leachate or trenches<br>▪ Proper training will be provided regarding the maintenance of health<br>▪ Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper handwash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>▪ First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>▪ Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>▪ Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>▪ Measures such as deferred timings and stretch break to be adopted<br>▪ Secure all installations from unauthorized intrusion and accident risks;<br>▪ Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every days start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipments, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>▪ EHS specialist with adequate experience & third party supervision are important for biomining activity<br>▪ Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>▪ Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>▪ Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas; | | |

| | | | | |
|---|---|---|---|---|
| | | ▪ Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>▪ Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br>▪ Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near thoseIn close proximity to this location, there is a transformer. Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>▪ All workers shall be registered as per prevalent labor laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>▪ Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractors person/insurance agent<br>▪ While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>▪ While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>▪ Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>▪ A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>▪ No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor<br>▪ All works related to working at heights will be undertaken only during the daytime when sufficient sunlight is available;<br>▪ Use of temporary fall protection measures and outer edges of any elevated work surfaces, such as handrails and toe boards to prevent materials from being dislodged will be done;<br>▪ All excavation activities to be conducted in supervision of the site contractor;<br>▪ Proper signage and lights to be provided in all work or activity areas & work permit system to be ensured.<br>▪ All records on emergencies, accidents, workers & their duty schedule, important site events, waste storage & disposal etc shall be maintained on site. All accidents including Indicative, Serious and Severe accidents to be recorded. All severe & serious accidents to be reported to the Bank & procedures followed for root cause analysis & Corrective Action Plans prepared and implemented, as per Banks Incident Reporting Tool | | |
| 9 | Risk of fire due to conditions leading to spontaneous combustion | ▪ Follow CPCB Directions (May 26, 2022) Directions under Section 5 of EP Act (1986) – for Implementation of SWM Rules 2016 – Fire Incidents at MSW Dumpsites (https://cpcb.nic.in/openpdffile.php?id=UHVibGljYXRpb25GaWxlLzQyNDRfMTY1NDE2Mzk3N19tZWRpYXBob3RvNzYxMi5wZGY= ), LSGD Kerala Government GO on Fire Safety of MRF, MCFs (for the MRF on site if | Contractor, ULB | SPMU/DPMU |

| | | | | |
|---|---|---|---|---|
| | *(Air environment, disturbance to communities and workers, health impacts, safety issues)* | used for storage of wastes)and other Regulations, guidelines applicable<br>▪ Divide the site & plan for work in each area/quadrant as per work plan & prepare fire safety plan & emergency response plan in line with EIA Annexure 3; and National/State regulations & WB EHS<br>▪ Examine the site everyday by experienced Fire Safety / OHS personnel for any smokes<br>▪ Avoid conditions that can lead to spontaneous combustion such as:<br>o Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard<br>o Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.<br>▪ Design the facility for access by firefighting equipment, including clear aisles among waste heaps or work areas and access to adequate water supply.<br>▪ Ensure workers are briefed of fire hazard & its management<br>▪ No unauthorized entry shall be permitted to the site; including of workers during holidays, nighttime, or hours other than normal work hours under the supervision of site engineer / supervisor. Fencing and barricades with proper signage boards indicating "trespassers not allowed"<br>▪ The following activities should be implemented to prevent fires from occurring at the facility<br>o adequate fire-fighting equipment should be made available on-site and stored in an accessible manner,<br>o all operating staff should be trained and able to manage fire outbreaks at any part of the facility.<br>o clear signage should be established to inform workers and the public that flammable liquids are not permitted on the site. This should be reinforced by advice to customers at the gatehouse and inspection of loads at the organic reception area.<br>o Approved quantities of combustible contaminants that have been separated (such as tires and plastic bottles) should be stockpiled in small piles or windrows.<br>o all fuels or flammable solvents for operational use should be stored in an appropriately ventilated and secure store (at appropriate height). This store should be located away from the biomining, storage, and processing areas.<br>o all flammable liquids should be stored within a bund that can hold 110% of the volume of the flammable liquids stored there so that any release of raw or burning fuel cannot cause a fire in the combustible organics present on the site or have an impact on contaminating stormwater.<br>▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented throughout the biomining activity in line with National State regulations, guidelines and international good practices<br>▪ Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.<br>▪ Contain all local smokes/small fires inside the dump asap. Fire brigade help shall be sought on all smokes/fires outside the dump<br>▪ Ash from fires to be contained at the earliest within the site using bunds or screens, rather than allowing to disturb nearby receptors. Early clearing and disposal of such ash at TSDF to be ensured. | | |

| | | | | |
|---|---|---|---|---|
| | | ▪ Provide contact details of Fire Department & ambulance other essential emergency services on site & ensure training to the workers by such service providers | | |
| 10 | Construction of new facilities in retrieved land | ▪ The excavated site shall be protected from any dumping during or after the biomining activity and shall be reserved for SWM activities in line with SWM Rules 2016<br>▪ Any new facility under KSWMP to be constructed on the retrieved land, shall follow EMF procedures & National State regulations | ULB | SPMU/DPMU |
| 11 | Pest / Vermin Control & Visual impacts (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted; preferably in coordination with Health section of ULB & local Health Center<br>▪ Communities around shall be made aware of possible pest menace & ULB shall support those in need with required pest management measures and offered health checkups<br>▪ Bio pesticides / biological control shall be followed. However, biopesticides, or bio cultures used shall be tested to ensure the presence of no banned chemicals or hazardous materials<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used<br>▪ Visual blight to be curtailed by screens, proper lighting, housekeeping, leachate management | Contractor, ULB | DPMU, SPMU |
| 12 | Odour nuisance | ▪ Waste with a strong odor to be covered immediately they are emptied from vehicles.<br>▪ Control and manage leachate treatment to minimize odor.<br>▪ Provide buffers screens to curtail odor from reaching surrounding communities especially to North side of site.<br>▪ Using natural deodorizers such as lemongrass, eucalyptus etc. and planting fragrant flowering plants around the site to mask odor. | Contractor, ULB | DPMU, SPMU |
| 13 | Storage, Collection, Transport, Treatment & Disposal of wastes and rejects | ▪ Storage, Collection, Treatment, treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste<br>▪ Storage, Collection, Transport, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc); & adequate protection shall be made to prevent such impacts even during rains / disasters<br>▪ Waste handling shall be inline with existing regulations & guidelines & avoid health & safety impacts<br>▪ No material is allowed to remain on site after the contract period<br>▪ Adequate fire safety arrangements & awareness & training to workers shall be ensured on site & at disposal / treatment areas for wastes in discussion with Local Fire Brigade to prevent any fire on legacy waste site or retrieved & stored wastes or that is transported<br>▪ Vehicles movement shall be tracked by ULB to ensure disposal of material/rejects/inerts in designated or agreed area & are in line with schedule; using GPS.<br>▪ Given that the access road is used by the public, it is imperative to implement the required safety precautions and environmental protection measures when transporting the waste. | Contractor, ULB | DPMU, SPMU |

| | | | | |
|---|---|---|---|---|
| 14 | Other activities | ▪ No activity other than biomining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>▪ If existing MCF shall be used for storing biomining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after biomining works shall be after proper cleaning / washing & disposal of all rejects/inerts & tools to ensure good housekeeping & no H&S impacts<br>▪ If existing MCF shall be used by the ULB for storing dry wastes from Town, during biomining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 15 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & biomining / construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water and Leachate to be treated & recycled/reused | Contractor | ULB |
| **C** | **Future Site Usage (EMP shall be updated in line with EMF & used if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Biomining, but of the future facility operator & ULB** | | | |
| 1 | Future use of the biomined site: Green Park, MCF, MRF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | ▪ ULB to ensure that the site will not be used for future dumping.<br>▪ Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around.<br>▪ ULB shall plan the future use of the site shall be in consultation with the communities.<br>▪ Phase 1 Environmental Assessment to be caried out, EA for existing facilities & EIA for proposed development in line with EMF in case this is proposed to be developed under KSWMP<br>▪ All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF/MRF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment, a nuisance to biodibersity, communities, Health impacts)* | ▪ The movement route shall be scheduled for each vehicle.<br>▪ Enforce speed limits applicable and make drivers aware of this<br>▪ Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule; preferably using GPS<br>▪ Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles<br>▪ Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards<br>▪ Proper lubrication shall be provided to minimize squeaking noise due to friction<br>▪ Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br>▪ The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public<br>▪ Traffic will be managed at the site by providing adequate space for parking of vehicles<br>▪ Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design<br>▪ No waste or material shall be disposed in any place other than the designated area; including water | Future Facility operator | ULB |

| | | | | |
|---|---|---|---|---|
| | | bodies, coasts/forests, or sensitive areas. | | |
| 3 | Exhaust emissions *(Air impacts)* | ▪ No idling of vehicles on site.<br>▪ Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed | Future Facility operator | ULB |
| 4 | Plying of vehicles through kutcha / unsurfaced roads and idling *(Air pollution: SPM, CO, CO2)* | ▪ Vehicle movement shall be well planned – through topped roads. In case of necessity to move through Kutcha roads, ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Future Facility operator | ULB |
| 5 | Impact on the ambient noise quality during the operations *(Noise, nuisance to sensitive receptors, health impacts)* | ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines;<br>▪ Using modern, well-maintained and regularly serviced vehicles;<br>▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>▪ Provision of earmuffs and ear protection to workers and employees in high noise areas | Future Facility operator | ULB |
| 6 | Occupational health and safety impacts of the workers:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust | ▪ All OHS and CHS measures to be followed in line with applicable regulations, guidance<br>▪ Workers & communities shall be made aware of OHS, CHS risks and impacts & mitigation measures adopted<br>▪ Emergency management plan to be prepared & followed<br>▪ Workers shall be appropriately trained or OHS during construction & Operation of all future facilities | Future Facility operator | ULB |

| | | | | |
|---|---|---|---|---|
| | *(Air environment, Health impacts)* | | | |
| 7 | Pest / Vermin Control (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted<br>▪ Biopesticides / biological control shall be followed.<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used | Future Facility operator | ULB |
| 8 | Fire Safety | ▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations, guidelines and international good practices | Future Facility Operator | ULB |
| 9 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

### 6.1.1 Disposal phase of By-products from Bio-mining process

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within a three-month period, penalties will be imposed on the contractor.

## 6.2 Disaster Management and Emergency Preparedness

A disaster is a catastrophic situation in which suddenly, people are plunged into helplessness and suffering and, as a result, need protection, clothing, shelter, medical and social care, and other necessities of life. In the case of Dumpsite remediation, Disaster Management Plan is aimed to ensure the safety of life, protection of the Environment, protection of installation, restoration of the remediation process, and salvage operations in this order of priorities.

For effective implementation of the Disaster Management Plan, it should be widely circulated and personnel training is to be provided through rehearsals/drills. The disaster management Plan consists of Onsite Emergency Plan and an offsite Site Emergency plan, which is outlined here for Emergency Preparedness.

**TABLE: 6.2 LIST OF EMERGENCY HELPLINE SERVICES**

| Sl. No. | Emergency Services | Distance from the dumpsite |
|---|---|---|
| 1 | Kothamangalam Police Station | 3.5 Km |
| 2 | Kothamangalam Fire and Rescue Station | 5.0 Km |
| 3 | Taluk Hospital | 4.5 Km |

### 6.2.1 Approach to Disaster Management Plan (DMP)

The objective and approach of the Disaster Management Plan is to make use of the combined resources of the plant and the outside services to achieve the following:

- Effect the rescue and medical treatment of casualties;
- Safeguard other people;
- Minimize damage to property and the environment;
- Initially contain and ultimately bring the incident under control;
- Identify any dead;
- Provide for the needs of relatives;
- Provide authoritative information to the news media;
- Secure the safe rehabilitation of the affected area;
- Preserve relevant records and equipment for the subsequent inquiry into the cause and circumstances of the emergency.

In effect, it is to optimize operational efficiency to rescue rehabilitation and render medical help and to restore normalcy. Disaster Management Plan should include Emergency Preparedness Plan, Emergency Response Team, Emergency Communication, Emergency Responsibilities, Emergency Facilities, and Emergency Actions.

#### 6.2.1.1 Identified Emergency Situations

Major disasters which can affect the remediation process are as follows:

- Floods due to heavy rainfall
- Fire risk in summer
- Occupational and health risks during the remediation process
- Safety-related accidents during the remediation process

#### 6.2.1.2 Proposed Organizational Structure for Disaster Management Plan

**Response team:** Setup an Emergency Organization. Emergency Organization includes the senior executive (head of EO as a Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

- All Incident control would be reported to the Site Controller. Each Incident Controller organizes a team responsible for controlling the incident with the personnel under his control.
- **Shift In-charge** would be the reporting officer, who would bring the incident to the notice of the Incidence Controller and Site Controller.
- **Emergency Coordinators** would be appointed who would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential and support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.
- In each shift, the electrical supervisor, in charge, and other maintenance staff would be drafted for emergency operations. In the event of power or communication system failure, some of the staff members in the office/facility would be drafted and their services would be utilized as messengers for quick passing of communications. All these personnel would be declared as essential personnel.

### 6.3 Proposed Monitoring Plan

The proposed monitoring plan is presented in table below,

**TABLE -6.3 PROPOSED MONITORING PLAN AND FREQUENCY**

| Monitoring media/parameters | Items and parameters | Frequency | Location |
|---|---|---|---|
| Ambient Air Quality | PM10, PM2.5, NOx, CH4, CO, Ammonia | Quarterly (1 sample) | 2 point |
| Noise | Leq Day and Night | Monthly | 2 point |
| Health safety Hazards | Medical records, documentation of injuries and accidents, Health and safety assessments | As and when accident/injury occurs | Incident reports |
| Leachate | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins<br>• Heavy metals (As per SWM rules 2016 Schedule B) | Quarterly | 2 point |

| | | | |
|---|---|---|---|
| Groundwater quality | Parameters will be defined and sampling, preservation, and analysis of water will be carried out following those stipulated in the subsections below and Standards Methods for Testing Water and wastewater, 21st edition, published by American Public Health Association (2005). | Quarterly | 8 points |
| Surface water quality | | Quarterly | 6 points. 2 upstream and 4 downstream |

### 6.4 Estimated Budget for Implementation and Supervision of EMP & SMP

The estimated capital cost of [redacted] is required for budget provision for implementation and supervision of EMP. The remediation will be only during shorter time duration and hence the recurring cost won't be incurred. The estimated cost particulars for EMP is mentioned below.

**TABLE -6.4 ESTIMATED BUDGET FOR EMP**

| Particulars | Capital Cost (In Lakhs) |
|---|---|
| Dust Mitigation Measures including site barricading, water sprinkling and Wheel Washing, Leachate Management | [redacted] |
| Mobile Toilet, Pest Control, Disinfectant | [redacted] |
| Medical cum First Aid facility | [redacted] |
| PPE for workers & welfare, Fire Fighting Equipment | [redacted] |
| Monitoring / testing (air, noise, water, soil, leachate) | [redacted] |
| **Total** | [redacted] |

# CHAPTER 7 INSTITUTIONAL ARRANGEMENTS

## 7.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organisation will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU.

## 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for HKS (Health & Hygiene, source level waste segregation and source level treatment, Fire and Safety)
- Training program for ULB Councilors and Ward convener (Proposed SWM project plan of KSWMP)
- Training program for Political and trade union leaders (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for Residence Association leaders (Health, Hygiene different composting methods and source level waste segregation, littering of waste, Public Health, Fire and Safety)
- Training program for workers of Municipal Sanitary workers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for school / college students (Health, Hygiene and source level waste segregation, Fire and Safety)

- Training program for ULB officials (Proposed SWM project plan of KSWMP, proposed policies, existing policies etc... to improve the existing pattern into zero waste concept of the municipality)
- Training program for School children, Parents and Teachers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Massive awareness campaign on 5R (Reuse, Recycle, Repurpose, Reduce and Refuse)

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

## 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

# ANNEXURE –I

**Environmental Screening Form**

**INITIAL ENVIRONMENTAL EXAMINATION**

Environmental Screening during the Initial Environmental Assessment Stage has been provided below:

**Subproject Details**

| | |
|---|---|
| **Name of Subproject:** | Kothamangalam Solid Waste Dumpsite Remediation by Bio mining |
| **Subproject Components:** | Dumpsite Remediation using bio-mining approach |
| **Subproject Location (City / Town/ Village with ward numbers):** | Kumbalathumury, Ward 06, Kothamangalam Municipality |

**Stage 1: Exclusion List**

**Is the Project Excluded from Consideration due to the following:**

| ***Sl.No:*** | ***Non-permissible Activities*** |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |

*This dumpsite remediation project involves 1. (i) no construction in demarcated Forest areas or protected areas or their buffers, (ii) no construction of landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) no treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). 2. NO activities which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas, 3. No activities with (i) any impact on or due to Dams or embankments (ii) and project will not purchase, store and use Banned Pesticides.*

*Hence, not excluded.*

*Proceeding to Stage 2 Screening*

**Stage 2: Environmental Screening Checklist**

| Project Details | | |
|---|---|---|
| **Sl. No** | **Components** | **Details** |
| 1 | Project components | Kothamangalam Solid Waste Dumpsite Remediation by Bio mining |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, bio mining of dumpsites, including for Linked activities / associated facilities) | Bioremediation of Kothamangalam Dumpsite: -<br>A total station survey and geo technical survey was conducted to determine the quantity of legacy waste, revealing a total of 29,906 cubic meters. |
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination)<br>Site Survey No:/s (attach map) with ownership details, Geographical co-ordinates of the site location [including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | **Location:** Kumbalathumury, Malayinkeezhu Ward 06, Kothamangalam Municipality<br>**Survey Number:** (959/1M2-2-2 and 1005/4A)<br>**Ownership–**Kothamangalam Municipality<br>**Land use –** Solid Waste Management Facility<br>**Geographical Coordinates:**<br>Latitude: 10.078930° N<br>Longitude: 76.647811° E<br>**Earthquake zone**: III<br>**Cyclone:** Moderate<br>Dump Sites have been in existence since 1980s. |
| 4 | Land Area proposed to be used: Location wise (in sq. km / sq.m) | Current total land area of 2.13 acres will be fully remediated through bio-mining. |
| 5 | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | For domestic usage 2 KLD will be met from private supplier. |
| 6 | Power Required and Source of Power | No DG set requirement for this sub-project. Electricity connection is available within the site. Source: KSEB |

***Baseline Environmental Conditions***

| ***Sl. No*** | ***Environmental Aspects*** | ***Yes*** | ***No*** | ***Details (include distance in Km, info on its importance)*** |
|---|---|---|---|---|
| 1 | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | | |
| *(i)* | Critically Vulnerable Coastal Areas (CVCAs), Eco-sensitive Areas (ESAs) | | ✓ | No Critically Vulnerable Coastal Areas and Eco sensitive Areas in the study area |
| *(ii)* | Cultural Heritage site, Protected monuments - listed by ASI/State | ✓ | | Mar Thoma Cheriyapalli church at a distance of 6.0 Km in SW direction. |

| | | | | |
|---|---|---|---|---|
| *(iii)* | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species? If Yes, which is the area? | | ✓ | No Eco-Sensitive Areas in the study area. |
| *(iv)* | Other Wetlands/ Mangrove/ Estuarine Region | | ✓ | There is no Wetlands/ Mangrove/ Estuarine Region in the study area |
| *(v)* | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | ✓ | There is no Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves in the study area |
| *(vi)* | Other Sensitive Environmental Components listed in EMF | | ✓ | There is no other Sensitive Environmental Components in the study area as listed in EMF |
| *(vii)* | Drinking water source, upstream and downstream uses of rivers, etc. | | ✓ | A pond adjacent to the dumpsite. |
| *(viii)* | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | ✓ | The location is not in a low lying area and not in a CRZ region. |
| *(ix)* | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | ✓ | | There is only one house at 200 metres from the site. |
| *2* | Is the site in Critical / Overexploited GroundWater Block. Provide the level of the groundwater table | | ✓ | The site is not in a critical/over exploited block. |
| *3* | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | ✓ | | Yes, the site is vulnerable to fire. The site has a history of Fire accidents in the year 2019 and 2022.<br>Bio-mining will be carried out by considering the fire control and safety measures. |
| *4* | Describe the type of soil and vegetation on site | ✓ | | Gravelly Clayey soil is the most predominant soil type, presence of vegetation is (shrubs) |
| *5* | Is the site present in the flood plains as recorded in the last 100 years? Provide the HFL level of the site/region | | ✓ | Site is not located in a flood prone area. |
| *6* | Existing pollution/contamination or degradation on site | ✓ | | Dump Sites have been in existence since 1980. |
| *7* | Any other remark on baseline condition | | ✓ | Based on the baseline data the AAQ, surface and groundwater, noise analysis indicates that the respective results are well within permissible limits. |

***Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils***

| *Sl. No* | *Impacts on Land / Soil Environment* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| *8* | Total extend of land to be covered/built | ✓ | | The existing dumpsite area of 2.13 acres will be remediated by bio-mining. |
| *9* | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | | ✓ | The existing dumpsite area of 2.13 acres will be remediated by bio-mining. |
| *10* | Extend of Land to be remediated | ✓ | | The existing dumpsite area of 2.13 acres will be remediated by bio-mining. |
| *11* | Extend of land expected to be under green belt | | ✓ | Currently the dumpsite has no greenbelt. The Area of 2.13 acres will be fully remediated and utilized for further use by ULB. |
| *12* | Will the proposed project cause the following on Land / Soil: | | | After bio-mining the land will be remediated and will have a positive impact on the land and soil. |
| *(i)* | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | ✓ | No Impact on Surrounding Environmental Conditions due to the proposed sub-project. |
| *(ii)* | Substantial removal of Top Soil (mention area in sq.m) | ✓ | | The dumpsite has legacy wastes of 3.0 m below ground level and 2.5 m above ground level. However, the legacy waste combined with soil will be remediated till the depth of 3.0 m below ground level. |
| *(iii)* | Any degradation of land / eco-systems expected due to the project? | | ✓ | No land use change or ecosystem change due to implementation of this project since the land will be reclaimed. |
| *(iv)* | Loss or impacts on Cultural/heritage areas/properties | | ✓ | No impacts or loss of cultural/ heritage areas/properties due the implementation of the project |
| *(v)* | Does the project activity involve cutting and filling/ blasting etc.? | | ✓ | The project activity does not involve any cutting, filling or blasting. The bio-mining sub-project involves only excavation of wastes which is to be remediated. |
| *(vi)* | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | ✓ | | Waste is about 3.0 m below Ground Level which is to be excavated and remediated. So there is a change in topography. |
| *(vii)* | Will the project involve any quarrying/ mining etc.? | | ✓ | The project does not involve quarrying/ mining |
| *(viii)* | Will the project / any of its components contaminate or pollute the Land? | | ✓ | The existing dumpsite will be remediated and utilized for further use, henceforth there won't be any contamination to the land. |

| | | | | |
|---|---|---|---|---|
| *(ix)* | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | ✓ | Due to the proposed bioremediation, the site will be remediated and biodiversity of the surroundings will be enhanced and it will have a positive impact in the longer term. |
| *(x)* | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | ✓ | The proposed subproject involves only remediation through bio-mining. Hence no negative impact to the land. |

| ***Sl. No*** | ***Impacts on Air and Noise Environment*** | ***Yes*** | ***No*** | ***Details/Remarks*** |
|---|---|---|---|---|
| *13* | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | ✓ | | The process of bioremediation may cause dust emission from process and vehicle movement which shall be managed by effective mitigative measures |
| *14* | Will the project cause or increase pollution due to GHG emissions? | ✓ | | Chances of GHG emissions due to un-stabilized waste. |
| *15* | Will the project cause or increase odor nuisance? | ✓ | | The process of bioremediation may cause odour during remediation for the shorter time duration, which shall be managed by effective mitigative measures |
| *16* | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | ✓ | | Chances of toxic gases release during excavation of legacy wastes. |
| *17* | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | | ✓ | Project activity stage (during the process of bioremediation, the noise may arise due to vehicular movements & working of machineries). The proposed mitigation measures will ensure the ambient noise within the permissible limits. The duration of work will be 8 hours/day. |

| ***Sl. No*** | ***Impacts on Water Environment*** | ***Yes*** | ***No*** | ***Details/Remarks*** |
|---|---|---|---|---|
| *18* | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | ✓ | The proposed remediation will only enhance the groundwater/surface water quality in the long term. |
| *19* | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | | ✓ | The proposed remediation will only enhance the groundwater/surface water quality in the long term. |
| *20* | Chances of Pollution of Water bodies/groundwater wells, nearby or downstream | | ✓ | The proposed remediation will only enhance the groundwater/surface water quality in the long term. |

| | | | | |
|---|---|---|---|---|
| *21* | Will the activities proposed at the site(s) hinder natural drainage | | ✓ | No, the proposed remediation activity does not hinder natural drainage. |
| *22* | Will the activities proposed at the site(s) decrease permeability/rainwater percolation | | ✓ | The proposed remediation will clear the legacy wastes and the land will be remediated. After remediation the permeability/rainwater percolation of the soil will be increased. |

| ***Sl. No*** | ***Impacts on Biodiversity and Host Communities*** | ***Yes*** | ***No*** | ***Details/Remarks*** |
|---|---|---|---|---|
| *23* | Will the project necessitates cutting of Trees / Loss of Vegetation | | ✓ | Cutting of trees is not required for the proposed remediation activity. |
| *24* | Will the project necessitate substantial removal of Top Soil (mention area in sq.m) | ✓ | | The dumpsite has legacy wastes of 3.0 m below ground level and 2.5 m above ground level. However, the legacy waste combined with soil will be remediated till the depth of 3.0 m below ground level. |
| *25* | Any degradation of land / eco-systems expected due to the project? | | ✓ | The proposed process of bio-mining ensures that there will be no degradation of the land. |
| *26* | Will the project result in Health & Safety Risks in the neighborhood including the release of toxic gases, leachate, accident risks | | ✓ | There is one house 200 m from the dumpsite. However health and safety management measures will be maintained periodically for the workers involved in remediation activity. |
| *28* | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | | ✓ | There is no habitable area near the dumpsite. |
| *29* | Potential disruption to common property, accessibility, traffic disruptions, conflicts, or disruption to the local community within the subproject area? | | ✓ | No disruption, there will be a marginal increase in traffic of medium sized vehicle (trucks) due to the forward linking of recovered products from dump site (i.e. For compost, plastic and other recyclable waste). |

***Project Categorization and Need for Safeguards Instruments, Oversight***

| *Project Category* | □ ✓*E2* |
|---|---|
| **Key Reasons (for categorisation)** | During screening, it has found that the project is having moderate level impacts to the baseline environment, land/ soil / water /noise environment, biodiversity or to the community. Hence it is categorized as E2. |
| **Safeguards Instruments Required** | a) E2: Project specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities) |
| **Additional Responsibilities Expected** (such as i) Specialists to be hired for Physical/Cultural resources, Natural Habitats/others, etc. for EIA preparation, and/or supervision), ii) Consultations, iii) any other aspect | |

| *Status* | *Agency / Official* | *Name, Signature with Date and Seal* |
|---|---|---|
| **Prepared by** | PIU or ULB (project in-charge) | |
| | Environmental Engineer | |
| **Checked, Categorised as ___ (E1, E2, E3) & ToR issued by:** | DESDU / SESDU | |
| | Environmental Specialist | |

# ANNEXURE II FIRE RISK ASSESSMENT

**Objectives:** The important elements of fire risk Management planning can be classified as:

- Identifying the disaster potential scenarios and advance planning to combat and minimize the damage.
- Vulnerable zone delineation.
- Assessment of loss probability and its severity.
- To deal with such emergencies expeditiously.
- Warning, protective actions like evacuation of personnel.
- To contain the disaster by isolating the area, firefighting etc.
- To make efforts to return to normal condition when the situation is controlled.

*Causes of fire and Risk:*

| Ignition (heat) sources | Fuel Sources | Oxygen Sources |
|---|---|---|
| Lit cigarettes/ butts, matches, lighters<br>Improperly stored batteries<br>Bushfire<br>Self-heating piles<br>Hot loads/contaminated waste<br>Hot work operations<br>Arson<br>Lightning<br>Fires from neighbouring activities<br>Faulty electrical wires | Flammable liquids, gases and solids<br>Combustible goods and waste (e.g. CRWM)<br>Contamination in CRWM storage<br>Dry and unmanaged vegetation | Oxidising chemicals such as oxy-acetylene sets, bleach, hydrogen peroxide, nitrates<br>Physical introduction of oxygen through unbaling or turning of loose piles |

**Fire Prevention & Management Plan**

It is a strategy well evolved, organized and rehearsed to contain the adverse effects of a possible disaster. It aims to mobilize the internal resources and use these with minimal dependence on external agencies for the following purposes:

- To control and contain incidents.
- To safeguard employees and people in the vicinity.
- To inform employees, the general public and the authorities about the hazards/risks assessed, safeguards provided, residual risk, if any, and the role to be played by them in the event of disaster.
- To effect rescue and treatment of casualties.
- To prevent recurrence of such a disaster.
- To establish machinery for review, rectification/modification of the emergency
- To ensure safety of works before personnel re-enter and resume work.

- To work out a plan with all provisions to handle and to provide for emergency preparedness and the periodic rehearsal of the plan.

**Pre-Disaster Stage**

The prevention of disaster is of vital importance and is the moral responsibility of each and every individual employed in the dumpsite site. It can be prevented by observance of precautionary and preventive measures. During pre-disaster stage following points will be followed to avert the occurrence of disaster:

The emergency operation procedures of the dumpsite site will be written down, so that no confusion is caused in the event of an emergency taking place.

- To reduce the probabilities of accidental leakage of methane.
- Smoking will be prohibited in the areas where handling of dumpsite will be done. “NO SMOKING” boards will be prominently displayed in Local Language i.e., Malayalam and English languages.
- All electrical wiring, fittings, cables, equipment will be checked periodically. Temporary wiring will not be permitted to be installed inside the dumpsite area. No inflammable material including papers, Oils, wooden racks will be stored within 1 meter of any electrical fittings. No unauthorized person will be allowed to tamper with electrical fittings.
- Welding, Burning, cutting, Chipping, soldering work, etc. will only be carried out by authorized persons.
- Necessary compliance with various Statutory Guidelines and other relevant instructions as issued from time to time will be done by the contractor.
- The Safety Department will arrange to educate all concerned regarding operational hazards of non-compliance of the safety guidelines. They will also provide necessary guidance and support in proper implementation of the program. They will also arrange mock exercises periodically.
- The Safety Department will display important telephone numbers and instructions, in Mizo & English languages. The Security Control Room located at the dumpsite site will be equipped with the following:
- Sufficient number of copies of On-Site Disaster/Emergency Management Plan.
- Master plan of the dumpsite site indicating vital locations and possible sources of disaster.
- Important Telephone numbers
- Emergency lights (portable) and Wireless sets if required and possible).
- First Aid boxes

**Disaster Stage**

The most probable disaster which may occur at the dumpsite site is because of accidental leakage and fire. To control leakage and fire the following measures/precautions will be taken at the dumpsite site:

The guidelines as given below for the protection of fire will be followed:

- The dumpsite’s fire protection will consist of structural solutions, fire extinguishing systems and fire alarm systems. The fire extinguishing system will consist of the fire system with fire pumps, distribution pipelines, hydrants and fire hoses and the portable extinguishers.
- The fire alarm system will be a part of the primary systems and take care of the places which are unmanned or will not have any fixed fire extinguishing system.

- The major operation areas shall be equipped with fixed smoke detectors, CO2 extinguishers near the door in the control room.
- All the rooms in the office shall be equipped with fixed smoke detectors.
- The ventilation rooms shall be equipped with fixed smoke detectors. One CO2 extinguisher will be located near the door to the ventilation room.
- The fire alarm and detection system shall be designed, installed, maintained and tested according to relevant standards.
- The water for firefighting shall be stored in the fire water tank (water reservoir).
- CO2 fire extinguishers contain extinguishing carbon dioxide which either by it or under expected conditions of use gives off CO2 to prevent fire.
- Dry fire extinguishers contain an extinguishing medium which either by itself or under expected conditions of use will give fine powder to prevent fire to get oxygen.
- As soon as a fire takes place inside the premises of the dumpsite, action to be taken by various persons/officials.

**Post Disaster Stage**

After the incident, an incident report will be prepared regarding occurrence of event/losses incurred and recommendations thereof for restoration of normalcy.

**Reporting of Accidents**

Situation in totality will be studied thoroughly, investigated with respect to the cause of the incident, extent of loss of life and property and a detailed report prepared by the individual/team nominated by dumpsite site authorities for this purpose. Based on the investigation report, the rescue team would finalize time bound programmes for implementation of corrective measures proposed and regularly monitor the progress thereafter. Rescue, medical and welfare operations would be continued by the concerned agencies.

**Fire Standards and Facilities:**

Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.

Below equipment and their required quantities should be strategically positioned according to the site's specifications.

- Fire extinguisher (A, B, C powder): It will be used to immediately put off fire caused by wood, Paper and textiles, flammable liquids and flammable gases. Commonly can be placed anywhere inside the site
- Fire extinguisher (Foam spray): Mainly used to put off the fire caused by flammable liquids. It should be placed in diesel storage area, lubricant storage area and DG sets.
- Fire extinguisher ($Co_2$): Mainly used to put off the fire caused by Electrical short circuit. It should be placed near the control panel room/operation room.
- Fire bucket filled with sand: It should be placed near the diesel storage area

To ensure rapid response in case of a fire, it's essential to have a water tanker filled with water, equipped with a fire-fighting hose, readily accessible along with the portable motor. The presence of this equipped water tanker ensures timely and effective action during fire emergencies. All requirements in line with National / State regulations and as advised the Local Brigade shall be arranged & followed.

The following points to be considered for assessing the fire risk and procedure to mitigate it.

1. Identification of Fire Hazards: The first step involves identifying potential fire hazards in the premises. These hazards could include sources of ignition (e.g., electrical equipment), combustible materials (e.g., flammable liquids, paper, cardboard), and other factors that could contribute to the outbreak of a fire.
2. Assessment of Risk: Once the hazards are identified, the next step is to assess the level of risk associated with each hazard. This involves evaluating the likelihood of a fire occurring and the potential consequences if a fire were to break out.
3. Escape Routes: Since operational phase occurs in an open environment, the need for conventional escape routes in the event of a fire emergency may not be required.
4. Fire Safety Measures: The assessment reviews existing fire safety measures in place, such as fire alarms, firefighting equipment, and fire suppression systems. Proper assembly point is required in case of fire break out
5. Emergency Procedures: The assessment evaluates the effectiveness of emergency procedures and evacuation plans in the event of a fire, ensuring that workers can safely evacuate the premises.
6. Fire Training and Awareness: The assessment considers the level of fire safety training provided to workers and the awareness of fire hazards and evacuation procedures.
7. Record-Keeping: Detailed records of the assessment process, findings, and recommended actions are maintained for future reference and regulatory compliance.
8. Recommendations: Based on the assessment, the fire risk assessor provides recommendations for improving fire safety, which may include installing additional fire safety equipment, conducting training programmes, or implementing any changes to reduce fire risks.
9. Review and Updates: Fire and risk assessments should be regularly reviewed and updated to account for any changes in the premises or regulations.

Fire and risk assessments play a crucial role in preventing fires and minimizing their impact if they occur. They are particularly important for dumpsites and other places with a higher risk of fire hazards to ensure the safety and well-being of workers.

## Executive Summary

Kothamangalam Municipality is located on the eastern part of Ernakulam District. Even though the ULB has good practice of waste management, the primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing the dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Consequently, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate them to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project for the remediation of legacy waste dumpsites in the ULBs of Kerala. As part of the project, in phase 1 the existing dumpsite at Kothamangalam, ward 6, Kumbalathumury is proposed for remediation.

The Kothamangalam Municipality has an area of 40.41 sq.km with 31 wards. The municipality, with the financial and technical support of KSWMP, intends to remediate the existing legacy waste dumpsite located in around 2.13 acres of land in ward 6, Kumbalathumury and to recover land for future developmental activities. The Kumbalathumury dumpsite was used for dumping municipal solid waste from the year 1988 to 2018. The dumping of solid waste (biodegradable waste) was stopped once the ULB level windrow compost plant was set up. Considering the impending threat of fire hazards and leachate issues, the Municipal Council intends to take-up the remediation of legacy dumpsite as a priority and to utilize the remediated land for setting up other solid waste management facilities. Since the cessation of dumping activities in 2018, only sweeping waste (silt & inert) from towns and streets was dumped at the facility daily and has now been discontinued.

The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. To assess the quantity & composition of legacy waste & also evaluate the environmental baseline of the dumpsite, samples from representative locations were collected and analysed for various parameters viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Groundwater and Surface Water. As part of the study, detailed site investigations were carried out for; – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical and Environmental Analysis by M/s Poluchem laboratories.

From the results of the investigations, it is found that the waste is seen up to a depth of 3 m. The total estimated quantity of legacy waste is around 29,915 Cum.

As per the SWM Rules 2016, selection of an applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out, and based on the detailed assessment of different parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite.

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, stationary trommel screening machineries shall be optimum for processing the legacy waste within the stipulated timeline of 31st March 2024.

The project attracts E2- Environmental category based on the project activities and status of the environment baseline. The project attracts moderate social risks based on the social mapping, transect walk and consultation with the people living around the proposed project site to assess the problems associated with the legacy waste dumpsite and the impact during the execution of the project.

The activities of bio-mining will be required approximately 5-6 months. An area of 2.6 acres will be reclaimed and will be utilized for setting up other solid waste management facilities. Total cost of the project is [redacted].

## 1.0 Introduction

The issue of municipal solid waste management in Urban India has become one of the foremost concerns during the last couple of decades.

The primary environmental issue currently faced by the municipal authorities in Kerala revolves around a longstanding existing legacy waste dumpsite. The state has a long history of more than three decades of continuous dumping of both bio- and non- biodegradable wastes. Though the waste dumping activity has been stopped, the dumpsite remains as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Improper management of such sites pose significant environmental, social, and economic challenges for the communities and ecosystems in the vicinity.

In view of the environmental and social issues connected with dumpsites, the SWM Rules 2016, directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the remediation projects of legacy waste dumpsites in the ULBs. As part of the project, in phase -1, the existing dumpsite of Kothamangalam ULB was proposed for remediation.

For arriving at a methodology for remediating the legacy waste in the dumpsites, as per the Project Implementation Manual, a feasibility study outlining the technical, economic, and socio- environmental factors has been carried out. As a result of the feasibility study that involved detailed field investigations & assessment, and market sounding, the method proposed for remediation of legacy waste dumpsite is biomining, which will ensure long-term sustainability and environmentally sound treatment, which is found technically feasible, economically viable, and socially acceptable. The details of various steps involved in the feasibility study are described in the following sections.

## 2.0 General Description about the Project

Kothamanglam, Ernakulam in the State of Kerala is experiencing the issues of treatment and disposal of MSW. The common solid waste management facility of the Kothamangalam Municipality is located within 2.6 acres of land in Kumbalathumury (10°4'45.75" N, 76°38'51.80" E). The legacy dumpsite is also located within this common solid waste processing facility. This is the only dumpsite present in the ULB.

This waste dumpsite at Kothamangalam needs to be remediated scientifically and the land is to be reclaimed for productive use. This feasibility report outlines the status including the environmental and social aspects. The feasibility report also examines various remediation options and suggests the most feasible option for the given context for the purpose of availing for the closure of the dumpsite by Kothamangalam Municipality.

## 3.0 Profile of ULB- Kothamangalam Municipality

### 3.1 Location

Kothamangalam Municipality is located in the eastern part of the Ernakulam district at latitude 10°4'44.15" N and longitude 76°38'52.12" E as as shown in **Figure. 3.1.** Kothamangalam town is linked by National Highway 85 to Ernakulam.

**Figure 3.1 Location Map of Kothamangalam ULB**

### 3.2 Demographic & Socio-Economic Status

The Kothamangalam municipality has a total population of 40,286 of which 20,150 are males while 20,136 are females as per report released by Census of India 2011 indicating a sex ratio is of 1,025 against state average of 1,084. The overall literacy rate of Kothamangalam Town is around 96%. The ULB portrays a literacy rate higher than state average of 94.00 %. The workforce participation details of Kothamangalam ULB is presented in Table below;

*Source: Census Data 2011*

**Table 3.1 Workforce Participation Details, Kothamangalam**

| Category | Total | Male | Female |
|---|---|---|---|
| Main Workers | 12,226 | 9,080 | 3,146 |
| Cultivators | 847 | 744 | 103 |
| Agriculture Labourer | 1,066 | 751 | 315 |
| Household Industries | 149 | 95 | 54 |

### 3.3 Connectivity

Kothamangalam became a municipality in 1978 and is also a legislative assembly constituency in Ernakulam District. The Kothamangalam town is spread around the intersection of National Highway 544 (previously NH 47) and the Main Central Road (MC Road) which connects Kothamangalam to the state capital Thiruvananthapuram.

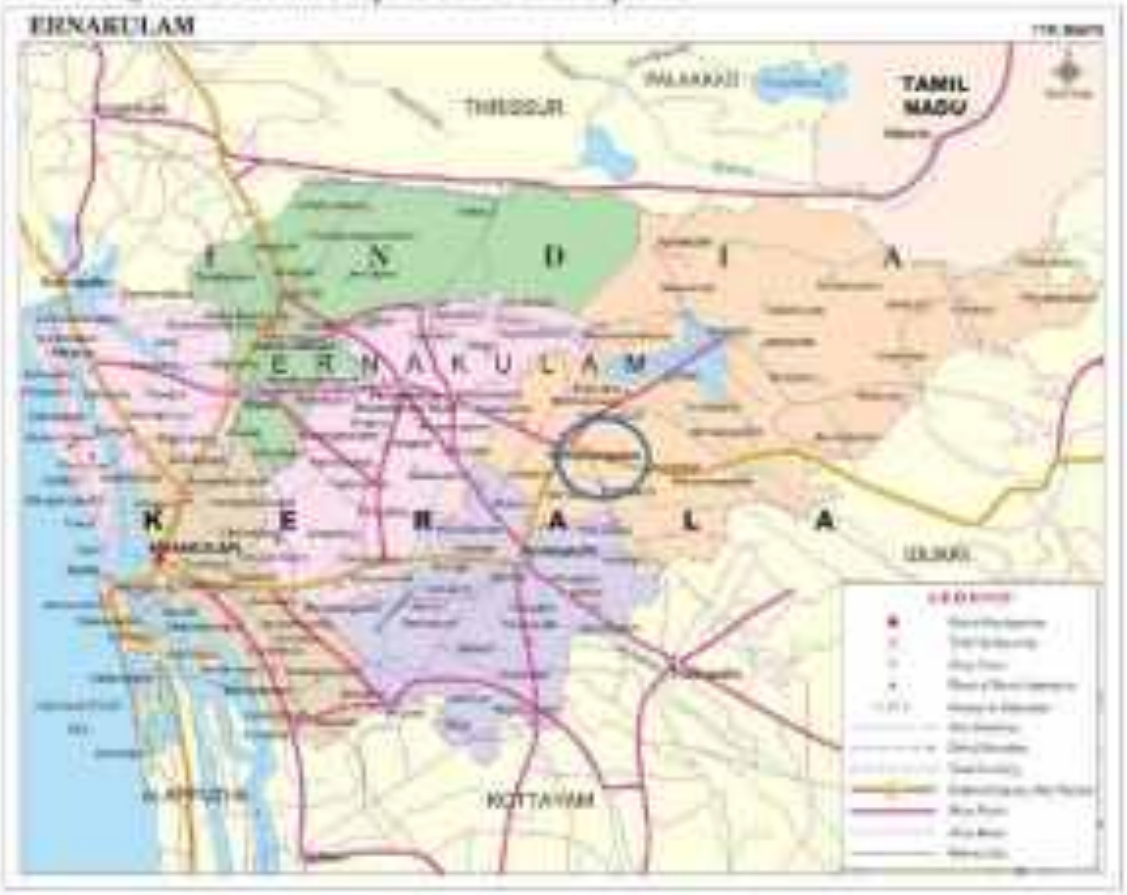

**Figure 3.2 Road Map of Ernakulam Showing Major Connectivity of Kothamangalam Town**

### 3.4 Climatic Condition

Kothamangalam has a tropical climate. As per Climate-Data.org, the average annual temperature is 27.8 °C in Kothamangalam. Precipitation here averages 3051 mm. The predominant wind directions are blowing from SW and WSW direction throughout the year.

### 3.5 Ground Water Level

The vicinity of the project area there are no households. The site is surrounded by rubber plantations. According to information published by the CGWB, the Government of India, the water level in Kothamangalam fluctuates from 3.53 to 6.54 MBGL.

### 3.6 Land use

Analysis of the existing land use is inevitable in understanding the predominant economic activities of an area and the availability of land for future economic activities. The current and future land use determines the quantum of waste that may be generated, the composition of waste and the direction of waste growth helps in planning the collection and transportation systems, decentralized processing facilities, transfer stations etc.

The land use data indicates a presence of over 62% agriculture, which indicates a ready market for city compost.

**Table 3.2 Land use Pattern of Kothamangalam Municipality**

| S. No | Land use | Area Ha | % |
|---|---|---|---|
| 1 | Residential Use | 1022 | 25.22 |
| 2 | Commercial Use | 35 | 0.87 |
| 3 | Public and Semi-public use | 85 | 2.13 |
| 4 | Industrial Use | 9 | 0.22 |
| 5 | Parks, Play Ground and Open space use | 53 | 1.33 |
| 6 | Agriculture | 2489 | 62.16 |
| 7 | Parking and Transportation use | 195 | 4.87 |
| 8 | Water bodies | 71.6 | 2.9 |
| | Total | 3959.6 | 100 |

## 4.0 Detailed Description of the Dumpsite

### 4.1 Physical Feature of the Site

Kothamangalam dumpsite is existing within the common municipal solid waste management facility of Kothamangalam (with an aerial extent of 2.6 acre) located at Kumbalathummuy in ward No. 6. This dumpsite is approximately 6.0 km away from the centre of Kothamangalam town in western side with very few human inhabitations nearby. The geolocation of the dumpsite is 10° 4'45.75" N and 76°38'51.80" E

The exact date for start of the dumpsite was not available with the municipality; however approximately it had started in the year of 1988 (from consultations during field visit). Presently, the quantity of waste dumped at this site is about 29,915 cum as per the topographical survey records available with the ULB. As of now 2.13 Acres of the area is covered with solid waste. The Legacy waste is present about 3m below and 2.5m above the surrounding ground level. There are high chances of water being contaminated in this area due to leachate percolation.

**Figure 4.1 Photographs of Kothamangalam Dumpsite**

**Table 4.1 Salient Features of Kothamangalam Dump Site during Site Visit**

| Particulars | Details |
|---|---|
| Name of Dumpsite | Kumbalathummy Dumpsite |
| Location of Dumpsite | Ward No. 6 of the municipality |
| Co-ordinates of Dumpsite | Latitude :- 10° 4'45.75" N<br>Longitude :- 76°38'51.80" E |
| Distance from the central part of the town | 6.0 KM |
| Area of dumpsite | 2.6 Acres |
| Average height of dumpsite | 2.5m Above the ground level<br>3.0 m Below the ground level |
| Ownership of dumpsite land | Municipality |
| Distance from nearby features- residential, school, offices, temples, institutions, industry etc.) | Uninhabited area with rubber plantation surrounding |
| Start date of dumpsite | 1988 |
| Quantity of waste dumped per day | None |
| Utilities on site | Electricity connection is available |
| Details of manpower and vehicles available in dumpsite | 46 persons and 5 Vehicles |
| Site demarcated | Site is currently demarcated with a boundary wall. |
| Details of weighbridge available at dumpsite | No weighbridge at site |
| Interlinked Facilities | Near to the dumpsite MCF, RRF and Windrow Plant is working |

## 4.2 Surrounding Features of the Dumpsite

The immediate surrounding land use of the dumpsite is for rubber plantation. Within the 200 m radial vicinity there is one residential unit, and beyond the same, few households (5 to 7 numbers) present within the 500 m radial vicinity. The LV line is available at dumpsite, hence it is convenient for setting up the biomining facilities. Site had proper access through a 5 m wide road.

## 4.3 Information on Site Management

This section describes the current management of the dumpsite in terms of agency responsibility, profile of workers and numbers, nature of work the labour force is engaged in, Waste pickers and other categories of workers at the site.

**Agency responsible for current management of the dumpsite:** Dumpsite is present within the common solid waste management area of the Kothamangalam Municipality. Currently, the dumpsite is closed and is non-functional. An MCF, RRF and a windrow compost plant are working near to the dumpsite. The MCF is operated by the ULB whereas RRF is operated by ASM Enterprises who is appointed for recycling of dry waste. The Windrow compost plant is operated by ULB itself for processing the bio-waste collected mainly from common market few institutions and households.

**Profile of workers and numbers:** Total number of 46 HKS workers have been appointed on a daily basis for the operation of MCF and windrow plants and also for the waste collection.

**Nature of work the labour force in engaged:** HKS workers are involved in the collection of non-bio waste. The segregation and forward linkage of the non-bio waste is managed by ASM Enterprises. HKS is also involved in the collection of bio waste from the market, few institutions, and households. The collected bio waste is converted to compost by processing in windrow plants by the HKS.

**Waste pickers and other category of workers at the Site:** The waste collection from the ULB is executed through HKS. Non bio waste collected is processed at MCF/RRF through the agency ASM Enterprises.

## 4.4 Relevance in local or regional SWM plans

The 2.6 acres of land after reclamation may be productively used by the ULB as it deems fit. The ULB may consider its use as a waste recycling park in which case the non-biodegradable waste from the ULB shall be brought to this facility for sorting, recycling and processed for further use. The project may be funded under the KSWMP project.

## 4.5 Litigation status of the Site

There is no litigation against the site. Whereas there is environmental compensation of Rs.35 Lakh calculated for a period from 01.04.2023 to 28.02.2023 for the non-compliance of the SWM Rules 2016 under environment protection Act 1986 by Kerala State Pollution Control Board via Letter No. PCB/HO/Rules/SWM EKM/2018(Vol2)-B dtd 06.05.2023.

## 5.0 Scope of Work

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Kothamangalam includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (100% land recovery – Biomining, capping, partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the ESMF developed for projects envisaged under KSWMP.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Delineation of baseline assessment, impact & risk assessment, mitigations measures, Environmental Management & monitoring plan, budget for EMP, EMOP, institutional responsibilities for implementing monitoring and reporting
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport,
- Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 Objectives

- To remediate the dumpsite by 31st March 2024.
- To reclaim 100% area and by eliminating the chances of dumpsite fires, leachate generation, and foul odour.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.

- To increase nearby social value and overall benefit to the citizens.

## 6.0 Detailed Investigation Strategy

### 6.1 Investigation Strategy

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected considering the state and national guidelines. Samples were collected as mentioned below.

- Bore hole upto a depth of 10 m and collection of 3 (No.) sample from the soil at interval of 1.5 m depth.
- Waste analysis viz., leachate sample from 1 (No.) locations and physical analysis from (No.) location, and chemical analysis from 1 (No.) location.
- Environmental baseline analysis surface water 1 (No.) location and ground water samples from 2 (No.) location (Well Water Samples -1 up gradient, 1 down gradient) and Air sampling from 2 (No.) locations and noise sampling from 1 (No.) location.

### 6.2 Investigation Plan

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

**Table 6.1 Detailed Investigation Plan**

| Sr. No. | Parameters | Sampling Nos |
|---|---|---|
| 1 | **Geotechnical Investigation** | |
| A | Bore Holes up to 10m depth(1No./2Hectare) (as per CPHEEO) | 1 |
| B | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | 1 |
| 2 | **Waste & Environmental Analysis** | |
| A | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM2016). Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | 1 |
| B | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | 2 |
| C | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor. | 1 |
| D | Ground water (well water samples-1 up gradient, 2 down gradient)-(shallow and deep wells) Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, | 2 |

| Sr. No. | Parameters | Sampling Nos |
|---|---|---|
| | As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | |
| E | Surface water (pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, CN, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | 1 |
| F | Ambient Air Quality (Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise level [E(P)] for 24 hours. | 1 |

## 6.3 Sampling Methodology

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

**Table 6.1 Detailed Investigation Plan Executed for Waste Dumpsite at Kothamangalam**

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide $SO_2$, Nitrogen Dioxide $NO_2$, PM 2.5, PM 10, Ozone, Lead Pb, Carbon Monoxide (CO), Ammonia ($NH_3$), Benzene($C_6H_6$), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Upwind direction in Northeast (NE) boundary of the dumpsite | The AAQ locations were chosen based on the Windrose data obtained for Kothamangalam. The most predominant wind direction is from SW and WSW. |
| | | | Downwind direction in Southwest (SW) boundary of the dumpsite | Down Stream Wind direction in line with windrows. |
| 2 | Noise (1 Location) | Ambient Noise level for 24 hours | Entrance of the dumpsite | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading vehicle. Please note that the site is devoid of proximity to any sensitive receptors within a 200 m radial circle. |

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, $NO_3$, $SO_4$, Total Alkalinity, Total hardness, E-coli and Total coliforms (IS 10500-2012). | Nearby pond which is adjacent to the dumpsite. | No alternative surface water sources were identified during sampling. So adjacent pond sampling was considered. |
| 4 | Ground water (2 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | Groundwater sampling location at 300 m distance in East direction | No alternative ground water sources were identified during sampling. |
| 5 | Bore Hole (1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS- Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | Centre of the dumpsite | Volume of legacy wastes were found to be higher in the centre part of the dumpsite during investigation. So, the bore hole test was performed in the centre. |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(morganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | South boundary direction within the dumpsite - one point | Based on contour mapping and cross section diagram, the leachate sampling location was identified as North (N)- 915 and East (E) - 975 points. |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | Within the dumpsite at 2 locations, one at East direction and at West direction. | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. So the two locations were considered for sampling. |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium(N- | | The legacy waste was found to be older and no access to the vehicular |

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | | movement, when compared to other parts of the dumpsite. So the two locations were considered for sampling. |

For the borehole investigation, the samples were collected by rotary drilling a 150mm bore hole using a fast rig attached to a drag bit. The soil drillings are removed by a circulating bentonite slurry which also aids in keeping the side walls stable. An SPT sampler was driven in to collect the representative samples, which is carefully packed in double walled polythene bags, sealed, and sent to laboratory for testing. Standard penetration tests were conducted on soil at every 1.5m depth and the number of blows to achieve 300mm penetration were noted. Fractions recovered from the mining of legacy waste were tested, especially for the presence of toxic metals and organic contaminants.

The total quantity of waste present in the waste dump is calculated based on the topographic study executed by ULB (for calculating quantum of waste above ground level) and the results of borehole investigation (for calculating the quantum of waste below ground level).

### 6.4 Analysis and Interpretation of Exploratory Data

The baseline condition of the waste dumpsite at Kothamangalam, has been assessed through the geotechnical investigation and Waste & Environmental baseline assessment executed through M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Poluchem Laboratories (P) Ltd respectively. The results of the topographical survey conducted by ULB in the year 2022 were also considered for the analysis. Results of topographic survey conducted by ULB, Geotechnical investigation report, waste and Environmental analysis are enclosed as **Annexures 1 to 4.**

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 16th May 2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 17th May 2023 and was completed on 23rd May 2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 06th June 2023 by M/s Poluchem Laboratories (P) Ltd.

#### 6.4.1 Details of Topographic Survey

Topographic survey was conducted by ULB itself in the year 2022 towards assessing the quantum of the waste present in the dumpsite above the ground level. The Topographical survey report is presented in **Annexure 1**. The inference of the Topographical survey is as follows.

- Topographical Survey Map shows Approximate 2.13 acres of land covered by waste dumping.

- Maximum height of waste dump above soil is 2.5 m
- Estimated waste volume above ground level is 21,295 cum which will constitute 22,999 T of waste (density of waste is 1.08T/cum as per the characterization study results presented in subsequent sections).

### 6.4.2 Geotechnical Exploratory Details

The geotechnical investigation at the dumpsite at Kumbhalathumuri, Kothamangalam, Ernakulam district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 8.30m (3.00 in waste after that 5.3m soil). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples. The full geotechnical report is appended as **Annexure 2**. The major inferences of the geotechnical investigations are as follows;

- In the borehole investigation it was asserted that the depth of waste column below ground level is 3.m.

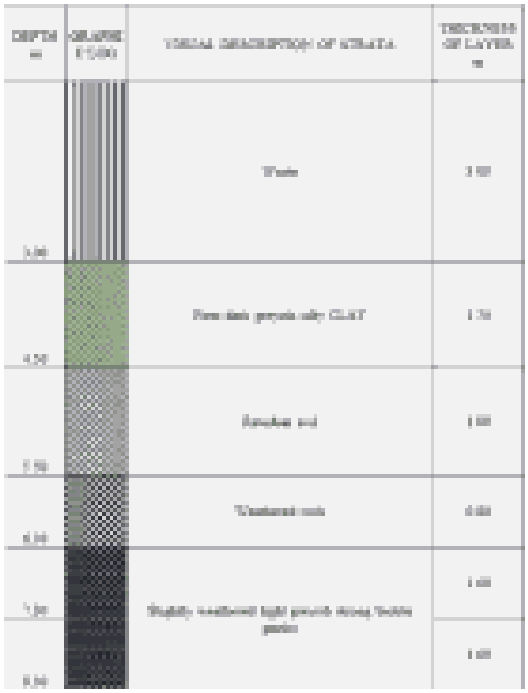

**Figure 6.1 Borehole Strata Obtained for Kothamangalam Dumpsite**

- The base soil has a plasticity index greater than 10 with clay and silt fractions account for more than 40%, which makes it suitable for the sub-base.
- The safe bearing capacity of the soil is 150 KPA, implying that the maximum height of fill may be about 15 m. During excavation, the side slopes should be maintained at 1 (V) and 3 (H).
- The Cation Exchange Capacity (CEC) of the soil is 11.03 meq/100gm.

### 6.4.3 Estimated Total Quantity of Waste

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). As detailed under section 6.4.1, the estimated quantity of the waste above the ground level is **21,295 Cum**.

Quantity of waste below the ground level is estimated as **8,620 Cum**. The quantity of waste below ground level is based on assumptions and may vary as per actual site conditions. We recommend taking 4 more bore holes for estimating exact quantity or the assessment of quantity below ground level may be included in the contractor's scope.

Thus, the total legacy waste present in the Kothamanglam dumpsite is calculated as below.

**Table 6.2 Total Waste Quantification for Kothamanglam Dumpsite**

| Sl no | Name of Dumpsite | Quantity of Waste present above the Ground level | Quantity of Waste present below the Ground level | Total quantity of legacy waste to be managed |
|---|---|---|---|---|
| 1 | Kothamanglam | 21,295 Cum | 8,620 Cum | **29,915 Cum** |
| | | 22,999 T | 9,309 T | **32,308 T** |

### 6.4.4 Legacy Waste Characterization

The characteristics of the legacy waste were assessed by collecting 15kg sample. The legacy waste samples were collected on 09/08/2023 by M/s Matters lab (P) Ltd. The assessment of waste characteristics was done based on the results of the analysis. The details of the physical characteristics are provided in the tables below. The detailed legacy waste characterisation reports are enclosed as **Annexure 3**

**Table 6.3 Grain Size Analysis of Legacy Waste total weight of sample taken 15 kg)**

| Sieve Size (mm) | Percentage Retained |
|---|---|
| 80 | 10 |
| 37.5 | 6.9 |
| 10 | 27.4 |
| 4 | 19.1 |
| Pan | 36.6 |

**Table 6.4 Characterisation of Waste Material Retained in Each Sieve**

| Test/ Parameters | Waste Material Retained on each sieve in % | | | |
|---|---|---|---|---|
| | 80mm | 37.5 mm | 10mm | 4mm |
| Plastic Waste | 77.5 | 10.3 | 4 | Nil |
| Cloth | 1 | 0.1 | 0.5 | Nil |
| Glass | Nil | 4.4 | 4.1 | Nil |
| Wood | 0.5 | Nil | 10.9 | Nil |
| C&D | Nil | Nil | Nil | Nil |

| Test/ Parameters | Waste Material Retained on each sieve in % | | | |
|---|---|---|---|---|
| | 80mm | 37.5 mm | 10mm | 4mm |
| Bio Fraction | Nil | Nil | Nil | Nil |
| Gravel | Nil | 85.2 | 79.5 | 100 |
| Rubber | 21 | Nil | Nil | Nil |
| Metal | Nil | Nil | 1.0 | Nil |

**Table 6.5 By Product Composition**

| Particular | Percentage of Composition (%) |
|---|---|
| Recyclable | 15.21 |
| Inert | 29.12 |
| Bio Earth | 19.27 |
| Soil Enricher | 36.60 |

**Table 6.6 Physical Characteristics of Waste**

| Sl No | Parameter | Test Method | Unit | Value |
|---|---|---|---|---|
| 1 | Moisture@105°C | ASTM D 2216 | % | 15.98 |
| 2 | Bulk Density | USEPA | kg/m3 | 1089 |
| 3 | Density | USEPA | g/cm3 | 1.0466 |
| 4 | Calorific Value | ASTM D 5865 | K cal /kg | Nil |

**Table 6.7 Chemical Analysis**

| Sl No | Parameters tested | Test Method | Unit | Result |
|---|---|---|---|---|
| 01 | pH@25°C | USEPA | .. | 7.26 |
| 02 | Biodegradable Factor | USEPA | % | 2.3 |
| 03 | Total carbon | USEPA 9060A | % | 4.7 |
| 04 | Phosphorus(P) | USEPA | % | 0.017 |
| 05 | Nitrogen(N) | USEPA | % | 0.24 |
| 07 | Potassium(K) | USEPA | % | 0.023 |
| 08 | C/N Ratio | USEPA | .. | 19.5:1 |
| 09 | Calorific Value | ASTM D 5865 | K cal/kg | Nil |

*Note : The average Nitrogen, Phosphorus and Potassium (NPK) content in the legacy waste samples picked from the site is 0.24, 0.017, 0.023, respectively by weight. Although the C/N ratio is >15, the actual nutrient values are far lesser than 0.8, 0.4 and 0.8 as specified by the Fertilizer Control Order (FCO) 1985 for city compost and hence cannot be used as compost. This could be due to the materials being exposed to sun and air over the years or that the carbon content may have leached into the ground through leachate during the rainy season. Another possible contributor to the reduced carbon levels could be multiple fire incidents at the site. Although the material has very less carbon content, the NPK value can be enriched by adding additives like poultry litter. The enriched material can be given to farmers or used for horticulture purposes. The material cannot be sold as organic compost in the present form due to very low carbon content. A comparison of the chemical nature of samples and FCO specified parameters is provided in the table below.*

| Parameter | Nitrogen (N) | Phosphorus (P) | Potassium (K) | Moisture | Organic Carbon | Bulk Density |
|---|---|---|---|---|---|---|
| As per FCO | 0.8 | 0.4 | 0.4 | 15% - 25% | 12% | <1 |
| Legacy Waste of Kothamangalam | 0.24 | 0.017 | 0.023 | 23.5 | 1.12 | 1147 |

**Table 6.8 Heavy Metal Analysis**

| Sl No | Parameters tested | Test Method | Unit | Result | USEPA Permissible |
|---|---|---|---|---|---|
| 1 | Iron (Fe) | USEPA 3050 | % | 2.4 | - |
| 2 | Arsenic (As) | USEPA 3050 | mg/kg | <0.1 | 41 USEPA, 12 Canada |
| 3 | Selenium (Se) | USEPA 3050 | mg/kg | <0.1 | 2 Canada |
| 4 | Nickel (Ni) | USEPA 3050 | mg/kg | 7.38 | 50 |
| 5 | Zinc (Zn) | USEPA 3050 | mg/kg | 15.71 | 1000 |
| 6 | Cadmium (Cd) | USEPA 3050 | mg/kg | <0.1 | 5 |
| 7 | Copper (Cu) | USEPA 3050 | mg/kg | 15.02 | 300 |
| 8 | Chromium (Cr) | USEPA 3050 | mg/kg | 9.33 | 50 |
| 9 | Lead (Pb) | USEPA 3050 | mg/kg | 9.8 | 100 |
| 10 | Mercury (Hg) | USEPA 3050 | mg/kg | <0.1 | 0.15 |
| 11 | Manganese (Mn) | USEPA 3050 | mg/kg | 36.5 | - |

Hence heavy metal contamination is not expected in the dumpsite. However, if heavy metal/ hazardous contamination is found in the recovered fractions at any stage of the works, the RFB should include necessary provisions for payment towards additional sampling of the recovered fraction and disposal to the KSPCB authorized hazardous waste management facility as per actual cost. The respective pre-set disposal costs of CHTSDF, as recommended by KSPCB, will be considered for such recovered fractions.

### 6.4.5. Soil Conditions of the Dumpsite

As it is an unlined dumpsite, there is a probability of finding traces of contaminant from waste and leachate in the underlying soil. Since it is an uncontrolled disposal site, the mixed waste contains different types of pollutants which may eventually have an impact on the soil. Results of soil analysis of the samples taken from the borehole in the Kumbalathummuri dumpsite is as shown below:

**Table 6.9: Chemical analysis of soil extracted from borehole at Kothamangalam dumpsite**

| Sl. No | Parameter | Result | US (NY State-Codes, rules and regulations) Industrial Use |
|---|---|---|---|
| 1 | Cadmium (Cd) mg/Kg | <5.0 | 60 |
| 2 | Chromium (Cr) mg/Kg | 166.7 | 800 (Hexavalent) 6800 (Trivalent) |
| 3 | Copper (Cu) mg/Kg | 83.8 | 10000 |
| 4 | Nickel (Ni) mg/Kg | 92.8 | 10000 |
| 5 | Lead (Pb) mg/Kg | 39.9 | 3900 |
| 6 | Zinc (Zn) mg/Kg | 573.9 | 10000 |

| | | | |
|---|---|---|---|
| 7 | Mercury (Hg) mg/Kg | <0.1 | 5.7 |
| 8 | Arsenic (As) mg/Kg | 2.0 | 16 |

While comparing results of the report with the US Industrial Use benchmark, it is observed that the values are significantly low and within the benchmark values. Bioremediation may be carried out to reduce traces of heavy metals in soil and for site clearance. Industrial land use may be promoted after bio-remediation of site. The location may be used as a site for the SWM facilities like Material Collection and Resource Recovery Facility. However, the solution may be considered after proper soil and groundwater investigation post dump-clearing stage.

### 6.4.6 Leachate Characterization and Quantification

There is no leachate collection/management system in the dumpsite. To address the concern of contamination of the groundwater and soil due to uncontrolled dumping, leachate samples are picked for analysis. The data is presented in **Annexure 4**. The data indicates that the TDS is about 1885 mg/l while the suspended solids is about 180 mg/l. The chlorides are high at 788.41 mg/l, while the COD, BOD are 320 mg/l and 120 mg/l respectively.

**Table 6.10 Leachate characteristics at Kothamanglam Dumpsite**

| Parameters tested | Test method | Results |
|---|---|---|
| Sampling Location | N-10 °04'.062" E -76°41'17.339 | |
| pH | IS 3025 (P) 11 –1983RA2017 | 7.09 |
| Total Dissolved Solids (Inorganic) | IS 3025 (P) 16 – 1984RA2017 | 1885 mg/l |
| Total Suspended Solids | IS 3025 (P) 15 – 1984RA2017 | 180 mg/l |
| Chloride as Cl- | IS 3025 (P) 32 – 1988RA2014 | 788.41 mg/l |
| C O D | IS 3025 (P) 58 -2006RA2017 | 320 mg/l |
| B O D (3 days at 27O C) | IS 3025 (P) 44 – 1993 RA 2014 | 110 mg/l |
| Total Kjeldhal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 72.4 mg/l |
| Ammoniacal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 45.5 mg/l |
| Phenolic Compound asC6H5OH | IS 3025 (P) 43-1992 RA2014 | 6.3 mg/l |
| Fluoride as F | IS 3025 (P) 60 -2008RA2014 | 4.5 mg/l |
| Cyanide as CN- | IS 3025(P) 27-1986RA2014 | BDL (MDL- 0.01 mg/l) |
| Nickel as Ni | IS 3025 (P) 54– 2003RA2014 | BDL (MDL- 0.01 mg/l) |
| Cadmium as Cd | IS 3025 (P) 41– 1992RA2014 | BDL (MDL- 0.001 mg/l) |
| Lead as Pb | IS 3025 (P) 47– 1994RA2014 | BDL (MDL- 0.01 mg/l) |
| Copper as Cu | IS 3025 (P) 42– 1992RA2014 | 1.6 mg/l |
| Mercury as Hg | IS 3025 (P) 48 – 1994RA2014 | BDL (MDL- 0.001 mg/l) |
| Zinc as Zn | IS 3025 (P) 49 – 1994RA2014 | 6.8 mg/l |
| Total Arsenic as As | IS 3025 (P) 37– 1988RA2014 | BDL (MDL- 0.01 mg/l) |

*BDL- Below Detection Level, MDL- Minimum Detection Level*

All the heavy metals are significantly low or below detectable limits. The ground water quality results (presented under ESIA Section indicate that the dumpsite has not caused any major increase in pollution levels and the quality parameters are within the IS 10500:2012.

The remediation is proposed to be carried out during the dry season and hence the probability of rain is less. In case of rains and leachate generation, the leachate will be collected in a leachate collection tank and sprayed back to the windrow area for enriching the moisture and aiding the decomposition process in line with CPCB guidelines for management of legacy waste.

### 6.4.7 Environmental Baseline

The environmental baseline was assessed from the analytical results of air, surface & groundwater, noise, and leachate. The samples by M/s Polychem Laboratories (P) Ltd. The Environmental baseline was analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the ESIA Section in **Annexure 4.**

### 6.4.8 Risk Assessment

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and pathogens. Proper containment and management of leachate is essential to prevent water pollution.

The analysis of surface water reveals that all the parameters are within the acceptable limit, except it is slightly acidic and the dissolved oxygen content is less than prescribed limit, so also the BoD is greater than the allowable limit, indicating that the water contains organic load.

**Table 6.11 Risk Assessment- surface water**

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite -BOD Higher than the acceptable limits |
| **Pathway** | Water/Run off |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | High BOD indicates the water is polluted and it is harmful to ecosystem. Also, it will make the water unfit for human and animal consumption. |

**Ground Water**: Pollutants from dumpsite can infiltrate into underlying groundwater, particularly if the dumpsite is not adequately lined or if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide

area, affecting drinking water sources. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

The analysis of ground water samples taken at one location reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 5.61, which is in a slightly acidic range which can make the water not fit for any industrial purpose as it is more corrosive.

**Table 6.12 Risk Assessment - Ground water**

| **Risk Assessment** | |
|---|---|
| **source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite - pH is acidic in nature |
| **Pathway** | Water, soil |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health are;<br>• Diarrhea<br>• Nausea and Vomiting<br>• Abdominal Pain<br>• Weakness<br>• Organ Damage<br>Possible risk to flora<br>It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increases the availability of some elements to toxic levels, particularly aluminium and manganese. |

Air: Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens, etc. to be ensure.

**Table 6.13 Risk Assessment - Air**

| **Risk Assessment** | |
|---|---|
| **source** | Legacy waste Dumpsite |
| **Pollutant** | Within the limits |
| **Pathway** | Air |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |

| | |
|---|---|
| **Risk** | No Anticipated risk |

**Soil**: Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

**Table 6.14 Risk Assessment - Soil**

| **Risk Assessment** | |
|---|---|
| **source** | Legacy waste Dumpsite |
| **Pollutant** | Heavy metals |
| **Pathway** | Soil |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health: Soil that contain substance such as heavy metals which may be toxic to human can pass those substances on to human through crop uptake leading to unsafe foods.<br>Possible risks to animals: when farm animals consume the plant grown from contaminated soil it affected the health of animal<br>Possible risk to flora: Soil pollution may after plant metabolism and reduce crop yield, also the trees and plants that absorb the soil contaminants enter into the food chain |

**Bioaccumulation in Biota**: Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the land and minimizing the exposure of organisms to contaminated environments.

**Table 6.15 Risk Assessment - Bioaccumulation in Biota**

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate and heavy metals |
| **Pathway** | Air, water, and soil |
| **Receptor** | Human, Animals, flora, and fauna |
| **Risk** | Possible risks to human health, animal flora and fauna<br>Accumulated of contaminants in plants and animals indirectly through food chain affects human health |

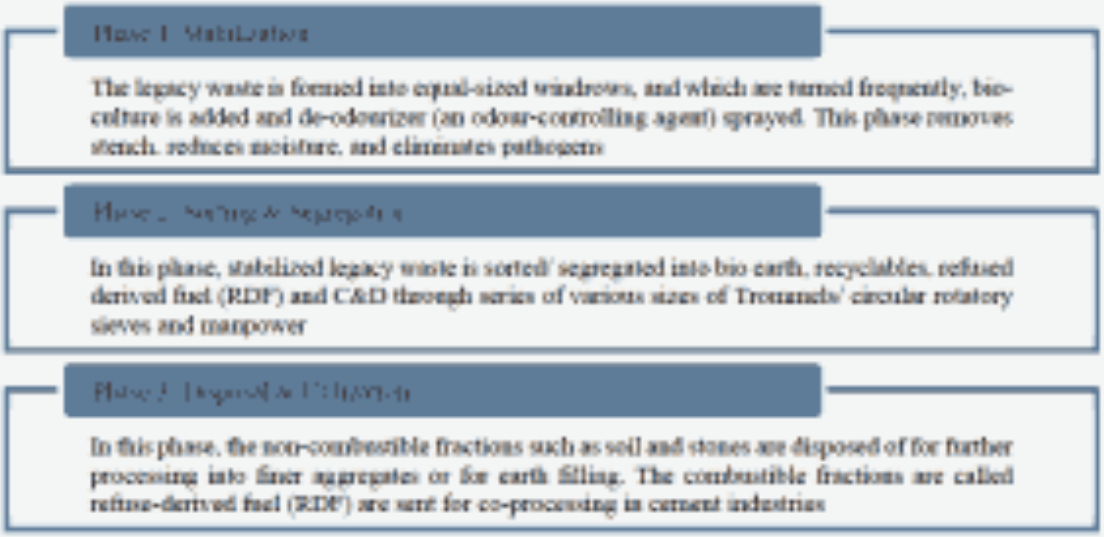
## 7.0. Evaluation of Remediation Techniques

Reclamation of existing unmanaged municipal waste dumpsites is becoming a key requirement for ULB's in India as unscientific and unplanned methods of waste disposal in non-engineered landfills have led to lot of environmental issues including soil and ground water contamination, uncontrolled landfill gas emissions into the atmosphere and exposure to disease vectors and scavengers. The Hon'ble NGT seized with these problems across the country has ordered that the respective authorities to remedy this at the earliest.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

Remediation of waste dumpsite is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

- Environment Enhancement - reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.
- Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
- Land - Dumpsite land becomes available for utilizing same for the establishment of other Waste Management Facilities.
- Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels.



For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- Baseline study of heavy metals; subsurface soils and water; rainfall; soil type; surface hydrology; topography; wind direction etc. Shall be studied prior to bioremediation.
- Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows:

## 7.1 Bio-Mining – Reclamation/Recovery of Land 100%

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc for the end use of the recovered fractions.

| | |
|---|---|
| Salient Features | • 100% land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>• Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>• Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>• Compliance to SWM Rules and NGT orders.<br>• Improvement in aesthetics and quality of life & health. |
| Applicability | • The ownership is well defined.<br>• Working space is available in the dumpsite.<br>• Linkage for utilization by-products is available |

## 7.2 Capping Without Land Recovery

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the cappped legacy waste.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas post monitoring period.<br>• Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years.<br>• Capped area needs to be inspected periodically for settlement due to physical, chemical, and biological transformation, leachate generation, erosion and naturally occurring invasion by deep-rooted vegetation.<br>• Recurring expenditure will be incurred for regular maintenance. On July 17, 2019 the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio- mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>• SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | • Simple & robust, least expensive method among various available technologies |

## 7.3 Capping with Partial Land Recovery

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can be linked to relevant buyers and the inert material will be capped over lower footprints, with well-designed slopes to prevent further degradation of the environment.

The top layer of capped material may also be provided with gas collection wells and pipes to trap the methane and the collected gasses are typically passed through an oxidation layer of passive venting or flared. If the gas quantity is substantial then, power generation may be a possibility. The capped area should have drains to collect the surface water flow as well as any leachate that may be generated. Such leachate is collected and treated in leachate treatment plants.

The reclaimed land may be covered with loamy soil that has plants with high transpiration rates. The plants do not permit the ingress of water into the soil thereby reducing the possibility of leachate generation. The plants and soil microbes also behave as oxidation layer. The soil is compacted and maintained with gentle slopes with 1:3. Contour drains may be provided to divert the water away from the soil thereby preventing ponding of water. The reclaimed land may be covered with solar panels to generate renewable energy during the period of observation following the post closure.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>• Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>• Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |
| Applicability | • Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>• Lack of linkage for disposal of inert<br>• Recovery land for public use is not a priority |

## 7.4 Selection of Remediation Option

Selection of the applicable method/type or technique is based on the factors like salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land 100% & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for 100% land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Moreover, as per Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping.

However, after the bioremediation, the municipality wants to use the land for setting up of Material Collection Facility and Resource Recovery Facility. Hence backfilling of the site with bio-earth and inert is planned.

For the execution of dumpsite bio-mining two strategies can be adopted.

- *In-situ biomining*: Here the biomining is carried out within the premises of the dumpsite after clearing the waste and reaching the original ground level or in level with the land

adjoining the dumpsite. The advantage is that only the finished products are moved out of the premises, inerts may be used for gradation and filling up low lying areas within the site, or in a newly developed sanitary landfill. This is quite economical when legacy waste quantities are significant. The possibility of gaseous emissions, noise and odor and formation of leachate exist as the processing takes place at the site. The location would remain affected for the time till all waste are processed.

- *Ex Situ biomining:* In small dumpsites, or where the area is a constraint, the entire waste is excavated and taken away to an alternate location for processing. The work in the dumpsite can be completed quickly and the disturbance due to the excavation can be minimized. The cost of transportation of the whole waste adds to the cost of bio-mining. But since the process plant can serve multiple locations, economies of scale may be achieved and may also compensate for the added transport cost.

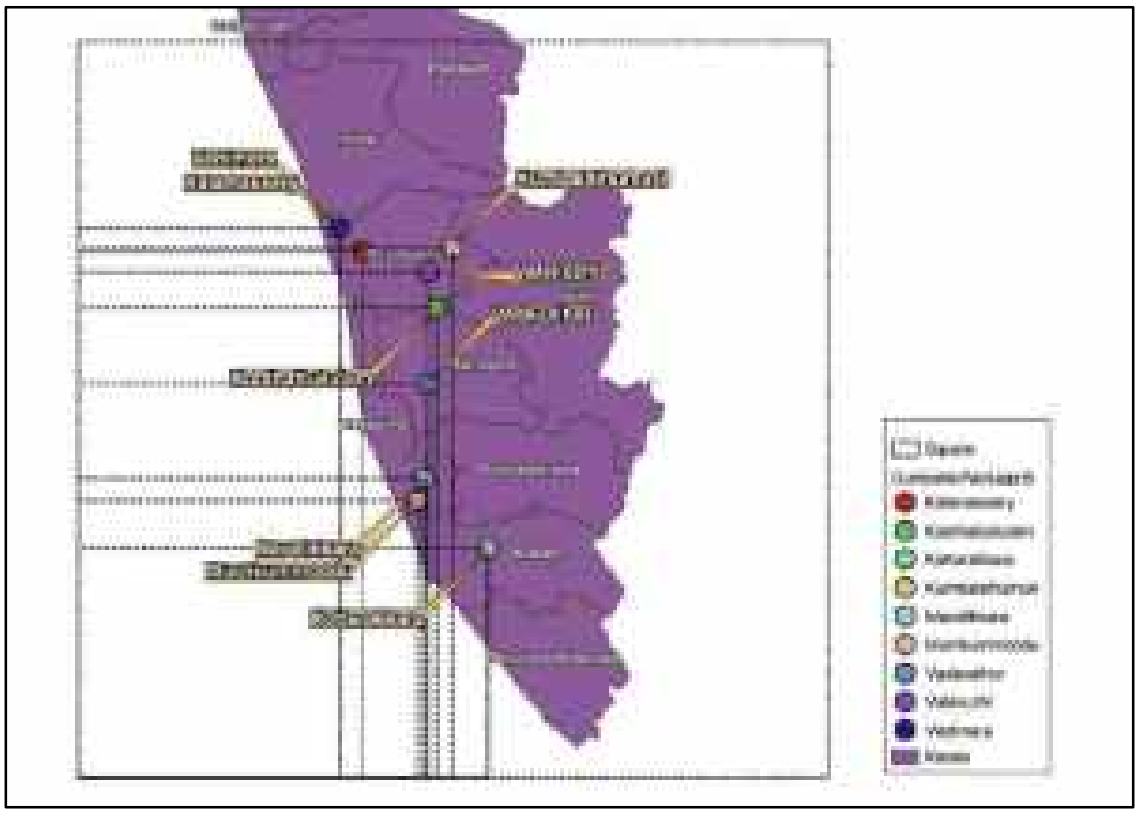


**Figure 7.1 Location of Other Dumpsites nearby**

## 8.0 Technical Description of the Selected Option

### 8.1 Methodology

The legacy waste dumpsite reclamation through bio-mining with recovery of land 100% involves

Phase 1: stabilization

Phase 2: sorting & segregation

Phase 3: disposal & utilization

Phase 4: Back filling of boulders and inerts

## 8.2 Selection of Machineries

The type of machinery, capacity, and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/ by-products/ recovered material.

The type of machinery available for the bio mining are as follows:

- Stationary screening machinery and
- Mobile/compact machinery

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen, and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process
- Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation

***Structure***: The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity

***Screening Mechanism***: The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

***Separation System***: Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

***Treatment Process***: In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

***Transport***: Quick and easy folding of conveyor helps in quick setup time.

***Discharge height***: Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land 100%) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, stationary trammel machine shall be the optimum screening machinery

## 8.3 System Requirements

The following are the infrastructural facilities required for setting up of machineries and equipment in biomining of a dumpsite. These are required irrespective of the option of in-situ or ex-situ processing.

- Fencing and secure entrance gate
- Security and reception office
- Weighing bridge
- Records room
- Laboratory
- Medical room
- Workers' area
- Parking for vehicles (heavy earth equipment, trucks, etc.) with tire washing facility.
- Administrative building
- Fire control unit (detailed methodology for fire management plan)
- Toilet–bath complex, with personnel protection equipment (PPE) storage room)
- Overhead water tank
- Leachate collection and treatment unit
- Environmental monitoring unit
- Segregation and processing area
- Temporary storage area for rejects, domestic hazardous waste and sanitary waste
- Material storage area
- Waste drying and windrow area.
- DG set

The total area required is about 900 sqm in an in-situ bio mining plant. The process shed needs to be a covered building. Temporary construction power at 440V needs to be obtained from KSEB. This can be easily availed as there is an existing electrical infrastructure passing through the site. A 440V, 125KVA needs to be established for the project. Water storage tanks needs to be provided for the duration of the project. The water may be supplied by tankers. Labour will reside in Kothamangalam and commute daily to the site, hence no labour sheds are envisaged during this project. The requirements are only indicative, and the contractor is

required to propose own design and capacity to complete the works in the stipulated time and standards.

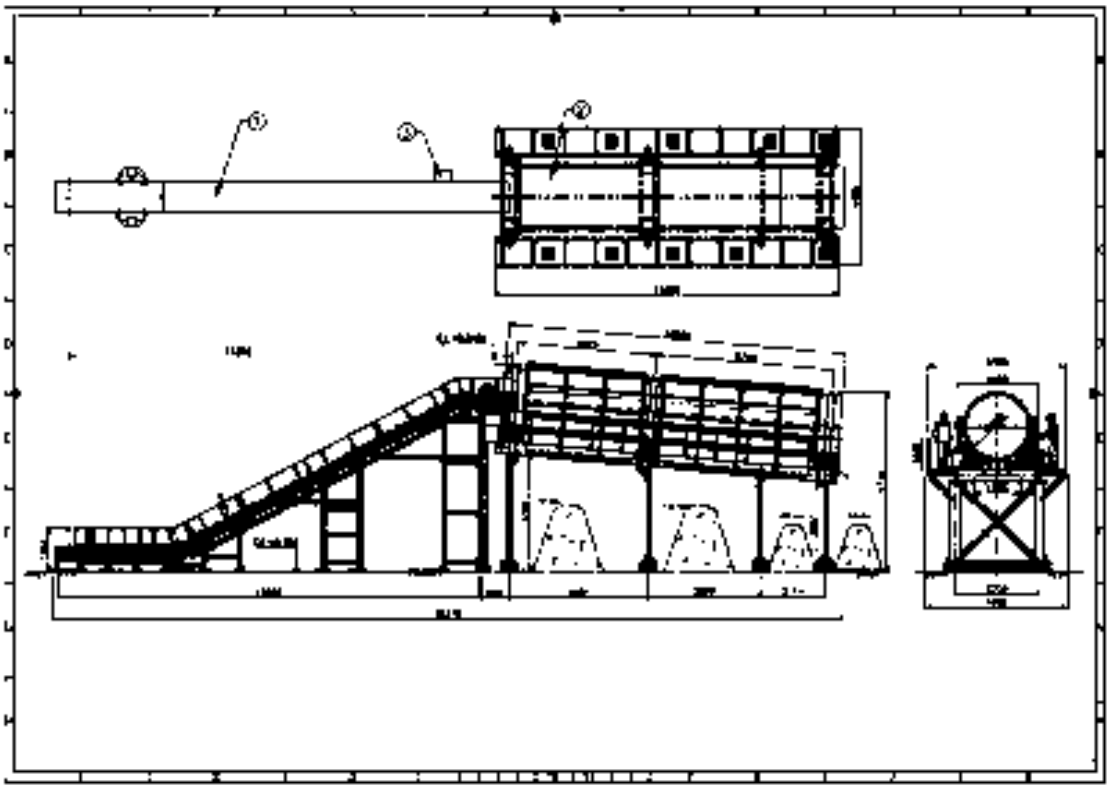

**Figure 8.1 Schematic of the Segregation System**

## 8.4 Site Reclamation Requirement

As detailed under section 6 the Kothamangalam Dumpsite have waste spread of Approx. 2.13 acres of land with a max of waste dump height 2.5 m from the ground level. Estimated volume of waste above the ground level is: 21,295 cum which will be around 22,999 MT by taking density as 1.089 T/cum

*(Source: Topographical survey result for the Kothamangalam Dumpsite conducted in the year 2022 by ULB)*

In the borehole investigation it was asserted that the depth of waste column below ground level is 3 m and the quantity of waste below ground level is estimated 8620 Cum as detailed under section 6.

*(Source: Borehole investigation survey conducted by KSWMP through Matter Labs for the Kothamangalam Dumpsite on June 2023)*

Since the ULB intends to use the land recovered after bioremediation, backfilling of the boulders and inert material obtained after the bio-mining is inevitable.

## 9.0 Scope of Disposal including Location of Disposal for RDF, Bio Soils, C & D Waste, And Others as Per Local Demands

### 9.1 Utilization of By Products

The details of the utilization of aggregates/by–products screened out by processing of the stabilized legacy waste are provided in the table below.

**Table 9.1 By Product Composition**

| By-products | Percentage Composition | Quantity (Cum) | Utilization/Linkage/Usage |
|---|---|---|---|
| RDF | 14.94 | 4,469.50 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. |
| Recyclable | 0.27 | 81.97 | Recyclables will be sold to authorized recyclers. |
| Inert | 48.39 | 14,474.47 | Can be utilized for filling at the site itself. |
| Compost cum Soil Enricher | 36.60 | 10,948.89 | Can be used as a soil enricher and given to farmers. The same cannot be sold as fertilizer unless it is enriched with carbon content to meet the standards suggested by FCO for city compost. |

The **Table 9.1** details the expected recovered items in line with the investigation results present. However, during the execution stage, the bidder is required to analyse each recovered fraction at least every 15 days and report submitted to the concerned authority. It is to be noted that the RFB document should cover necessary clause in this regard.

Based on the chemical analysis the waste material has less than 4.7% total carbon as compared to the 12% suggested by the Fertiliser Control Order (FCO). The screened compost materials having size less than 4 mm shall be heaped to form windrows, the compost should be enriched to the FCO standards and its amendments from time to time. The materials shall be tested for carbon content and NPK values during execution of works, the materials may be sold to farmers depending on the test outcomes. If the compost materials are not meeting with the standards, the same shall be used as bio-earth/ soil enricher for refilling within site itself.

Inert is coarse fraction (10mm to -35mm) received from the landfill mining of MSW. It is comprising stones, construction debris, ceramics, some decomposed organic matter. This is helpful in backfilling in the site or can be used as a subgrade material for highways, low land filling. It can also be used as cover for landfills.

RDF / SCF consists largely of combustible components of such wastes, as non-recyclable plastics (not including PVC), paper cardboard, cotton, labels, and other corrugative materials. These fractions are separated by different processing steps, such as screening, air classification, ballistic separation, separation of ferrous and non-ferrous materials, glass, stones and other foreign materials and sometimes shredding into a uniform size, in order to produce a

homogenous material which can be used as substitute for fossil fuels in e.g. cement plants, lime plants, coal fired power plants or as reduction agent in steel furnaces. The calorific value of the RDF should be higher than 1500kcal/kg for co-processing.

The RDF fraction from the site, once dried and shredded can be compacted and carried for disposal to RDF / SCF power plants or cement factories which can use this material in their kiln for burning if it meets the specification for SC/RDF.

The nearest cement industry that can accept the RDF / SCF from Kothamangalam City is located near Trichy, Tamil Nadu at a of 355 kms from the Dumpsite site. The other sites are at Karnataka between 740 km to 1074 km, while cements plants at Andhra are at 740 km to 900 kms.

**Table 9.2 Distance to potential RDF / SCF users**

| Name of the cement plant | Location | State | Distance from Kochi (KM) |
|---|---|---|---|
| Dalmia Bharath | Ariyalur | Tamilnadu | 458 |
| Dalmia Bharath | Dalmiapuram | Tamilnadu | 355 |
| ACC | Wadi | Karnataka | 1,075 |
| Chettinad | Karikazhi | Tamilnadu | 315 |
| Chettinad | Kallur | Tamilnadu | 386 |
| Dalmia Bharath | Belagavi | Karnataka | 956 |
| JK Cement | Muddapur | Karnataka | 965 |
| Dalmia Bharath | Kadapa | Karnataka | 739 |
| Bharathi VICAT | Kalburgi | Karnataka | 1,074 |
| JSW | Kurnool | Andhra Pradesh | 901 |
| Bharathi VICAT | Kadapa | Andhra Pradesh | 739 |
| Ultratech | Tadiparri | Andhra Pradesh | 815 |
| Zuari | Yerraguntla | Andhra Pradesh | 877 |

## 10.0 Estimated Project Cost

The details of the estimated cost for bio-mining the legacy waste dumpsite is provided in the table below:

**Table 10.1 Details of Estimated Project Cost**

| Sl. No. | Activity | Rate/ m3 | Quantity (m3) | Amount (INR) | Details |
|---|---|---|---|---|---|
| 1 | **Bio-mining Operations** | | | | |
| a | Processing the Waste | [redacted] | | [redacted] | Rate adopted from Calculation from Suchitwa Mission (DSR 2018 including baling) |
| 2 | **Disposal Cost** | | | | |
| a | Disposal of RDF | [redacted] | [redacted] | [redacted] | The average distance to cement factories works out to be 400 km. [redacted] |

| Sl. No. | Activity | Rate/ m3 | Quantity (m3) | Amount (INR) | Details |
|---|---|---|---|---|---|
| b | Disposal of Compost/ Soil enricher | [redacted] | [redacted] | [redacted] | Considering the disposal cost of [redacted] (market rate) |

| | Contractors Profit and Overheads at 15% | | | [redacted] | |
| | Net Cost | | | [redacted] | |
| | Grand Total (considering avg cost index of 1.35 based on DSR 2018) | | | [redacted] | |
| | Cost per m3 | | | [redacted] | |

*Note: It is to be noted that the total quantity of the waste is assessed based on the investigation test results and variation in the quantity of the same is expected during the execution stage. Hence RFB should include sufficient clauses to incorporate this expected quantity variation under the rate quoted by the contractor.*

### 10.1 Revenue from the Project

The anticipated sources of revenue from the processing of the legacy waste dumpsite are by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at free cost and transportation cost to be borne by the ULB/ contractor.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable.
- Paucity of time and limited storage space.

### 10.2 Funding for Project

The estimated cost of INR [redacted] for the project Dumpsite Remediation of legacy waste at Kothamangalam. The sources and funding pattern is given below:

**Table 10.2 Sources of funds in Crores**

| Sl no | Item wise funding pattern | | | |
|---|---|---|---|---|
| | Item | External (70%) (INR) | State Govt.(30%) (INR) | Total Cost (INR) |
| 1 | Dumpsite remediation for the Kothamangalam | [redacted] | [redacted] | [redacted] |

## 11.0 Project Implementation Plan

Kothamangalam Municipality intends to complete this project as early as possible. However, considering the time required for mobilisation, installation, sieving and handling recoverable etc, a time frame of about 06 months is considered.

### 11.1 Timeline

The broad timeline for the execution of this project is given below:

**Table 11.1 Project Timeline**

| TIMELINE CHART FOR EXECUTION | | | | | | | |
|---|---|---|---|---|---|---|---|
| S. No | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries, Hiring & Installation of Machineries, Electrical Works | ■ | ■ | ■ | ■ | ■ | ■ |
| 3 | Excavation of Legacy Waste | | ■ | ■ | ■ | | |
| 4 | Site Development for Windrows & Leachate Collection | | | ■ | ■ | ■ | ■ |
| 5 | Windrow Formation & Spraying of Bio culture | | | | ■ | ■ | ■ |
| 6 | Sieving Operations | | | | | ■ | ■ |

| 8 | Project Closure Activities:<br>Levelling of Reclaimed Land using Bio-soil<br>Handover the available infrastructure at site to the ULB<br>Closure Report Submission to ULB. | | | | | | ■ |

## 11.2 Contract Model

***Execution Method:***

Design, Build, Operate and disposal/Management of by-products/aggregates with -zero residues and 100% land recovery. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

***Working Model***

- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for setting up the facility to the Contractor.
- Electricity connection to be under contractor's scope.
- Electricity charges for the usage of the plant to be paid by contractor
- ULB may facilitate the disposal/Utilization of By-products and contractor is responsibility for disposal of RDF, recyclables, and aggregates.

*Note: The authority has put stringent selection criteria and it is expected that the onboarded contractor has sufficient experience and qualified technically to avoid contract failure. The client will have a proactive contract management and monitoring system in place to address any potential issues for successful completion of the contract*

## 12.0 Benefits of the Project

The project benefits of dumpsite remediation at Kothamangalam are:

- Reclamation of Land: An area of 2.6 acres will be reclaimed which can be used for resetting SWM facilities of ULB or any other use deemed fit by the ULB.
- Environmental Protection: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By clearing up contaminated site, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity
- Health Improvement: Remediation projects reduce pollution risks, leading to improved public health outcomes and a reduction in water borne and airborne diseases.
- Enhanced Water Quality: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to the safe water.
- Aesthetic and Social Benefits: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents.
- Operational & Life cycle Aspects - Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through bio-mining process.

## 13. Conclusion

- The activities of the bio-mining will require 5-6 months. An area of 2.6 acres will be reclaimed and will be used for setting up other solid waste management facilities/ or any other use deemed fit by the ULB in future.
- The land will be reclaimed and recovered through the biomining process, and this will done by ensuring environmental and social safeguards.
- For the optimum screening of the 29,915 m3 of legacy waste, mobile / compact screening machinery shall be used.
- Favourable site conditions for bio-mining:
    - Optimum width of the road is available for movement of the vehicles.
    - Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
    - Piped water supply and a storage of water tank 5000 liters are available at the dumpsite.
- The project activity requires "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, CPCB 2018 guidelines for legacy waste management, NGT orders, KSPCB norms, World Bank guidelines and KSWMP ESMF and other regulatory rules & norms Environmental & Social safeguards:
    - The project attracts E2 Environmental category based on the project activities and status of the environment baseline.
    - Site specific Environmental Assessment and Environmental Management Plan has been developed.
    - The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is Rs [redacted].

# Annexures

| | |

| Annexure 1 | Topographical Survey Report |
| Annexure 2 | Geotechnical Survey Report |
| Annexure 3 | Waste Characterization Report |
| Annexure 4 | Waste and Environmental Baseline Assessment Report |
| Annexure 5 | Site Plan |
| Annexure 6 | Site Operation Plan |
| Annexure 7 | Environmental & Social Impact Assessment Report |

## SUBMITTED

A detailed contour mapping survey of the dump site located at Kumbalathumury in Ward No-06 of Kothamangalam Municipality was conducted to quantify the legacy waste deposited over years.

The survey was carried out using total station (make-Leica) for precise details. The total voumne of legacy waste is calculated by using the software tool **G Survey CAD**. The total volume of the legacy dump is found to be **21295.462 cubic metres** which is spread over in an area of 8620 square metres. For the survey and qunatification purpose, the entire area was divided into eight different plots and the volumes of each plot was assessed individually.

The detailed drawing, contour map and quantity calculations are enclosed herewith.

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Kumbhalathumuri, Kothamangalam, Ernakulam district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 23rd May 2023. During the site visit, it was observed that the dumpsite is situated on an elevated terrain (a small hill) without any inhabitants around the dumpsite. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 06th June 2023 and was completed on 09th June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

## 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along with Mr. Ajit Kumar Nayan and Mr. Ravi Kumar of IPE Global during the fourth week of May 2023, in order to collect the information regarding the site prior to mobilizing the equipment for drilling.

The location of the dumpsite is situated on an small hill without any inhabitants around the dumpsite.

**Figure 1** : Location of the borehole drilled at the dumpsite.

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and cleaning out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste in the landfill.

### 4.2 Drilling equipment

Mechanical rotary drilling machine was used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Extraction of Cores:**

The core samples were extracted from the core barrels in a manner to prevent disturbances to the core. All the pieces of cores were sequentially numbered from top to bottom. Arrows indicating the lower end of the piece are marked on each core. Rock classification in terms of weathering and state of fractures and strength is carried out in the following manner. Tabulations given in below explain it briefly.

**Table 1: Rock Classification**

| Terms | Description | Grade |
|---|---|---|
| Fresh | No visible sign of rock material weathering; perhaps slight discoloration on Minor discontinuity surfaces. | I |
| Slightly Weathered | Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discoloured by weathering. | II |
| Moderately Weathered | Less than half of the rock material is decomposed or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as core stones. | III |
| Highly Weathered | More than half of the rock material is decomposed or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as core stones | IV |
| Disintegrated Rock | All rock material is decomposed and / or disintegrated to soil. The original mass structure is still largely intact. | V |
| Residual Soil | All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported. | VI |

-As per IS 4464-1985 (Reaffirmed 2004)

It should be understood that all grades of weathering may not be seen in a given rock mass and that in some cases a particular grade may be present to a very small extent. Distribution of the various weathering grades of rock material in the rock mass may be related to the porosity of the rock material and the presence of open discontinuities of all types in the rock mass.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log the commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing are presented in **Appendix II**.

**Table 1: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |
|---|---|---|---|
| 1 | Soil | Grain-Size Analysis | IS: 2720(Part-4)-1985 |

**Figure 2** : Laboratory tests performed at MatterLab.

## 6 SUMMARY

The geotechnical investigation of the original ground below the waste at the dumpsite at Kumbhalathumuri, Kothamangalam, Ernakulam district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a

single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 8.30m (3.00 in waste and 5.3m in the ground). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples.

It was observed from the laboratory results and samples obtained from SPT and the undisturbed samples collected, that the ground encountered below the dumped waste was a 1.5m thick sandy clay layer, followed by a 1.0m thick layer of residual soil which is underlain by a 0.8m thick weathered rock followed by a highly weathered strong biotite gneiss with an average core recovery of 20% for the depth of cutting of 2.0m. As per the information provided by the client, the waste in the dumpsite needs to be excavated, segregated using a few machinery and the inert material left after the bio-mining needs to be dumped within the site. As informed by the client, during the process of bio-mining the waste would be excavated from one feasible location of the site and transferred to another location of the site. During these operations, any temporary storage waste in the form of heaps should be carried out ensuring the stability of the sloping face of the waste. It is suggested that for slopes with height ≤ 1.5 m the angle of face should not be steeper than 45°. For slopes of height greater than 1.5 m the slope should be limited to 30° to horizontal or flatter. It is not advisable to use slope heights > 5 m without a proper stability analysis. If the inert material is being disposed at the site with no further plans of transporting it or transferring it, it is recommended to compact the material into layers using an 8-10 T roller with compacted lift thickness not exceeding 300 mm. It is important to perform stability analysis for different stages of excavation by including the operations of machines during the process of excavation, as the dumpsite is situated on a hilly terrain. It is suggested to do a geological survey to have a complete understanding of the subsurface profile of the dumpsite.

**The Safe Bearing Capacity (SBC)** is calculated as per IS 6403:1981 (Reaffirmed 2021). For any temporary structures planned at the site, the **recommended allowable bearing pressure** for isolated footings at a minimum depth of 1.0 m below **original ground level** is **150 kPa.** For any slope stability calculations involving the natural ground, the parameters presented in the summary sheet of laboratory results can be used.

The above recommendations are made based on the subsoil profile and laboratory test results obtained on the samples collected from the site. If there is any variation in soil profile during execution, fresh recommendation may be obtained from M/s Matter Material Testing & Research Laboratory (P) Ltd. or from a qualified and experienced geotechnical engineer.

**Contour Map – Kothamangalam Dumpsite**

**Proposed Operation Plan**

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the contractor to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

# Part B

## Social Impact Assessment

## KOTHAMANGALAM DUMPSITE

DISTRICT - ERNAKULAM ULB - KOTHAMANGALAM

# Contents

1. Introduction ..... 3

2. Kothamangalam Municipality- Brief Profile ..... 3

3. Profile of Kothamangalam Dumpsite ..... 4

4. Socio economic baseline of Host community ..... 4

4.1 Vulnerability mapping of Host community ..... 4

5. Data Collection Tools ..... 4

5.1 Social Screening ..... 4

The social screening has been conducted with social screening checklist as per the requirement of ESMF. And it is observed that there is only the risk associated with labour are envisaged. There are no other adverse social impacts on dwellings, land, labour, livelihood, community resources of host and other vulnerable communities. The assessment of social screening indicates that the dumpsite remediation can create a positive impact in the living conditions of the host community. ..... 4

5.2 Transect walk ..... 5

5.3 Site specific Observations from Transect walk and social screening ..... 5

5.4 Focus Group Discussion ..... 5

6. Stakeholder Analysis ..... 5

7. Positive social impacts after remediation ..... 6

## 1. Introduction

The goal of the sustainable approach for dump site remediation is to carry out the process in a way that reduces adverse impact on human and environment. So, it is very important to consider social safeguard aspects during dump site remediation with a key focus on meaningful engagement with stakeholders, comprehension of stakeholders' risk perceptions, and the restoration of sites to a safe and environmentally sustainable condition. This report provides an update about the remediation of the dump site in Kothamangalam Municipality based on the findings from the social screening and transect walk. The report addresses the current situation at the dumpsite, potential social impacts due to the implementation of the project, recent fire incidents, remediation efforts, the quantity of legacy waste, the dumpsite's location within the solid waste management facility, and the complaints received from nearby communities.

## 2. Kothamangalam Municipality- Brief Profile

Kothamangalam is a Municipality in the eastern part of Ernakulum district in the Indian state of Kerala. It is around 14 km northeast of the town of Muvattupuzha and 55 km northeast of Kochi city. The town is in the foothills of the Western Ghats Mountain ranges. The highway NH-49 Ernakulum – Madurai – Rameswaram passes through Kothamangalam. The town serves as the headquarters of a taluk and a municipality of the same name.

**Table 1 Socio Economic Profile**

| SOCIO ECONOMIC PROFILE DATA | |
|---|---|
| District Name | Ernakulum |
| Sub District Name | Kothamangalam |
| Town Name | Kothamangalam |
| Total Households | 10389 |
| Total Population of Town | 42012 |
| Total Male Population of Town | 20812 |
| Total Female Population of Town | 21200 |
| Total Scheduled Castes Population of Town | 2283 |
| Total Scheduled Castes Male Population of Town | 1118 |
| Total Scheduled Castes Female Population of Town | 1165 |
| Total Scheduled Tribes Population of Town | 34 |
| Total Scheduled Tribes Male Population of Town | 18 |
| Total Scheduled Tribes Female Population of Town | 16 |

## 3. Profile of Kothamangalam Dumpsite

Kothamangalam dumpsite is located at 6.0 km from the center of Kothamangalam town in western side and encompasses a total area of approximately 2.6 acres of land, out of this 2.13 acres of land is covered with solid waste. The geographical coordinates of the dumpsite are 10.078930° N & 76.647811° E. It is in ward no. 6 of the municipality. Kothamangalam municipality holds the ownership of the dumpsite.

Dumping was started approximately 30 years back and stopped in 2019. Currently, the quantity of waste dumped at this site is about 21,295 Cu.m above the surface level as per the topographic survey, and 8620 cu.m below the surface as per geotechnical survey. The legacy waste is presented about 3.0 m below and 2.5 m above the ground level respectively. Hence bioremediation of the dumpsite is essential to mitigate the environmental and social impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues

## 4. Socio economic baseline of Host community

It is identified that there is only one family residing within 200m distance from this dump site. Shops or any institutions are also not there near to the site. 6 migrant labours are working in the MCF and RRF employed by the agency ASM Enterprises. 12 sanitation workers (10 women and 2 men) are employed in the windrow compost unit at site.

### 4.1 Vulnerability mapping of Host community

The site is far from habitation. So, it will not affect any vulnerable communities. There is no risk with respect to the social and economic conditions of the host communities.

## 5. Data Collection Tools

### 5.1 Social Screening

The social screening has been conducted with social screening checklist as per the requirement of ESMF. And it is observed that there is only the risk associated with labour are envisaged. There are no other adverse social impacts on dwellings, land, labour, livelihood, community resources of host and other vulnerable communities. The assessment of social screening indicates that the dumpsite remediation can create a positive impact in the living conditions of the host community.

As per the social screening, it is identified that there is no need of land acquisition/transfer or purchase for the project implementation. The dumpsite has enough road access thus there will not be any disruption to the public for any type of transportation. There are no scheduled tribes, rag pickers and other vulnerable communities living near the dumpsite. Since there is not much risk with respect to the social and economic conditions of the host communities, the dumpsite can be categorized into “Moderate Risk”.

### 5.2 Transect walk

A transect walk was conducted around the dumpsite on 06/06/2023. The aim of the transect walk was to assess the site and gather information about its location, potential social risks, existing infrastructure, and the impact on surrounding communities. The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions, and systems by observing, asking, listening, looking, and producing a transect diagram. Information collected can be used to reveal land use practices, hazards, and vulnerabilities to inform disaster mitigation and water management.

### 5.3 Site specific Observations from Transect walk and social screening

- Dumpsite is located more than 200 meters from the habitation/settlements as there is only one family residing within 200m aerial distance.
- 6 migrant labourers of ASM Enterprises are working there in the MCF and 12 sanitation workers of Municipality are engaged in Windrow composting unit. The dumpsite remediation works may not affect their livelihood during the remediation period as there is no need to shift these facilities during the implementation period.
- During the transect walk, it was observed that there are no rag pickers associated with the dumpsite. Therefore, there are no livelihood risks for rag pickers in this context.
- The total scheduled tribal population in the ULB is 34, but there are no scheduled tribes staying near the dumpsite,
- There are no households affected by the proposed project activity, including non-titleholders or squatters.

### 5.4 Focus Group Discussion

One Preliminary FGD was conducted dated on 1-11-2023 in the Municipal Hall with the residents living near to the dumpsite. Concerned social and Communication experts from TSC, DPMC, and DPMU along with dumpsite remediation expert participated. Communication expert from TSC presented the detailed activities that are going to be done as part of remediation. In the discussion that followed, people shared their concerns. Concerned expert cleared the doubts and all the anticipatory risks and precautionary measures we are planning explained.

## 6. Stakeholder Analysis

The remediation process requires collaboration of the following stakeholders.

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| **Service Providers** | | |
| 1 | ULB Council | Providing ground support for the process |
| 2 | Govt institutions like PCB, KSEB, KWA, Fire station, Police station, Thaluk Hospital etc | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | DPMU | Monitoring and Evaluation |
| 5 | TSC/PMC | Technical support and consultation |
| 6 | Contractor | Execution of the Remediation process |
| 7 | 48 HKS workers and 22 sanitation workers of the Municipality | Proper collection and waste segregation to prevent further dumping after remediation |
| **Affected Community** | | |
| 1 | 12 sanitation workers employed in windrow composting unit. | Attending in orientation programs about the remediation process, comply with health and safety measures and deliver support and cooperation to the remediation process |
| 2 | 6 migrant labours engaged in MCF and RRF deputed by the agency ASM Enterprises. | Attending in orientation programs about the remediation process, comply with health and safety measures and deliver support and cooperation to the remediation process |
| 3 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |

Table 2 Stakeholder Details

## 7. Positive social impacts after remediation

### a) Enhanced quality of life

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing in the ward, the

project can contribute to an improved sense of well-being. Also, it results to a clean and hygienic work environment for the workers engaged in MCF and RRF.

**b) Livelihood and employment of vulnerable community**

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

**c) Economic opportunities**

After remediating the site, the Municipality is planning to enhance the capacity of the MCF and RRF to process more non-biodegradable waste and to set up some more centralized waste management units here to process the bio-degradable waste. These projects will create more job opportunities to the people who are looking for employment in waste management sector.

**d) Access to service**

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the exiting site.

**e) Land availability**

2.6 acres of land is available in the in the existing dumpsite, which is owned by the Municipality, so there is no need of land acquisition/transfer or purchase. Dumpsite remediation will create acres of vacant land which can be effectively useful for other purposes of ULB especially for the waste management. Recovered land can be converted to Transfer Station for the temporary storage of the inert waste. The cleaned-up land can potentially be used for new construction, commercial development, or recreational activities. The property value after the remediation will be very high.

## 8. Expected site-specific social impacts/risks

6 migrant labourers of ASM Enterprises are working there in MCF. 12 sanitation workers of the ULB are also employed in windrow composting unit. Proper safety measures need to be adopted to make them safe during the remediation work.

## 9. Suggestions/recommendations

- A project-level grievance redressal mechanism will be established at ULB level to receive and facilitate resolution of the stakeholder's concerns and grievances. Necessary information boards shall be installed at site about the GRM.
- Awareness shall be given to the HKS, Sanitation workers and ULB council members about the remediation process.
- Protective gears shall be provided to all the employees engaged in MCF and Windrow compost unit.
- The public access towards the dumpsite should be restricted during the execution of the project.

- Prior information shall be given to the nearby Police station, Fire station and Thaluk hospital about the process for the immediate

## 10. Scoping of Social Impact Assessment and required Action plans

All the social risks were identified through the social screening and Transect walk conducted at site. Considering the social impact assessment, certain action plans have been formulated to be followed at site

- **Labour Management Plan**

Maximum of 15 labours are expected to be engaged in remediation process at a time. A detailed labour Management plan has been prepared and attached as Annexure.

- **Labour Influx Management Plan**

Only one family is residing near the site. So, there will not be much impact to the community due to the labour influx. But considering the service providers employed at site, a Labour Influx Management plan has been prepared and attached as Annexure.

- **Preventive GBV Action plan**

Considering the labours at site, a detailed GBV action plan has been prepared and attached as Annexure.

- **Citizen Engagement Plan**

A detailed citizen engagement plan has been prepared considering the service providers employed at site and attached as Annexure.

As per the detailed assessment of potential social risk during the remediation process, the identification from social screening with screening checklist, transect walk and focus group discussion indicates that there will not be any impacts on the livelihood of the community and service providers including rag pickers and land acquisition is not required as sufficient land is available.

## 11. Conclusion

The Social Screening and Transect Walk helped to analyze and identify the potential social impacts on host community related to the remediation of the dump site. There will not be any adverse social impacts on any valuable community, tribes, dwellings, land and community resources of host communities. The availability of land and the moderate social risk associated with the implementation of dumpsite remediation activities are positive factors for the success of the project.

# CITIZEN ENGAGEMENT PLAN

## 1. Brief introduction about the project

Dumpsite is an open piece of land where all kinds of waste are being dumped for long- long years back. Dumpsites mainly emit gas and contaminated water as well as wind-blown litter and dust. Through dumpsite remediation these negative impacts on health would be addressed finally; this may be defined as a process by which disposed wastes in an existing dumpsite are excavated and either reused or disposed of in a scientific manner. However, during the execution there are some potential health hazards for the people who would be directly engaged in the remediation work. The site used to receive untreated unorganized mixed waste stream, there is a possibility of biomedical and hazardous items within the accumulated waste in the dumping ground.

Along with the health hazards some social impacts are there. There is no land issue; within 200 meters from the site there is only 1house. As no rag picker's livelihood depends upon this dumpsite so their livelihood would not be at stake due to the remediation work and there is no tribal population resident in the nearby location of the dumpsite.

## 2. Stakeholder identification

***2.1 Waste Generators:*** The nearby community, viz., resident, commercial establishments, different institutions are the waste generators.

**2.2 Service Providers:** The service provider may be considered a primary and secondary. Primary service providers are the HKS workers, where the secondary service providers are the all concerned staff including the ward councilors, office bearers of the concerned municipality.

**2.3 Agency Workers for Remediation Work:** For this particular project the agency workers will play the most crucial role so basic orientation of the project along with some other awareness programs like GBV, OHS etc. are very pertinent here.

## 3. Socio-economic profile of the community

Kothamangalam is a Municipality in the eastern part of Ernakulum district in the Indian state of Kerala. It is around 14 km northeast of the town of Muvattupuzha and 55 km northeast of Kochi city. The town is in the foothills of the Western Ghats Mountain ranges. The highway NH-49 Ernakulum – Madurai – Rameswaram passes through Kothamangalam

It is identified that there is only one family residing within 200m distance from this dump site. Shops or any institutions are also not there near to the site. 6 migrant labours are working in the MCF and RRF employed by the agency ASM Enterprises. 12 sanitation workers (10 women and 2 men) are employed in the windrow compost unit at site.

## 4. Vulnerability data of host community:

The site is far from habitation. So, it will not affect any vulnerable communities. There is no risk with respect to the social and economic conditions of the host communities

## 5. Need of the plan

The management of municipal solid waste is one of the main functions of all Urban Local Bodies (ULBs) in the country. All ULBs are required to meticulously plan, implement and monitor all systems of urban service delivery especially that of municipal solid waste. As per the 74th Constitution Amendment Act, the SWM Rules, 2016 and the State Municipal Laws, ULBs are primarily responsible for the provision of municipal solid waste management services which includes the following initiatives regarding dumpsite:

Ø stop land filling or dumping of mixed waste soon after the timeline as specified in rule 23 for setting up and operationalization of sanitary landfill is over.

Ø investigate and analyze all old open dumpsites and existing operational dumpsites for their potential of bio- mining and bioremediation and where so ever feasible take necessary actions to bio-mine or bio-remediate the sites.

## 6. Objective of the plan

- To reduce pollution effects
- To protect groundwater sources
- To reduce the health hazards of the workers engaged in the existing MCF
- To improve the aesthetic ambience of the locality
- To improve workers friendly environment for those engaged in the MCF& RRF located in the same site

## 7. Stakeholder concerns

**7.1 Waste Generators**: The waste generators will comply with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future; not only that their cooperation during the remediation work is highly expected.

**7.2 Service Providers**: Officers and the council members are responsible for tendering, finalization and deputing contractor/agency for remediation & arranging alternative livelihood of the HKS workers engaged in the MCF, RRF functional in the same compound and monitoring the day to day project activities. HKS workers, and the other staff engaged directly to collect the waste from the doorstep of the waste generator expected to collect and segregate the waste properly to prevent further dumping after remediation

### 7.3 Agency Workers for Remediation Work

All the labors, drivers, supervisors, security staff of the contractor/ agency engaged in the remediation work directly are the main player of the to make it successful. They will play the most

crucial role in remediation work and not only that during the execution they may be primary contact person of the neighborhood community.

## 8. Public disclosure

Project-related information shall be disclosed through a public consultation and making relevant documents available in public locations. The project agencies and associated line departments shall provide relevant safeguards information promptly, in an accessible place, and the manner and language understandable to affected persons and other stakeholders. For illiterate people, other suitable communication methods will be used.

The following documents shall be made available at the offices of municipality, Bus stand, Local Police Station, Project site and other public places for public reference and shall also be uploaded on respective websites.

(i) Summary of project (in English and local language - Malayalam)

(ii) Draft ESMF Report (in English; translated summary in Malayalam)

(iii) Environmental monitoring reports

(iv) Grievance addressing measures

## 9. Activities proposed

### 9.1 Community/citizen Awareness

Before remediation work community / citizen awareness regarding the whole process of remediation work is the precondition for smooth execution of the project. Informed community is always the power bank of the proper and time bound execution of any community based development work. During the execution of the process regular interaction with the host community is also required.

### 9.2 Awareness to Service providers

All primary and secondary service providers should come under awareness activity under the remediation work; the mode of communication may vary depending upon their status of primary or secondary, but the total process of the remediation work should be imparted. They should be intimated regarding the benefit of the activity and their important role in this concern.

### 9.3 Awareness to the Workers

All the labors, drivers, supervisors, security workers of the agency who would be awarded for the work should be aware about the project and their responsibility, the community, issues concerned with GBV, OHS, basic labor laws. They should also be aware about the important services like fire, police and health facilities for emergency situations.

## 10. Citizen Engagement Plan Matrix

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Awareness on project activities - bio mining | Proper awareness will be created. | Exposure visit | Contractor |
| 2 | Awareness boards. | Proper awareness will be created. | Installation of boards and signage's. | Contractor |
| 3 | Health and safety education. | Do's and Don'ts will be cleared. | Orientation session. | Contractor |
| 4 | Traffic management | Schedules are to be finalized. | Planning meeting. | Contractor |

## 11. Budget

| S. No | | Specification | Quantity | Cost |
|---|---|---|---|---|
| 1 | Awareness on project activities - bio mining | 1. Training to SWM workers at site, and family residing nearby | 1 No's | [redacted] |
| 3 | Health and safety education. | SWM Workers at site, Sub contract labors | 1 No's | [redacted] |
| | **Total** | | | [redacted] |

# LABOUR MANAGEMENT PLAN

## 1. INTRODUCTION

### 1.1 PROJECT TITLE:

Project for the remediation of dumpsite at ward 6 owned by Kothamangalam Municipality

### 1.2 PROJECT AREA

The Dumpsite of Kothamangalam Municipality is situated in ward 6 of the municipality, covering an area of 2.6 acres.

## 2. SCOPE AND STRUCTURE OF THE LABOUR MANAGEMENT PLAN

The scope of the LMP shall be as outlined in the World Bank's ESMF. The engagement will be planned as an integral part of the project's social assessment and project design and implementation. This document has 10 chapters. This chapter viz., chapter 1 served as introduction. Scope and structure of LMP is provided in chapter 2. An overview of labour use in the project is presented in chapter 3. Key potential labour risks are listed in chapter 4. Legislative framework governing labour employment in India/Kerala is discussed in chapter 5. Implementation Arrangements, policies and procedures follow in the subsequent chapter. Grievance redressal mechanism, contractor management are presented in the last chapters.

## 3. OVERVIEW OF LABOUR USE ON THE PROJECT

### 3.1 Details of Labors

The proposed remediation process requires following category and number labors

| Sl.No | Equipment | Category of labors | Required No.of labors |
|---|---|---|---|
| 1 | trammel | Labors for waste segregated purpose | 5 |
| 2 | One excavator | Operator | 1 |
| 3 | One JCB | Operator | 1 |
| 4 | Two small tippers | drivers | 2 |
| | | Helpers | 2 |
| 5 | | Supervisor | 1 |
| **Total Labours** | | | **12** |

# 4. ASSESSMENT OF KEY POTENTIAL LABOUR RISKS

## 4.1 Project Activities:

The bioremediation of the dumpsite includes the following activities;

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement
- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

## 4.2 Key Labour Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.
- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female

SWM workers are engaged.

- Absence or inadequate or in accessible emergency response system for rescue of labor/workforce.
- Health risks of labor relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form workers organizations, etc.
- Absence of a grievance redressal mechanism for labor to seek redressal of their grievances/issues.

## 5. BRIEF OVERVIEW OF LABOUR LEGISLATION: TERMS AND CONDITIONS

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |

| | | |
|---|---|---|
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |

| | | |
|---|---|---|
| 10. | Industrial Disputes Act 1947: | The Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

## 6. RESPONSIBILITY MAPPING

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring laborers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labor laws in the state of Kerala while employing laborers, ensuring compliance with all applicable welfare measures mandated by the relevant labor legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the laborers. The ULB will actively monitor the contractor's compliance with legal and welfare requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

## 8. CODE OF CONDUCT

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured;

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favors or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)
- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favors, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

## 9. SYSTEMATIZING THE CODE OF CONDUCT

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

## 10. TRANSPARENCY IN CONTRACT SPECIFIC TERMS AND CONDITIONS

All contracts must contain

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism

**LABOUR MANAGEMENT PLAN MATRIX**

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |

| | | | | |
|---|---|---|---|---|
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on.<br><br>To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local | One notice board<br><br>One notice board | As soon as the work is started.<br><br>Do | Photographs of the notice board where the license is displayed.<br><br>do | Contractor |

| | | | | |
|---|---|---|---|---|
| labour inspector and his/ her office and emergency contact numbers. | | | | |
| To conduct pre-employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |

| | | | | |
|---|---|---|---|---|
| in the box is mentioned in this document) | | | | |
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the construction period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance | | As and when the work starts | Copy of registers. | Contractor |

| | | | | |
|---|---|---|---|---|
| Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | | | |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. Female members should be minimum 50%. ) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |

| | | | | |
|---|---|---|---|---|
| 2. The Employee compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act<br>5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity Benefit Act<br>☑ | | | | |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| Conduct HIV/AIDS awareness programs | As per requirement | Once in six months | Reports, photographs etc | Contractor |

| | | | | |
|---|---|---|---|---|
| All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of licence ids to be collected | PIU |
| All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only after procurement of third-party insurance to the vehicle | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

# PREVENTIVE GBV ACTION PLAN

## 1. Sub project information

Bio Remediation of existing dumpsite in ward 6 of Kothamangalam Municipality

### 1.1 Details of labors

The project is under pre planning stage. ULB has to finalize contactor/Agency for Remediation. So the exact number of Labors are not available. But approximately we can expect maximum of 12 labors

| | |
|---|---|
| Total number of labors | : 12 (Approx.) |
| Category of labors (Age/sex/gender) | : Not available |
| Data of migrant labors, if any | : Not available |

## 2. GBV Issues likely to be identified at site

1. Issues against female workers at site
2. Lack of safe and Gender friendly toilets at work sites
3. Disparity in work and wages based on gender

## 3. Activities under GBV Action plan

1. **Formation of Internal Complaints Committee**

   The committee should be Presided by a senior women and more than half of the total Committee members should be women. There should be an external member who has experience in dealing with issues related to women. Preferably a Social Worker /Advocate/NGO Representative.

2. **Placing of ICC informatory boards at Work site**

| Insert Logos of KSWMP,WB,AIIB | | | |

| **Project Name (KERALA SOLID WASTE MANAGEMENT PROJECT)** | | | |
| **Sub Project Name:** | | | |
| **Internal Complaints Committee** | | | |
| Sl.No | Name | Designation | Contact Number |
| | | | |
| | | | |
| | | | |
| **EMERGENCY CONTACT NUMBER** | | | |

3. **Gender Sensitization trainings for Labors**

Based on an earlier bio remediation process conducted at this site, Project expect around 12 labours will be employed in a day and women participation in the labor force is limited, even the project is taking precaution to protect and prevent any GBV incidence at the site. Taking into consideration all these aspects, the project plan to conduct a half day sensitization program in the following subjects, viz. the type of GBV, the action to be taken by the victim, the laws and the support organizations which extend support to the victim of GVB and the role of ICC and their contact details etc.

4. **Allocation of Gender friendly and safe toilet facilities for women**

Project has taken special care to arrange a separate toilet, wash and rest facility for female workers to protect their privacy and safety, and the same must be arranged by the contractor.

5. **Keeping of wage register at site to restrict wage disparity based on gender**

The project actively opposes gender-based wage disparity at any site funded under the KSWMP-supported SWM project. To ensure gender parity in various aspects such as wages, division of labor, and facilities, an appropriate monitoring mechanism, such as a wage register, should be maintained for the scrutiny of the project implementers.

6. **Details of GBV Service Providers identified**
The government of Kerala has constituted a help desk under Kudumbashree to support or to prevent and extend support to the GBV victims, and their details are given below.

Kudumbashree Snehitha Gender Help Desk

Contact Number – 0484-2428745

Toll free number - 180042555678

## Preventive GBV Implementation plan Matrix

| Sl No | Activity | Timeline | Primary Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Formation of Internal complaint committee | Pre-Construction Phase. | ULB/Contractor | TSC |
| 2 | Placing of ICC informatory Board at worksite | Pre-Construction Phase. | Contractor | TSC |
| 3 | Gender sensitization Training to labors | During Construction | Contractor | TSC |
| 4 | Ensuring Gender friendly and safe toilet facilities | Construction stage | Contractor | TSC |
| 5 | Keeping Wage Register at site | Construction stage | Contractor | TSC |

# Summary

Kottarakkara, a Semi Urban Local Body (ULB) in Kollam District, with a total area of 17.67 Sq.kms divided into 29 administrative wards, has a total population of 30055 as per 2011 census. Ugrankunnu dumpsite operation was started in the year 1994. The dumpsite, at Ward no.26 is located at a distance of 3Km from Muncipal Office, Kottarakkara. Dumping of waste at Ugrankunnu was continued till 2018 and due to public protest, it was stopped. Originally the site had an area of 0.24 hectares (60 cents), an additional land of 0.4046 hectares (1 acre) adjacent to it was acquired and now the area is about 0.15 hectares (37.66 cents).

"Legacy Waste" refers to aged municipal solid waste in landfills or dumpsites. It is a mix of partially or completely decomposed biodegradable waste, plastics, cloths, metals, glass and other such discarded items. Legacy waste of Ugrankunnu is almost 30 years old. Bio Mining is proposed for the remediation of the site. Land area proposed to be remediated is 0.15 ha (37.66 cents). Total quantity of legacy waste calculated on the basis of Total Station Survey was 8591 tonnes. Bio mining process will begin by excavating the legacy waste, followed by Windrow formation and stabilization of it. Once the waste gets stabilized it will go through trommel and then will be sieved to various fractions such as bio-earth, inerts, rejects, recyclables and RDF. The project envisages the reuse of recovered products. RDF will be transported to cement factories for co processing. Inert/ soil will be disposed at approved locations and recyclables will be sent to authorized recyclers.

Project duration estimated as five months. Sieving & sorting plant, machinery and other infrastructure are required to be set up. It is expected that the time for mobilisation, and installation of machinery would be concurrent. Transportation of materials are concurrent. The design considers three months of sieving/baling operations with mobilisation and setting up of plant within 30 days of commencement of contract. Based on this, an average of 100 to 120 tonnes per day to be excavated.

Plant and machineries to be set up at site are: Back hoe loader (2 nos.), excavators (with 8-10 cu m/hr,2 nos.), trucks of 10 cu m for internal transport (1nos.), trucks of 16 cu m capacity for carrying earth/RDF etc (4 nos), trucks of 10 cu m capacity for RDF (1), trucks of 10 cu m capacity (1), sieving machine of 60 to 80 TPD for inert/recyclable/glass (1) with dual trommel and baling machine of 50 T (1).The plant and machinery details are explained in detail in FR of dumpsite

Total manpower required for the project is 20 persons (staff and labourers). Out of 8591 tonnes of legacy waste, approximately 7803 tonnes of soil/bio-earth, 518 tonnes of RDF/ plastics, 109

tonnes of recyclables/glass along with an expected 2% inert/rejects which is approximately 160 tonnes may be available. Soil /bio earth and stones can be used for filling of land for playground, formation of medians in the ongoing highway, ring road projects, Vizhinjam port, or similar construction sites and also in low lying areas within the state. A part of earthen material approximately 20% can be used for filling the low-lying areas within the site. Another feasible option is to use as daily cover in sanitary landfill facilities. Stabilised organic manure recovered from the dumpsite after processing in Windrows Sieving.Value Addition and Packing is a viable option for utilisation in the nearby areas for agricultural purposes. Recyclables like glass and iron can be sent to recyclers within or outside the state.

Various available methods were studied to select the best remediation process. Based on baseline environmental assessment, stage of degradation of organic waste, absence of toxic contamination in the dumpsite as well as in the surrounding environment, biomining is found to be the viable method

In accordance with the SWM Rules of 2016, the selection of an appropriate method or technique for remediating a dumpsite should be determined through a feasibility study that consider technical, financial and Environmental aspects complying with regulatory requirements (KSPCB/NGT).The formulation of the subproject adhered to the State/National and World Bank safeguards policies, both in its planning phase and will continue to do so during the implementation and monitoring stages. This commitment to compliance will be upheld for a period of two years following the completion of the remediation activities.

As Ugrankunnu biomining project comes under KSWMP and its projects are funded by the World Bank, the present project should adhere to the safeguard policies like Environmental Assessment (OP/BP 4.01), Natural Habitats (OP/BP 4.04) and Pest Management (OP 4.09) of the Bank.

Preliminary environmental screening for the evaluation of the present condition of the dumpsite and it's surrounding, and also to assess the impact on the nearby sensitive receptors due to the project was conducted. Based on it, the present project falls under E2 category due to the very small extent of the dumpsite, absence of any sensitive environmental feature in or around the site, short biomining period, and the overall positive impacts of the proposed development post mitigation measures. A transect walk was also carried out to assess the socio-environmental characteristics in the surroundings of the site.

As part of the ESIA, a detailed environmental baseline study was carried out for analyzing quality of air, groundwater, surface water, noise levels and, leachate characteristics. Apart from

the primary data, secondary data such as rainfall, temperature, hydrology and land use pattern of the project area were analysed.Secendory data showed that the climate of the project area is mostly warm ,with temperatures ranging from 22°C - 32°C.Project area experiances heavy rainfall during the months of May to July and then from September to November in calendar year.The planning of major project activities should be in a timeline avoiding these heavy rainfall months.

Primary baseline studies have been conducted on major environmental parameters such as air, noise, water, soil and ambient air quality of the project area by collecting samples from two locations, one being the sensitive location. None of the analysed parameters exceeded the NAAQS at time of sampling. This shows that the dumpsite in the present condition does not create any type of air pollution in and around the vicinity. Ground water environment was studied by collecting ground water samples from one bore well within the RRF/MCF/dumpsite compound and three dug well samples from nearby houses. The results revealed that most of the ground water parameters were confirming with the drinking water standards, IS 10500: 2012. There are some minor variations in pH of GW1 sample. Turbidity exceeds in GW3 and GW4 samples. The biological analysis of GW1 and GW2 showed presence of coliform bacteria. These variations are not influenced by the dumpsite.

The ambient noise levels at project area were analysed by a noise survey at the front gate of the dumpsite. The results, while comparing with noise standards, show that at daytime the noise levels were within the prescribed limit. During night there is a slight increase of 5 dB. There is a mobile tower near the sampling station and there are chances of DG sets attached to the tower may affect the noise level while in operation.

Soil beneath and above the legacy waste was assessed and the results were compared with the standards specified in the SWM Rule 2016 for organic compost. It is found that the level of heavy metals was within the prescribed limits and hence the recovered soil can be used for the manufacture of organic compost.

Social risk factors of the project were assessed with a social screening checklist, personal interviews with key stake holders and site reconnaissance survey. The social exclusion criteria shows that socio economically weaker groups in the project area have to be invoved in the project. During the transect walk in and around the dumpsite area, it has been observed that the proposed project does not affect any community resources and will not cause any displacement, or loss of assets or resources

Environment impact/risk of the project has been assessed in a step-by-step process. Impacts associated to selected resources of concern, such as ground water, air and noise quality and biodiversity are identified and the significance of each impact was calculated based on its's extent, duration and intensity. The major impacts during, pre and post bio mining phase are identified and management measures are formulated for each of them.

Social impact on host communities/ vulnerable/ livelihood/labour laws/gender/health and safety risk/improper grievance redress mechanism/disruption of utilities was assessed. SIA was conducted in a seven-step process. Concerns of livelihood, gender equality, labour welfare etc. were individually assessed and management measures for each concern is detailed in the SIA section of the report.

Project specific environmental and social management plan is formulated, to ensure that the project is implemented as a sustainable and socially responsible one. A bio mining set up plan, as part of the environmental management plan, is given in Chapter 5. Major process in bio mining and management measures are illustrated in the plan.

The indicative, critical environmental and social attributes of environmental and social performance of the project should be periodically monitored and analyzed during the biomining and post bio mining phase of the project.The major Environmental parameters in concern such as Air,Water,noise and Ground Water will be monitored during the bio mining phase and site specific Environmental Monitoring Programme is forumated .The total budget proposed for Environmental monitoring, social monitoring and Environment Management is [redacted] which will be covered in the allocated ESMP budget. Through the dumpsite remediation the present environmental and social setting of the project area will be improved.

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-financing Framework agreement and as agreed Project Co-lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65% of the urban population (approximately 10 million people) spread across the 14 Districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and BMW management facilities.

## 1.2 Rationale of the proposed Sub project:

Ugrankunnu dumpsite has an area of 0.15 ha. the waste which is present at site is back from 1994. Untill 2018 the unscientific dumping continued and thereafter halted due to public protest. "Legacy waste" typically refers to aged municipal solid waste in landfills or dumpsites. Legacy waste is a mix of partially or completely decomposed biodegradable waste, plastic waste, textiles, metals, glass and other components. Total quantity of legacy waste calculated based on total Staion survey was 8591 t. The site is located between Lat: 9°05.18"N and Long: 76°45'33.09"E. The elevation of the Ugrankunnu dumpsite is 105 (m), gentle slope towards the South Eastern side and South Western section from the dumpsite.

The wastes are covered with a soil caping in Ugrankunnu dumpsite. This soil covering is not scientific and the legacy waste still exists there. Legacy waste may contaminate the soil and GW, cause air pollution, Habitat destruction etc. and also may affect the Aesthetic properties of the area.

***Figure 1.1: Legacy waste conditions on March 2023 and June 2023***

Above **Figure 1.1** shows the condition of the legacy waste in Ugrankunnu which are mixed with soil and vegetation. The vegetation cover acts as breeding gorund for many rodents, reptiles, dogs etc which can cause significant health effects to nearby inhabitants.

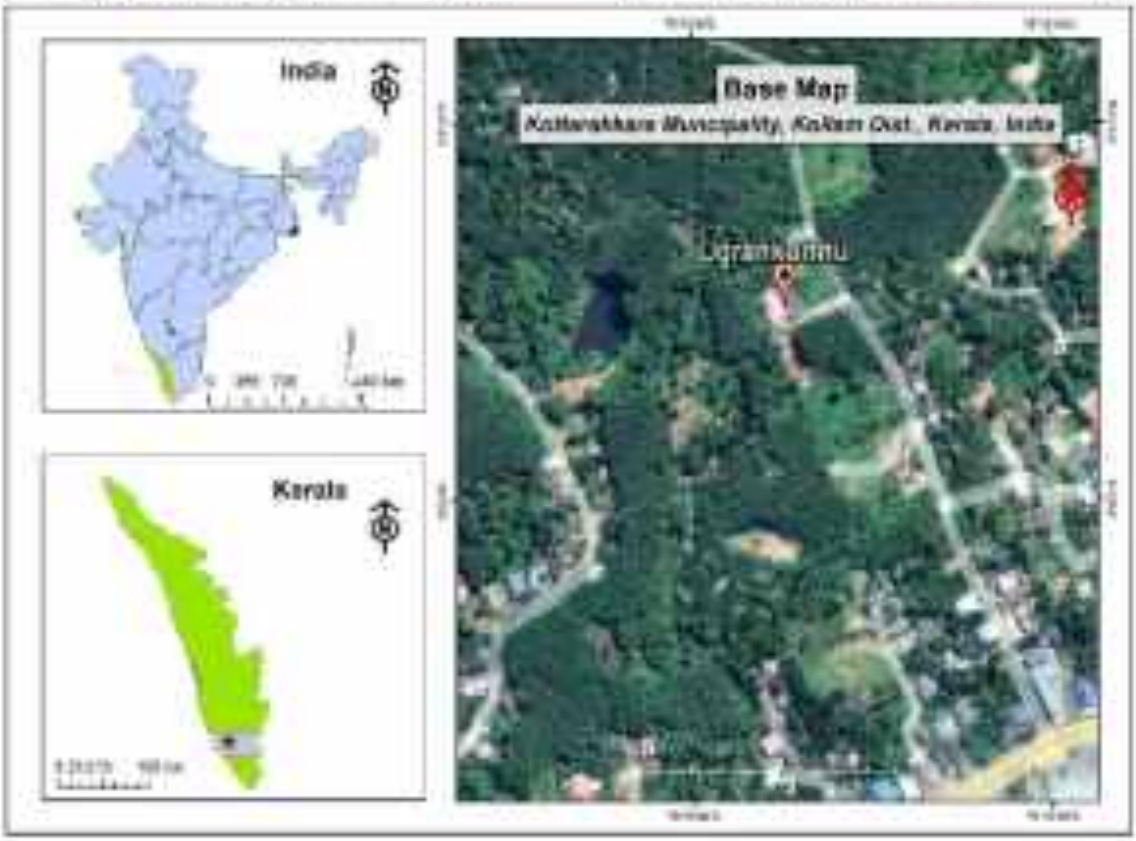
Kottarakkara ULB proposes biomining and bioremediation of the Ugrankunnu legacy waste dumpsite site under KSWMP supported by the World Bank and Feasibility Report has been prepared for this subproject. Considering the environmental and social impacts associated with legacy dumpsite biomining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Objective and Scope of ESIA

### 1.3.1 Environmental Categorisation and Assessment

As per indicative categorization for dumpsite biomining and bioremediation, this subproject is categorized as E1. In case of Ugrankunnu the overall extent of the dumpsite area is limited (0.15 ha).At present the dumpsite area is covered with unwanted vegetation above legacy waste and this vegetation cover acts breeding gorund for many rodents, reptiles, dogs etc.Thus the dumpsite area may cause serious health effects to nearby residents.Post bio mining the land area can be utilised by the ULB for any public benifiting project.Although there are sensitive receptors such as houses and one temple within 200m,through suggested management measures these receptors will be least affected by the project .Thus Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (0.15 ha) and absence of environmentally sensitive features around, this subproject is individually considered as E2, and EIA is prepared accordingly.

Process of Bioremediation commences after the site preparation. This cycle commences with the excavation of materials and ends with the disposal of recovered outputs.



### 1.3.2 Social Impact Assesment

Under this category social impact assessment is also a key factor to be considered. Accordingly, detailed assessment of the environmental and social impacts was carried out

## 1.4 Proposed Sub Project details

**Table 1.1 Sub-Project Details summarized**

| Sl No | Project description | Details | Units | Remarks |
|---|---|---|---|---|
| 1. | Name of the ULB | Kottarakkara | | |
| 2. | District | Kollam | | |
| 3. | Ward No. | 26.Railway Station Ward | | |
| 4. | GPS Co-ordinate of the Site | Latitude: 9°05.18"N, Longitude: 76°45'31.09"E | | |
| 5. | Total Land Area | 6070 | sq. m | Dump site is only 37.66 Cents out of 1 acre 50 cents total land |
| 6. | Disposal Site Used till | 2018 | Year | |
| 7. | Legacy Waste Disposed over | 1524 | sq. m. | |
| 8. | Legacy Waste Volume | 8249 | cum | |
| 9. | Quantity of Legacy waste | 8991 | Tonne | Density @1.042 T/m m |

### 1.4.1 Stages in Biomining

The proposed steps for executing biomining process,

**Source TSC Package A*

***Figure 1.4: Dumpsite location in Ugrankunnu, Kottarakara Muncipality***

## 1.5 Site Management Plan

Site Managemnt plan is developed as a proposed site setting of machineries which will be deployed during bio mining phase. The efficient and sustainable bio mining can be made possible with suggested management measures. The plan will be able to minimise the impacts to nearby receptors.

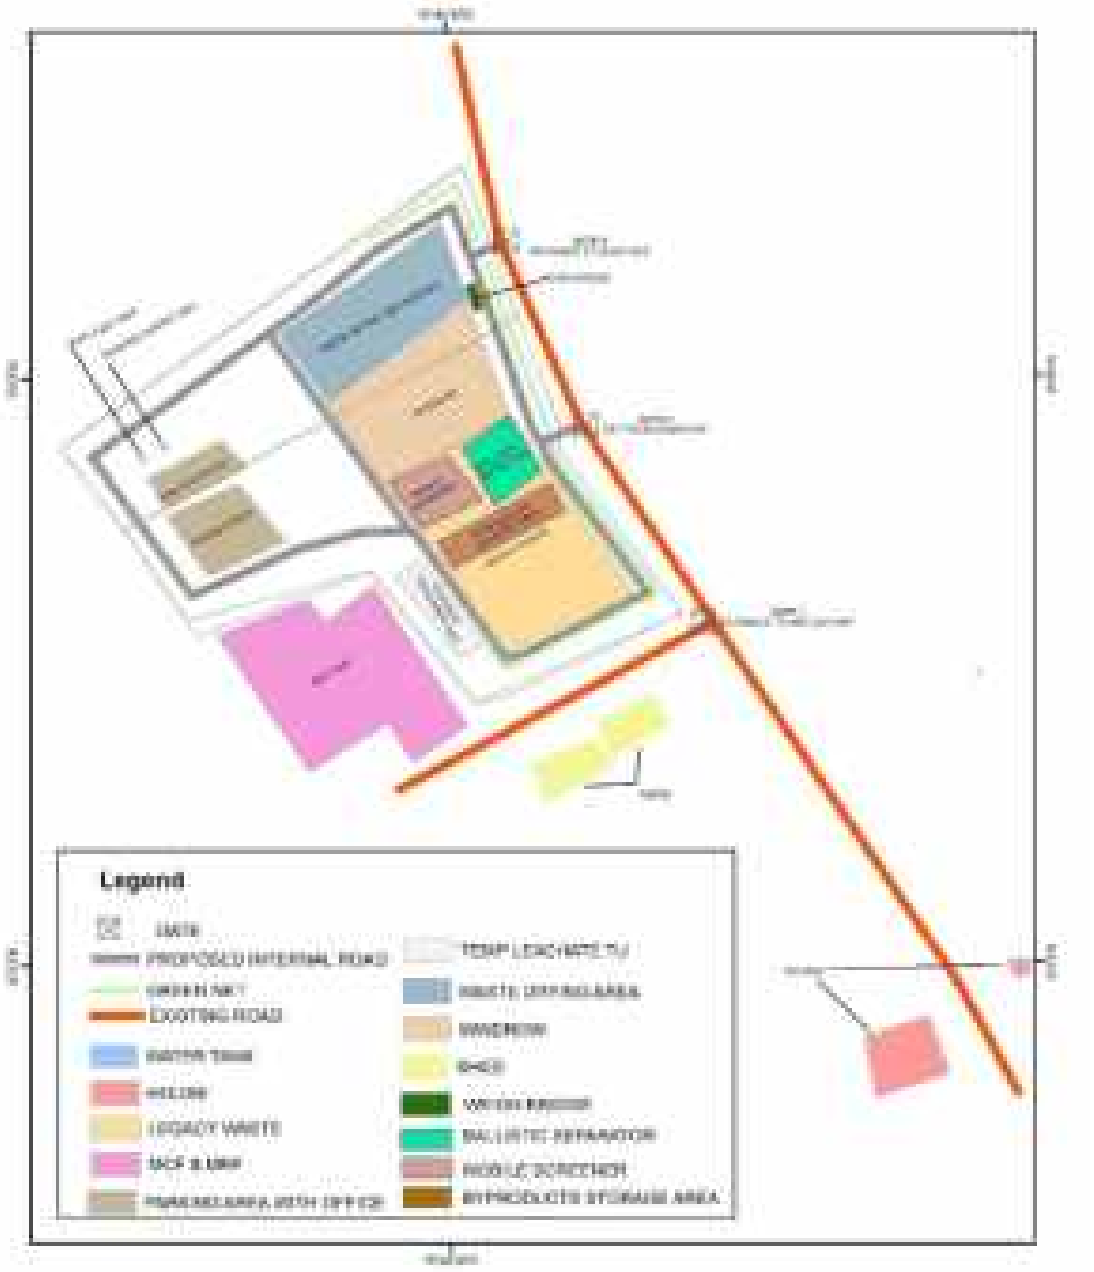

***Figure 1.5: Dumpsite location in Ugrankunnu, Kottarakara Muncipality***

## 1.6 Structure of the Report

The ESIA report contains project features, baseline environmental conditions, assessment of environmental impacts, and formulation of mitigation measures along with environmental management and monitoring plan.

The ESIA report for the Ugrankunu Dumspite will be comprising of 9 chapters. The chapters are as discussed below,

**Chapter 1: Introduction**

This chapter provides background information of the project proponent, need for the rapid ESIA study as per prevailing legislation, Location and brief description of the project, methodology adopted for ESIA study and structure of the report.

**Chapter 2: Policy and Regulatory Framework**

This chapter deals with the details of the potential legal, administrative, planning and policy framework which have been referred in the preparation of the ESIA Report.

**Chapter 3: Environmental and Social baseline**

This Chapter describes the baseline environmental conditions around the project site for various environmental attributes, viz. physical, biological and socio-economic, within the 200 m radial zone, which is termed as the study area. Topography, soil, water, meteorology, air, noise, and land constitute the physical environment, whereas flora and fauna constitute the biological environment. Demographic details and occupational pattern in the study area constitute socio-economic environment. Baseline environmental conditions are based on the information collected from the various agencies and the secondary data collected from published sources.

**Chapter 4: Analysis of Alternatives**

This chapter deals with systematic comparison of the proposed methodology used for remediation with other existing one's. There process and operational alternatives are compared in terms of their potential environmental impact.

**Chapter 5: Assessment of Environmental Impacts**

This chapter details the inferences drawn from the environmental & social impact assessment of the proposed project. It describes the overall impacts of the project activities and underscores the areas of concern, which need mitigation measures.

**Chapter 6: Environmental Management Plan**

This Chapter provides mitigation and control measures to attenuate and/or eliminate environmental impacts, which are likely to be caused by the proposed project. An Environmental Management Plan (EMP) has been developed to mitigate the potential adverse impacts and to strengthen the beneficial impacts. This chapter also provides the environmental monitoring plan proposed for the project.

**Chapter 7: Institutional Arrangements**

This chapter provides the information regarding Proposed Institutional Arrangement for Implementation of ESMP.The responsibility of the monitoring of ESMP, capacity building and grievence redressal mechanism will be discussed in this chapter

## Chapter 8: Public Consultation and Disclosure

This Chapter provides an insight into the process & methodology followed for carrying out the public consultation meetings in study area and proceedings of pubic consultations.

# 2

# POLICY AND REGULATORY FRAMEWORK CONSIDERATION

## 2.1 Introduction

A review of the existing legislations and institutions relevant to this project at the national and state levels are presented in this section. Since the project is funded under the IPF instrument of the World Bank, its Operational Policies (OPs) and Bank Procedures (BPs) are applicable for the project Regulations concerning procedures and requirements that may directly concern the project, the capacity of the concerned institutions and their ability to successfully implement the environmental management measures have been addressed.

## 2.2 Environmental Regulations of Government of India

The Indian constitution makes environmental protection an explicit duty for every citizen by the statement, "It shall be duty of every citizen of India to protect and improve the environment including forests, lakes, rivers, wild life, and to have compassion for living creatures." In addition, GoI has laid out various policy guidelines, acts and regulations pertaining to sustenance of environment and these have been presented in the following sections.

### 2.2.1 Applicable Environmental Legislation

As per the nature of the project, screening has been done as per intital Environmental Screening form of ESMF guidance manual.Additonal Screening form from Guidance document for assessment and remediation of contaminated sites in India by MoEF was also utilised for the current project .This helped in the identifications of the legislations applicable to the project. Legislations applicable to the project are given in **Table 2.1**

*Table 2.1: Summary of Environmental and Other Legislation with Applicability Screening*

| Name | Key Requirement | Applicability | Type of permit and stage of applicability | Administrative Authority | Responsibility |
|---|---|---|---|---|---|
| **Environmental Protection Legislations** | | | | | |
| G.O.(Rt)No.2629/2022/LSGD dated , 29-10-2022- Guidelines for implementation of projects for reclamation of legacy waste dumpsites through bio remediation (bio mining and management of recoverables and rejects) by State Government of Kerala | Comprehensive guidelines incorporating the various steps to be followed during the bio mining implementation | Applicable | Technical sanction for the project shall be issued by the concerned Engineer in LSGD (LID & EW) as per the existing financial powers and necessary reporting to the Chief Technical Examiner (Finance Wing) may be ensured for compliance as per norms | LSGD/SPCB | ULB /Contractor |
| NOC from Department of Kerala Fire and rescue Services | To follow SOP published by Department of Kerala Fire and rescue Services | Applicable.<br>Applicable due to windrow formation and waste segregation activities and operation of machineries | NOC | Kerala Fire and Rescue Services | ULB |
| Air (Prevention and Control of Pollution) Act, 1981, 1987 | An act to prevent and control Air pollution | Applicable.<br>The applicability is due to Emission from Operation of construction equipment like Trommels/Conveyors, DG sets, and similarly, during operation stage backup power generation, material handling related aspects | Consent to Establish & Consent to Operate | SPCB | ULB /Contractor |
| Water Prevention and Control of Pollution) Act, 1974, 1988 | An act to prevent and control water pollution. | Applicable. It is applicable for the projects having potential to generate effluent during any stage of the project. Effluents are | Consent to Establish & Consent to Operate | SPCB | ULB /Contractor |

| Name | Key Requirement | Applicability | Type of permit and stage of applicability | Administrative Authority | Responsibility |
|---|---|---|---|---|---|
| | | expected to be generated during biomining phase of the project as leachate | | | |
| Noise Pollution (Regulation and Control Act) 2000 and amendment till date | Ambient Noise Standards for different areas and zones | Applicable due to generation of noise during construction and operation stage | No permits issued under this act | SPCB | ULB /Contractor |
| Hazardous Wastes (Management Handling and Trans- boundary) Rules, 2008 | Protection to general public against improper handling storage and disposal of hazardous waste. The rules prescribe the management requirement of hazardous wastes from its generation to final disposal. | Applicable. Project has potential to generate hazardous waste (Waste Oil) during bio mining phase | Authorization for storage and handling hazardous waste | SPCB | Contractor shall obtain authorization for handling, storage and disposal of hazardous waste (Waste Oil) along with CTE/CTO under air and water act. |
| MSIHC Rules, 1989 | Usage and storage of hazardous material | Applicable only for storage of highly inflammable liquids like HSD/LPG | No specific permit is required. however precautions defined under the material safety datasheets shall be followed. Safety audit and other requirements shall have to be complied if storage quantity exceeds the threshold limit | Chief Controller of Explosives, MoEF&CC & DC | Contractor and ULB |
| The Batteries (Management and Handling) Rules 2001 | To regulate the disposal and recycling of lead acid batteries | Applicable for disposal of used led acid battery if likely to be used in any equipment during bio mining stage. | No specific registration required. Compulsion to buy and sale through | MoEF&CC | Contractor and ULB |

| Name | Key Requirement | Applicability | Type of permit and stage of applicability | Administrative Authority | Responsibility |
|---|---|---|---|---|---|
| | | | registered vendor only. | | |
| Building and Other Construction Workers (Regulation of Employment and conditions of Service) (Central Act) 1996, Kerala Building and Other Construction Workers Act, 1998 and Welfare Cess Rules | Health and Safety and environmental aspects associated with construction and allied works | Applicable | No specific permit is required. | Central and Kerala State Govt. | Contractor |
| Construction and Demolition Waste Management Rules 2016 | Proper management including segregation, collection, processing, and reuse of C&D waste | Applicable | strictly adhere to the Standard Operating Procedures of CPCB and KSPCB in handling and storage of C&D waste<br>Bulk generators shall enter into an agreement with authorized C&D waste management facility operators for the removal of the waste and shall strictly abide by the protocol for storage, collection, transportation and processing of C&D waste as per the directions and guidelines of PCB | Central and Kerala State Govt. | Contractor |

| Name | Key Requirement | Applicability | Type of permit and stage of applicability | Administrative Authority | Responsibility |
|---|---|---|---|---|---|
| E-Waste (Management) Rules, 2022 | To regulate the proper reuse of E waste | Applicable for disposal of any type of e waste observed from mined out legacy waste | To provide to registered E waste recyclers | SPCB | Contractor / ULB |
| The Kerala Municipality (amendment) Bill, 2023 | Waste management duties of ULB amended | Applicable | No specific permit is required | ULB | |
| The Bio Medical Waste (Management and Handling rules), 1998 | To control storage, transportation and disposal of Bio Medical Waste | Applicable for the disposal of bio-medical waste generated at site ,if any | No specific permit is required. Just comply with the handling and disposal requirements of the rule | Contractor/ULB | |
| **Safety and Other Related Legislations** | | | | | |
| Fire Prevention | To avoid accidental fires and explosion during bio mining phase | Applicable, as per fire and Safety protection rules | Permission from local Fire and rescue Dept. | Chief of Fire and Rescue Dept. | ULB |
| Petroleum Rules, 2002 | Use and Storage of Petroleum products | Applicable as storage of HSD/LPG or any other petroleum product may be required for the project purpose | License to store petroleum beyond prescribed quantity. | Chief Controller of Explosives/DC | Contractor / ULB |
| Central Motor Vehicle Act 1988 and amendment Central Motor Vehicle Rules, 1989 and amendments till date | To minimize the road accidents, penalizing the guilty, provision of compensation to victim and family and check vehicular air and noise pollution. | Applicable, for all the vehicles at site during construction & operation phase | No permit issued under this Act | Motor Vehicle Department (Licensing authority, registration authority & State Transport Authorities) | Contractor to follow Rules for all the construction vehicles being used at site during construction purpose. Contractor shall follow the rules for all its vehicles at site during operation phase and should also |

| Name | Key Requirement | Applicability | Type of permit and stage of applicability | Administrative Authority | Responsibility |
|---|---|---|---|---|---|
| | | | | | monitor that loading & unloading vehicles also comply with these rules |
| Kerala State Traffic Police | Traffic regulations | During traffic re routing | To take permission if rerouting of road traffic is suggested | Local Traffic Police Station | Contractor/ULB |

**Source: TSC Package A*

## 2.3 International Best Practices& Guidelines

### 2.3.1 Operational Policies of World Bank

The project is being developed with the financial aid from World Bank. World Bank operational policies triggered for this project are listed in **Table 2.2.**

*Table 2.2: World Banks Operational Policies – Environmental & Social Safeguard*

| Name | Key Requirement | Applicability | Remarks |
|---|---|---|---|
| OP 4.01 Environmental Assessment | Ensures sustainability and environmental feasibility ofthe project. Projects are classified into A, B & C category depending on the nature and extent of the impact. | Triggers | Project classified asCategory E2 consideringnature of activities and impacts |
| OP 4.04 Natural habitats | Ensures conservation ofnatural habitats anddiscourages disturbance to any natural habitat due toproject development byrecommending adoption ofalternative method/route/approach oradopting managementmeasures | Not Triggers | Applicable for projectslocated in close vicinity to eco-sensitive zones likewildlife sanctuary, wetlandsunder Ramsar convention, national parks bird sanctuary, turtle breeding grounds etc. |
| OP 4.36 Forests | Ensures that project activities does not disturbs/interfere with theforest, forest dwelleractivities, fauna and flora ofthe forest. Prevents and discourages deforestationand impacts on rights of forest dependent people | Not Triggers | Neither diversion of forest land is involved nor any tree cutting is anticipated.However, tree cutting may be involved for access road. Permission will be required for felling any tree from forest department. |
| OP 4.12 Involuntary Resettlement | Ensures minimal involuntary resettlement by considering feasible alternatives project design, assisting displaced people to improve their former living standard | Not Triggers | Pvt. Land proposed to be acquired for facilitating biomining activity is unhabitated |
| OP 4.09 Pest Management | Objective of the Policy is to minimize and manage the environmental and health risks associated with pesticide use and promote and support safe, effective, and environmentally sound pest management | Not Triggers | The project does not involve any usage of Pesticides |
| OP 4.11 Physical Cultural Resources | Ensures preservation of property of cultural and religious importance, heritage and property of natural importance and enhancement of cultural properties | Triggers | Nearby Ugrankunnu Bagavathi temple exists. |

# 3

# ENVIRONMENTAL BASELINE

## 3.1 Project location & Area of influence

The dumpsite is located at Ugranikunnu (9°0'4.68"N 76°45'33.73"E), a hillock in Kottarakkara Municipal area, and about 3 km away from the Municipal Head Quarters. It was a burial ground, with an area of 0.24 hectares and before converting it to a waste processing area, an additional land of 0.4046 hectares adjacent to it was acquired.

For the present study ,200m area around the dumpsite was considered as area of influence and baseline studies was conducted covering this 200 m radius from centere of the dumpsite. **Figure 3.1** shows the boundary of the facility and 200 m area of influence. The air, water, noise and soil samples within 200m radii showed that there is no significant contamination at present and hence further samplings are not carried out above 200 m radii. The sensitive receptors were also covered in the sampling area. **Table 3.1** shows the immediate sensitive receptors near to dumpsite.

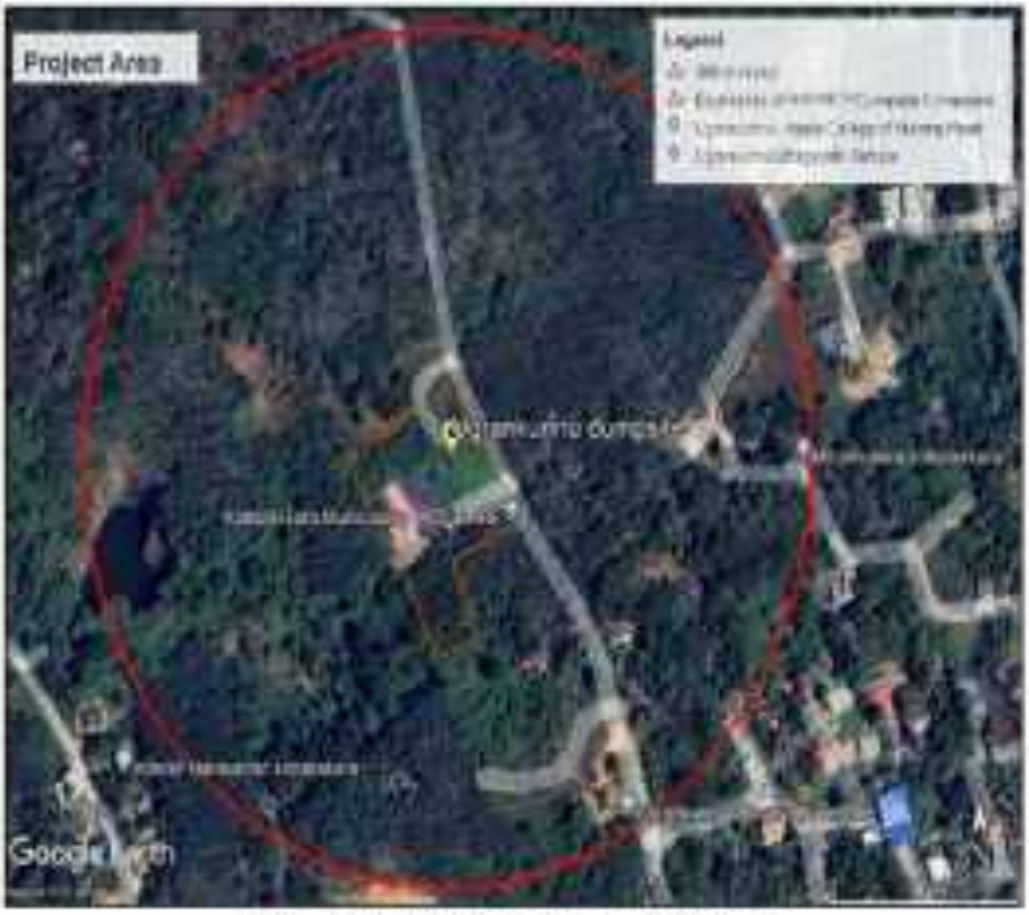

*Figure 3.1: Project area and area of influence*

*Source: TSC Package A

*Table 3.1: Details of sensitive receptors near to dumpsite*

| S. No | Sensitive Receptors | Distance |
|---|---|---|
| 1 | Residential buildings | Nearest house located at a distance of 90m from the entrance of dumpsite area in Eastern direction. |
| 2 | Educational institutions | Vijaya college of Nursing, located at Northern side with a distance of 435 m |
| 3 | Religious Places | Ugranikunnu Devi temple located at Southern Side with a distance of 150 m |
| 4 | Nearest waterbodies | One unused quarry, with a pond exists around 165m aerial distance from site in Western direction. But the water is not used for any purpose by nearby residents as no access to enter to waterbody. |

*Source: TSC Package A

## 3.2 Methodology for Environmental Baseline studies

A Baseline Study in EIA process refers to a comprehensive assessment of an area's existing environmental conditions and characteristics that may be potentially affected by a proposed project. The relevance of the Baseline Study in EIA process cannot be overstated. It provides essential information that guides decision-making on the proposed project, ensures compliance with regulatory requirements, and helps minimise the project's adverse impacts on the environment and communities.

For the current project 200m radii area from centre of the dumpsite has been considered for baseline studies. The study involved collection of both primary and secondary baseline data. Baseline of the area was established by the combination of both primary and secondary data. Primary data collection was carried out for the environmental parameters such as air, water, noise and soil. NABL approved laboratory Poluchem Laboratories conducted the sample collection and analysis of air,water and noise parameters.Geo technical studies of soil and waste analysis was conducted by Matter Material Testing and Research Laboratory Pvt. Ltd., Kozhikode. The below table indicates the environmental attributes and frequency of monitoring.

*Table 3.2: Environmental Attributes*

| S.No | Attributes | Parameters | Latitude & Longitude | No. of sampling locations | Frequency of monitoring / Data collection |
|---|---|---|---|---|---|
| 1 | Meteorology | Temperature humidity and rainfall | - | Study area | Data collected from IMD |
| 2 | Ambient air quality | $PM_{10}$, $PM_{2.5}$, $SO_2$, $NO_2$, VOCs | AAQ1 – N- 9° 0'4.70", E -76°45'33.60"<br><br>AAQ2 – N- 9° 0'16.10", E -76°45'24.00" | 2 | 24 hourly samples |
| 3 | Noise levels | Noise levels in dB(A) Leq | N1 – N- 11°35'39.983", E -75°36'20.205 | 1 | Once |
| 4 | Groundwater quality | Physical, chemical and biological parameters including pH, temperature, turbidity, magnesium hardness, total alkalinity, chlorides, | GW1- N- 9° 0'4.20" E - 76°45'32.90" GW2- N-9° 0'4.10" E-76°45'36.40" GW3- | 4 | Once |

| | | | | | |
|---|---|---|---|---|---|
| | | sulphates, fluoride, Copper, DO, BOD, COD, salinity, Zinc, Lead, Arsenic. | N-9° 0'1.70" E-76°45'36.30" GW4- N-9° 0'10.80" E-76°45'30.00" | | |
| 5 | Biological environment | Existing flora and fauna | - | Study Area | Through field visits and substantiated through secondary data sources. |
| 6 | Soil characteristics | Physical, chemical and biological parameters including pH, Total Hardness, Nitrites, Phosphates, Organic matter, Fluorides, Total Iron, Nickel, Copper and Lead, TOC, Permeability.,Heavy metals | Soil Samples collected from dumpsite | Dumpsite area | Once |
| 7 | Land use/land cover | Land use for different land use Classifications. | - | Study Area | Land use / Land Cover Analysis using satellite imaging and GIS Technique |

*Source: TSC Package A

## 3.3 Existing Facilities on site and its Environmental Audit

RRF and MCF facility exists in same compound and there are 42 female HKS members working for entire Municipality for collection, transportation and segregation of waste. Dumpsite consists of toilet, rest sheds and one borewell

The MCF/RRF is not considered under this subproject. However, an environmental audit of the facility is important as this is an associated facility to which some recyclables may be channelized to and is situated at the same site and might be impacted by the booming activities.

*Table 3.3: Environmental Audit of existing facilities*

| Sl No | Aspects | Remarks |
|---|---|---|
| 1 | Structural Characteristics | MCF and RRF facility exists in 767 sq m<br>Buffer/setback around the MCF-5m<br>Distance from waste pile of dumpsite-5m<br>Roof: (Material, condition)-GI sheet and in good condition<br>Floor (Material, Condition)-Concreted floor in good condition<br>Walls: buildings are enclosed with masonry wall of 1.5 m and the above portion is enclosed with metal nets.<br>Doors & windows: Metal Doors<br>Bio mining will not impact the structural characteristics of the building. The MCF/RRF exists at an offset of 5m and in different topographical level. Damages to roof can anticipate if there are accidents /tip over occurs |
| 2 | Functional Characteristics | Activities in the MCF/RRF: Waste segregation, baling activities<br>Materials and condition of stacking: Improper stacking of material inside and outside<br>Activities spilling out into the dumpsite: No since both exists in different elevation, there is no spilling onto dumpsite<br>Access to the MCF (through dumpsite or other): There are separate gates for dumpsite and MCF/RRF compound<br>No: of workers: 42, HKS members |
| 3 | Facilities | Parking area: There is limited area available infront of MCF and RRF for parking.<br>Loading/unloading area: The area infront of the MCF/RRF is utilised as loading /unloading area<br>Storage room & area: One office room of area 45m$^2$<br>Worker snack/rest areas: 2 rest room<br>Worker / other washrooms & sewerage: One toilet facility<br>Water supply for Cleaning, Washroom: One borewell is available within facility<br>Greenbelt: Facility itself does not have any green belt, but the entire facility is surrounded by rubber plantations which acts as a green belt |
| 4 | Expected Impacts | Since common road is available for MCF/RRF and dumpsite there will be access issues during bio mining stage<br>Additional toilet facilities required<br>The compound wall is partially covering the existing MCF/RRF, this increases the trespassing of animals/personnels into facility premises So the compound wall to be completed<br>Chances of damages to existing compound wall to the eastern side of MCF, if buffer is not given during bio mining stage. |

## 3.4 Analysis of Environmental baseline

*Table 3.4: Environmental baseline*

| Sl No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| 1 | Topography | The elevation of the Ugranikunnu dumpsite is 105(m), gentle slope towards the South Eastern side and South Western section from the dumpsite. The land area in dumpsite is midland. Soil is predominantly lateritic in nature. Ugranikunnu site falls within the tropical to sub-tropical climatic region. | No leachate was observed in downward sides |
| 2 | Climate | The climate of Ugranikunnu is mostly moderate The place experiences warm temperatures of 22°C - 32°C. | Rains are heavy, and the site is at an elevated draining out of stored waste and leachate during dumpsite biomining & bioremediation works |
| 3 | Hydrology/Hydrogeology & Soil | The decadal average water level of the Ugranikunnu dumpsite area ranges from 10-15m.The high elevation of the area is the reason behind higher depth of water levels.<br><br>Soil is predominantly hard lateritic/laterite soil Ground below waste was observed as sandy clay | The clay content below waste can act as a barrier in holding up of leachate and prevents spreading to nearby GW sources.<br><br>But during bio mining the excavations will bring up the wet waste and if rain occurs the leachate can immediately slow to nearby GW sources |
| 4 | Forests and Ecology | The Kottarakkara ULB does not have any forest area. As per protected areas in Kerala, Kollam district consists of one notified protected area Shendurney Wildlife Sanctuary.Place is located at a distance of 41 Km from the dumpsite area Some of the common flora and fauna found near the site. | None of the flora fauna found near to dumpsite falls in IUCN red list<br><br>The flora will be affected during the bio mining phase .But trees are not disturbed.These all fauna will be mainly creepers and plants that are grown on top soil of dumpsite<br><br>Fauna that are found are basically birds and squirell .they will shift to nearby undisturbed areas by themselves and the current project will not be a concern to them. |

| | Scientific name | Common Name | Type |
|---|---|---|---|
| | Corvus macrorhynchos | Large-billed crow | Fauna [Bird] |
| | Acridotheristristis | Commmon Myna | Fauna [Bird] |
| | Centropes sinensis | Greater Coucal | Fauna [Bird] |
| | Funambulustristriatus | Jungle palm squirrel | Fauna [Mammals] |
| | Corvus macrorhynchos | Large-billed crow | Fauna [Bird] |
| | **Species** | **Family** | **Type** |
| | Macaranga peltata | Vatta | Flora [Tree] |

| Sl No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| | | Xenostegia tridentata \| Prasarani \| Flora [Creeper]<br>Cissampelos pareira \| \| Flora [Creeper]<br>Clerodendrum odoratum \| Connaraist pacha \| Flora [Shrubs]<br>Macaranga peltata \| Vatta \| Flora [Tree] | |
| 5 | Socio Economic Aspects | The dump site is in the middle of Rubber estate. On the southern side, 130 metres from the site, there is a temple called Ugrankunnu Sree Bhadra Bhagavathi Temple and on the Northern side there is a Nursing (Vijaya Nursing College) college which is 435 m away. On the eastern side a rubber plantation area 7 families with 62 inhabitants residing within 200 meters of it and 7 residential houses are there and on the western side is MCF and RRF.<br><br>The proposed dumpsite rehabilitation project will not have any adverse impact on livelihood of rag pickers. Similarly, there is no influx of migration of workers to the site or to the nearby areas. The proposed project does not affect any community resources and will not cause any economic displacement, or loss of assets or resources | Transect Walk map and discussions are briefly explained in Section 7.3.1 |
| 6 | Land use, Development Pattern and Key Projects | As per the LULC map, Ugrankunnu dumpsite area comes under dry agriculture/residential area. The dumpsite is surrounded by Rubber plantations and some houses in south -eastern side of the dumpsite-.<br><br>Nearby cultural resources- Ugrankunnu Devi temple is located at a distance of 135m in Southern Side<br><br>MCF/RRF exists in same compound and occupies an area of 767 sq.m | Measures have to be taken not to affect the functioning of existing MCF/RRF |
| 7 | Infrastructure and Services | For the efficient bio mining activity, the present available land is not sufficient Hence an additional adjacent land of area about 1500 – 2000 sq m to be leased out.<br><br>Also there is need to enhance the fire safety equipment and arrangements in place. | NA |
| 8 | Traffic and Transportation | Traffic arrangement is discussed seperatly along with Traffic map in section 3.5 | The implementing agency shall ensure staggering of the traffic movements from site considering peak hours/college timings. Also, night time vehicular movements can be implemented.<br>More accurate information shall be available once Contractor is being |

| Sl No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| | | | onbourded. EIA to be updated by the contractor based on his work plan |
| 9 | Water Supply<br>Surface water<br>Ground Water | Ground Water collected from 3 different location and results found – all parameters are well within limits except for pH.<br><br>The analysis results revelaved that most of the parameters in Ground water were confirming with the drinking water standards, IS 10500: 2012.There are some minor variations in pH of GW1 sample. Turbudity exceeds in GW3 and GW4 parameter. In case of biological analysis GW1 and GW2 showed presence of Coliform bacteria. The variations in these results are not influenced by the dumpsite | Site Drainage & leachate Impacts due to of biomining activity (esp during any seasonal rain) is important with respect to nearby soil & water environment |
| 10 | Drainage, Sewerage and Sanitation | Ugranikunnu dumpsite does not have any drainage network. The water flows naturally along the slope of the area.<br>Ugranikunnu is mainly served with septic tanks for individual premises and in dumpsite one toilet and septic tank exists within the MCF/RRF compound | |
| 11 | Soil quality of dumpsite | Soil and Waste in dumpsite were analysed for the presence of heavy metals. Heavy metals were under the prescribed limits as per SWM Rule 2016 for organic compost | Compost manufacturing from the soil fractions can be considered |
| 12 | Solid Waste Management | Kottarakkara Municipality is collecting only dry waste from households and institutions and the dry waste is stored in MCF facilities and at RRF the materials are recovered and sorted. The MCF/RRF exists in same compound of the dumpsite. The recovered materials are transferred to CKCL. The dumpsite area/project area is non functional since 2018 | |
| 13 | Air quality | 2 locations -One in sensitive receptor on Northern side of the dumpsite and another location is in the front gate of the dumpsite in Southern direction to dumpsite. All parameters were within permissible limits | In bio mining stage due to continious truck/equipment movement and during the travel thorugh katcha road inside the dumpsite there will be increase in particulate matter |
| 14 | Noise level | 1 location -In the entrance of bio mining Parameters were within the permissible limits at day and at night there is a slight increase in noise level (+5dB) from permissible limits | Dumpsite is surrounded by rubber plantations and there are no other commercial institutions in immediate vicinity<br><br>There is a mobile tower situated nearby sampling station and during certain occasions there are chances for operation of DG sets attached to mobile tower and the operation of DG set during |

| Sl No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| | | | night time can affect the noise level |

*Source: TSC Package A

## 3.5 Traffic arrangement

Ugrankunnu dumpsite is situated at a distance of 0.4 km from the major road Kollam Punalur Thenkashi road. The road infront of dumpsite leads to Vijaya College of nursing, which is at a distance of 0.4 km from dumpsite entrance. Along the road another sensitive receptor Ugrankunnu Bagavathi temple also exists.The road is not a wide road it is having a width of 3 m.

As per the college officials, the college buses will do services in shift basis, i. e from 7.30 am to 9.30 am in the morning and 3.30 pm TO 5.30 pm in the afternoon. This will be the peak time of traffic through the road infront.

So during the project phase ,the tipper/other meachinery operations should be done in time frame outside of the college trip timing .Also there should be coordination with the drivers of college bus ,so that the mining contractor can free up the road during there trip.Also there should be traffic control points with representative at major junctions/points to avoid any traffic congestion.One should be at exit to Kollam Punalur Thenkashi road and one should be before Vijaya College of Nursing.Also the temple during festive occasion there will be higher traffic ,during this time traffic arrangments to be modified based on that.

The dumpsite is situated in RRF/MCF facility ,the facility will be active during the bio mining phase ,there will a total of three/four trips per day/month to the facility for the processing of waste.At present there is no specific time schedule followed by ULB to dispose these wastes.But during the bio mining phase ,the timing should be arranged in discussion with the mining contractor and ULB ,to avoid traffic congestion in roads.

Below **Figure 3.2** shows the road map of the dumpsite area, road connection with major sensitive factors has been showed in the figure.

***Figure 3.2 Traffic map of Ugrankunnu Dumpsite***

## 3.6 Description of Environmental Parameters

The primary baseline characteristics of Dumspite area and the immediate vicinity has been evaluated by conducting Environmental Monitoring of Air, water, noise and soil characteristics. The Environmental monitoring stations established for the present project is presented in below **Figure 3.3** The analysis was carried out on month of April 2023. (Summer Season).

***Figure 3.3 Environmental Monitroing Station locations***

*Source: TSC Package A

*Table 3.5: Distance of sampling points*

| S.No. | Description | Direction and distance from dumpsite | Inference |
|---|---|---|---|
| *Air quality monitoring stations* | | | |
| | Main Gate of MCF/RRF compound (AAQ-1) | 34 m- adjacent to existing dumpsite | Air quality stations are slected based on predominant wind direction and covering one sensitive receptor.<br><br>Northern and Southern Sides are covered |
| | Vijaya College of Nursing (AAQ-1) | 427.10 m- in North Western direction from dumpsite | |
| *Groundwater quality stations* | | | |
| | Borewell Sample inside dumpsite - GW1 | 51m-Within the MCF/RRF compound | Samples are selected such that one point as control point not interfered by the dumpsite .One within the dumpsite boundary and all other samples are collected from downward side of the dumpsite, according to natural slope of terrain |
| | Mr.Shanavas.S, Alnvilaveeduhouse -GW2 | 106m-in South Eastern direction from dumpsite | |
| | Mr.Thulaseedharan ,Aswathy Bhavan-GW3 | 153m-in Southern direction from dumpsite | |
| | Mrs.Lekha, Pazhankanjivilla-GW4 | 186m-in northern direction from dumpsite | |
| *Noise quality* | | | |
| | Near Main Gate of Dumpsite Ugranizamm-N1 | 34 m- adjacent to existing dumpsite | The entrance gate where oncoming vehicles are coming |
| **Note:** Surface water body existing within 200m radii is an abanded quarry pond. There was no acess to collect water from the pond.and the water was not used for any purposes by the residents | | | |

### 3.6.1 Sampling Methodology

*Table 3.6: Sampling Methodology*

| S.No | Description | Method |
|---|---|---|
| 1 | Air sampling | Calibrated High Volume Sampler, Calibrated rotameter & calibrated Dry gas meters and sampling locations selected based on wind rose and impacts on surrounding landuses |
| 2 | Noise | Calibrated sound level meter and sampling locations selected based on highest noise level on site and impacts on surroundings |
| 3 | Ground water | Water collected in polyethylene bottles in presence of TSC/IPE global persons and sampling locations selected based on leachate and run off flow and impacts on surroundings |

***Note: Sampling result and photographs of sampling is attached as Annexure in FR report***

# 4

# ANALYSIS OF ALTERNATIVES

During the entire stage of the project preparation, comprising of screening and detail design preparation, various alternatives were identified and analyzed to help in decision making.

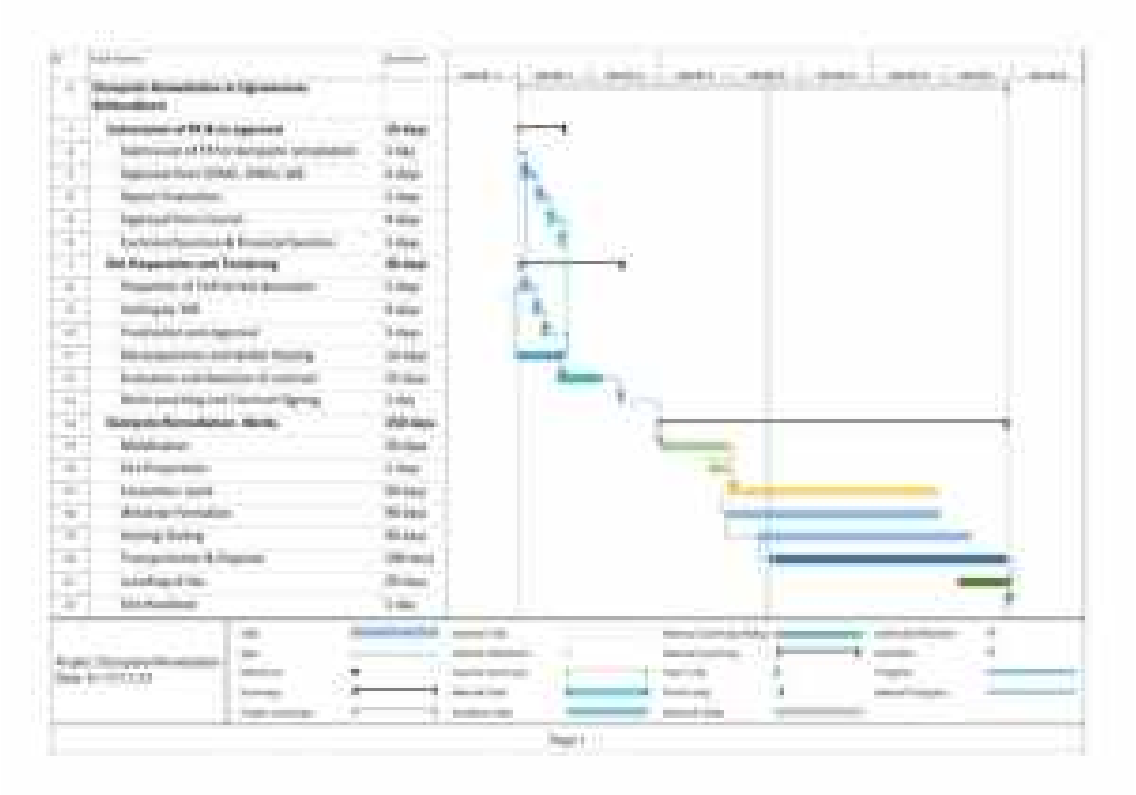
## 4.1 Zero or No Project Alternatives

The "With" project scenario with positive/beneficial impacts results in overall improvement of the area and also the land area can be utilised for any other development projects by ULB.The availability of vacant land is deficient in Kerala.The legacy waste inside the soil ,is an environmental concern as it may pollute the soil and if leachate contamination occurs it can contaminate nearby ground water.Also at present the dumpsite acts a breeding ground for reptiles,insects,dogs,mosquitoes and this can cause health related issues to nearby residents."With" project these environmental and health effects can be effectively addressed.

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.

If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.

- 1. Foul Oder Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.
- 2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.
- 3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.
- 4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.
- 5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.



On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested biomining and bioremediation as environmentally safe and the most preferable approaches to dumpsite remediation. *(Source: Toolkit Legacy Waste Management and dumpsite remediation in India).* Bioremediation is one of the key focus areas of Swachh Bharat Mission 2.0. The guidelines released in October 2021 expects that all the legacy historic waste dumpsites across the country are remediated and converted to green zones or as state-of-the-art Solid Waste Management facility.

## 4.2 Mode of execution /Management alternatives

Regarding the execution strategy, the storage of recovered by products obtained from bio mining will be an issue. The existing compound does not have the infrastructure facility to hold on these wastes for long period of time.

The present dumpsite has very limited land availablity for the efficient execution of the process. The nearby vacant land is available to lease for the project activities. These are some of the hindrances that can have issue during the site-based approach of biomining in Ugrankunnu.

The total duration anticipated for the completion of the project is five months.Proposed timeline for the activity is given below in Figure 4.1

***. Figure 4.1 Proposed timeline for Ugrankunnu dumpsite biomining***

## 4.3 Technology Alternatives

There are various techniques/technologies for remediation of waste landfills. Based on the type /nature of the waste, geographical conditions, and required outcomes of the project suitable project specific technique need to be selected.

A few known technologies for bioremediation are discussed below

- Biomining
- Capping of landfill
- Capping with partial land recovery

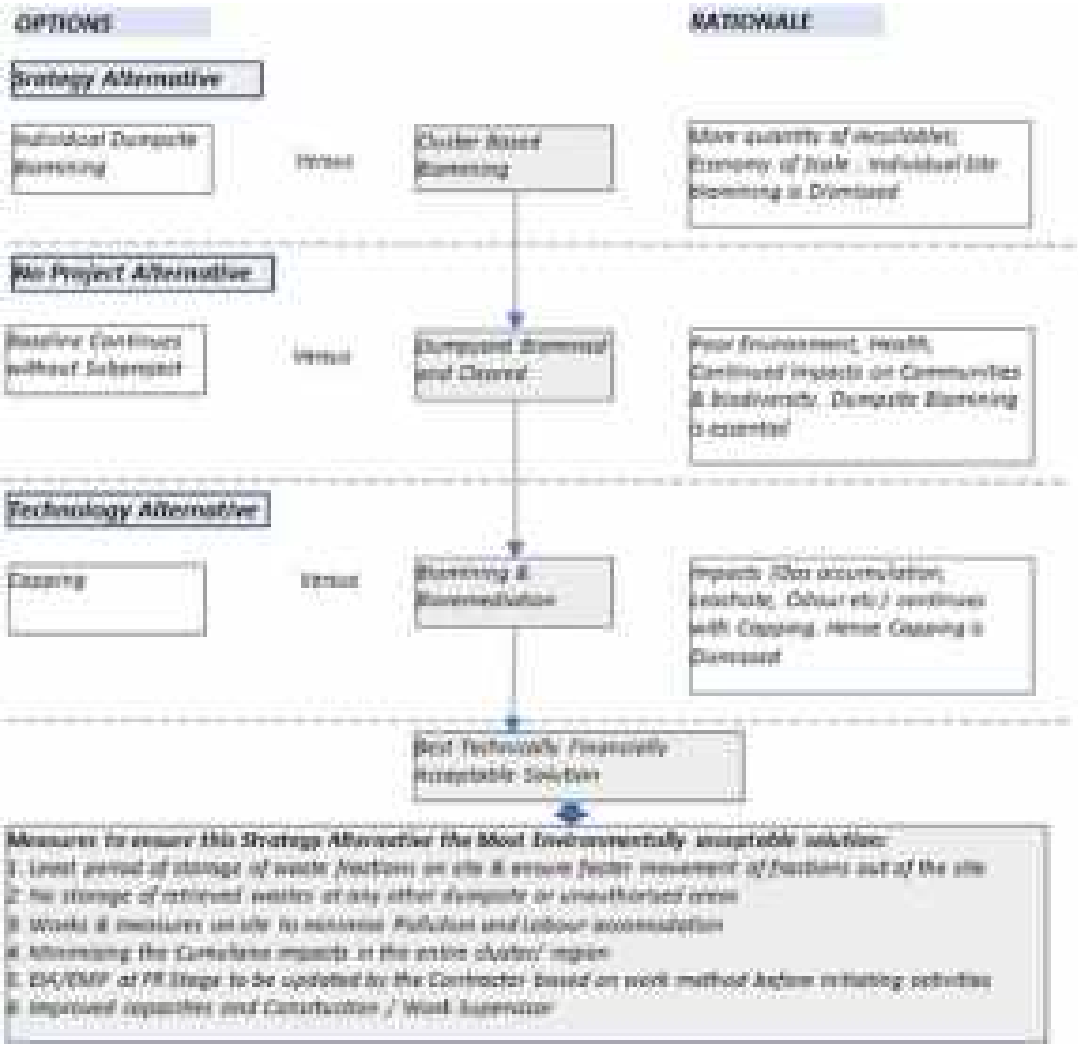


***Figure 4.2 Analysis of Alternatives***

*Source: World Bank

5

# ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS

Biomining and bioremediation of existing legacy dumpsites beings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more mandays at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, biomining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition, cumulative impacts of simultaneous biomining of multiple such legwork on the environment is important. Especially with respect to (i) drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies, (ii) pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks, (iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and (iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at ths stage, while some would be known only based on the project details that would be known from the work plan of the contactor once s/he is on board.

Source -pathway receptor study.

## 5.1 Source Pathway Receptor Analysis

### 5.1.1 Source:

Legacy waste remaining and being deposited at the Ugrankunnu closed dumpsite may act as a source of contamination, more specifically the probalble landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is 30 years old, as dumping had started in year 1994 and ceased in 2018 Initially the dumpsite was acting as a burial ground. The total waste volume is 24327cu m with the dumpsite spread over 0.15 ha and rises to a height of approximately 4.3 m from the base. Waste is seen 4.3 m above ground level and 6.3 m below ground level. In addition to the landfill gas and leachate, material spill over from the existing MCF in the compound and windblown dust and litter may also be considered as sources of contamination.

### 5.1.2 Pathways:

The following pathways for migration of contaminants have been identified: Wind The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will

continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards South Eastern and South Western side acts as a pathway for the uncovered waste to flow into unlined drainage canal along the boundary to Eastern side, which runs along the boundary of the compound wall of the dumpsite and then exit onto the road.

Lateritic Soil acts as a pathway for transport of leachate to the groundwater and for uptake of contaminated surface run-off.

The leachate flows with groundwater and acts as the pathway. Surface water Contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals, rivers and streams are further transported by surface waters and in this case the surface water acts as the pathway.

### 5.1.3 Receptors:

Air, surface water (drain passing through residential areas), ground water including drinking water sources (for 17 number of families, Ugrankunnu Devi temple etc), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the residences and institutions living nearby in Ugrankunnu As the dump is not contaminated, remediaion would improve the pollution scenario provided the bioearth used is pollution free and of good quality. However, other impats are expected on the final destinatons of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from biomining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after biomining activity, activities in biomined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post biomining activity.

## 5.2 Impacts on Air Environment

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on workers on site/other facilities on site (MCF in this case), nearby communities of Ward 26 /Railway Station Ward.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.
- When the legacy site is opened, existing gases would get emitted. Further, any delay / unexpected stoppage of biomining activity, might further the process of gas formation be depending on waste composition, odour and fire risks. In the case of Ugrankunnu, since the analysis of wastes shows calorific value of 844 for whole waste with around more than 90% of soil/Bio Earth, the chances of fire are less.

## 5.3 Impacts on Water Environment

### 5.3.1 Ground water

- The decadal average water level of the Ugrankunnu dumpsite area ranges from 10-15m. Borehole data indicates waste upto depth of 6.3m with hard lateritic strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. But at Ugrankunnu during the site visit no leachate was observed around the dumpsite and same has been confirmend by the analysis of nearby GW well samples. None of the GW samples were contaminated
- Soil below the waste was analysed and there was no Heavy metal contamination observed in soil samples.

### 5.3.2 Surface water

- Dumspite is situated at a higher elevation, and hence no submergence was experienced at the site during the floods. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas.
- There are no surface waterbodies near the site, except an abondade quarry pond located at a distance of 152 m
- Predominant slopes are from North Eastern to South Eastern direction.At South Eastern side there are houses The drainage and leachate from the site flows to nearby open drainage channel which flows through residential areas, and ends at main drainage in Kollam Punlaur road It is important to contain and treat leachate from the proposed biomining activities on site. Treated leachate may be recirculated or used for other purposes.

## 5.4 Impacts on land/soil

- Historic landuse assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as biomining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.
- Spillover of activities to nearby road, and land would result in pollution of all types on thse areas. Hence it is important to restrict all activities to the site for legacy waste biomining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.
- Ground beneath dump remain polluted if heavy metal/other parameters exceeds limits in leachate, soil, water. In Ugrankunnu all parameters including heavy metals were found within the limit. Ugrankunnu does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while biomining, same shall b transported, treated and disposed as per specific waste guideline of the CPCB, Guidelines of CPCB on Legacy Waste Biomining of dumpsites and WB EHS. A plan shall be auditing of all wastes, management, eliminating

pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

- Wherever fuel, combustibles and retrieved waste is stored, it shall be on impervious surface, at appropriate elevation, protection against rains, flooding (such as cut off drains, berms etc.), wind and fly / pest menace (screens, green cover etc), intruders (compound wall (existing at Ugrankunnu), watch and ward, lighting, remote monitoring measures etc). Risk of fire, dust and leachate contamination shall be well assessed by the contractor. Emergency Action Plan shall be prepared and mitigation measures shall be updated based on work plan/DPR, and implemented. Communities shall be made aware of works and advice to follow measures such as use of fly/dust covers/nets on wells etc.
- Of the waste samples analysed, 90 percent comprises of Bio earth and C/N ratio greater than 30 indicating slight unpleasant odour (high Nitrogen; releasing ammonia) less than that suitable for good compost.

## 5.5 Impacts due to Noise/Vibration

- Various machines vehicles and activities contribute to noise and vibration on and off site. This includes vehicles carrying recyclables, operation of JCB, and other machines, diesel generator sets, motors on site, etc. In addition, activities on the site and in relation to the existing MCFs such as vehicles transporting the dry waste from households to MCF, loading / unloading of collected waste materials, and workers activities on site would add to noise and vibration. Impacts include disturbance to fauna flora on site, health impacts on communities around due to exposure to large volume of sound.

## 5.6 Other impacts on biodiversity-Fauna/Flora

- Contaminants in soil and water: Direct or indirect contact with polluted soil or water by neighboring water users. Additionally, because of their locations, recovered lands are subsequently used as parks, or for SWM facilities or office spaces etc. This may pose risk of bioaccumulation of metals which can constitute a health risk. Also impacts on buildings due to gaseous emissions, risk of fire etc if used after clearing.
- Health Risks: One of the primary health risks of dumps is the spreading of diseases - diarrhea, hepatitis etc. The ways such infection can be spread are numerous but are often related to direct contact with the waste (e.g., clinical waste, faecal matter) by scavengers and other unauthorized persons being on the site. The other main pathway is by vectors such as, foraging animals, rats, birds, flies and mosquitoes etc. - Flies, mosquitoes, rodents, crows, pigeons, pest menace on site, for workers & communities & their assets (such as wells) due to exposure of putrefied wastes.
- Impacts if separate common site/s or a site among these dumpsites is chosen to store wastes from other dumps till it is disposed, or as transfer stations or for common processing of certain fractions: Such activities would result in Air, odor, dust, noise, water, vibration, flora, fauna, communities around the new site. There is also risk of contamination due to newly placed wastes, and pollution impacts and disturbances to communities due to works/activities on this site. Such sites and activities shall be avoided, and if quintessential for the project, be carefully chosen and approved only after thorough discussions with KSPCB, and all stakeholders. An assessment of their sensitivity and appropriateness shall be undertaken considering the environmental risks. They shall be audited and assessed for existing and future environmental impacts of such activities and mitigation shall be

implemented. However, details on such sites shall be known only based on the final schema of implementation proposed by the contractor. Hence, the Contractor shall update EIA based on this before starting any activity on site.

- OHS impacts: Infectious wastes, faecal matter, clinical wastes and sharps; batteries, e-waste and possible bursting; Hazardous wastes like asbestos and other chemicals dumped; pesticides / insecticides, inoculum storage, handling and use on wastes/land leading to diarrhoea, hepatitis, insect & reptile bites, interactions with foraging animals like rats, dogs, cattle, vector (mosquitoes, flies etc) transmitted diseases etc.
- Worker facilities in the labour Camp if any, & site are important, as the density of population is high in Kerala. It is important that camp sites are not set up in the land to be remediated. Periodic health checkups (once a week) are very important as the work involves handling of waste. It is important to also provide periodic health check up and co-ordination with local PHC/CHS for medical camps for residents, schools and others during the biomining period.
- Risk of Fire during biomining and due to retrieved material storage; possible Burning of retrieved materials; storage and use of firewood for various purposes, fuel for vehicles. The smoke from burning solid waste can result in respiratory complaints, dizziness, and headaches in the short-term, as well as potentially more serious diseases such as cancers and heart disease in the long term.
- Impacts of other site development works shall be well assessed, EIA/EMP updated, and mitigation measures included in Project costs and implemented by the contractor/ULB (whoever is responsible as per FR/Final Bid document).

## 5.7 Visual impacts, Noise, Odour, Vibrations

- Odour & impacts on workers and communities during biomining, storage and transport are key determinants of community agreement to the activity. Such odour would attract flies and vectors in large numbers, who may also contaminate the food, and water sources of nearby communities. It is important to minimize odor emission as guided by the CPCB Guidelines on Legacy Waste Biomining, 2019. also provide periodic health checkup and co-ordination with local PHC/CHS for medical camps for residents, schools and others during the biomining period.
- Visual impacts of the waste being dug up, screened ad heaped/stored is not appealing. It is important to mask this appropriately

## 5.8 Traffic impacts

- Impacts due to new access road construction/upgradation. New roads in the site will be unpaved and slushy during rains. It is important to minimize temporary pollution due to increased movement men, and materials from and to the site during biomining activity and beyond as it is proposed to store material on site including air and noise pollution, access restrictions to properties nearby, and vehicular conflicts.
- Large vehicles moving in and out of the site carrying materials, tools, equipment & pedestrian/worker -vehicular conflicts; increased traffic on roads, large equipments & vehicles, noise, air pollution: vehicle emissions, DG sets
- Vehicles, equipment's not adhering to pollution standards

## 5.9 Other impacts on existing or proposed activities on site/s

- There may be approvals from various agencies for biomining activities and associated facilities; depending on utilities and uses on site. & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of biomining on existing facilities on site such as MRF, MCF etc (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post biomining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped & impacts if this is dumped elsewhere or not processed. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, H&S impacts on workers, communities. Also forward linkages are considered as associated facilities/linked activities. Impacts of Transportation of these fractions (traffic increase, odor, leachate, dust) impacts during rains & emergencies, and its handling, storage at the identified locations, reuse etc. shall be mitigated.

## 5.10 Impact/Risk Assesment Methodology

The analysis of environmental impacts/risks is done in terms of their likelihood and severity. The criteria used to determine significance are summarized in **Table 5.2**

*Table 5.1: Criteria Used to Assign Level of Significance*

| Likelihood - the likelihood that an impact will occur | |
|---|---|
| **Unlikely** | The impact is unlikely to occur. |
| **Likely** | The impact is likely to occur under most conditions. |
| **Definite** | The impact will occur. |

### 5.10.1 Magnitude and duration of the Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Biomining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table 5.3 Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity. However, magnitude of cumulative impacts of various dumpsite remediation might be High.

*Table 5.2: Magnitude of Impacts*

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| *Duration of the potential impact* | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program (Likely) | Temporary with no detectable potential impact |
| *Spatial extent of the potential impact* | Regional – reach beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (Likely) | A specific location within program component or site boundaries with no detectable potential impact |
| *Reversibility of potential impacts* | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months(Likely) | Baseline remains constant |
| *Legal standards and established professional criteria* | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines(Likely) | Not applicable |
| *Likelihood of potential impacts occurring* | Commonly occurs under typical operating or construction conditions (Definite ) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

### 5.10.2 Sensitivity of the Receptor

The dumpsite is surrounded by residential buildings and rubber plantations, during the time of site assessment the experts observed, some sensitive receptors within 200m from the site. Namely some College, religious places and households. The project lies near residences, within a 200-meter radius, and its potential air, odour, fire, noise, vibration, ground water impact on over 17 families over a duration of 5 to 6 months. The sensitivity of these receptors is High, in addition, the surface run off from the dumpsite drains through the residential areas of Ugrankunnu this include the leachate that may be generated during bio mining from the site. The sensitivity of this receptor is also estimated as High.

### 5.10.3 Significance of the Impact

Significance if the impact is high as it would even result in community resistance to biomining and bioremediation. Since the project operational time 5 to 6 months, then the magnitude of the negative impact can be considered as small and medium sensitivity. In other hand magnitude of the positive impact, after the biomining of the existing land can be used for the recreational park for the public use or for any other development projects proposed by Kottarakkara Muncipality

# 6

# ENVIRONMENTAL AND SOCIAL MANAGEMENT AND MONITORING PLAN

## 6.1 Scope of Environmental Management Plan

The Environment Management Plan (EMP) is a site-specific plan developed to ensure that the project is implemented in an environmentally sustainable manner where all contractors and subcontractors, including consultants, understand the potential environmental risks arising from the project and take appropriate actions to properly manage that risk.

EMP ensures that the project implementation is carried out in accordance with the design by taking appropriate mitigation actions to reduce adverse environmental impacts during its life cycle. The plan outlines existing and potential problems that may adversely impact on the environment and recommends corrective measures where required. Also, the plan outlines roles and responsibility of the key personnel and contractors who will be in-charge of the responsibilities to manage the project site.The Environment Management Plan (EMP) would consist of all mitigation measures for each component of the environment due to the activities during the pre biomining phase and bio mining phase and to minimize adverse environmental impacts resulting from the activities of the project.

*Table 6.1: Environmental Management Plan*

| Sl. No | Probable impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| *Pre Bio mining Phase/Preparatory phase* | | | | |
| 1 | Biomining & Remediation Plan & Capacities | Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / biomined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these biomined material in line wit the agreements with such facility owners and National, State regulations and WB EHS<br>Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate management Plan.<br>The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers. | Contractor | SPMU/DPMU/ULB |
| 2 | *Non-compliance with applicable rules*<br><br>Site /Dumpsite Initial preparatory works | Site clearance / obtain NOC from the revenue authorities for obtaining the permissive use of land and council approval.<br><br>Consent to establish from the KSPCB has to be obtained for starting construction work related to the sub-project. | Contractor/ULB | SPMU/ULB |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality, odor, water contamination due to leachate, health and safety impacts of the people working in the site assessment* | Carry out site assessments as per Guidelines for Biomining of Legacy waste Dumpsites of CPCB<br>Consider safe biomining & gas / leachate generation from existing capped portion of the site<br>Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>Provision of appropriate PPE's to the team undertaking the site assessments | TSC, ULB, Contractor | SPMU/DPMU/ULB |

| | | | | |
|---|---|---|---|---|
| | | Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>Plan for machinery operated which will be operated by skilled operators at all times.<br>Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | | |
| 4 | *Operational difficulties to existing MCF/RRF existing in same compound of Dumpsite*<br>-<br>Ugrankunnu dump site is located within the existing RRF and MCF facility.The biomining can affect the operation of existing RRF and MCF | There is provision for separate access to dumpsite and to the RRF-MCF facility.Biomining related vehicles and meachineries should not use acess gate of MCF/RRF<br><br>The pathway to RRF/MCF and dumpsite to be differentiated and hence the operation of the existing RRF MCF will not be disturbed.<br><br>But at present dumpsite area is accessible to all as there is no gates present. During the biomining phase the access to the dumpsite will be gated and closed and authorized personnels will be allowed inside.<br><br>Fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely to avoid risk to the public. | Contractor | ULB/SPMU |

| | | | | |
|---|---|---|---|---|
| | | To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br><br>Grading shall be performed where necessary to provide a neat appearance | | |
| 5 | *Dust impacts due to SitePreparation*<br>Excavation in summer season will result in dust emission to surrounding areas and can have a rise in Particular matter in the area.The increased dust emission can have an effect on nearby rubber plantations | Provide temporary green nets buffers around the site before the start of work to curtail dust emissions. | Contractor | ULB |
| 6 | *Material sourcing, transport, and stacking of construction materials*.<br>Uncontrolled transportation of the equipment /materials will result in increased traffic in existing road.<br>Existing road is having 3 m width, and the increased truck/equipment movement will create traffic blocks<br>Nearby nursing college is utilizing the same route for daily commute the increased traffic will result in there college timing.<br>Material transportation through the dumpsite road and along the kollam Thenkashi road will increase the dust emission and chances of spillage of materials are there.<br>Travelling of vehicles in kacha road inside dumpsite will increase the dust emission<br>Vehicles/Equipments operating in Kacha roads will be having materials sticking onto tyres,when this reach main roads this can create nuisance to public | Vehicles coming to and from dumpsite will be scheduled in a timing which will not affect the oncoming traffic of the nearby college.<br><br>Deploy manpower to control traffic infront of dumpsite and in junction where the road is joining with the Kollam Thenkasi road.<br><br>Materials transportation to and from the dumpsite should be in closed trucks with PUC certificates.<br><br>Kacha roads inside dumpsite to be dampened from time to time | ULB with help of Traffic Police<br><br>Contractor<br><br>Contractor<br><br>Contractor | ULB |
| 7 | *Setting up of Labour camp*<br>Unauthorised creation of labor camp will result in unsanitary conditions in nearby settlements. | Proper residence or accommodation facilities with basic facilities such as toiletries, good drinking water ,food to be provided to workers | Contractor | ULB |

| | | | | |
|---|---|---|---|---|
| 8 | *Contamination of groundwater due to leaching.*<br>During excavation of wastes, there are chances of leachate formation from the wastes, which if not directed properly can reach to ground damaging the soil and if leachate quantity is higher can affect the ground water in the area. | Plan the works on-site only during non-rainy seasons and to complete the works before rain.<br><br>The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br><br>Design and maintain the slope and orientation of windrows of mined wastes and/or leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles of mined waste and waste windrows to maximize runoff and hence reduce infiltration;<br><br>Store leachate aboveground storage tanks, and provide for emergency containment additionally<br><br>Provide liner in areas ,where mined materials is stacked | Contractor | ULB |
| 9 | *Transportation of wastes retrieved or other material in overloaded and open vehicles*<br>Impacts caused to Air, Odour nuisances; spills and littering impacts on Air, Water, Land) | All vehicles shall carry only approved load of weight as per SOP<br><br>Regular cleaning of roads & drains and removal of spills if any.<br><br>All Transport vehicles shall be covered<br><br>Ensure provisions of SWM Rules 2016 for all waste / retrieved material Transportation activities | Contractor | ULB |
| 10 | Site Access Closure | The total cessation of dumping in the site will be implemented before any works.<br>All public access to the site, including waste pickers and scavengers should be prohibited via adequate temporary fencing, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ULB |

| | | | | |
|---|---|---|---|---|
| | | to indicate that the waste dump has been closed from the operation.<br>To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>Grading shall be performed where necessary to provide a neat appearance | | |
| *Biomining Stage* | | | | |
| 1 | Impacts due to increased tipper and equipment movement through the narrow road<br><br>In bio mining stage there will be contionious movement of tippers and equipments through the existing roads, that can create dust emissions, noise disturbances to nearby community<br><br>Overspeeding of the vehicles can cause accidents along the route | Tipper movement route ,and timing to be planned and providing GPS tracker to tippers<br><br>Ensure all tippers are having speed limiter installed and provide drivers with awareness regarding over speeding<br><br>Proper lubrication shall be provided to minimize squeaking noise due to friction<br><br>Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br><br>The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public<br><br>Traffic will be managed at the site by providing adequate space for parking of vehicles<br><br>Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design<br><br>No waste or material shall be disposed in any place other than the designated area; including water bodies, coasts/forests, or sensitive areas. | Contractor | 1 |
| 2 | *Exhaust emissions*<br>Idiling of heavy machineries and tippers contribute to increased emissions of air pollutants | No idling of vehicles on site. | Contractor | ULB |

| | | | | |
|---|---|---|---|---|
| | | Regular maintenance of heavy equipment used at the site and waste hauling vehicles toensure their exhaust emissions meet the emissions standards prescribed | | |
| 3 | Vehicular movement through kacha roads /unpaved roads<br>During bio mining there will be temporary acces routes created inside the dusmpsites for waste segregation and removing. Movement of tippers /equipments through these roads can create dust emissions at large scale. | Ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Contractor | ULB |
| 4 | Odor<br>The compaction of wastes will generate odor problems and can create nuisance to workers and nearby communities | Proper aeration to be maintained in Windrow Composting and protocol for the Windrow composting shall be observed | Contractor | ULB |
| 5 | *Contamination of groundwater due to leaching*.<br>In mining area, there are chances of leachate formation from the wastes, which if not directed properly can reach to ground damaging the soil and if leachate quantity is higher it can affect the ground water in the area. | Installation of leachate collection facility at site<br><br>To re use the leachate collected onto wind-rows as a type of bio culture<br><br>To prevent the entering of run off water from the surrounding area into mining area,a garland drains shall be constructed around the mining area. | Contractor | ULB |
| 6 | *Impact on the ambient noise quality during the operations*<br><br>Heavy machinery operations and vehicular traffic can increase the noise levels to considerable levels. | Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines;<br><br>Use modern, well-maintained and regularly serviced vehicles;<br><br>Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br><br>Provision of earmuffs and ear protection to workers and employees in high noise areas | Contractor | ULB |

| | | | | |
|---|---|---|---|---|
| 7 | *Pest / Vermin Control*<br>Odour, flies, rodent / other pest menaces<br><br>During the waste segregartion, there will be increase in pests, insects and rodents in the area. If it is not controlled these can reach on to nearby communities and can create health issues | Regular cleaning and approved pest control measures to be adopted<br><br>Pest Traps/Biopesticides / biological control shall be followed.<br><br>Banned pesticides/insecticides shall not be used.<br><br>Workers shall be made aware of storage and use of pest control measures and PPEs to be used | | |
| 8 | *Fire Accidents*<br>Since there will be chances for emission of sparks from exhausts of vehicles, causing fire<br><br>Equipments /Vehicles catching fire | To provide spark arresters to the vehicles inside the mining area<br><br>To provide suitable no of different types of Fire extuinguisher for handling different types of fire .<br><br>Training to be given to worforce in fire safety<br><br>(Fire Risk assement details are provided in Section 6.4 ,Table 6.3) | Safety officer/Contractor | ULB |
| 9 | *Occupational health and Safety Impacts of the workers*<br>Health impacts to workers due to conitionous exposure to harmful pollutants<br><br>Electrical ,Fire hazard causing damage to materials and worforce<br><br>Finger/hand injuries/Cuts | Safety officer to be present at site<br><br>Permit System can be implemented at site before major works .No permit no Work Policy to be implemented<br><br>Tool Box talk to all workers and Staff daily before commencing of work ,and safety officer to insure that it is implemented regulary<br><br>Weekly and Monthly Campaingns at site regarding electrical safety,Fire Safety ,Trip Hazard .Posters to be displayed on site on each campaign<br><br>Safety training to worforce Topics like safe usuage of Fire extuinguisher, Electrical Safety can be discussed<br><br>Once in a month conduct Safety Mock Drills on varios topics like Oil spillage,Fire ,Electrical hazard etc… | Safety officer/Contractor | ULB |

| | | | | |
|---|---|---|---|---|
| 10 | *Land /Space Constriaints*<br><br>For the efficient and sustainable bio mining the present dumpsite area is not sufficient An additional area of 1500m$^2$ in minimum is required for setting up the bio mining activities | Nearby land, which is currently a vacant land with no major trees can be leased (The land owner showed willingness to lease out) | | |
| *Disposal phase of By-products from Bio-mining process* | | | | |
| 1 | Impacts due to diesel emission due to long travel of by products loaded truck | The effort to identify the disposal site within Kerala state Only to travel outside state when no options are available within state<br><br>Idiling of vehicles to be minised to maximum<br><br>Regulary maintained trucks to be used for long distance travel with vaild PUC certificate | Contractor | ULB |
| 2 | Unauthorised usuage of by products<br><br>Ilelgal Dumping of by products | GPS system to be installed in trucks for there tracking<br><br>Waste Consignemnt notes system to be implemented and driver to get sign and seal from disposal facility/company<br><br>Imposition of fine/blackilsting of contractor | Contractor | ULB |
| 3 | Recovered Soil degradation by excessive compaction | The compaction process should be monitored to avoid excessive soil compaction | Contractor | ULB |

## 6.2 Scope of Environmental Monitoring Plan

The critical environmental and social attributes which are indicative of environmental and social performance of the project should be periodically monitored and analyzed during the biomining phase and post bio mining phase of the project. Environmental Monitoring Plan for each of the environmental components specifies the technical aspects of monitoring like locations of monitoring: frequency of monitoring and duration, parameters to be monitored and their budget The environmental monitoring plan is presented in **Table 6.2** and Social Monitoring Plan is illustrated in Chapter 7.

*Table 6.2: Environmental Monitoring Programme*

| Monitoring media/parameters | Items and parameters | Frequency | Location | Budget |
|---|---|---|---|---|
| Leachate | pH<br>Biological Oxygen Demand- BOD<br>Chemical Oxygen Demand-COD<br>Nitrogen (Ammonia, Nitrate, Nitrite)<br>Oxidation-Reduction Potential- ORP<br>Electrical Conductivity-EC<br>Total Organic Carbon (TOC) Dioxins | Middle of the project and end of the project | @ One leachate generation point ,if leachate generation is observed | [redacted] |
| Noise Monitoring | Day time and Night time Leq Monioting | Once during bio mining phase | Entrance of dumpsite | [redacted] |
| Gas Accumulation at Disposal Site | Oxygen (O2)<br>Nitrogen (N2)<br>Methane (CH2)<br>Carbon anhydride (CO2)<br>Hydrogen sulphide (H2S)<br>Temperature | Gas monitoring should be conducted at leastwice a day for about 7 consecutive days' during the bio mining phase and then after end of the bio mining phase one time sampling to be done | Windwards side and at center of mining area (2 points ) | [redacted] |
| Ambient Air | PM10, PM2.5, NOx, CH4, CO, Ammonia, dust and Odour | Once during bio mining phase | Downward side 1 near by residential areas/sensitive receptors<br><br>Ugward side 1 near by Vijaya College of Nursing | [redacted] |
| Groundwater quality | pH,Color ,Turbidity,Electrical Conductivity,Total Dissolved Solids,Total Suspended Solids,Total Hardness as CaCO3,Total Alkalinity as CaCO3,Chloride as Cl-,Sulphate as SO4, Nitrate as NO3,Fluoride as | | Middle of the project and during the end of the project period.<br><br>Downstream side 2 wells.(Same wells used in prior project monitoring can be utilized /retained) | [redacted] |

| | | | | |
|---|---|---|---|---|
| | F,Nickel as Ni,Cadmium as Cd,Lead as Pb,,Copper as Cu,Manganese as Mn,Mercury as Hg,Zinc as Zn,Iron as Fe,<br><br>Parameters will be defined and sampling, preservation, and analysis of water will be carried out following those stipulated in the subsections below and Standards Methods for Testing Water and wastewater, 21st edition, published by American Public Health Association | | | |

## 6.3 Disaster Management and Emergency Preparedness

National Disaster Management Act, 2005 (DM Act, 2005) is the basic legislation in the purview of Disaster Management (DM). DM Act defines disaster as "a catastrophe, mishap, calamity or grave occurrence in an area, arising from natural or manmade causes, by incidence or negligence which results in substantial loss of life or human suffering or damage to and destruction of property or damage to, or degradation of environment of such a nature or magnitude as to be beyond the coping capacity of the affected area". They can be natural, manmade or hybrid based on the cause of their occurrence.

DM Act defines disaster management as a "continuous and integrated process of planning, organizing, coordinating and implementing measure which are necessary or expedient". It can be divided into the following steps:

- Prevention: Preventing threat of any disaster which is possible to a great extent in the case of a manmade disaster.
- Preparedness: Contingency planning, stockpiling of equipments and supplies, arrangements for inter-agency coordination, preparation of evacuation plans and public awareness, capacity building and associated training and mock drills.
- Response: Prompt response to any threatening disaster situation or disaster including evacuation, rescue and immediate relief.
- Recovery & Mitigation: Assessing the severity or magnitude of effects of any disaster. Rehabilitation and Reconstruction and implementing measures for reduction of severity or consequences of a disaster

So, in case of disaster management, the phase wise activities required could be summarized as in **Figure 6.2**.

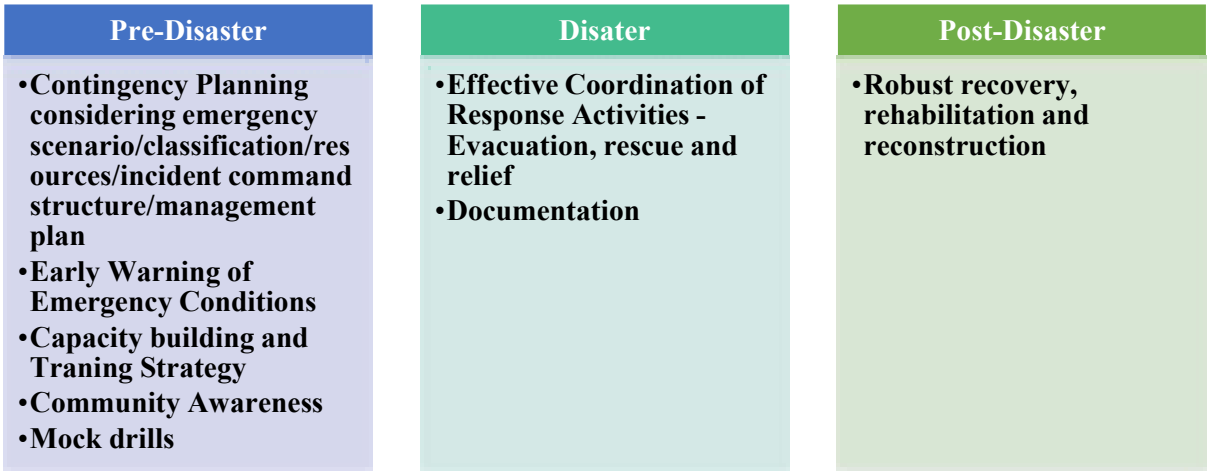

***Figure 6.1 Various Phase of Disasters and Activities Involved – On a Broader Profile***

Towards identification of the probable disasters associated with the project, a hazard risk, vulnerability and capacity analysis were carried out as presented below.

### 6.3.1 Hazard, Risk, Vulnerability and Capacity Analysis (HRVCA)

The project components include the mining of legacy waste, windrow formation and seperation of waste and inerts and soils Hazards due to the project may be natural or manmade which may turn out in to a disaster during bio mining phase. Towards deriving the disaster management plan, the probable hazards along the project area and activities were identified followed by risk assessment.

A hazard is defined as an agent, which has the potential to cause harm or damage to a vulnerable target i.e. people, property or environment. Historical analysis has been carried out based on the literature review to understand the hazards associated with bio mining operation. The accident data were analyzed to delineate the major hazard as well as the causes of hazard and further the same was analyzed w. r. to their applicability for cruise operation in cruise route.

The hazards could be categorized as natural and manmade. Natural hazard include flood, tsunami, earth quake etc., and manmade hazards include chemical disasters, road accidents etc. An extensive literature review was carried out for the various causes and contributing factors of bio mining accidents worldwide and probability of the same w.r.to the project region was assessed with specific reference to the local factors which may have an additional influence on the risk profile.

*Table 6.3 Probable Disasters due to Natural Hazards*

| Sl.No | Risk Factors | Disaster |
|---|---|---|
| 1 | Bad Weather Condition /Natural Hazard | |
| 2 | Storm | Destruction of Temporary site facilities<br>Falling of stack piled materials /wastes<br>Vehicle/Equipment tip overs due to soil erosion |
| | Flood | |
| | Earth Quake | |
| | Cyclone | |
| | Tsunami | |

*Source: TSC Package A*

Risk factors w r.to vessel operation include channel related risk as well as vessel related risk and leading to the probable disasters are as presented in **Table 6.4**

*Table 6.4 Probable Disasters due to Bio mining Activities*

| Sl.No | Risk Factors | Probable Disaster | Control Measures |
|---|---|---|---|
| 1. | Excavations: | $H_2S$ gas Emission,Other Obnoxious gases emission, Subsidence of surround earth banks during bio mining | Risk can be mitigated by the following<br>▪ Mining shall be done in such a way that the extraction activity do not make much impact on surrounding area.<br>▪ No water accumulation<br>▪ Only positive-pressure self-contained breathing apparatus (SCBA) or positive-pressure air-line units with an emergency egress bottle shall be used in any known or suspected $H_2S$ environment of 10 ppm or greater in the breathing zone |

| Sl.No | Risk Factors | Probable Disaster | Control Measures |
|---|---|---|---|
| | | | • Emergency Plan |
| 2. | Electrical Hazard | • Electric wires if any damaged<br>• Poorly insulated<br>• During temporary repairs<br>• Circuits overloaded may lead to major accident | Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br><br>Circuit breakers to be provided as per requirement. |
| 3. | Fire Hazard | Fire risks may occur due to the following<br>• Storage of flammable liquids / Gas LPG, Diesel<br>• Any combustible materials<br>• Sparks<br>• Open flames<br>• Chance of fire hazard from the exhust of vehicle | • Fire protection arrangements shall be provided at site as per the conditions stipulated in clearance from the Fire and Rescue Dept.<br>• Proper Class of Fire extinguisher to be made available to follow IS Standard IS 2190:1992<br>• Fire hydrant Network with reserve water (As per NFPACode) should be made available.<br>• Emergency Plan in case of fire<br>• Spark arresters to be used in vehicles |
| 4. | Working at height | *Ladders*<br>Risk may occur due to the following<br>• Not secured against dislodgement<br>• Defective ladders<br>• Not sufficient length<br>• Incorrectly placed | Ladder risk can be mitigated by the following<br>• Secured against movement or footed<br>• Ladders in good condition<br>• Regular inspection<br>• Ladder should be extended one (1m) meter above platform to avoid injuries |
| 5. | Falls and Slips at the dumpsite | Slippery surfaces or uneven surfaces and poor access to work areas climbing on and off plant | • Housekeeping Practice and importance of it to be conveyed to workers<br>• Proper PPE to be provided to workers . |
| 6. | Oil Spill | Oil Spills can happen during Genrator maintance and recharge of fuel<br>Breakdown of equipment/Vehicles . | • To provide Spill kit at site<br>• Contamined soil to be recovered and disposed as hazardous waste |

*Source: TSC Package A

### 6.3.2 Disaster Management Measures

Management Measures to be adopted for the reducing the impact of the expected disasters are discussed in the following section.

#### *6.3.2.1 Constitution of Onsite Disaster/ Emergency Management Cell (EMC)*

An Emergency Management Cell (EMC) will be constituted before the operation phase towards the better coordination and implementation of disaster management measures. The EMC proposed is as presented in **Figure 6.3.**

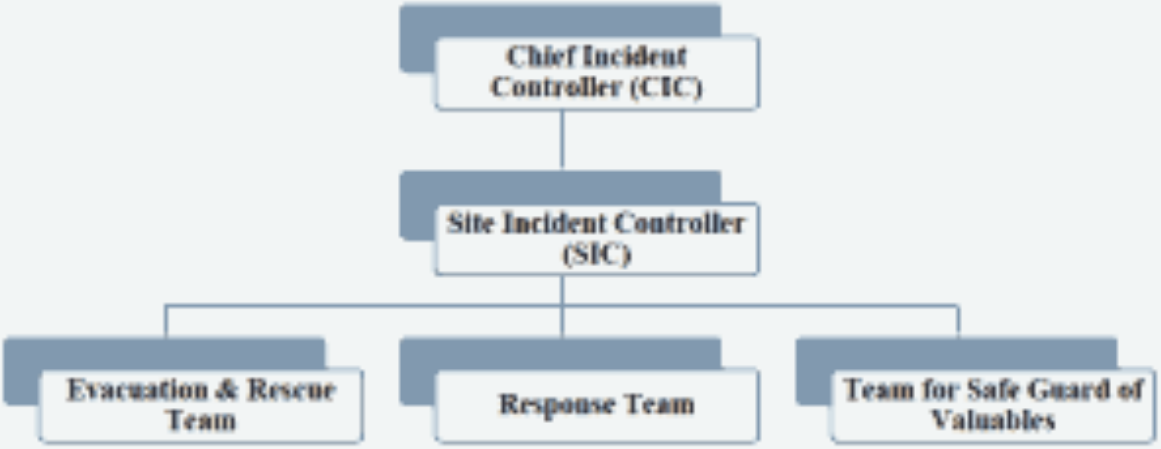

*Figure 6.2 The Emergency Management Cell proposed for the Ugrankunnu Dumpsite*

The EMC shall meet monthly to review the working of contingency plan, problem faced in recent disaster and amendment modification to be adopted in future. The Committee will be responsible for overall managing the disaster situation, take administrative decisions as and when required, review the disaster plan and to inform the Government on the situation. ULB shall coordinate with KSDMA and formulate the EMC cell. (To be included in bid document)

An Emergency Response Centre (ERC) should be maintained and put in action within the facility which would co-ordinate with various state departments to ensure planning, response and recovery. The responsibility allocation of each member EMC during a disaster management is presented in **Table 6.5.**

*Table 6.5 Responsibility Allocation of each Member in EMC*

| Sl. No. | Designation | Responsibilities |
|---|---|---|
| 1 | Chief Incident Controller (CIC) | Overall, In charge of the Incident.<br>Coordination with Management/ mother Department District Disaster Management Authorities, external agencies, media etc.,<br>Appraise the incident and give proper directions to the SIC and his team from time to time.<br>Declare emergency as well as issue 'ALL Clear' order after emergency. |
| 2 | Site Incident Controller (SIC) | Analyse the onsite emergency response requirement and request for the same to CIC from time to time.<br>Deploy the team members and supervise their operations.<br>Support CIC for coordination internal and external communication and administration. |
| 3 | Response Team headed | Initiate response with equipment and facilities available at site.<br>Report regarding the adequacy of existing equipment and provide the requirement for additional facilities.<br>Identifying safe route for firefighting, ambulance, medical team etc., |
| 4 | Evacuation & Rescue Team headed | Alert the occupants about the emergency<br>Blow siren |

| Sl. No. | Designation | Responsibilities |
|---|---|---|
| | | Show evacuation paths. Assembly points and site self-protection measures.<br>Arrange for rescue and first aid with the help local and occupant volunteers.<br>Arrange for sending causalities to hospitals. |
| 5 | Team for Safe Guard of Valuables headed | Take appropriate actions for the safe guard of valuables and assets such as important documents, cash chests etc.,<br>Take head count (Live/Injury/ Death) after emergency. |

*Source: TSC Package A

#### *6.3.2.2 Fire Alarms/Other Measures*

Sufficient fire and smoke alarms at common areas shall be provided, so that visitors and all the staff will be are informed in the event of the disaster for initiating appropriate measures for rescue.

#### *6.3.2.3 DO's and Don'ts Pamphlets*

Dos and Don'ts pamphlets for the visitors towards each disaster will be prepared and displayed in prominent places.

### 6.4 Environmental Budget

The details of Environmental Budget for Implementation and Supervision of Environmental Management Measures suggested is given below

***Table 6.6 Anticipated budget for Environment Management***

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| 1 | Deodorizer equipment (power sprayer) | Only Once | [redacted] | [redacted] | [redacted] |
| 2 | Green Net for covering site premises | Based on requirement | [redacted] | [redacted] | [redacted] |
| 3 | Spill Kit | Only Once | [redacted] | [redacted] | [redacted] |
| 4 | Training on capacity building | Entire Process | [redacted] | [redacted] | [redacted] |
| 5 | Temporary leachate collection tank -500L | Only Once | [redacted] | [redacted] | [redacted] |
| 6 | Personal protective equipment | Only Once | [redacted] | [redacted] | [redacted] |
| **TOTAL** | | | | | [redacted] |

*Source: *TSC Package A*

*Note: This can be captured in allocated ESIA Budget , ULB/TSC shall be monitoring and reporting during the implementation phase*

# 7

# INSTITUTIONAL ARRANGMENTS

## 7.1 Proposed Institutional Arrangement

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organisation will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments.

Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU.

## 7.2 Capacity Building

The major objective of capacity building under Solid Waste Management Programs is to develop a basic understanding about the waste management in various process such as the waste generation, segregation, primary collection, secondary collection, transportation, processing and disposal. It focuses on institutional development, community participation and strengthening of managerial system. The capacity building program shall ensure to improve the capacity of service providers in the Waste management System and to generate sense of responsibility among the waste generators. Capacity building shall focus on sensitization and orientation of various stakeholders of SWM project with adequate information on various project components.

- Training to contractors and labourers on labour laws, Gender Based Violence (GBV), Health and Sanitization etc.
- Training program for Haritha Karma Sena (HKS) on health and hygiene, Waste segregation, source level treatment, primary transportation, baling and shredding, fire and safety etc.
- Awareness programme on the proposed "Dumpsite Remediation" project for ULB councillors and officials.
- Awareness program for school and college students on Solid Waste Management.
- Massive awareness campaign on 5Rs (Reuse, Recycle, Repurpose, Reduce and Refuse).

A schedule for capacity building of stakeholders is incorporated in the Social Impact Assessment and Social Management Plan of dump site remediation. The components included in capacity building are livelihood, labour, gender and social parametres. Multifaced intervention for officials, service providers, waste generators and local public are emphasised. Local specific issues on the said components will be mitigated through the capacity building program envisaged.

## 7.3 Grievence Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

# 8

# PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

## 8.1 Approach to Public Consultation

As a part of the project preparation and to ensure that the community support is obtained and the project supports the felt needs of the people; public consultations were carried out as an integral component. A continuous involvement of the stakeholders and the affected community was obtained. The feedback in the consultation sessions has led to substantial inputs for the project preparation including, influencing designs. Consultations involve soliciting people's views on proposed actions and engaging them in a dialogue. It is a two-way information flow, from project authorities to people and, from people to project authorities. While decision making authority would be retained by the project authority, interaction with people and eliciting feedback allows affected populations to influence the decision-making process by raising issues that should be considered in designing, mitigation, monitoring and management plans and the analysis of alternatives.

Well planned public consultation meeting can lead to reduced financial risks of time and cost over- run, legal disputes, and negative publicity, direct cost savings, increased market share through good public image, and enhanced social benefits to the affected local communities. Public Consultation Meeting (PCM) provides an opportunity for the general public, private and community bodies to know the environmental and social impacts as a result of project implementation.

Major purpose of the public consultation of environmental and social issues in the ESIA study is to appraise the stakeholders on potential environmental impacts and collect their feedback so that adequate safeguards can be considered during the planning phases. The objectives of consultation sessions, the procedure adopted and the outputs of the consultation conducted have been described in the following sections.

## 8.2 Objectives

The main objective of the consultation process is to minimize negative impacts of the project and to maximize the benefits from the project to the local populace. The objectives of public consultation as part of this project are:

- To obtain the information on baseline scenario
- Promote public awareness and improve understanding of the potential impacts of proposed projects;
- Identify alternative designs, and mitigation measures;
- Solicit the views of affected communities / individuals on environmental and social problems;
- Improve environmental and social soundness;
- Identify contentious local issues which might jeopardize the implementation of the project.
- Establish transparent procedures for carrying out proposed works;

- Inform the affected populace about the entitlement framework and to settle problems with mutual consent; and
- Create accountability and sense of local ownership during project implementation

## 8.3 Type of Stakeholders

For the subject project, following major groups of stakeholders were identified for consultations at screening stage:

- **Primary Stakeholders** are local people including nearby residents, HKS members, College bus Drivers, Rubber Plantation owners surrounding the dumpsite, Schools, Colleges, Hospitals and Bus Stops, etc.; and
- **Institutional Stakeholders** such as concerned Govt. departments etc.

The stakeholder consultation adopted was rapid appraisal methodology which included face-to face interviews and in-depth interviews institutional stakeholders.

Consultations were done using various tools including, interviews with government officials, dialogues were set-up with the community through structured questionnaire and general environment & social aspects related questions. The public consultation carried out at the various stages of the study has been summarized in this section.

***Figure 8.1 Stakeholder Consultation***

*Source: TSC Package A

# ANNEXURES

*Annexure I-Environmental Screening Checklist*

*Annexure II- OHS RISK ASSESMENT*

*Annexure III-Fire Risk Assesment*

ANNEXURE I

Section II: Environmental Screening Form

INITIAL ENVIRONMENTAL EXAMINATION

Environmental Screening during the Initial Environmental Assessment Stage has been provided below:

Sub-project Details

| | |
|---|---|
| **Name of Sub-project:** | Dumpsite remediation |
| **Sub-project Components:** | Biomining of dumpsite |
| **Sub-project Location (City/Town/Village with ward numbers):** | Ugrankunnu,Kottarakkara,Ward No:26 |

**Stage1: Exclusion List**

| ***Sl. No:*** | ***Non-permissible Activities*** | ***Applicability*** |
|---|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i)any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to sitting criteria as per SWM Rules2016, or (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards sitting criteria for specific industry (various types of treatment plants)types(where mitigation measures are not possible). | Not Applicable |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas | Not Applicable |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides | Not Applicable |

## Stage 2: Environmental Screening Checklist

| Project Details | | |
|---|---|---|
| **Sl.No** | **Components** | **Details** |
| 1 | Project components | Remediation of dumpsite waste in Ugrankkunu |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities/associated facilities) | Biomining of dumpsite<br><br>The project duration is 5 months. It is expected that Mobilisation, machinery installation period is concurrent and is required to set up a 100 to 120 TPD production output sieving and sorting plant and machinery infrastructure. Mobilisation period of one month and operational period of 4 months at site and transportation of material is concurrent. The design considers 3 months of sieving operations/Baling with completion of mobilisation and setting up of plant within 30 days of commencement of Contract. Based on this, an average of 100 to 120 tonnes per day of excavation is to be carried out. |

| 1 | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | No | |
| *(i)* | Critically Vulnerable Coastal Areas (CVCAs), Eco-sensitive Areas (ESAs) | | No | Not applicable |
| *(ii)* | Cultural Heritage site, Protected monuments-listed by ASI/State | | No | Not applicable |
| *(iii)* | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species?<br>If Yes, which is the area? | | No | Not applicable |
| *(iv)* | Other Wetlands/Mangrove/Estuarine Region | | No | Not applicable |
| *(v)* | Natural Habitat areas, roosting / nesting areas, Spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | No | Not applicable |
| *(vi)* | Other Sensitive Environmental Components listed in EMF | | No | Not applicable |
| *(vii)* | Drinking water source, upstream and downstream uses of rivers, etc. | | No | Not applicable.<br>One unused quarry, with a pond exists around 165m aerial distance from site. But the water is not used for any purpose by nearby residents. One pond exists at a distance of 370 m aerial distance from North West Boundary of the MCF/RRF compound |
| *(viii)* | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | No | Not applicable |

| | | | | |
|---|---|---|---|---|
| *(ix)* | Sensitive Receptors a) Habitations/ Households/ Hostels, other special areas, etc.<br>b) School<br>c) Religious Places<br>d) Tourist Areas | Yes | | Religious places: Ugrankunnu Devi temple located at Southern Side with a distance of 130m<br><br>College:Vijaya college of Nursing .located at Northern side with a distance of 435m<br><br>Habitations:Nearest house located at a distance of 90m from the entrance of dumpsite area in Eastern direction. |
| *2* | Is the site in Critical/Over Exploited Ground Water Block. Provide the level of the ground water table | | No | Not applicable |
| *3* | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other(specify) | | No | Not applicable |
| *4* | Describe the type of soil and vegetation onsite | | | Laterite soil,Fodder land with weeds and shrubs |
| *5* | Is the site present in the flood plains as recorded in the last 100 years? Provide the HFL level of the site/region | | No | Not applicable |
| *6* | Existing pollution/contamination or degradation onsite | Yes | | Unscientifically soil capped Dumpsite exists with legacy waste |
| *7* | Any other remark on baseline condition | | No | |

### *Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology and Soils*

| *Sl.No* | *Impacts on Land/Soil Environment* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| *8* | Total extend of land to be covered/built | | | NA |
| *9* | Total extend of land where the waste will be dumped openly/or expected to get contaminated<br>By waste or leachate/material storage | | | NA |
| *10* | Extend of Land to be remediated | Yes | | 1524 Sq. m |
| *11* | Extend of land expected to be under green belt | No | | Project does not have scope to provide green belt as the time frame is very limited |
| *12* | **Will the proposed project cause the following on Land/Soil**: | | | |
| *(i)* | Impact on Surrounding Environmental Conditions<br>Including Occupation on Low-lying lands/floodplains | | No | The project area is not in flood plain/or lowlying area |
| *(ii)* | Substantial removal of Top soil (mention area in sq m) | Yes | | |
| *(iii)* | Any degradation of land/eco-systems expected due to the project? | | No | There will not be any significant changes expected due to biomining |
| *(iv)* | Loss or impact on Cultural/heritage areas/properties | | No | There are no heritage centers nearby |
| *(v)* | Does the project activity involve cutting and filling/ blasting etc? | | No | |
| *(vi)* | Will the project cause physical changes in the project area(e.g., changes to the topography) due to excavation, earth work, or any other activity? | Yes | | Positive change occurs as the waste dump will be removed |
| *(vii)* | Will the project involve any quarrying/mining etc? | Yes | | There will be mining of legacy waste within the existing dump |
| *(viii)* | Will the project/ any of its component contaminate or pollute the Land? | Yes | | There are chances of leachate generation .If not treated there are chances of contamination |
| *(ix)* | Will the project contribute to any long term significant adverse(negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | No | Post Project, the land and environment aspects of the area will improve |
| *(x)* | Will the Project or related activities cause negative impacts on the land in combination with other anticipated/ existing projects in the region? | | No | |

| *Sl. No* | *Impacts on Air and Noise Environment* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| *13* | Will the project cause or increase air pollution due to dust and/or vehicle emissions? | Yes | | During Bio mining there will be increased truck traffic, which may cause air pollution due to truck/machinery emission |
| *14* | Will the project cause or increase pollution due to GHG emissions? | Yes | | Bio mining process release methane gas |
| *15* | Will the project cause or increase odor nuisance? | Yes | | But if bio mining is done in a systematic way odor problem can be reduced |
| *16* | Is there a potential for release of toxic gases or accident risks (eg: potential fire out breaks) | Yes | | Fire fighting measures will be adopted |
| *17* | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | Yes | | Heavy machinery operation and truck movement |

| *Sl.No* | *Impacts on Water Environment* | *Yes* | *No* | *Details* |
|---|---|---|---|---|
| *18* | Will the activities have proposed at the site(s) impact water quality (surface or ground) leachate, runoff, wastes deposition, erosion? | Yes | | Leachate if not treated can create impact on GW |
| *19* | Will the activities proposed at the site(s) impact water resource availability and use-leachate, runoff, wastes deposition, erosion? | Yes | | If bio mining is carried out in Summer season then the chances of run off and leachate is less |
| *20* | Chances of Pollution of Water bodies/ ground water wells, nearby or downstream | Yes | | |
| *21* | Will the activities proposed at the site(s) hinder natural drainage | | No | |
| *22* | Will the activities proposed at the site(s) decrease permeability/rain water percolation | | No | |

| *Sl. No* | *Impacts on Biodiversity and Host Communities* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| 23 | Will the project necessitates cutting of Trees /Loss of Vegetation | Yes | | The plants grown on top of dump site will be removed .The same can be compensated through green belt development after the land has been transfered back to ULB for future projects Also there is proposal to take land area of 1500-2000$m^2$ for bio mining then there is chances of trees cutting .It will be very minimum |

| *Sl.No* | *Impacts on Biodiversity and Host Communities* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| 24 | Will the project necessitate substantial removal of Top soil (mention area in sq.m) | Yes | | |
| 25 | Any degradation of land/eco-systems expected due to the project? | | No | |
| 26 | Will the project result in Health & Safety Risks in the neighborhood including the release of toxic gases, leachate, accident risks | Yes | | Management measures are suggested in EMP |
| 28 | Potential Noise, Light Pollution/ movements causing disturbance to nearby habitats/communities | Yes | | Management measures are suggested in EMP |

| | | | | |
|---|---|---|---|---|
| 29 | Potential disruption to common property, accessibility, traffic disruptions, conflicts, or disruption to the local community within the sub-project area? | Yes | | Trafiic map and Control Measures are provided in ESIA report |

### *Project Categorisation and Need for Safeguards Instruments, Oversight*

| *Project Category* | **E2** |
|---|---|
| **Key Reasons** | Bio minning process can create moderate impacts impact to the base line environment, land/ soil / water /noise environment, biodiversity or to the community.<br><br>Site is not close to any Environmental Sensitive Receptor<br><br>Site specific EMP will be formulated for tackling the impacts<br><br>No heavy metal contamination observed from the labortary analysis of waste samples<br><br>EC/CRZ clearance are not applicable<br><br>Land will be remediated and ULB my use the land for other waste management projects in future |
| **Safeguards Instruments Required** | a) E1: Project-specific EIA (impact assessment considering the project details & location) by Independent Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>b) E2: Project-specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>c)E3: signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities |
| **Additional Responsibilities Expected**(such as i) Specialists to be hired for Physical/Cultural resources, Natural Habitats/others, etc for EIA preparation, and/or supervision),ii)Consultations, iii)<br>Any other aspect | . |

| *Status* | *Agency/Official* | *Name, Signature with Date and Seal* |
|---|---|---|

| | Environmental Engineer | |
| **Checked, Categorized as E2 & ToR issued by** | DESDU/SESDU | |
| | Environmental Specialist | |

## Annexure -II-OHS RISK ASSESMENT

### Introduction:

Open dumpsites and landfills have been created throughout the world, with serious impacts on the environment and public health. In such a context, occupational health and safety (OHS) issues related to workers that have to deal with landfill characterization or management have not been considered sufficiently.

### Scope:

The major scope is of identifying the risks of biomining process and what are the factors contributing to these risks and how these risks can be avoided. The risk is assessed based on the proposed activities during the bio mining phase

### OHS Risk Assessment

In dumpsite remediation and management activities, major risks for workers can derive from the fluxes of contaminants released by dumps, in such an environment, gases, leachate, and dust can be found. The presence of gases can lead operators to states of illness and even generate explosive climates. Moreover, toxic gases could be generated by waste burning, which is not unusual in landfills.

Another aspect that should be taken into account is represented by the effects of both the anaerobic degradation of organic material and the infiltration of rain. The resulting leachate can have negative consequences for the workers both in case of direct exposure (e.g., contact with skin or ingestion) as well as in case of indirect exposure, such as the inhalation of gases and vapours.

Solid waste can also cause injuries due to the presence of sharp objects, while its surface can cause falls and could even collapse due to its poor geotechnical stability Surface deformations are caused by the low level of cohesion of solid waste and its friction angles. Accordingly, risks for workers, such as falling from height and cuts, should be considered together with falling objects/materials and entrapment due to the presence of sinking areas.

Finally, it is worth noting that additional risks derive from the presence of bacteria and animals (e.g., rats and snakes) that can lead to both diseases and injuries Besides these specific risks, it must be noted that other hazardous situations can be found in construction sites, for example, those related to the use of machinery, hazardous substances (which are needed for field tests), and the presence of falling materials and electricity As previously remarked, only a few studies deal with OHS risks in these activities, underestimating the fact that landfill personnel work in direct proximity to numerous sources of danger

In below table, the risk exposure per main activity carried out in dumpsite remediation is illustrated

**Table A1: Risk exposure based on activities**,

| Acitvity | Hazards | OHS risks |
|---|---|---|
| Topographic measures | solid waste, cutting objects, toxic gases, electricity, bacteria, and pathogens | biologic risk, fire risk, chemical risk, electric shock |
| Sampling | solid waste, cutting objects, toxic gases, geotechnical instability, leachate, flammable waste, | biologic risk, chemical risk, slipping and tripping, fire risk, risk of falling from height, risk of |

| | | |
|---|---|---|
| | machinery, bacteria, and pathogens | falling materials, risks related to machinery |
| Preliminary site visits | solid waste, cutting objects, toxic gases, leachate, bacteria, and pathogens, geotechnical instability | risk of falling materials, slipping and tripping, fire risk, biological risk, chemical risk |
| Working area set up | solid waste, cutting objects, machinery, contemporary presence of different contractors | risk of falling materials, slipping and tripping, machinery-related risks, interferential risks |
| Remediation activities | solid waste, cutting objects, toxic gases, leachate, bacteria and pathogens, machinery, geotechnical instability | risk of falling materials, biological risk, chemical risk, slipping and tripping, fire risk, machinery-related risks |
| Logistics/transportation | machinery, vehicles, contemporary presence of several workers | machinery-related risks, transportation-related risks |

**Risk Mitigation measures**

The risk assessment has illustrated the various risks that may come due to the various activities during the bio mining phase, Following levels of control measures can be adopted in order to minimize the impacts of these risks,

*Electrical safety*

• Adequately rated and quick response circuit breakers, aided by reliable and selective digital or microprocessor based electromagnetic protective relays would be incorporated in the electrical system design for the proposed activities.

• The metering and instruments would be of proper accuracy class and scale dimensions

*Fire Fighting Facilities*

- All the fire extinguisher system will be controlled by the Safety Department(officer).
- Safety officer with (OHS risk management experience) and one supporting staff.
- Portable fire extinguishers
- Fire Hydrant system (optional)
- Sprinkler system employed near fire prone areas (optional)
- Fire Buckets

*Personal Protective Equipment (PPE)*

Personal Protective equipment kept onsite is made readily available to plant personnel. Below Table shows the lists of recommended Personal Protective equipment (PPE) onsite.

**Table A2: Summary of recommended PPE according to Hazard**

| Part of body exposed Workplace Hazards Suggested PPE | Part of body exposed Workplace Hazards Suggested PPE | Part of body exposed Workplace Hazards Suggested PPE |
|---|---|---|
| Eye and face protection | Flying particles, molten metal, gases or vapors, light radiation | Safety glasses with side-shields, protective shades, etc. |
| Head protection | Falling objects, inadequate height clearance, and overhead power cords Plastic helmets for top and side impact protection | Plastic helmets for top and side impact protection |
| Hearing protection | Noise | Hearing protectors (ear plugs or ear muffs) |
| Foot protection | Failing or rolling objects, points objects. Corrosive or hot liquids | Safety shoes and boots for protection against moving and failing objects, liquids and chemicals |
| Hand protection | Hazardous materials, cuts or lacerations, vibrations, extreme temperatures | Gloves made of rubber or synthetic material (Neoprene), leather, steel, insulation materials, etc. |
| Respiratory protection | Dust, fogs, fumes, mists, gases, smokes, vapors | ➢ Facemasks with appropriate filters for dust removal and air purification (chemical, mists, vapors and gases).<br>➢ Single or multi-gas personal monitors, if available |
| | Oxygen deficiency | Portable or supplied air (fixed lines). Onsite rescue equipment |
| Body / leg protection | Extreme temperatures, hazardous materials, biological agents, cutting and laceration | Insulating clothing, body suits, aprons etc. of appropriate materials |

*Administrative Controls:*

Developing standard operating procedures (SOPs) for Biomining operations. - Implementing a comprehensive training program for all personnel involved in the project. - Scheduling regular breaks and rotation of tasks to minimize fatigue.

*Environmental Monitoring: -*

Regular monitoring of air and water quality to ensure compliance with safety standards. - Establishing emergency response protocols in case of any unexpected environmental events. Further Disaster management details are provided in ESIA report in Chapter no.6.

**Conclusion**

Waste landfills/Dumspite represent a significant concern worldwide due to the extensive environmental pollution and the related risks to human health and environment. Occupational risks to which the personnel working in these sites is exposed to are scarcely addressed. Occupational Health and Safety Risk Assessment aims to ensure the safe and successful execution of the dumpsite remediation Project

through Biomining. Continuous monitoring and improvement will be essential throughout the project tomaintain a safe work environment

## Annexure III: Fire Risk Assessment

**Introduction:**

Fire Risk assessment are collection of fire prevention measures that identified links and equipment which could cause a fire within a certain area. The assessment aims to identify potential fire hazards, assess the level of risk they pose, and recommend measures to mitigate or manage those risks effectively.

**Fire Risk Assessment**:

The major fire risk causing factors in dumpsite are,

- Fresh solid dumping (Not applicable to Ugrankunnu as the dumpsite is closed)
- Fire incidents have been reported at locations where fresh waste is being dumped
- Inaccessible slopes of garbage were observed (At present covered with vegetation)
- No standard operating plan in place for prevention and management of dumpsite fires
- Cause of fire incident reported is excess release of Methane ($CH_4$) gas due to anaerobic decomposition of the bio-degradable organic waste, high temperature and dry atmospheric conditions.
- Patrolling the site not observed.
- No fire tender (Emergency vehicle) observed at site.
- No Anti-Smog Gun at dumpsite

*Source:CPCB*

**Tentative Mitigation Measures**

**Disposal of Waste:** Fresh waste not to be disposed at the dumpsite where bio-remediation is being undertaken. Organic waste from slaughter house, fish market etc., industrial waste not to be disposed at the dumpsite. It is to be further ensured that industrial waste / E-waste / lithium battery is not dumped at the site. Waste that is being unloaded at the site should be examined visually for potential fire sources fire sources when located, should be neutralized with cover material immediately. Emergency tipping area to be provided to set aside from the immediate working area where incoming loads of material known to be on fire or suspected of being so can be deposited, inspected and dealt with.Adequate compacting of waste to be done to minimize formation of air or methane pockets which can lead to subsurface fire at site.

**Monitoring at dumpsites:** Methane Gas Detectors (on downwind side) to be installed at site so that area with high methane concentration can be identified and preventive actions be undertaken. Further temperature at windrows to be monitored with non-contact infrared thermometer (as used for monitoring human body temperature under COVID circumstances) and records be maintained for any major deviations. The temperature is to be in the range of 35°C to 59°C. Treated leachate / water to be sprayed on the waste when rise in temperature is observed at the bioremediation site. Provision of fencing & frequent patrolling to be done for checking unauthorized entry at dumpsite.

**Arrangements for Fire Extinguishing**: Arrangements for adequate storage of sand / chemical fire extinguishing medias such as foam or powder at site to be made to douse fire in case a fire incident is reported. Usage of water for dousing fire to be avoided. Isolation and allowing rapid natural burnout or smothering with soil to be done for dousing dumpsite fires. Dedicated fire tenders (preferably chemical extinguishing media) and adequate fire safety measures are to be deputed, specifically during summer

season when dumpsites fire is more likely to take place. All mobile equipment or vehicles should be fitted with fire extinguisher and spark arrester.

**Health &Safety of Workers**: Fire protection measures and safety equipment to be provided to all workers at the site and checked before entry to the dumpsite. Workers to be trained for detection of fire and necessary action to be taken in case of fire. Periodic training of workers be conducted in Safe handling of Waste, PPE's, Health & Safety issues etc.

**Mock Drills**

Periodic mock drills to be conducted to prevent fire accidents at dumpsites. Mock drills will make the workers and staff more familiar with fire incidents and hence easy remediation

# Executive Summary

The dumpsite of Kottarakkara ULB is at Ugrankunnu (9°0'4.68"N 76°45'33.73"E) is about 3 km away from the Municipal Head Quarters. Dumping of solid waste at Ugrankunnu started in 1994 and continued till 2018 and was stopped due to public protest. At present, the municipality collects only dry waste from residences and institutions and store in MCF and the materials are recovered and sorted at RRF.

Originally a burial ground, the site had an area of 0.24 hectares (60 cents) and before converting it to a waste processing area, an additional land of 0.4046 hectares (1 acre) adjacent to it was acquired.

Almost 30 years old legacy waste of Ugrankunnu dumpsite was capped with 40 cm thick soil. This soil capping is not done scientifically, and the waste still remains. Current condition of the legacy waste in Ugrankunnu is a mixture of soil and vegetation.

The proposal is to remediate the dumpsite in compliance with the Municipal Solid Waste Management Rules 2016 and other National and State Guidelines for management of Solid Waste by sustainably removing the accumulated legacy waste and to use the site for other activities.

A study of the baseline environmental quality was done to assess the level of impact on the environment due to the dumping of unprocessed solid waste in open area.

Sampling and testing to assess the contamination levels of the source and to identify the major pathways and receptors of concern were done and are detailed in the subsequent sections. Results of physical and chemical analysis of legacy waste collected from the dumpsite using borehole technique are also detailed in this report.

Sampling and analysis of physical and chemical characteristics of legacy waste, soil, air, noise and water reveals that these environmental components are not much contaminated due to dumping of waste. It can be inferred that the waste dump with soil cover in between and red soil top covering helped the degradation of organic matter. The impermeable sub strata of laterite, rocky terrain may be another reason for not polluting the ground water and surrounding water bodies.

Total station survey was carried out to estimate the quantity of legacy waste which is predominantly of a mix of inorganic material, stones, including silt material. Based on the Total Station survey details the total volume of legacy waste spread over 37.66 cents and 4.3 m height is 8245 cubic meters. With a density, considered to be 1.042 Tonnes/cu m, the total quantity of waste dumped is estimated as 8591 Tonnes.

It is estimated that out of 8,591 Tonnes of legacy waste, approximately there are 7,803 Tonnes of soil/earthen materials, 518 Tonnes of materials for RDF/plastics, 109 Tonnes of Recyclables/Glass along with an expected 2% Inert, which is approximately 160 Tonnes.

Evaluation of various techniques for remediating the existing dumpsite reveals that biomining is the best option for remediating the dumpsite at Ugrankunnu. The remediated land can be utilised for establishing other solid waste management activities of Kottarakkara Municipality. The bioremediation works has been designed on the basis of physical analysis, chemical analysis reports, field inspections, topographical conditions.

As Kerala does not have facilities to consume the RDF generated, it has to be transported to factories in neighbouring States and this would enhance the cost of the bio-remediation. The possible forward linkages are identified in the nearby state, Tamil Nādu and is approximately 390 km from dumpsite at Ugrankunnu. This implies that the cost of transportation of the RDF will be high. Recyclables would be predominantly glass, which would be sent to approved recyclers and traders of recyclables. However, there are possibilities for utilisation of recyclables/RDF in the neighbouring state and is recommended to be the responsibility of the successful bidder.

Soil and stones can be used for filling of land for playground, formation of medians in the ongoing highways, ring road projects or Vizhinjam port, and similar construction sites. A part of soil/stones can also be disposed in low lying areas within the site. It is advisable to avoid use of this soil for agriculture/ fruit bearing tree plantations. Another feasible option is to use as daily cover in sanitary landfill facilities.

The project duration is proposed to be 5 months. It is expected that the time for mobilisation, and installation of machinery would be concurrent. It is required to set up a 100 to 120 TPD production output sieving/sorting plant and machinery infrastructure. The design considers 3 months of sieving operations/baling with completion of mobilisation and setting up of plant within 30 days of commencement of contract. Based on that, the excavation capacity is to be on an average of 100-120 tonnes per day.

Total Project cost including all machineries required for processing, transporting is estimated to be [redacted] which accounts to be about [redacted] per cum (including GST, EMP and SMP cost and cost index).

[redacted]

# 1. INTRODUCTION

Kottarakkara Municipality proposes to remediate the old solid waste dumpsite following the Norms, Guidelines and Standards notified at National and State level. Dumping of municipal solid waste was started in 1994 and continued till 2018 when public protest led to stopping of the practice. The old dumpsite is covered with ordinary soil and it is a non-active dumpsite. It is proposed to remediate the site for establishing an MCF for the management of NBDW in the recovered land. The land is valuable as there is no other land available for establishing solid waste processing facilities, therefore, remediation of the existing dumpsite is essential for upgrading the existing NBDW facilities.

A study/assessment of the baseline environmental quality was done to assess the level of impact on the environment due to dumping of unprocessed solid waste in the open area. This feasibility report is proposed for the remediation of dumpsite in the Ugrankunnu area of Kottarakkara Municipality in Kollam District, Kerala.

The Feasibility Report (FR) is prepared following guideline/norms specified by the Central Public Health and Environmental Engineering Organisation (CPHEEO), Government of India (GoI); Ministry of Housing and Urban Affairs (MoHUA), GoI; Ministry of Environment, Forests and Climate Change (MoEF&CC), GoI; Central Pollution Control Board (CPCB) and Local Self Government Department (LSGD), Government of Kerala (GoK).

# 2. GENERAL DESCRIPTION OF THE PROJECT

The dumpsite is located at Ugrankunnu (N 9°0’4.58”, E 76°45’32.29”), a hillock in Kottarakkara Municipal area, and about 3 km away from the Municipal Head Quarters. It was a burial ground, with an area of 0.24 hectares (60 cents) and before converting it to a waste processing area, an additional land of 0.4046 hectares (1 acre) adjacent to it was acquired. Therefore, now a total area of about 0.6446 hectares (1.5 acres) is available in the solid waste processing plant compound. The area of dumpsite is only 0.24 hectares, remaining area is utilised for managing NBDW.

Kottarakkara was a Grama Panchayat and on January 14, 2015 it has been upgraded into a Municipality. At present, the municipality is collecting only dry waste from households and institutions and the dry waste is stored in sheds situated near to the dumpsite. The site is about 3 km away from the Municipal Head Quarters. Location of dumpsite is shown in the map given below Figure 1 and details of the dumpsite are provided in Table 1.

**Table 1: Dumpsite Details**

| | |
|---|---|
| Name of Muncipality | Kottarakkara |
| District | Kollam |
| Location | Ugrankunnu,Kottarakkara |
| Geo Coordiantes | 9°0'4.68"N 76°45'33.73"E |
| Total Land area | 1 Acre 50 Cents |
| Dumpsite area | 37.66 Cents |

# 3. DEMOGRAPHY

## 3.1 Demography

As per the Municipality survey, 2022 The present population of the Kottarakkara Municipality is 33,772 with 9,273 residential units. Ugrankunnu dumpsite at Ward No. 26, has a population of 1,188 as per the Municipality statistics

## 3.2 Access

Kottarakkara Municipality in Kollam district is at the meeting point of National Highway (NH 744) and Main Central (MC) road. It is at a distance of 27 km from the Kollam District Head Quarters (Chinnakkada), with an extant of 17.67 sq.kms, encompassing of 29 wards, the municipal area falls in the revenue village of Kottarakkara. It shares boundary with Mylom, Melila, Vettikkavala, Ummannoor, Veliyam, Neduvathur Grama Panchayats.

Ugrankunnu dumpsite is at a distance of 0.4 km from the Kollam -Punalur -Thenkashi road. The road in front of dumpsite leads to Vijaya College of nursing, which is at a distance of 0.5 km from dumpsite entrance. Along the road another sensitive receptor Ugrankunnu Bagavathi temple also exists. Road to the site is narrow and steep, with a width of about 3 m. The existing road can be utilised for remediation activity, avoiding public inconvenience and is detailed in Section 3.9, Traffic Management, in ESIA. The transportation layout of the raod network near to dumpsite is illustrated in figure 2

### 3.2.1 Transportation Corridor

- NH Highway 744 – connecting Kottarakkara to Punalur
- State Highway 1 – MC road
- Kottarakkara – Oyur road (PWD)
- Kottarakkara market junction road (PWD)

There are other roads connecting Kottarakkara to Puthoor, Neeleswaram and Sasthamcotta. The main sections for traffic bottlenecks are along NH744, Market road and near Mini Civil Station. Pulamon junction also faces this issue to a lesser degree as it is the location of both the KSRTC bus depot and the Private bus depot. The entry and exist of buses creates traffic blocks near this junction, which in turn increases pressure near the central business district of Kottarakkara town. Kottarkkara also has a railway station some distance away from this junction. All of these factors may contribute to the large traffic volume in this area.

Kottarakkara is connected to Thanjavur in Tamil Nadu through NH 744. Several important forward linkages (namely cement companies) lie along this route, near Thiruchirapalli. Solid waste Transportation vehicles travelling from Ugrankunnu along NH 744 take around 9-12hrs to reach Thiruchirapalli.

Site specific traffic plan is developed and it has been illustrated in ESIA report. Below figure 2 shows the site-specific traffic map developed

**Fig.2: Traffic Map**

*Source: TSC Package A*

## 3.3 Land Use

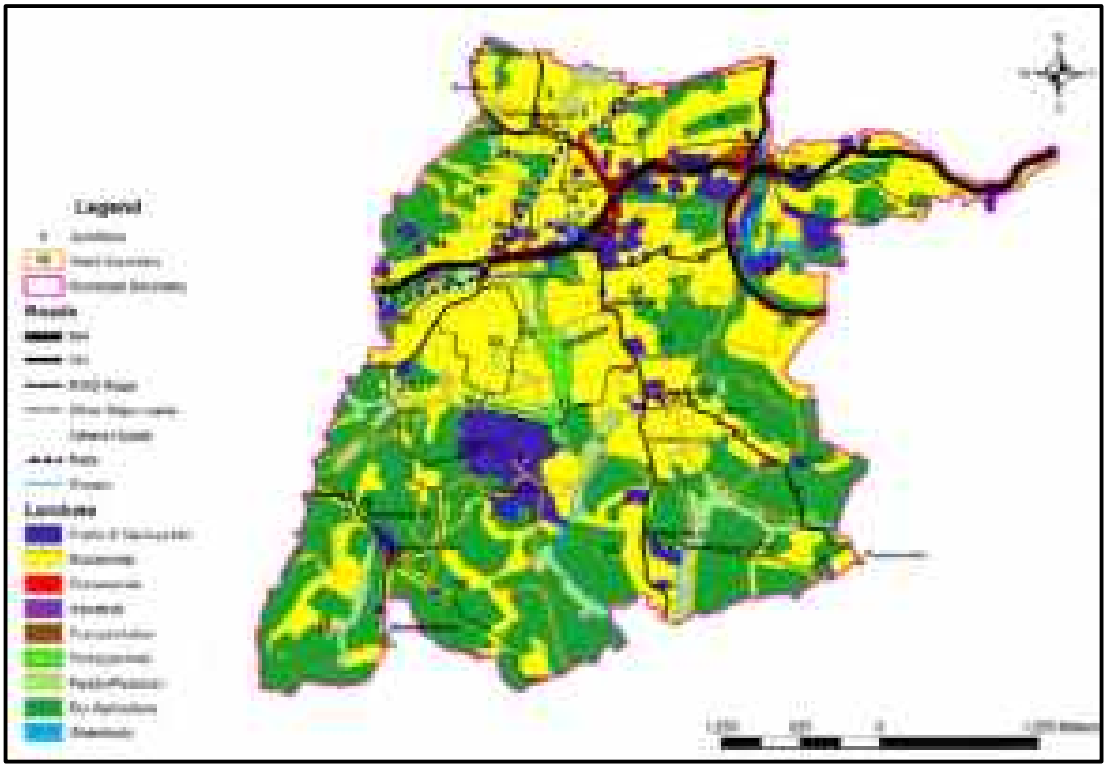
The existing land uses are classified under several categories namely residential, commercial, industrial, public and semi-public, agricultural, park and open spaces, transportation, water bodies etc. Existing Land use breakup of 2016 and land use map – Kottarakkara Municipality – Kottarakkara Municipality is given in Table 2 and Fig 3.

**Table 2: Existing Land use breakup of 2016 – Kottarakkara Municipality**

| Description | Area (sq. km) | Percentage (%) |
|---|---|---|
| Residential | 7.51 | 42.5 |
| Commercial | 0.33 | 1.87 |
| Institutional | 0.03 | 0.17 |
| Agricultural | 7.84 | 44.36 |
| Recreational, open space (Public and semi-public) | 1.43 | 8.09 |
| Transportation | 0.42 | 2.38 |
| Water bodies | 0.11 | 0.62 |
| Slums | 0 | 0 |
| Forest | 0 | 0 |
| Revenue Surplus land | 0 | 0 |
| Other Vacant land | 0 | 0 |
| **Details of drains in the ULB** | | |
| Open drains | 7 | |
| Closed drains | 14.35 | |

* Source: Land Use Survey, 2016

As per the land use map, Ugrankunnu dumpsite area comes under dry agriculture/residential area. The dumpsite is surrounded by Rubber plantations and some houses in south -eastern side of the dumpsite-MCF/MRF compound.



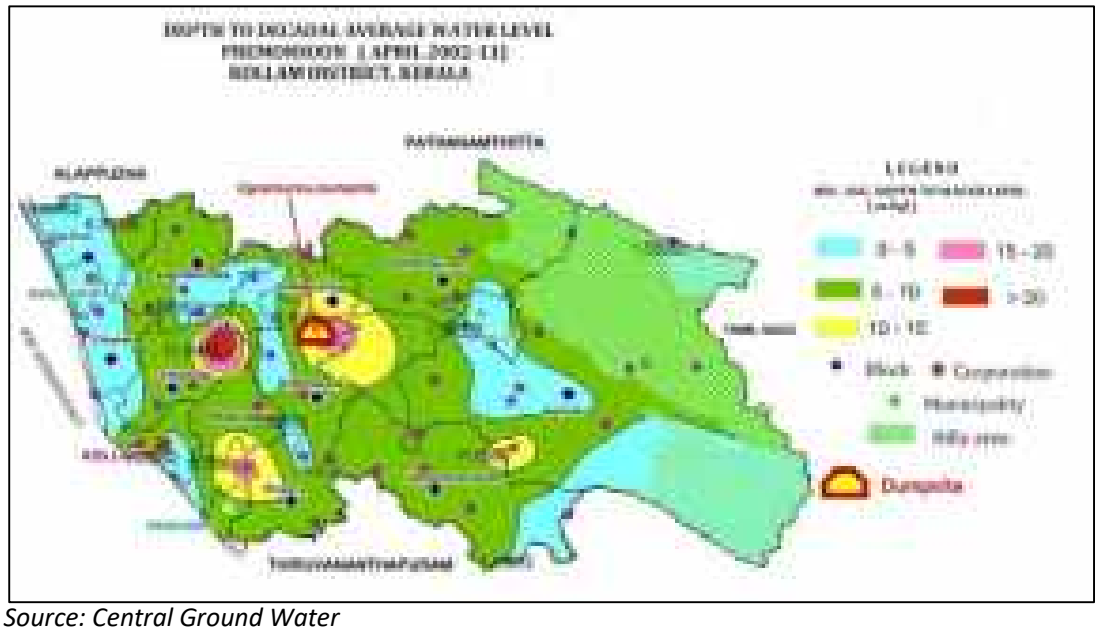


**Fig.3: Land use map – Kottarakkara Municipality**

## 3.4 Water Table

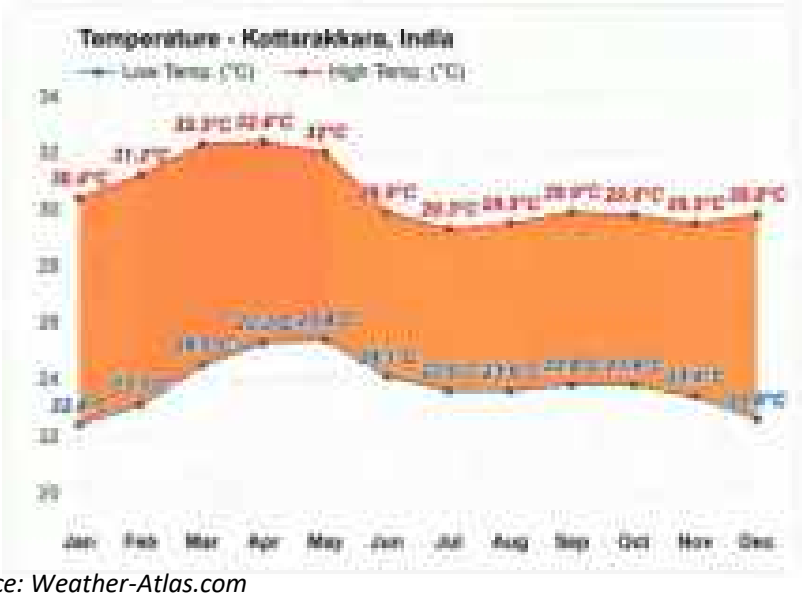
Depth of decadal average water level during pre-monsoon, post-monsoon and hydrogeology of Kollam District is shown below. The Ugrankunnu in Kottarakkara Municipality is shown in the maps.

*Source: Central Ground Water*

**Fig.4: Depth of decadal average water level during pre-monsoon**

*Source: Central Ground Water*

**Fig.5: Depth of decadal average water level during post-monsoon**



*Source: Central Ground Water*

**Fig.6: Hydrogeology of Kollam District, Kerala**

Depth of decadal average water level at Ugrankunnu, Kottarakkara during pre-monsoon is ranging from 10-15 m below ground level (BGL) and Post-monsoon, the ground water table depth can rise from 10m depth to 5m depth BGL. This data indicates that the dumpsite situated at higher elevation and the water table is well below. Ugrankunnu has hard rock mostly, yielding 1 l/s of ground water, having high iron content.

## 3.5 Climate

Temperature in Ugrankunnu is mostly moderate. The project site experiences three seasons. The winter from December to February is followed by summer between March and May, the monsoon season between June to September and the post-monsoon season between October and November. The place experiences temperatures of 22°C - 32°C. Month wise average temperature of Kottarakkara Municipal area is shown in the chart below:

*Source: Weather-Atlas.com*

**Fig.7: Average Monthly Temperature data of Kottarakkara Municipality**

Kottarakkara Municipality including Ugrankunnu receives an average monthly rainfall of about 209.75 mm with rain around 180 rainy days. The months of July, August, September and October receive highest rainfall. Rainfall is a factor to be considered in the solid waste processing as this contributes in leachate formation. Month-wise average rainfall data of Kottarakkara Municipality is shown in the figure below

*Source: Weather-Atlas.com*

**Fig.8: Average monthly Rainfall data of Kottarakkara Municipality**

## 3.6 Natural Hazards

- **Flood Proneness**

  As per the flood prone area mapped by KSDMA, the Ugrankunnu dumpsite area is not flood prone, at a higher altitude and away from water bodies. Topography of the area indicates easy drainage of storm water. Flood map of Ugrankunnu, Kottarakkara is shown below.

*Source: KSDMA, GoK*

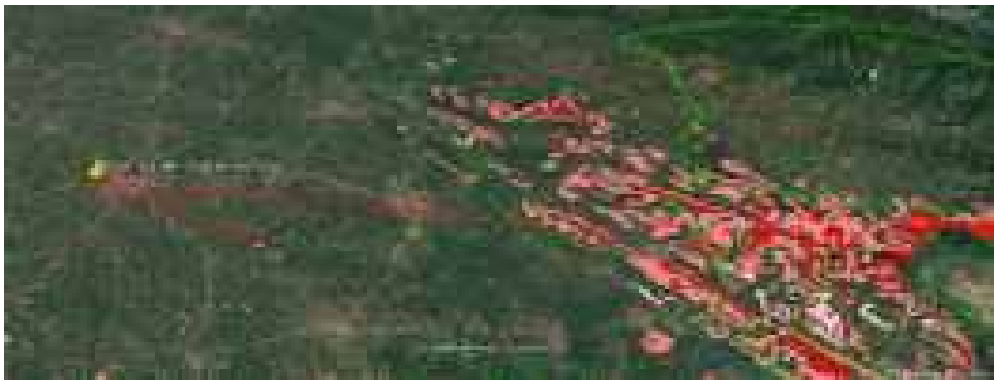


**Fig 9: Flood Map of Ugrankunnu, Kottarakkara**

- **Drought data**

  There is no historical data available on drought affected in Ugrankunnu area of Kottarakkara Municipality, Kollam District.

- **Land Slide Hazard Proneness**

  As per the landslide hazard zonation map published by the Kerala State Disaster Management Authority (KSDMA), the Ugrankunnu site is free from landslide proneness. The high land slide hazard zone is situated at a distance of about 27 km and medium land slide hazard zone is at about 11 km away from the Ugrankunnu dumpsite situated in the Kottarakkara Municipality.

*Source: KSWMP TSC Package-A*

**Fig 10: Land Slide hazard map of Ugrankunnu, Kottarakkara**

- **Seismicity and associated hazards**

As per the seismic map published by the Kerala State Disaster Management Authority (KSDMA), the Ugrankunnu site is not affected by earthquake incidents and lineaments. Kollam district lies in earth quake hazard zone III.

# 4. DESCRIPTION OF THE DUMPSITE

## 4.1 Physical Feature of the Site

The area is at a higher altitude with lateritic soil. Natural vegetation, local species of trees including rubber are the predominant flora of the area. The wastes are covered with a soil capping in Ugrankunu dumpsite. This soil covering is not scientific. The legacy waste in Ugrankunnu which are mixed with soil, bushes and shrubs. The vegetation cover acts as breeding ground for many rodents, reptiles, dogs etc which can cause significant health effects to nearby inhabitants. In same compound RRF/MCF facility of Kottarakara Municipality exists and one crematorium is also being constructed, which is in final finishing stage.

There is one non accessible pond, formed at an abandoned quarry, 165 m away from the dumpsite. There are no natural drains to the pond. The water is not used by any communities nearby.

## 4.2 Current Site Management

Dumping of municipal solid waste was started in 1994 and continued till 2018, when public protest led to stopping of the practice. At present, there is no dumping, and the accumulated waste was covered with red earth in a slopped manner with a height of about 0.40 m and there is only a minimum chance of stagnation of water over the dumpsite. Storm water over the dump area is effectively drained due to the gentle slope of the covered area. There is no rag pickers or labour force available for removal of recoverable material from the dumpsite as it is fully covered with red earth. Land available at Ugrankunnu dumpsite is a part of the new Solid Waste Management Plan for upgradation of existing NBDW facility at Kottarakkara Municipality being finalized.

## 4.3. Site History Including Public Protest

It is learned that there were some public protests due to dumping of waste in Ugrankunnu area during the year 2018. It is also understood that the Municipality discontinued the dumping and the area is maintained by covering the dump with red earth for avoiding bad odour and fly nuisance in the area.

*Source: KSWMP TSC Package-A*

**Fig.11: Ugranknnnn Dumpsite, Kattaraklcara**

## 4.4. Directions From different Statutory bodies

### 4.4.1 NGT Directions & orders

The National Green Tribunal (NGT) has set norms and guidelines (O.A. No. 606/2018) to address legacy waste accumulated at long-operating dumpsites, to mitigate environmental and health hazards. The norms focus on closure and remediation of dumpsites, waste segregation and treatment using appropriate technologies, conducting Environmental Impact Assessments (EIAs), implementing land use planning and zoning regulations, monitoring and compliance measures, and promoting public participation and awareness regarding legacy waste management. These guidelines aim to stabilize dumpsites, prevent further pollution, and involve community's indecision-making and risk education.

### 4.4.2 Local Self Govt. Department-Guidelines

The remediation of dumpsites is further directed by Honourable NGT in its order OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. Remediation of Legacy Waste Dumpsites through Bioremediation – G.O.(Rt)No.2629/2022/LSGD Dated, Thiruvananthapuram, 29-10- 2022.

### 4.4.3 KSPCB – Guidelines for dumpsite remediation

The Kerala State Pollution Control Board (KSPCB) has established guideline (PCB/HO/SEE2/Model City/Kozhikode corporation/2019 dated 09/09/2021) for dumpsite remediation to address the environmental and health impacts of waste disposal. The recommended steps include conducting a site assessment, developing a remediation plan based on risk assessment, selecting appropriate remediation technologies, implementing remediation activities under supervision, verifying the success of remediation, and ensuring long-term management and monitoring of the site. By following these guidelines, the KSPCB aims to mitigate the adverse effects of waste disposal, protect the environment, and safeguard public health.

### 4.4.4 CPCB – Guidelines

Hon'ble NGT warned that due to incremental growth of Municipal Solid Waste (MSW), these MSW dumps are converting into virtual mountains. Hon'ble NGT further directed that every city/town should adhere to clause 'J' of Schedule–I of SWM Rules, 2016. Finally, Hon'ble NGT directed CPCB to propose Standard Operating Procedure (SOP) for implementation of Bio-mining and Bioremediation of legacy solid waste.

### 4.4.5 Swachh Bharat Mission (SBM) advisory

The advisory on dumpsite bioremediation addresses the challenges of legacy waste and promotes sustainable waste management practices and emphasizes the importance of dumpsite bioremediation as a sustainable solution for managing legacy waste. By adopting these guidelines, municipalities can address the environmental and health risks associated with dumpsites and promote a cleaner and healthier living environment for communities.

### 4.4.6 Central Public Health and Environmental Engineering Organization (CPHEEO) guidelines

The guidelines aim to provide a comprehensive approach to remediate dumpsites in a safe and environmentally sustainable manner. Key points from the guidelines include conducting site

assessments, segregating waste, and implementing engineering and biological measures to control contamination, treating leachate to prevent groundwater contamination, and conducting post-remediation monitoring. These guidelines are crucial to ensure effective and environmentally sound dumpsite remediation that protects public health and the environment.

# 5. SCOPE OF WORK AND OBJECTIVE

Though Kerala has made achievements in introducing the practice of source level and decentralised mode of treatment and disposal of municipal solid waste, lack of common facilities force the urban local bodies to use the compound of their Common Treatment Facility for dumping of waste. Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Ugrankunnu includes the following steps,

- Conducting detailed field investigations – Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. And
- Environmental Baseline and Waste Analysis by M/s Poluchem Laboratories Pvt.Ltd.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the by-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (100% land recovery – Biomining, Capping partially Biomining & Capping)
- Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages
- Utilization/Management of By-products and Environmental & Social categorization as per the Environmental Management Framework – Vol II Part A.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Baseline assessment, impact & risk assessment, mitigations measures and Environmental Management & monitoring plan and its budget.
- Social Safeguards – Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.

- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport, Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 Objectives

The objectives of this project are,

a. To assess the existing dumpsite with Historic waste at Ugrankunnu based on the rapid risk assessment comprising of a set of basic technical, environment and social criteria and further technical investigations, test and field surveys.
b. Preparation of a Feasibility Report including the options available for bioremediation, processes, and studies conducted at site, components and equipment required based on the ground conditions at Ugrankunnu.
c. Prepare a project implementation time line based on the final option recommended for bioremediation.
d. Estimating the project cost.

# 6. COMPOSITION, CHARACTERISTICS OF LEGACY WASTE AND ITS IMPACTS

## 6.1 Investigation Strategy

The preliminary assessment was focussed on locations where the highest contaminant concentrations are expected and the locations of the most sensitive land use. It was necessary to verify all potential sources, pathways and receptors at the site.

To achieve this objective, a different investigation strategy was applied for each type of contamination so that the point of attention can be given to the fieldwork and laboratory work which are specified in the Protocol investigation strategy of preliminary site investigation. The following baseline environmental assessment were done at the Ugrankunnu site at Kottarakkara Municipality.

a. Physical and Chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Ground Water and Surface Water analysis
b. Sampling and testing program to assess the contamination levels of the source and identification of the major pathways and receptors of concern as defined below
c. Analysis and interpretation of exploratory data including concentration levels compared with the appropriate standards
d. Risk assessment based on applicable source-pathway-receptor-combinations for human health
e. Reporting
    - Pathways: leachate, surface and groundwater, soil and air tested for parameters as CPCB specified standards
    - Receptors: to identify to locate sampling and testing at the critical locations

## 6.2 Detailed Investigation

The detailed investigations carried out for the legacy waste dumpsite is given in the table 3 below,

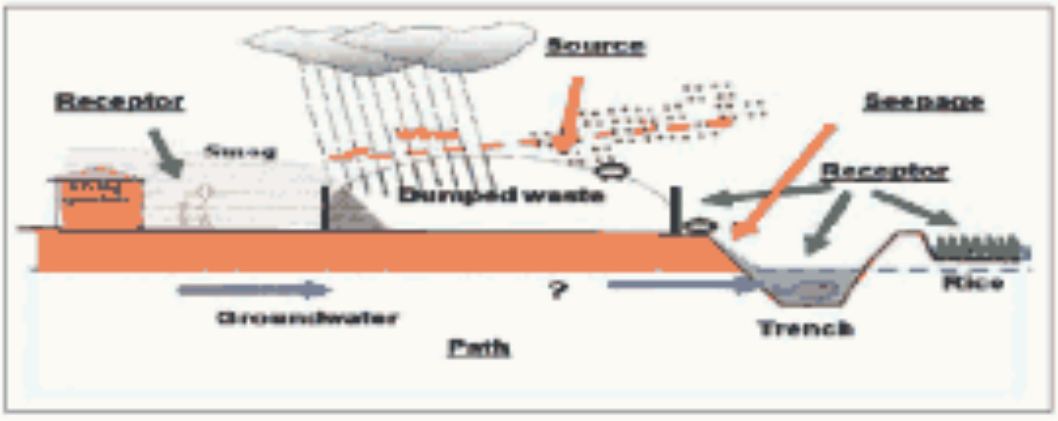
**Table 3: Site Investigation carried out**

| S.No | Parameters | Sampling Nos. |
|---|---|---|
| *1* | *Geotechnical Investigation* | |
| A | Boreholes up to 10m depth (as per CPHEEO Manual) | 1 |
| B | Permeability test- (as per CPHEEO Manual) standard penetration test SPT and collection of undisturbed samples - Soil Investigation – Classification, gradation, Atterberg's limit, Bulk density, dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, strength, compressibility (vertically-3 samples per borehole) | 1 |
| *2* | *Waste & Environmental Analysis* | |
| A | Leachate Analysis (TCLP usepa 1311) (SCHEDULE II of SWM rules, 2016), Suspended solids, Dissolved solids (inorganic),pH, Ammonical nitrogen (as N), Total Kjeldahl nitrogen (as N), BOD, COD, Arsenic (as As), Mercury, Lead, Cadmium, Copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds | No Leachate at Site |
| B | Physical Analysis of waste (As per CPHEEO manual) including Density, Bulk Density, Moisture Content, Size of waste Constituents, Calorific Value | 2 |
| C | Chemical Analysis of waste/soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), total Carbon, C/N ratio, calorific value, Bio-chemical – biodegradable factor | 1 |
| D | Ground Water (BoreWell -1 Shallow Well-3): pH, Colour, EC, Turbidity, SS, TDS, TOC, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, TKN, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total Coliforms (IS 10500 – 2012) | 4 |
| E | Ambient Air Quality (Sulphur Dioxide (So2), Nitrogen Dioxide (No2), Particulate Matter 2.5, Particulate Matter 10, Ozone (O3), Lead (Pb), Carbon Monoxide (CO), Ammonia (NH3), Benzene (C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 H | 2 |
| F | Ambient Noise Level (E(p)Rules) for 24 hours | 1 |
| Source: Detailed Investigations Conducted as per PIM | | |

## 6.3 Methodology of Sampling

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed sampling methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. Table 4 shows the strategic location details of samples selected for the detailed investigation.

**Table 4: Details of sampling location**



| Sl No | Description | Sampling location | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sensitive receptor<br>Dumpsite entry point | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind-rose data the air sampling location fixed at two locations |
| 2 | Noise (1 Location) | Dumpsite entry point | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 3 | Ground water (4 Locations) | 1 bore well within the dumpsite area<br>3 shallow wells near to dumpsite area | The dumpsite is located at a higher elevation with slopes in South-eastern and Western direction. Water samples are collected based on this. |
| 4 | Bore Hole (1 Location) | Within the dumpsite area | |
| 5 | Legacy Waste (1 Location) | Within the dumpsite area | |

** Source: TSC Package A*

## 6.4 Environmental and Social Baseline Data

i. **Study Area**

- As a primary requirement of preliminary environment and social assessment, the following areas were covered
  - Source (Existing dumpsite)
  - Receptors (Buffer zone)
  - Collection of primary baseline data within 500 m.
  - Collection of Secondary data

*Source: KSWMP TSC Package-A*

**Fig.12: Flowchart of possible pathways for contamination**

Sampling and testing program were carried out to assess the contamination levels of the source and identification of the major pathways and receptors of concern and are detailed in below tables.

Further Analysis and interpretation of exploratory data including concentration levels compared with the appropriate standards are carried out along with Risk assessment based on applicable source-pathway-receptor-combinations for human health.
Accordingly, Pathways such as leachate, surface water, ground water, soil and air were tested for parameters specified by CPCB. Receptors are identified to locate sampling and testing at the critical locations.

Sampling stations were selected at the dumpsite and around the site based on guideline/norms followed for selection of samples for waste, soil, water, ground water, noise and ambient air. The selected sampling locations for the above components are given in the table 5.

**Table.5: Sampling locations selected in and around dumpsite at Ugrankunnu**

| SL No. | Parameter | Locations | Co-ordinates |
|---|---|---|---|
| 1. | Legacy Waste | Mid portion of the dumpsite | |
| 2. | Soil | Mid portion of the dumpsite below the waste heap | |
| 3. | Air | Near Main Gate, Ugrankunnu Dumpsite | N- 9°00'13.04" E -76°75'93.12" |
| | | Vijaya College of Nursing, Kottarakkara | N- 9°00'44.26" E -76°75'66.10" |
| 5. | Noise | Near Main Gate, Ugrankunnu Dumpsite | N- 9°00'13.04" E -76°75'93.12" |
| 6. | Borewell | Near Ugrankunnu MCF/RRF | N- 9°00'11.66" E -76°75'91.55" |
| 7 | Shallow Well | Mr.Shanavas.S, Ahmilbeedu | N- 9°00'11.45" E -76°76'00.25" |
| | | Mr.Thulaseedharan-Aswathy Bhavan | N- 9°00'48.45" E -76°76'00.25" |
| | | Mrs.Lekha, Pazhankanjivilla | N- 9° 0'10.80" E- 76°45'30.00" |

*Source: TSC Package A*

Sampling and analysis of waste, soil, air, noise and ground water were done following norms/guidelines of CPCB and CPHEEO. Method of sampling and testing was as per IS 3025 and CPCB specified analytical methods. The baseline rapid environmental assessment of the dumpsite was done in and around the dumpsite considering pathways and receptors. Method of sampling and analysis following the approved norms/procedure was ensured through two competent NABL accredited laboratories.

There is no surface water like pond, stream, river etc. near to the dumpsite, therefore unable to collect water samples from such environmental feature. It was identified that there is an abandoned quarry pit situated 200 m away from the dumpsite but there is no chance of contamination of that water body as it is a pit situated within the granite block. Moreover, it is inaccessible due to fencing around the abandoned quarry area.

Sampling stations selected for ground water and ambient air quality monitoring stations shown in Fig 13.

*Source: KSWMP TSC Package-A*

**Fig.13: Sampling and Monitoring Stations**

### 6.4.1 Ambient Air

Baseline ambient air quality monitoring was done near to the site as per the procedure specified by the CPCB by engaging a competent NABL accredited laboratory. Air quality monitoring was done by establishing two monitoring stations. One monitoring station was fixed near to the Main Gate of Dumpsite Ugrankunnu, Kottarakkara Municipality which can be taken as leeward side of the dumpsite. Another monitoring station was fixed near to the major receptor, Vijaya College of Nursing, Kottarakkara which is situated at the forward side of dumpsite which is 420 m away. Monitoring was done for a period of 24 hrs for the common parameters specified by the CPCB and the test result is given in table 6.

**Table.6: Results of Ambient Air Quality Monitoring done near to Ugrankunnu**

| Parameters | Test Method | Locations | | Limits as per NAAQS specified by CPCB |
|---|---|---|---|---|
| | | Main Gate of Dumpsite | Vijaya College of Nursing | |
| Particulate Matter ($PM_{10}$) | I S 5182 Part 23 2006RA2012 | 50.3 µg/m³ | 36.5 µg/m³ | 100 µg/m³ |
| Particulate Matter ($PM_{2.5}$) | CPCB | 23.4 µg/m³ | 15.6 µg/m³ | 60 µg/m³ |
| Sulphur Dioxide ($SO_2$) | I S 5182 Part 2 2001 RA 2017 | 13.4 µg/m³ | <1 µg/m³ | 80 µg/m³ |
| Nitrogen Dioxide ($NO_2$) | IS 5182 Part 06 2006 RA2017 | 19.5 µg/m³ | 3.2 µg/m³ | 80 µg/m³ |
| Carbon monoxide (CO) | SOP/PCL/COA/ 17 | 0.8 mg/m³ | 0.4 mg/m³ | 4 mg/m³ |
| Hydrogen Sulphide ($H_2S$) | IS 5182 Part 07 2021 | < 1 µg/m³ | < 1 µg/m³ | -- |
| Methane ($CH_4$) | IS 13270 :19992 RA 2003 | Not Detected | Not Detected | -- |
| Odour | ---- | Unobjectionable | Unobjectionable | -- |

**Source: Pollachem Laboratories Pvt.Ltd*

The baseline ambient air quality monitoring results indicate that all parameters are well within the specified limit. Therefore, there is no air pollution noticed in the dumpsite area

### 6.4.2 Noise

Baseline ambient noise levels were monitored utilizing service of a NABL accredited expert agency, Pollachem Laboratories Pvt. Ltd., Ernakulam. Measurement of Noise levels were made near Main Gate of Dumpsite Ugrankunnu Kottarakkara Municipality. Results of monitoring of ambient noise levels at Ugrankunnu is provided in Table 7

**Table.7: Result of monitoring of ambient noise levels at Ugrankunnu**

| Location | Main Gate of Dumpsite Ugrankunnu Kottarakkara Municipality | |
|---|---|---|
| **HOURLY INTERVAL** | **OBSERVED VALUE** | **LIMITS SPECIFIED BY CPCB** |

| $L_{eq}$Day | 50.4 dB (A) | |
| $L_{eq}$Night | 50.2 dB (A) | |

**Source:Polluchem Laboratories Pvt.Ltd*

The results while comparing with Noise standards, it can be seen that at day-time the noise levels are within the prescribed limit. In night-time there is a slight increase of 5 db. There is a mobile tower situated nearby sampling station and during certain occasions there are chances for operation of DG sets attached to mobile tower and the operation of DG set during night-time can affect the noise level.

### 6.4.3 Ground Water Quality Monitoring

Sampling and analysis of borewell and shallow wells were done through an NABL accredited laboratory namely, Poluchem Laboratories Pvt. Ltd. Ernakulam. The water environment was studied by collecting Ground water samples from one bore well within the MRF/MCF/dumpsite compound and 3 Dug well samples from nearby houses

Results of ground water quality monitoring conducted near to the dumpsite in a borewell, and open wells existing nearby area is given in table 8 to 11.

**Table 8: Results of monitoring of Borewell at Ugrankunnu dumpsite**

| Parameters | Test method | Results | Acceptable Limit As per IS – 10500 – 2012 |

MDL- Minimum Detection Level
*Source:Pollachem Laboratories Pvt.Ltd*

Results of groundwater sample indicates that all parameters are well within the limits specified as per IS 10500:2012. This indicates that there is no physical and chemical contamination of ground water from the existing dumpsite at Ugrankunnu, Kottarakkara, Kollam.

Results of biological parameters monitored in the borewell/groundwater is given in the following table 9.

**Table. 9: Results of monitoring of Microbiology Analysis of borewell at Ugrankunnu**

| PARAMETERS | UNIT | TEST METHOD | RESULTS | LIMIT AS PER IS 10500:2012 |
|---|---|---|---|---|

Results of physical and chemical quality monitoring of three shallow wells/ground water conducted in and around Ugrankunnu dumpsite indicates that all parameters are well within the limits except pH and turbidity are slightly above the acceptable limit specified by IS 10500:2012 (Observed value of pH = 5-6, Acceptable limit of pH = 6.5-7.5, Observed value of turbidity = 1.8-4 NTU, Acceptable limit of turbidity = 1 NTU).

Results of biological parameters monitored in the shallow/groundwater is given in table 11.

**Table 11: Results of monitoring of Microbiology Analysis of three shallow wells around Ugrankunnu Dumpsite**

| Parameters Tested | Unit | Test Method | Results of shallow well of Mr. Shanavas S, Aluvilaveedu | Results of shallow well of Mr. Thulaseedharan, Aswathy Bhavan | Results of shallow well of Mrs. Lekha, Pazhankanji villa | Limit as per 10500:2012 |

**Source: Pathachem Laboratories Pvt.Ltd*

Results of biological monitoring of three shallow well/ground water conducted around Ugrankunnu dumpsite indicates that the coliform bacteria are slightly above the acceptable limit specified by IS 10500:2012 (Observed value = 30, Acceptable limit = 0) in one of the wells. The variations in these results are not influenced by the dumpsite. The coliform content presence can be dependent on may other factors, the primary factor is the nearness to septic tank or a faulty septic tank.

## 6.5 Interpretation of Physical and Chemical Characteristics of Legacy waste and its Impacts

### 6.5.1 Waste

Sampling and analysis of legacy waste accumulated at Ugrankunnu Kottarakkara was conducted through an NABL accredited laboratory namely, Matter Material Testing and Research Laboratory Pvt. Ltd. Kozhikode. Results of physical and chemical analysis of legacy waste collected from the dumpsite using borehole technique is given in table12 and table 13 and physical composition is shown in Fig 14.

**Table.12: Physical analysis of legacy waste collected from Ugrankunnu dumpsite**

| Parameters | Sample 1 | Sample 2 | Average |
|---|---|---|---|
| Percentage of Plastic Waste, % | 5.96 | 6.1 | 6.03 |
| Percentage of Glass Waste, % | 1.24 | 1.3 | 1.28 |
| Percentage of Metal Waste, % | Nil | Nil | |
| Percentage of Soil/Earthen Material, % | 92.79 | 92.6 | 92.69 |

**Source: Matter Material Testing and Research Laboratory Pvt. Ltd*

It is found that all physical and chemical parameters including heavy metals are well within the FPO specified standards for Compost in the SWM Rule 2016.It is found that there is no specific Indian Standards for soil below the dumpsite or soil above waste therefore the FCO standard which is found suitable for land application without affecting the local Environment is selected. The FCO standards are taken for comparing admissibility of soil for usage /utilisation at the time of Sieving /segregation from the dumpsite

### 6.5.2. Soil

Sampling and analysis of soil collected below the solid waste dump at Ugrankunnu Kottarakkara was conducted through an NABL accredited laboratory namely, Matter Material Testing and Research Laboratory Pvt. Ltd, Kozhikode. Analysis results of soil collected from the dumpsite using borehole technique is given in table 14 and 15.

**Table.14: Analysis results of soil collected from Ugrankunnu dumpsite**

*Source: Matter Material Testing and Research Laboratory Pvt. Ltd*

**Table.15: Chemical analysis of soil collected from Ugrankunnu dumpsite**

| TEST PARAMETERS | UNIT | RESULTS | LIMITS as per Schedule II of SWM Rule 2016 for Organic Compost (FCO 2009) |

| Mercury (Hg) | mg/Kg | < 0.01 | 0.15 |

*Source: Matter Material Testing and Research Laboratory Pvt. Ltd*

### 6.5.3. Leachate

The investigation done during the site visit, boring operation and sample collection of legacy waste and soil below the dump area reveals that there is no leachate generation inside the dump. Leachate was not observed within the dumpsite area during the time of baseline sampling and due to the absence of leachate sample, leachate characteristics study was not conducted

## 6.6 Risk Assessment

**Groundwater:** Pollutants from dumpsites can infiltrate into the underlying groundwater, if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources and ecosystems. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

Results of borewell sample indicates that all parameters are well within the limits specified as per IS 10500:2012. This indicates that there is no physical and chemical contamination of ground water from the existing dumpsite at Ugrankunnu, Kottarakkara, Kollam. Results of biological monitoring of borewell/ground water conducted at Ugrankunnu indicates that the coliform bacteria is slightly above the acceptable limit specified by IS 10500:2012 (Observed value = 30, Acceptable limit = 0).

Results of physical and chemical quality monitoring of three shallow wells/ground water conducted in and around Ugrankunnu dumpsite indicates that all parameters are well within the limits except pH and turbidity are slightly above the acceptable limit specified by IS 10500:2012 (Observed value of pH = 5-6, Acceptable limit of pH = 6.5-7.5, Observed value of turbidity = 1.8-4 NTU, Acceptable limit of turbidity = 1 NTU).

Results of biological monitoring of three shallow well/ground water conducted around Ugrankunnu dumpsite indicates that the coliform bacteria are slightly above the acceptable limit specified by IS 10500:2012 (Observed value = 30, Acceptable limit = 0) in one of the wells. The variations in these results are not influenced by the dumpsite. The coliform content presence can be dependent on may other factors, the primary factor is the nearness to septic tank or a faulty septic tank.

**Table.16: Risk Assesment -Groundwater**

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite – pH is acidic in nature |

| | |
|---|---|
| **Pathway** | Water, Soil |

| **Risk** | **Possible risks to Human health**<br>• diarrhoea<br>• Nausea and Vomiting<br>• Abdominal Pain<br>• Weakness<br>• Shortness of Breath<br>**Possible risks to Animals**<br>Animals when intake waters with pH acidic in nature it affect the health of the animals.<br>**Possible risks to flora**<br>It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increases the availability of some elements to toxic levels, particularly aluminium and manganese. |

**Source:TSC Package A*

**Air**: Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens etc.

**Table.17: Risk Assessment -Groundwater**

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Within the limits |
| **Pathway** | Air |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | No anticipated Risks |

**Source:TSC Package A*

**Soil**: Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

**Table.18: Risk Assessment -Groundwater**

| Risk Assessment | |

**Source:TSC Package A*

**Bioaccumulation in Biota**: Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. Contaminated soil or water can be taken up by plants, and these plants may then be consumed by animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the ecological balance and minimizing the exposure of organisms to contaminated environments.

## 6.7 Inferences of Baseline Conditions at Ugrankunnu Dumpsite

Sampling and analysis of physical, chemical and biological characteristics of legacy waste, soil, air, noise and water reveals that there is no much contamination in the above-mentioned environmental components due to dumping of waste at Ugrankunnu, Kottarakkara, Kollam. It can be inferred that the waste dump is having soil cover in between and covering of top with red soil helped for degradation of organic matter. The impermeable sub strata of laterite, rocky terrain may be another reason for not polluting the ground water and surrounding water environment.

# 7. Evaluation and Remediation Techniques

Remediation is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

1. Uplift of the environment- reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.

2. Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.

3. Land - Dumpsite land becomes available for public use or for setting up SWM facility on the reclaimed land.

4. Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled, or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels.

For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- Baseline study of heavy metals in Legacy waste and Soil below,water, rainfall, soil type, surface hydrology, topography, wind direction etc. shall be studied before and after bioremediation.
- Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area

## 7.1. Quantity of Legacy Waste

Total station survey was carried out at the dumpsite for estimating quantity of legacy waste accumulated at the dumpsite. Report of total station survey conducted at the dumpsite is attached as Annexure.

The legacy waste at the Ugrankunnu dumpsite predominantly of a mix of inorganic material, stones, plastic material and including silt material. The total area of Ugrankunnu dumpsite is 1 acre 50 Cents. Based on the Total Station survey details from Kottarakkara municipality the total volume of legacy waste spread over 37.66 cents and 4.3 m height is 8245 cubic meters. With a density of the material considered to be 1.042 T/cu m the total quantity of waste dumped is estimated as 8591 T.

## 7.2 Evaluation of Technologies for Remediation of existing Dumpsite

From the quality assessment of the legacy waste, material consists of 92.69 % soil/earthen materials, 1.28 % glass waste and 6.03 % plastic waste.

The chemical analysis confirms that the scope for recovering any compost from these landfill materials is minimal since the legacy waste has degraded over the period of time

The Ground and Surface water test result are within the limits and has no contamination except in the downstream and upstream shallow wells for pH, turbidity and coliform non-compliance.

The Solid Waste Management rules 2016, Central Pollution Control Board (CPCB) and Swachh Bharat Mission guidelines recommend taking up bioremediation of legacy waste to recover land. The existing site can be reclaimed to set up any SWM facilities complying to Solid Waste Management rules 2016. Bioremediation is one of the key focus areas of Swachh Bharat Mission 2.0. The guidelines released in October 2021 expects that all the legacy historic waste dumpsites across the country are remediated and converted to green zones or as state-of-the-art Solid Waste Management facility.

There are various techniques/technologies for remediation of waste landfills. Based on the type /nature of the waste, geographical conditions, and required outcomes of the project from the project suitable project specific technique need to be selected.

i. Biomining
ii. Capping without land recovery
iii. Capping with partial land recovery (Combination of biomining and capping)

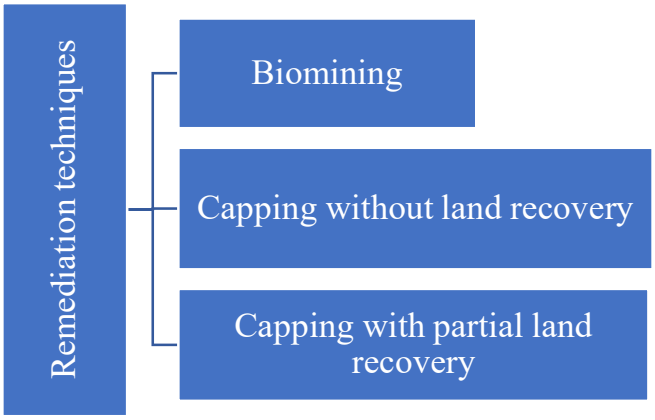

**Fig.15 Bioremediation Methods/Technologies**

i. **Biomining**

Biomining is a process in which solid wastes which have previously been landfilled are excavated and processed. The process is a sequence of processing machines laid out in a functional conveyor system and to excavate, sieve and sort the landfill material.

Biomining eliminates leachate and landfill gases by removing old waste from the top down, and turning the loosened waste into bio-treated aerobic windrows. Further process is to sieve the material to recover any bio enricher/soil//compost, RDF and other waste. The sieving machinery should consist of automated feeder system, conveyor belts to trommel. This allows for an almost total separation of waste, making it an efficient way of reusing or disposing of separated products. Ultimately the land is reclaimed.

Some of the advantages of biomining are highlighted below:

- increases the post-closure area for alternate use.
- near-zero emissions of methane and leachate.
- clearance of legacy waste at less cost than conventional capping
- reduce annual cost of management, leachate treatment and gas monitoring.
- recycle both organics and buried recyclables.
- It can achieve all this in lesser time
- Environmentally safe and green.

### ii. Capping without land recovery

Capping is the traditional method for isolating landfill wastes and contaminants. It is basically used to address large volumes of soil or waste with low levels of contamination. Caps can be of asphalt or concrete, or a layer of soil planted with grass.

Capping is a scientific process of profiling legacy waste and covering with barrier layof soil, high density polyethylene (HDPE) liner, gas collection system surface drainaa vegetative cover to minimize the percolation of rainwater into the legacy waste.

Features of capping without land recovery:

- The capped area becomes a green space and can be developed into parks/recreational areas
- Capped area will be equipped with environmental monitoring systems for posclosure maintenance to monitor pollution levels in groundwater and surface-watersources and air (especially methane emissions) at least 15 years.
- Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep-rooted vegetation. Recurring expenditure will be incurred for regular maintenance.
- On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio-mining as environmentally safe and the most preferable approaches to dumpsite remediation
- SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste

Capping is a containment technology that form a barrier between a waste body or contamination source area and the ground surface, thereby minimising the exposure of humans and environmental receptors to the waste. The cap design will be such to restrict any infiltration of surface water and rainwater into the waste body accumulated and thereby reduce the potential for leaching of site contaminants. The landfill cap design generally will be an impervious clay liner, along with an efficient drainage system. Further this is covered by a layer of clean soil and plants, which ideally in is sloped to prevent rainwater and surface water from infiltrating into the legacy waste.

Recovery of landfill gas from capped dumpsite is an option for recovery of energy from the dump and for minimising emission of greenhouse gas not the environment. Landfill Capping is generally less expensive than other technologies and effectively reduce the infiltration into the landfill, controlling the leach, Minimise emissions of gas

The disadvantage of landfill capping is requirement of more space and may need periodic maintenance of drainage and inspection of covers: and the land cannot be reclaimed to be used for other purposes and also with is no recovery of recyclables from the waste.

iii. **Capping with partial land recovery**

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can linked to relevant buyers and the inert material will be capped to prevent further degradation of the environment. Capping is a containment technology that form a barrier between a waste body or contamination source area and the ground surface, thereby minimising the exposure of humans and environmental receptors to the waste. The cap design will be such to restrict any infiltration of surface water and rainwater into the waste body accumulated and thereby reduce the potential for leaching of site contaminants. The landfill cap design generally will be an impervious clay liner, along with an efficient drainage system. Further this is covered by a layer of clean soil and plants, which ideally in is sloped to prevent rainwater and surface water from infiltrating into the legacy waste.

Recovery of landfill gas from capped dumpsite is an option for recovery of energy from the dump and for minimising emission of greenhouse gas not the environment. Landfill Capping is generally less expensive than other technologies and effectively reduce the infiltration into the landfill, controlling the leach, Minimise emissions of gas

Features of capping without land recovery:

- The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.

- Ensures short -term sustainability and environmentally sound treatment of legacy waste. Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area

## 7.4 Comparison of various Remediation Technique

Various options for remediation of existing dumpsite at Ugrankunnu has been examined by considering its quantity, characteristics of waste, stage of degradation of organic waste, percentage of high calorific value material present in the dumpsite, potential for utilisation of land for other purposes and results of baseline environment and geotechnical survey conducted at the site, the following the strategy is suggested for remediating the site.

**Table 20: Suggested method for Remediating Dumpsite at Ugrankunnu**

| Sl No | Remediation Technique | Analysis/Justification | Suitability to Ugrankunnu |
|---|---|---|---|
| 1 | Biomining | • Viable option based on baseline environmental assessment, stage of degradation of organic waste, absence of toxic contamination in the dumpsite as well as in the surrounding environment<br>• Benefit of reclamation of land for setting up of SWM facilities<br>• Less expensive compared to other techniques. | Recommended |
| 2 | Capping | • It is an accepted method but considering the land constraints and requirement of land for SWM management the option is not viable<br>• The waste dumped at the site are partially capped periodically but scientific capping may not be suitable for the dump at Ugrankunnu. | Not Recommended |
| 3 | Combination of biomining and capping((Capping with land recovery) | • Suitable for landfill with large land area available<br>• Avoids the forward linkages for inerts | Not recommended |

*Source: TSC Package A*

# 8. TECHNICAL DESCRIPTION OF THE SELECTED OPTION

Evaluation of various techniques for remediating the existing dumpsite reveals that biomining is the best option for remediating the dumpsite at Ugrankunnu, Kottarakkara.

The objective is to recover/reclaim land from the existing site and use the same for setting up SWM facilities in the reclaimed land. This rules out other remediation techniques except Biomining. The legacy waste at the Ugrankunnu dumpsite is a mix of soil/earthen material, plastic, glass and inerts. The technique/process recommended for the bioremediation of legacy waste at Ugrankunnu is Biomining.

## 8.1 Planning for dumpsite remediation

The initial step of a dumpsite remediation project is preparing and planning the site for after having carried out the estimation of the material, processing method, various parameters such as geological features, the stability of the surrounding area, proximity of ground water, and determine the fractions of usable soil, recyclable material, combustible waste, and hazardous waste at the site Factors considered in planning and site preparation are as below

- Site Location (Maps/GIS)
- Geology
- Surface and Ground Water
- Quality of Ground Water
- Land environment
- Landscape
- Depth and Volume of Waste
- Type of Waste
- Type of Waste disposal

### 8.2 Bio mining Process/Step

Process of Bioremediation commences after the site preparation. This cycle commences with the excavation of materials and ends with the disposal of recovered outputs.

The process involves

**Fig.16: Flowchart or process of biomining**

There are two options that can be considered for stabilising the waste after excavation;

- ***Option 1***: Windrow formation
- ***Option 2***: Coning method wherein legacy waste is made as a heap continuously so as to expose to air and is the recommended option.

## 8.3 Proposed Design of Bioremediation (Biomining)

It is proposed to carry out the bioremediation works over a time frame of about 5 months. The basis of design of this bioremediation works are the physical analysis, chemical analysis reports, field inspections, topographical conditions, and knowledge and understanding of the process. The proposed steps for executing biomining process is explained in below Fig 17:

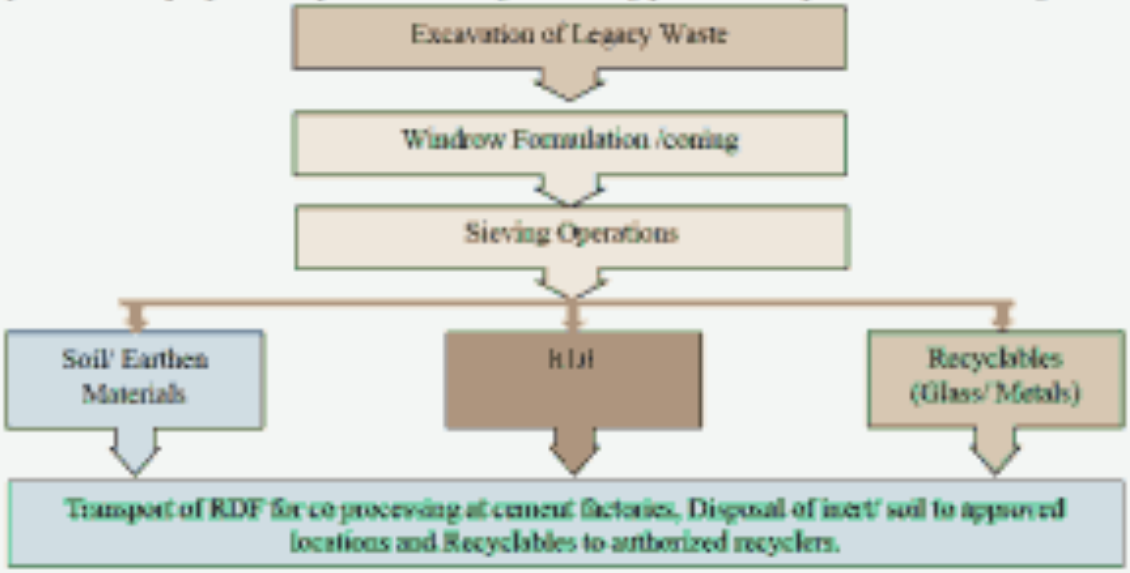

**Fig.17: Proposed steps for performing biomining process**

## 8.4 Project Design Basis

Based on the above the Project Design basis can be summarised as below table 21

**Table 21: Project design basis of dumpsite remediation at Ugrankunnu**

| Sl No | Project description | Details | Units | Remarks |
|---|---|---|---|---|
| 1 | Site Location | Ugrankunnu | | |
| 2 | Total Land Area | 6070 | Sq. m | Dump site is only 37.66 Cents out of 1 acre 50 cents total land |
| 3 | Disposal Site Used till | 2018 | Year | |
| 4 | Legacy Waste Disposed over | 1523.7 | Sq. m | |
| 5 | Legacy Waste Volume | 8245 | cu m | |
| 6 | Quantity of Legacy waste | 8591 | Tonne | Density @1.042 T/cu m |
| 7 | Quantity of soil | 7963 | Tonne | Density @1.042 T/cu m<br>Soil Earthen Material-92.69 % (7642.3 cu m) |
| 8 | Quantity of waste (plastic and glass) | 627.98 | Tonne | Density @1.042 T/cu m<br>Plastic – 6.03 % (497.17 cu m)<br>Glass-1.28 % (105.5 cu m) |
| 9 | Excavation Duration | 120 | Days | |
| 10 | Transportation and Disposal | 130 | Days | |

**Source:TSC Package A*

The project duration is 5 months. It is expected that Mobilisation, machinery installation period is concurrent and is required to set up a 100 to 120 TPD production output sieving and sorting plant and machinery infrastructure. Mobilisation period of one month and operational period of 4 months at site and transportation of material is concurrent. The design considers 3 months of sieving operations/Baling with completion of mobilisation and setting up of plant within 30

days of commencement of Contract. Based on this, an average of 100 to 120 tonnes per day of excavation is to be carried out.

## 8.5 Basis of Plant & Machinery Estimation

The details of vehicle, trips and machinery required for remediating dumpsite at Ugrankunnu is given in following tables 22 and 23

**Table 22: Details of vehicle and trips required for remediating Dumpsite at Ugrankunnu**

| Sl. No | Description | Soil/ Earthen Materials | RDF | Recyclables (Glass) | Inerts |
|---|---|---|---|---|---|
| 1 | Quantity (Tonne) | 7803 | 518 | 109 | 160 Estimated about 2% in Earthen Material as Inerts |
| 2 | Volume of Tipper Truck (cu m) | 16 | 10 | 10 | 10 |
| 3 | Quantity in a Truck (Tonne) | 15 | 10 | 10 | 1 |
| 4 | No of Trips Proposed per day (No) | 4 | 1 | 1 | 1 |
| 5 | Distance to transport RDF to Cement Plants in neighbouring states for Co-incineration -Km | | 390 | | |
| 6 | Distance to dispose Soil Earthen Material for median formation in ongoing NH/outer ring road -Km | 35 | | | |
| 7 | Distance to transfer recycling glass in neighbouring states -Km | | | 150 | |
| 8 | Estimated no of trips per day (No) | 4 | 1 | 1 | 1 |
| 9 | Estimated No of Trucks (No) | 4 | 1 | 1 | 1 |
| 10 | Duration for completion of task (days) | 110 | 51 | 10 | 17 |

*Source:TSC Package A*

**Table 23: Details of machinery for remediating Dumpsite at Ugrankunnu**

| | Activity | Quantity | Remarks |
|---|---|---|---|
| I | **Excavation** | | |
| i | Total Quantity (Tonne) | 8591 | |
| ii | Estimated quantity of excavation per day (Tonne) | 100 | Considered for 8 hrs working over 90 days |

| | Activity | Quantity | Remarks |
|---|---|---|---|
| iii | Excavator required for excavation of waste heap | 2 no | 10 Cu m capacity |
| 2 | **Transportation of materials within the site** | | |
| i | Required no of Tipper Trucks per day | 2 | @10 cu m capacity truck for 8 hrs |
| 3 | **Windrow/Stabilisation process** | | |
| i | Required no of front end loader for heap elongation / Windrow of the Legacy waste transported/ tipped from tippers and waste turning | 2 no. | 0.26 cu m capacity<br>(taken as 8 to 10 cu m/hr minimum) |
| 4 | **Sieving and Baling process** | | |
| i | No of sieves required for Legacy Waste sieving | 1 no. | 100 to 120 TPD Sieving Machine with dual trommel with sieve sizes of 30mm and 6 mm with Feeder, trammel, accept and reject conveyors |
| ii | No of baling machine required | 1no. | Baling Machine to process RDF material into blocks by hydraulic pressing 50 T capacity |
| iii | Front End loader with Backhoe for loading of materials to sieve | 2 no. | Taking 10 cu m/hr to be sieved |

*Source: TSC Package A*

## 8.6 Summary of Plant & Machinery and Manpower

### 8.6.1 Plant &Machinery

The Project estimates requirement of 2 no of front-end loader with backhoe along with 6 tipper trucks, 1 excavator for site activities and sieving /baling machine as detailed below. Generator for temporary power supply and operations are also required. **It may be noted that the details of plant, machinery, manpower, electrical power, fuel etc shown is only indicative and the contractor is required to propose and arrange for all necessary requirements to complete the works in the stipulated time and standards.**

**Table 24: Details of plants and machinery for remediating dumpsite at Ugrankunnu**

| Sl No | Vehicle Type | Quantity (Nos) |
|---|---|---|
| 1 | Backhoe Front end loader<br>0.24 cu m Capacity | 2 |
| 2 | Excavators (with 8-10 cu m/hr) | 2 |
| 3 | Trucks for internal Movement 10 cu m | 2 |
| 4 | Trucks for Earth/RDF etc 16 cu m capacity | 4 |
| 5 | Trucks for RDF 10 cu m capacity | 1 |

| Sl No | Vehicle Type | Quantity (Nos) |
|---|---|---|
| 6 | Trucks for Inert/Recyclable/Glass 10 cu m capacity | 1 |
| 7 | Sieving Machine 100 to 120 TPD with dual trommel with sieve sizes of 30mm and 6 mm Feeder, trommel, accept and reject conveyors | 1 |
| 8 | Baling Machine 50 T | 1 |

** The details of Plant and Machinery shown is only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards.*

### 8.6.2 Manpower Requirement

Manpower requirement is expected to be about 12 labourers, 2 Supervisors, 2 technicians and 1 Health and Safety Officer other than the Plant and Machinery operators.

**Table 25: Details of manpower required for remediating dumpsite at Ugrankunnu**

| No | Description | Quantity Nos |
|---|---|---|
| 1 | Supervisor | 2 |
| 2 | Technicians/ Support Staff | 2 |
| 3 | Health and Safety Officer | 1 |
| 4 | Labour | 12 |
| 5 | Security Staff | 3 |
| | **Total** | **20** |

*Note: Environmental and Social Safeguard experts are considered to be outsourced at the time of execution of the project by the contractor. The details of manpower shown is only indicative and the contractor is required to propose necessary manpower to complete the works in the stipulated time and standards.*

### 8.6.3 Electrical Power

**Table 26: Electrical power details**

| Machineries | Required Electrical Load (KW) | Working Hr. | Total Units (KW-Hr) |
|---|---|---|---|
| Baling Machine | 5 | 4 | 20 |
| Ballistic Separator | 15 | 6 | 90 |
| Magnetic Separator | 5 | 6 | 30 |
| Total | 25 | | 140 |

** The details of power requirement shown is only indicative and the contractor is required to propose and arrange necessary power supply to complete the works in the stipulated time and standards.*

### 8.6.4 Fuel diesel for vehicle

**Table 27: Fuel /diesel for vehicle**

| Description | Liters per Day |
|---|---|
| Fuel - Diesel Mobile Trommel (12 liters/hour) | 96 |

**The details of fuel/ diesel requirement shown is only indicative and the contractor is required to propose and arrange necessary fuel/diesel supply to complete the works in the stipulated time and standards.*

### 8.6.5 Water Requirement

**Table 28: Water Requirement**

| Description | Liters per Day |
|---|---|
| Water - Liters per day for domestic purpose | 250 |
| (Source – Municipality water Supply) | |

*Source:TSC Package A*

## 8.7 Leachate Management

Leachate generation is predominantly due to rainwater getting mixed with the solid waste when the material is not covered. The Ugrankunnu dumpsite has a temporary capping with soil which was carried out by the ULB. The ground and surface water test carried out in the open shallow wells nearby and bore well at site do not indicate contamination due to leachate. Further chosen window of six months for the project from the month of October would have relatively less rainfall and especially the three active months of January to March, 2024 would be the peak dry season in the State.

However, when legacy waste heaps are opened up, some leachate may likely tickle out. This is not produced by the formation of windrows or cones, which in fact help to dry out the waste through aerated decomposition. Since the material is older, the only possibility of moisture addition is rainfall unlike in fresh waste where the material itself contains 20-30% moisture.

Channels must be created to lead the oozing leachate into a lined depression or pond for treatment as required

## 8.8 Fire Management

Though the existing site is temporarily capped with a layer of soil and most unlikely does not consist of fires and flames. However, there is a possibility of fire incident when any high calorific material like plastic is being taken out, baled and stacked at the site. It is important that a fire risk associated with material handling need be considered at the time of remediation activities are undertaken. It is required to conduct risk assessment and prepare on-site emergency plan prior to commencement of remediation work. It is also suggested that the contractor to liaison with Fire and Rescue Services and deploy a fire tender at site as stand by during the works. Also, the following should be considered under fire safety:

a. Fire Fighting System including fire hydrant, pressure pumps, 5000 Ltr (min) water storage, adequate hose reel and fire extinguishers to be provided at site.

b. Alternate source of power (DG)
c. Manual Fire Alarm System with evacuation plan
d. Regular check, maintenance of equipments for firefighting (before initiating work and then at interval of 1 months thereof)
e. Training to all men. (Before initiating work and then at interval of 3 months thereof)
f. Maintaining fire line while storage of material (RDF). RDF to not exceed 10% of total estimated waste at site at any given time.
g. any other requirement in consultation with local Fire & Rescue Services office.

## 8.9 Transportation /Traffic Management

Considering the limitation of access road which is only 3 m wide, and due to the surrounding inhabitants and functioning of an educational institution within 500 m, it is critical that the site activities and transportation are to be carried out with minimal disruptions. Necessary precautions should be taken at the time of transportation of materials within and outside the site. Proper transportation/traffic plan is to be in place where movement of truck has to be restricted during the peak hours such as 7.30 am to 9.30 am and further from 2 pm to 3.30 pm. Further details on transportation are available are in Sec 3.9 of ESIA report. (Vol II- Annexure)

## 8.10 Temporary Site Facilities

There are no facilities currently at the Ugrankunnu dumpsite. It is necessary to build/ install temporary infrastructure for execution of this project such as electrical generators and associated electric panels, site office, rest rooms and area for storing inert waste till transportation.

## 8.11 Space Constraints

The total land area of Ugrankunnu is 1 acre 50 cents and the dumpsite occupy an area of 37.66 cents (i.e. spread over an area of 1525 Sq. m). The rest of the plot occupies MCF, RRF, Rest Rooms, Toilet and Crematorium due to which further open space is limited.

The remediation works require a working area for a minimum of 100 to 120 TPD of waste for windrow formations, sieving, sorting and baling operations. Temporary site facilities including machinery parking /repair are also required. This space constraints necessitates additional adjacent land of area about 1500 – 2000 sq.m. This much area is required to be leased even

with coning or windrow method of stabilisation. The map showing plot availability in the area near to Ugrankunnu dumpsite are shown below. The map showing plot availability in the area near to Ugrankunnu dumpsite are shown below.in Fig 18

**Fig.18: Proposed steps for performing biomining process**

Proposed Site Management Plan for Bio mining activity at Ugrankunnu dumpsite is given in Fig.19

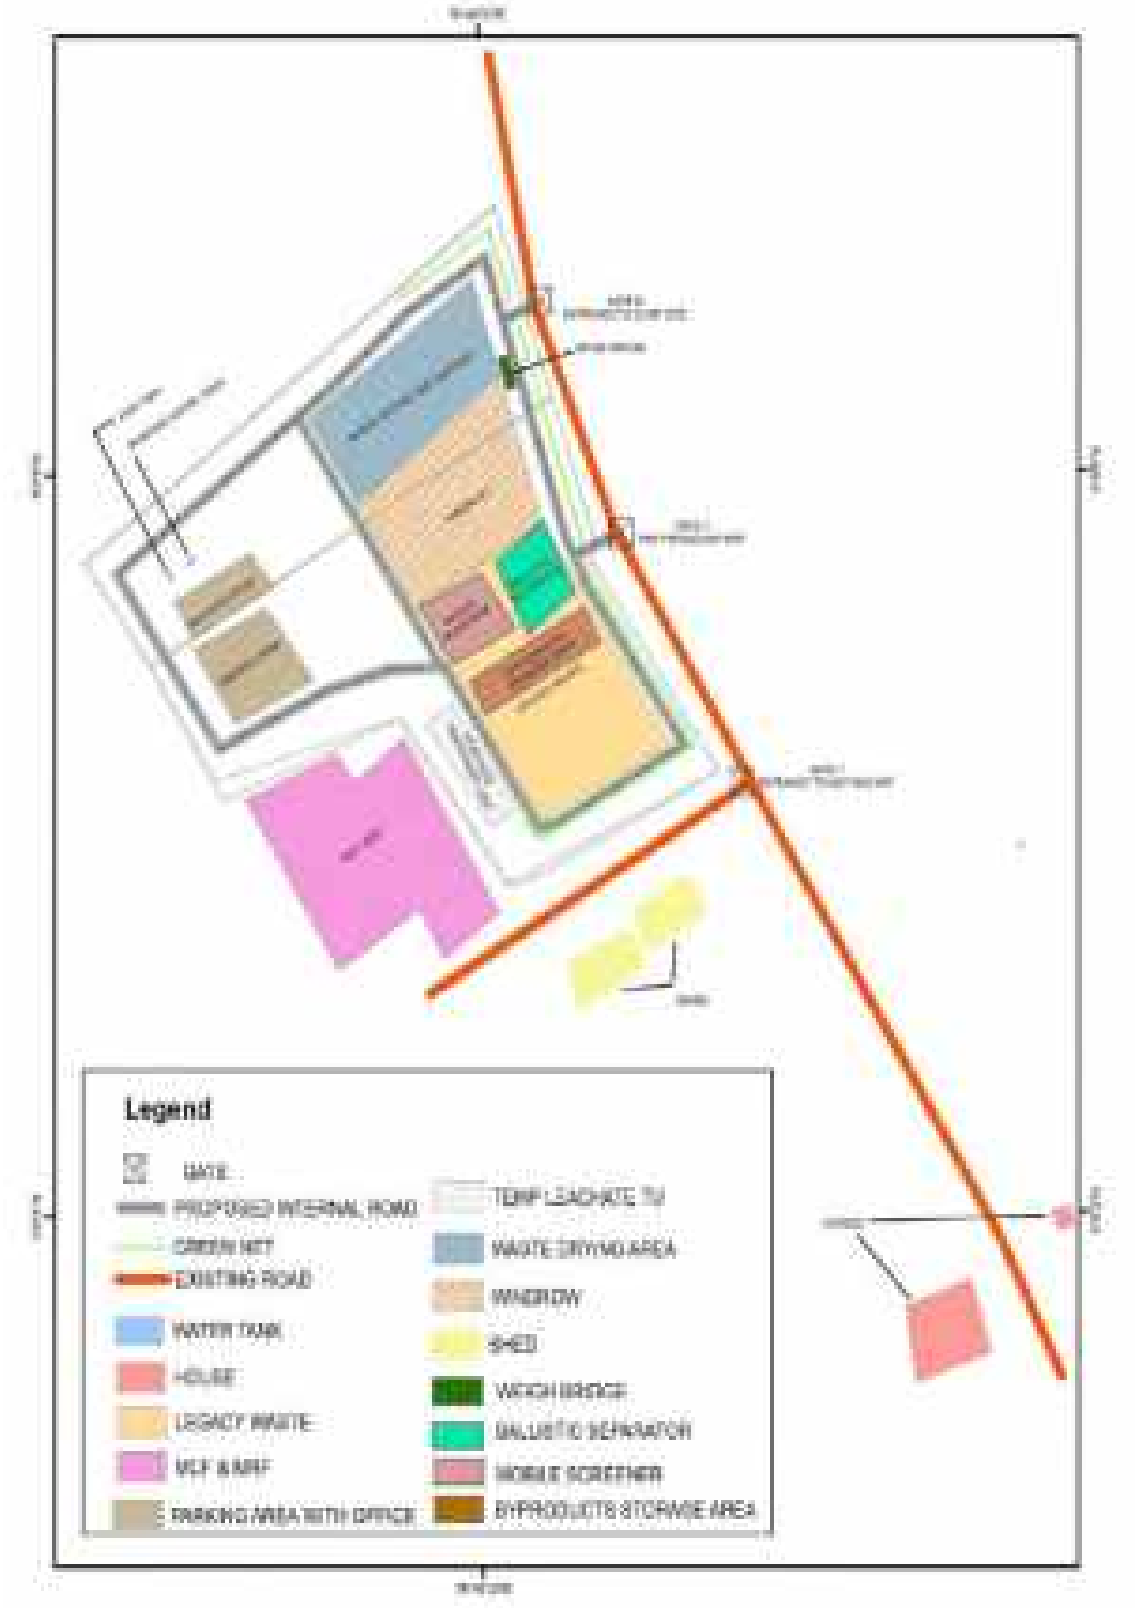

**Fig 19: Proposed Site Management Plan**

# 9. SCOPE OF DISPOSAL INCLUDING LOCATION OF DISPOSAL FOR RDF, BIO SOILS, C & D WASTE, AND OTHERS AS PER LOCAL DEMANDS -FORWARD LINKAGES

It is expected that 8591 Tonnes of legacy waste is to be disposed. The components to be disposed by bio mining process is listed in below table 29

**Table 29: Details of Legacy waste components for disposal**

| Description | Soil/ Earthen Materials | RDF | Recyclables (Glass) | Inerts /Rejects (Estimated about 2% in Earthen Material as Inerts) |
|---|---|---|---|---|
| Quantity (Tonne) | 7803 | 518 | 109 | 160 |

**RDF**: In the absence of cement industries in the State of Kerala to consume the RDF generated, it would necessitate the transportation of the generated RDF to factories in distant locations in neighbouring States and this would enhance the cost of the bio-remediation.

The possible forward linkages identified are M/s Dalmia Bharath Limited Cements, Ultratech Cements and Chettinad Cement Corporation which are situated at Tiruchirappalli, Tamilnadu which is approximately 390 kms from dumpsite at Ugrankunnu.

**Fig.20: Possible forward linkages for RDF disposal (nearby cement plants for co-incineration)**

**Recyclables:** Typically, these would be predominantly glass and iron, which would be sent to recyclers and traders of recyclables within the state or outside the state.

**Soil Enrichers/ Earthen Materials:** This is essentially fine soil with size below 8 mm having a higher organic content, which will be used for use in the agricultural sector. Primarily, this will be used in the Government Social Forestry, Nurseries and similar projects

Recommended utilisation are;

- For filling of land for playground, formation of medians in the highways/ ring roads/ Vizhinjam port and similar construction sites within the state.
- A part of earthen material approximately 20% can be used for filling the low lying areas within the site
- Another feasible option is to use as daily cover in sanitary landfill facilities.
- Stabilised organic manure recovered from the dumpsite after processing in Windrows Sieving ,Value Addition and Packing is a viable option for utilisation in the nearby areas for agricultural purposes
- Remaining 80% soils ,gravel and stones recovered from the dumpsite can be utilised for filling of land in nearby areas other than paddy fields

The standards specified in the SWM Rule 2016 for organic compost has been compared for ascertaining use of bio soil for agriculture/filling of land. The quality analysis of waste as well as bottom soil reveals that most of the toxic parameters including heavy metals are well within the specified limits. The standard specified in the SWM Rule 2016 is followed. Dumpsite is having solid waste and the resources recovered, like bio earth, which can be used as it contains compost and organic matter in stabilised form. It is also found that there is no standard specified for heavy metal in soil in the point of utilisation of land for agricultural purposes

# 10. PROJECT COST

The Project cost estimation for bioremediation of legacy waste at Ugrankunnu is based on the Project Design basis mentioned above paragraphs.

The Capital Cost include site preparation, execution of biomining process, recovery of materials, transportation of material and temporary site facilities/mobilisation cost for the Project. The details of the tentative capital costs with rates are provided below.

Operation cost for the project include the costs to be incurred every month. These costs include vehicles, fuel expenses, Manpower cost and other running costs.

## 10.1 Breakdown of Project Cost

Important components of implementation of bioremediation process of Ugrankunnu dumpsite are briefed below;

1. Site Preparation
    a) Leasing of land for site operations
    b) Permits and licences
    c) Levelling /Clearing of existing vegetation
2. Mobilisation
    a) Setting up Temporary facilities
    b) Setting up plant and Machinery
    c) Fire Management
3. Works

    Excavation, Sieving, Sorting, /windrow, baling, disposal and levelling as required at 100-120 TPD per day
4. Post works levelling of site
5. Environmental Monitoring and handing over the site

## 10.2 Project Cost Estimation

The Project cost estimation for bioremediation of legacy waste at Ugrankunnu is as given below table 30.

**Table 30: Estimated project cost for remediating dumpsite at Ugrankunnu**

| Items | | Quantity | Rate (Rs) | Months | Duration in days | Amount (Rs) | Remarks |
|---|---|---|---|---|---|---|---|
| **Site Preparation** | | | | | | | |
| i. | Land Lease or Purchase | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | |
| ii. | Clearing of site | [redacted] | | | [redacted] | [redacted] | Include Dumpsite and lease land (2 no JCB and Tipper) |

# 11. PROJECT IMPLEMENTATION PLAN

## 11.1 Timeline

Proposed timeline for the activity is given below.

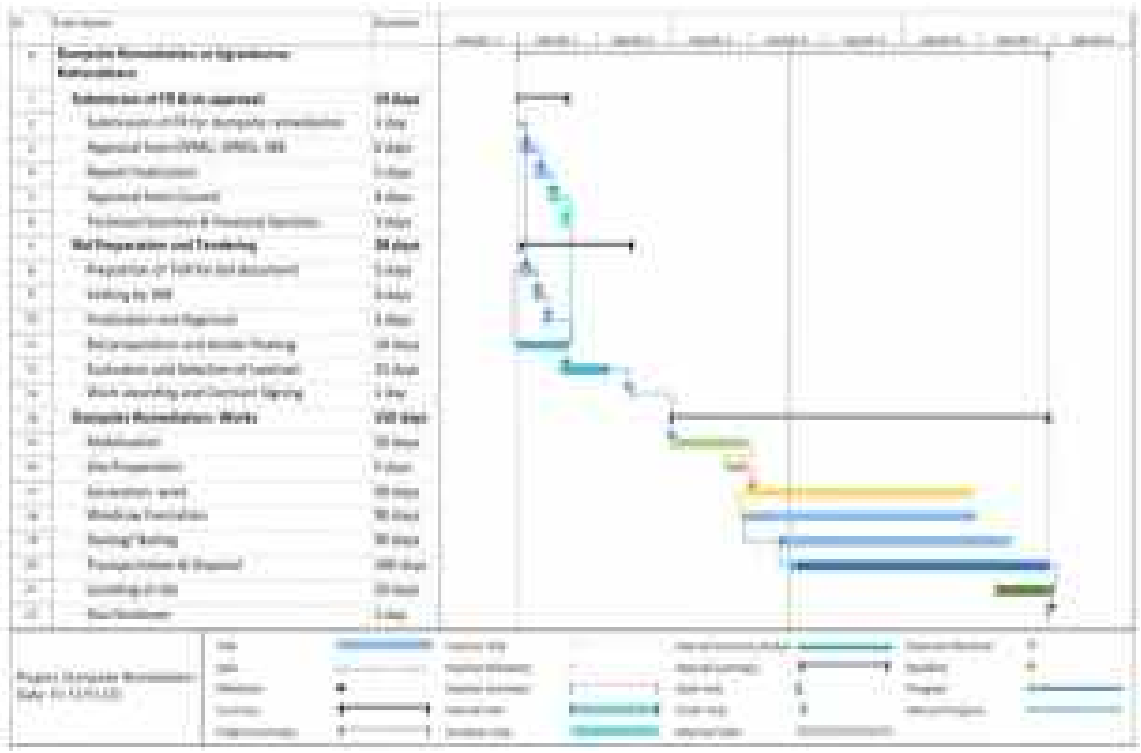

**Fig.21: Proposed timeline for Ugrankunnu dumpsite biomining**

The project duration is estimated as 6 months and all works of bio-remediation is to be completed before 31/03/2024.

## 11.2 Contract Model

For the timely and effective reclamation of the legacy dumpsites, a competent Agency should have the capability to undertake the physical process of **segregation and processing**, as well as the forward linkages for the **safe disposal / utilisation** of the segregated fractions (aggregates) generated from the legacy waste.

The project considered as a fast track critical project, its implementation will have to be with a clear time bound plan and action, supervision and control. It is recommended to tender out this project to vendors as an open tender who are technically qualified, capable to source all

required plant and machinery with proper supervision. The tendering shall be on rated criteria with 30% weightage to technical offer and 70% to financial offer.

The Contract shall also explicitly state the requirement of disposal to approved locations and shall have valid receipt /acceptance documentation for each trip. The success of the project would be based on the ability of the selected agency to dispose / utilise all the fractions effectively. Hence, it is recommended that the bid document should clearly insist on the time bound disposal of these fractions generated from the legacy waste. The qualifying criteria should unequivocally stipulate that the bidder should showcase their proven tie-ups with established third parties for the forward linkages for the time-bound disposal of all fractions as per the existing regulatory requirements.

As per the provisions of the SWM Rules 2016 and the CPCB Guidelines, the entire bio-remediation process has to be carried out under the close monitoring of the respective State Pollution Control Board (SPCB). Additionally, there are few regulatory approvals to be obtained, which will ensure that the entire bio-remediation process, including the safe disposal / utilisation of the material produced is carried out under the close monitoring of the Regulatory Agencies.

Bid document should stipulate that the entire work should be undertaken following the regulatory parameters applicable under law and that the bidder should have the necessary licenses or should obtain the necessary licenses as prescribed by law.

An indicative list of approvals/sanctions/licenses to be obtained are as follows:

- Authorization from the State PCB under Solid Waste Management Rules 2016.
- Consent to Establish under Air and Water Act from State PCB.
- Consent to Operate under Air and Water Act from State PCB.
- Registration with the local Urban and Local Body for Professional Tax.
- License for Petrol and Diesel Storage (if applicable)
- Legal Meteorology Stamping for Weigh Bridge and weighing scales.
- LPG and Oxygen usage NOC from Urban and Local Body (if applicable)
- Electrical Energization for power supply.
- Authorization from Electrical Inspectorate for operation of DG set.
- License for extraction of ground water from bore wells for meeting
- domestic/process needs.

- Electrical O&M personnel along with their wireman permits and supervisory certificates.
- PSARA License, Gunman License from the Security Company/Agency

The quantity of legacy waste to be remediated is less in volume and therefore there is a possibility that large scale companies may not participating in the tender. It is understood from market sounding that minimum of 1,00,000 Tonne of legacy is the minimum for such companies to participate. It is recommended that the tender qualification criteria shall cater to medium companies to participate as well.

Alternatively, if the project is considered cluster wise by adding few more ULBs having dumpsite together, the large-scale companies can be attracted to participate in the tender.

# 12. PROJECT BENEFITS

Following are the few benefits of the project;

*Reclamation of Land*: An area of 37.66 cents will be reclaimed and can be utilised by Municipality for setting up of other projects related to Waste Management A contamination assessment is to be carried out before any public use project is taken up at the location.

*Environmental Protection*: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity. The project shall arrest GHG emissions from the legacy dumpsite.

*Health Improvement*: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.

*Enhanced Water Quality*: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to the safe drinking water.

*Aesthetic and Social Benefits*: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.

*Operational & Life cycle Aspects:* Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through bio-mining process.

*Employment:* During remediation & post- remediation period, requirement of un-skilled labor can be fulfilled by sourcing from local areas

# 13. CONCLUSION

As the **Solid Waste Management Rules, 2016** mandate bio-mining of legacy waste instead of 'capping', this is the essential way forward for the reclamation of the existing legacy dumpsites in the State of Kerala.

Evaluation of various techniques for remediating the existing dumpsite reveals that biomining is the best option for remediating the dumpsite at Ugrankunnu, Kottarakkara. The objective is to recover/reclaim land from the existing site and use the same for setting up SWM facilities in the reclaimed land.

The risk assessment carried out during the detailed investigation on environmental and geotechnical aspect do not indicate any risk or mitigation requirement. However, during execution close Environmental monitoring is mandatory to ensure compliance to regulations of Pollution Control Board. It is important that a risk assessment and an onsite emergency plan is ready as a part of Fire Management prior to commencement of dumpsite bio remediation and bio mining. All precaution with regard to leachate management shall also be ensured prior to commencement of any work. It is also important to ensure compliance to all required environmental and social safeguard during the execution of work as well as after completion of work.

The proposal is to remediate the dumpsite in compliance with the Municipal Solid Waste Management Rules 2016 and other National and State Guidelines for management of Solid Waste by sustainably removing the accumulated legacy waste and to use site for other activities.

Sampling and analysis of physical and chemical characteristics of legacy waste, soil, air, noise and water reveals that these environmental components are not much contaminated due to dumping of waste. It can be inferred that the waste dump with soil cover in between and red soil top covering helped the degradation of organic matter. The impermeable sub strata of laterite, rocky terrain may be another reason for not polluting the ground water and surrounding water bodies.

The total volume of legacy waste is estimated to be 8245 cubic meters spread over 37.66 cents and 4.3 m height. With a density, considered to be 1.042 Tonnes/cum, the total quantity of waste dumped is estimated as 8591 Tonnes.

It is estimated that out of 8591 Tonnes of legacy waste, approximately there are 7803 Tonnes of soil/earthen materials, 518 Tonnes of materials for RDF/plastics, 109 Tonnes of Recyclables/Glass along with an expected 2% Inert, which is approximately 160 Tonnes.
Evaluation of various techniques for remediating the existing dumpsite reveals that biomining is the best option for remediating the dumpsite at Ugrankunnu. The remediated land can be utilised for establishing other solid waste management activities of Kottarakkara Municipality.

The bioremediation works has been designed on the basis of physical analysis, chemical analysis reports, field inspections, topographical conditions.

As Kerala does not have facilities to consume the RDF generated, it has to be transported for co processing at cement factories in neighbouring States and this would enhance the cost of the bio-remediation. The possible forward linkages are identified in the nearby state, Tamil Nādu and is approximately 390 km from dumpsite at Ugrankunnu. This implies that the cost of transportation of the RDF will be high. Recyclables would be predominantly glass and iron, which would be sent to approved recyclers and traders of recyclables. However, there are possibilities for utilisation of recyclables/RDF in the neighbouring state and is recommended to be the responsibility of the successful bidder.
Soil and stones can be used for filling of land for playground, formation of medians in the ongoing highways, ring road projects or Vizhinjam port, and similar construction sites. A part of soil/stones can also be disposed in low lying areas within the site. It is advisable to avoid use of this soil for agriculture/ fruit bearing tree plantations. Another feasible option is to use as daily cover in sanitary landfill facilities.
The project duration is proposed to be 5 months. It is expected that the time for mobilisation, and installation of machinery would be concurrent. It is required to set up a 100 to 120 TPD production output sieving/ sorting plant and machinery infrastructure. The design considers 3 months of sieving operations/baling with completion of mobilisation and setting up of plant within 30 days of commencement of contract. Based on that, the excavation capacity is to be on an average of 100-120 tonnes per day.

Total Project cost including all machineries required for processing, transporting is estimated to be [redacted] which accounts to be about [redacted] (including GST, EMP and SMP cost and cost index).

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

Kerala State Waste Management Project (KSWMP) has entrusted the work of investigation work for the preliminary investigative works for the remediation of dumpsite in Kotattukara, Kollam district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. Waste samples were collected from the dumpsite and chemical test analysis was done on the samples. The initial site visit was done on 26th April 2023. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 12th May 2023 and was completed on 25th May 2023. Collection of waste samples and transporting the samples to the laboratory was done during this time. Standard Penetration test (SPT) was conducted within the borehole as required. Soil samples were collected and relevant laboratory tests were carried out on it. This report presents results of the geotechnical investigation, chemical analysis and physical analysis of waste collected at the dumpsite.

**Figure 1 :** Location of the borehole drilled at the dumpsite.

## 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil and waste samples and conducting relevant laboratory tests on the collected samples.
- Preparation of report with laboratory test results.

## 3 GEOTECHNICAL INVESTIGATIONS

### 3.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste in the landfill.

### 3.2 Drilling equipment

Mechanical rigs of rotary drilling machine were used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 3.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as disturbed samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

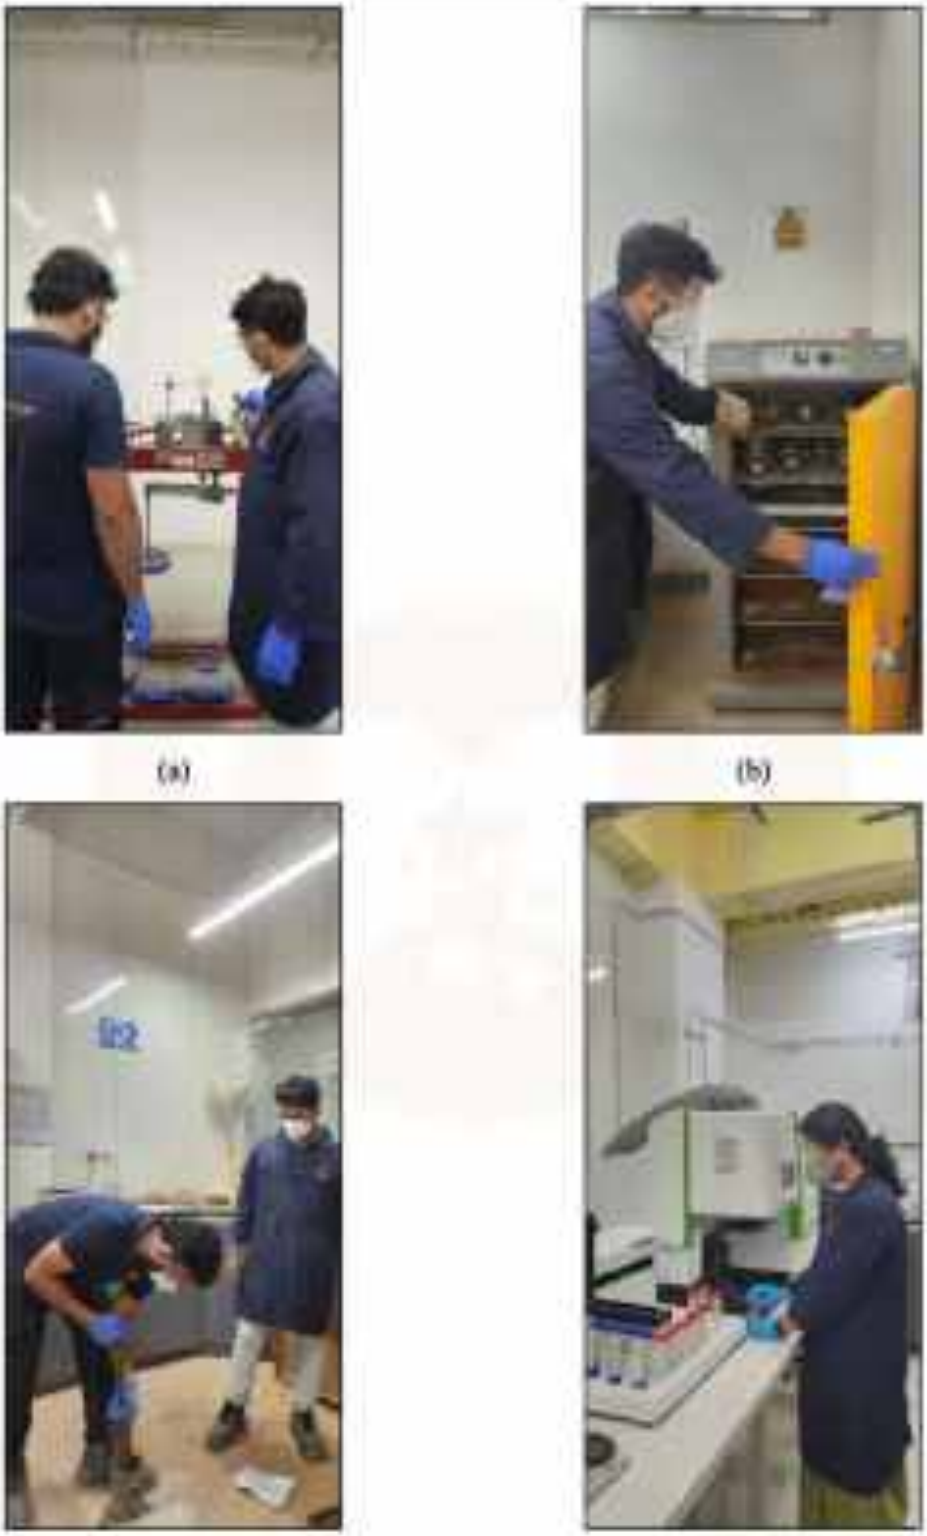
**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log the commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelogs are attached as **Appendix-I.**

## 4 DUMP WASTE SAMPLING FROM SITE

Matterlab has deputed a team from our chemistry operations during the third week of May 2023, in order to collect the already dumped waste material over the ground using appropriate sampling gears.



A bulk waste sample was collected from various locations of this dumpsite in the presence of KSWMP representatives and this bulk sample collected was sealed in polythene bags and dispatched to Matter laboratory at Kozhikode for further laboratory physical and chemical analysis.

**Figure 2** : Gear for sample collection from dumpsite

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 2** and the complete results of laboratory testing are presented in **Annexure II**.

## 6 SUMMARY

The geotechnical investigation of the original ground below the waste and the physical and chemical analysis of the waste collected at the dumpsite at Ugranukunnu, Kottarakkara, Kollam was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was bored using a rotary drilling method. The maximum depth of investigation was 10.5 m (4.2 m in waste and 6.3 m in the ground).

The representative samples collected during the site investigation were transported to the lab. Whereas collection of undisturbed soil samples at the site was not possible as the ground comprises of hard lateritic soil/laterite and collection of undisturbed samples within these kind of formations is very difficult. The tests mentioned in the above table were performed on the representative samples in the laboratory following the respective codes to obtain the necessary parameters. The laboratory results on soil samples and waste samples are appended in **Appendix II**.

The ground encountered after drilling through the waste was a sandy clay of high plasticity (CH) with a liquid limit in the range of 70 and a plastic limit of 30. Consolidated drained direct shear tests were performed on the soil samples to determine the shear parameters of the soil and the average cohesion is of 33kPa and angle of friction with a value of 25°. The permeability of the soil layer below is at an average value of 2.465E-03 cm/sec. The maximum dry density achieved by light compaction method on the soil samples was 1.6gm/cc with an optimum moisture content of 20%.

The physical analysis done on the waste samples collected at the site has shown that the density of waste is 1042 kg/m$^3$, percentage of total waste to be 7.4% with a moisture content of 23%.

The chemical analysis for the collected solid waste samples was performed as per IS 9234:2021 and as per CPHEEO manual. The heavy metals are analysed as per EPA 3050 ICP OES technique. The parameters analysed are pH, Electrical Conductivity, Nitrogen, Phosphorus, Potassium, and Carbon, C/N ratio, Calorific Value, biodegradable factor and

heavy metals. The C/N ratio above 30 indicates that organic manure of solid waste is rich in nutrients.

### Test Results

Method: IS 2720 (Part 13)-1986

| | | |
|---|---|---|
| Area of specimen (cm²) | : | 36 |
| Height of specimen (mm) | : | 25 |
| Rate of strain (mm/min) | : | 1.25 |
| Test Condition | : | Unconsolidated Drained |
| Bulk Density (Mg/m³) | : | 1.50 |
| Moisture content (%) | : | 23 |
| Dry Density (Mg/m³) | : | 1.50 |

| Load Increment | Applied Normal Stress (kPa) | Maximum Shear Stress (kPa) | Displacement at Max. Stress (mm) |
|---|---|---|---|
| 1 | 49 | 89.4 | 4.8 |
| 2 | 98 | 93.8 | 4.4 |
| 3 | 147 | 110.1 | 5.8 |

Cohesion Intercept (C') kPa 33

Angle of Internal friction (ϕ') 27°

For and on behalf of MatterLab

**Comments**

*Information provided by client

Material tested was passing 4.75 mm test sieve, recompacted at maximum achievable density and moisture content.

This document may not be reproduced other than in full, except with the prior written approval of the issuing laboratory.
These results relate only to the samples tested.
