# SITE MANAGEMENT PLAN-
## UGRANKUNNU DUMP SITE

Annexure 2

# Proposed Operational Plan

The project of the Bio-mining with 100% land recovery will be implemented through 100% outsourcing model. The detailed operations of 100% land recovery is provided below:

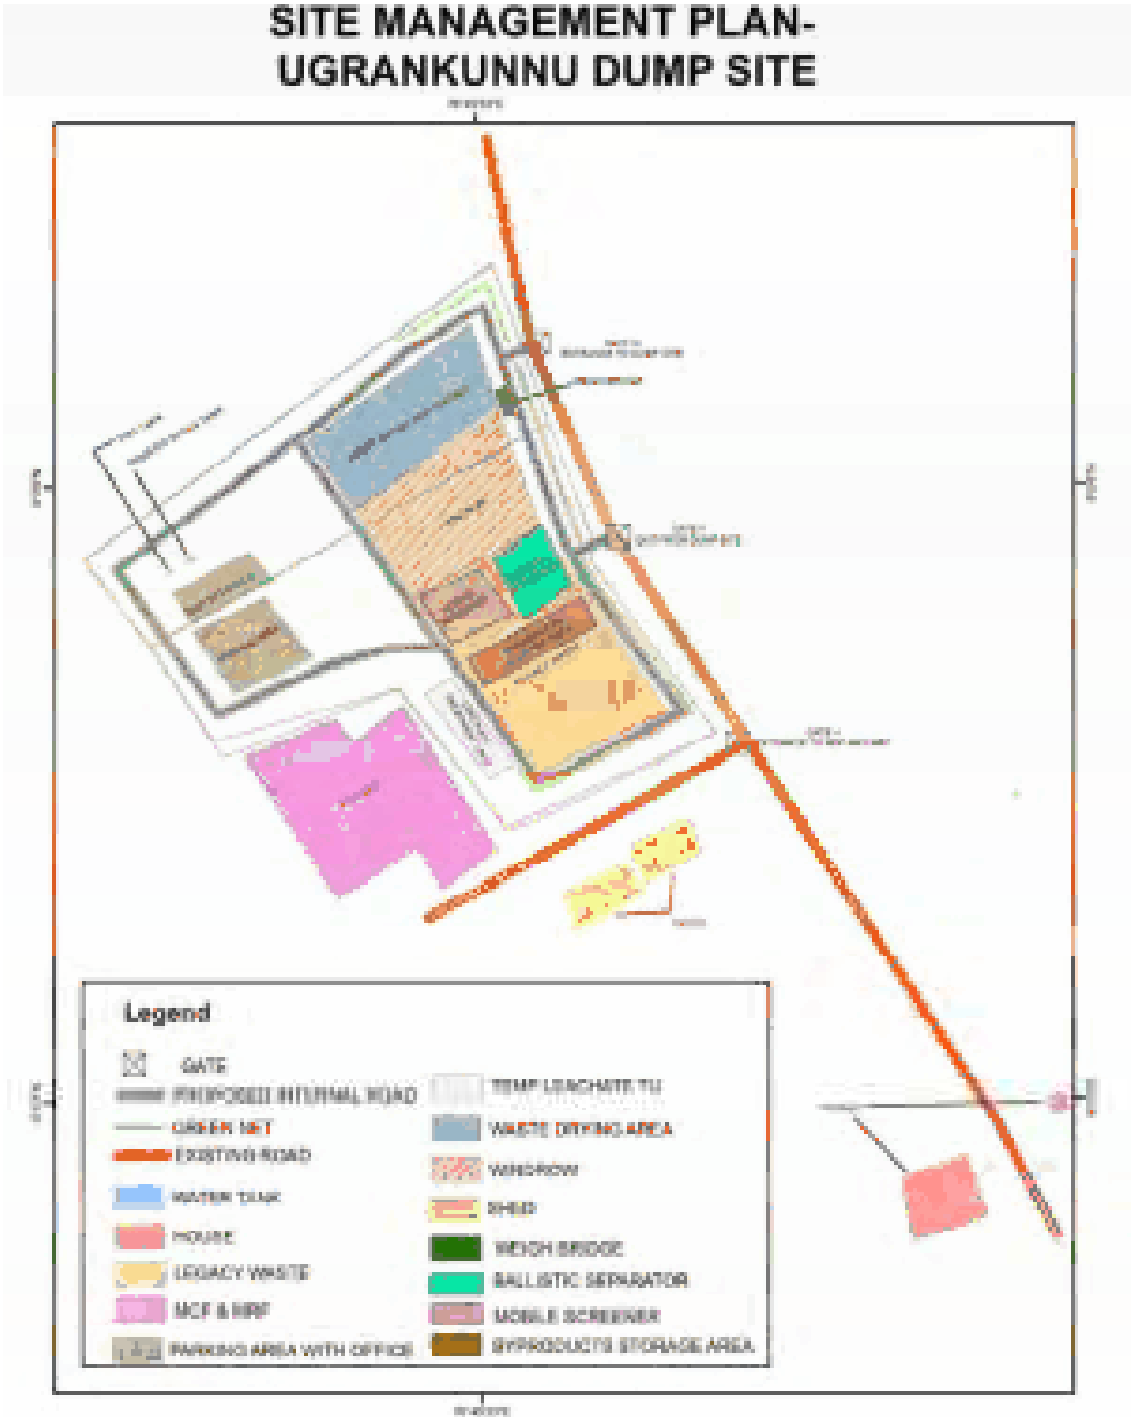
1. Project Kick-off

The existing legacy waste dumpsite should be visited jointly by representative of implementation agency, officials ULB and experts of PMU/PMC & TSC for the following

- For assessment of As –Is Situation of local settings viz., human settlement & environmental settings etc.,
- For validation of profile, quantity & physical characterization of legacy waste.
- Available services viz., electrical power, source of water and access road etc.,
- For ground truthing the sampling locations of baseline environmental parameter, locations where monitoring will conduct during operation phase and post reclamation phase
- For sensitizing/awareness of the upcoming the project activity to the stakeholders within the vicinity of the dumpsite.
- For understanding the sensitive of environmental & social aspects/social considerations viz., educational institutions, religious places and settlements settings.
- For ensuring that the implementation agency understands and to complies with all local and national regulations related to project activities.

2. Site Management Plan

The position of the machineries and other auxiliary machineries/equipment's in-line with the defined process of biomining with 100% land recovery play imperative role in effective implementation of the project activities.



A detailed site management plan is prepared including the details of excavation & pre stabilization area in phases (1to 4), machineries, weigh bridge, area allocation for by-products storage, vehicle parking area and position of CCTV cameras. The detailed site Management plan is provided below.

3. Site Preparation

The portion of the legacy waste dumpsite will be clear vegetation and levelling the area to create a stable & level platform for positioning of bio-mining machineries/equipment's and for processing of legacy waste.

4. Procurement of Machinery & Vehicles and Equipment's

An indicative list of Machineries &Vehicles and equipment's are proposed to for effective processing the quantity of existing legacy waste in-tune to the timeline of NGT orders. The indicative list of the Machinery & Vehicles and equipment's are provided in the Section 8.5 IN FR

**Site plan Figure**

5. Mobilization of Manpower

For effective management of the project activities, an indicative list Manpower provided in the Section 8.6.2 shall be mobilize required.

6. Statutory Approvals

The implementation agency is responsible for obtaining all required permission/consent/approvals from the competent authorities. The ULB/DPMU/DPMC will only facilities implementation agency in obtaining the approvals etc. The indicative list of statutory approvals required for the project is provided below.

a. Site Authorization from KSPCB in conforming to SWM Rules 2016 and Consent to Establish/Operate KSPCB.

b. Dept. of mining and geology

c. Necessary permission for storage of process materials and chemicals

d. NOC from Dept. of Fire and Rescue

e. Segregated Hazardous waste disposal arrangement (eg: KEIL Ambalmedu, Kochi)

f. Any other statutory approvals/ permissions

7. Establishment of forward linkages

The By-products from the bio-mining process/operations viz., Bio earth/ C&D waste (Inert), RDF and Recyclables will be stored in the designated place (as indicated in the site management plan) within the dumpsite. The contractor is responsible for management/establishment of forward linkages. Utilization of Bio earth/C&D (inert) may be finalized in consultation with ULB. An indicative forward linkage is provided in the Section 8.7. The compost should conform to Schedule II of SWM Rules 2016, and RDF should conform to the Guidelines on Usage of RDF in various Industries issued by MoHUA. Bi-weekly sampling will be carried out to confirm the same.

**Bio-mining operations**

. | Step-1 – Waste Stabilization

The initial step involves the use of a front-end loader to excavate the legacy waste, allowing for the leachate to dry out through exposure to solar radiation and for the removal of trapped methane from the heap. To ensure the decomposition of biodegradable waste such as discarded food, fruits, flowers, and garden waste, proper aeration is necessary to prevent the generation of leachate and odors. The top layer of the legacy waste, approximately 150 mm in depth, is repeatedly loosened using the front-end loader. Additionally, the waste is lightly mist-sprayed with biocultures to manage odors and disperse decomposing microbes throughout the waste. The loosened legacy waste forms windrows.

: | Step-2 – Windrow Formation

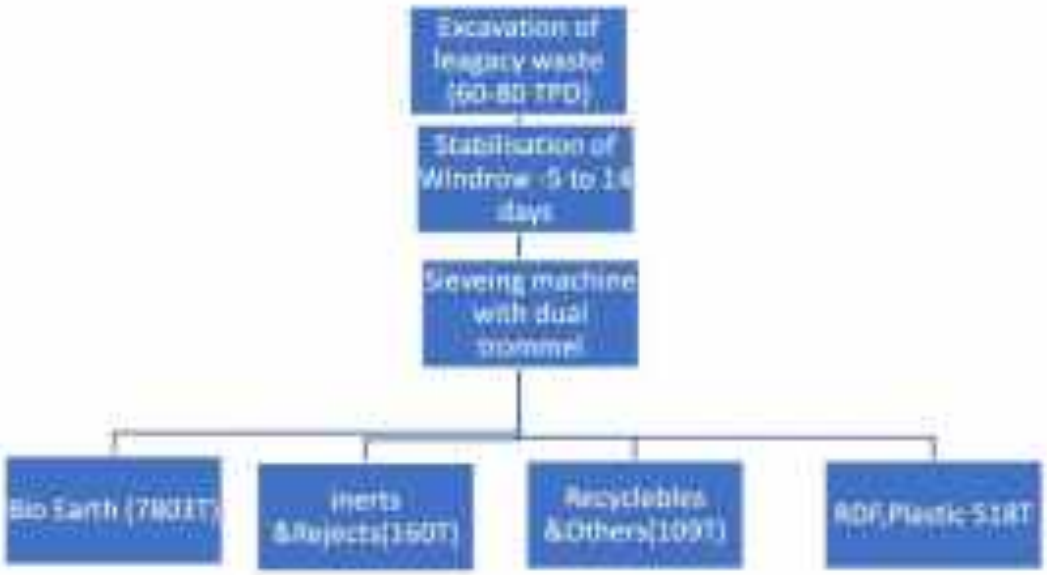
The second step involves creating windrows of the legacy waste using backhoe. Composting bio-cultures are added to accelerate decomposition and generate biological heat within the waste, aiding in drying it out and reducing its volume. These windrows are turned every 3 days to ensure proper biological treatment and moisture loss. After 12weeks, when the heaps have reached a suitable consistency for screening, the material is weighed and transferred to a Mobile Trommel, which consists of rotating cylinders with different-sized perforations.

Step-3 – Sorting and Segregation by Mobile Trommel

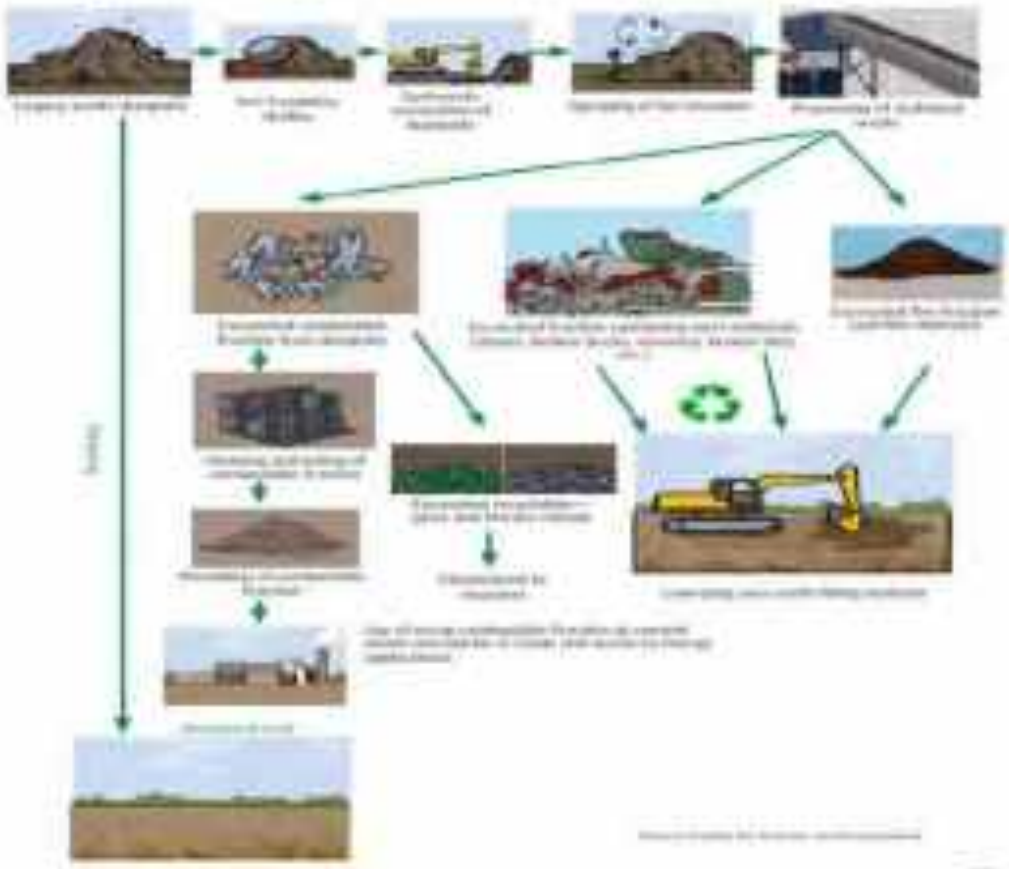
The third step is to move stabilized waste to mobile trommel to get 3 different sizes of fractions

- Fraction 1 – (minus 30 mm) – Bio Soil/earth -Used for filling low lying areas
- Fraction 2 – (30-80) mm – Mixed fraction – Plastics with C&D (send to Ballistic Separator)
- Fraction 3 – (80 +) mm – Mixed fraction – (send to Ballistic Separator)

The Fraction-2 & Fraction-3 (30-80) mm & (80 +) mm is required to move for further separation process through ballistic separator.



Step-4 – By - products – C&D materials



In the fourth step, the fraction-2 and fraction-3 are sorted into three types based on their shape and weight: heavy and rolling fraction (referred to as 3D) - C&D Material, light fraction (referred to as 2D) – RDF, and the sieved fraction (or under-screen fine fraction) – Plastic.

Step-5 – By products – RDF

In the fifth step, the RDF sorted by the ballistic separator (30TPH) is moved to the baling machine (50TPD) for packaging the RDF fractions. The baled RDF is then transported to Cement plants via a weigh bridge (30Ton), where a co-processing facility is available.

**STEPS IN BIOMINING PROCESS**

8. Monitoring & Supervising Mechanism

Supervision and monitoring during dumpsite remediation by TSC/PIU/DPMU

9. Record keeping and Reporting

- The Implementation agency shall maintain a record of the daily processed legacy waste and also keep proper record of all the recovered and disposed of materials.
- The Implementation agency shall maintain authorized weigh bridge records at the point of receipt by end designated agency. A consolidated weigh bridge records certified by the Plant Manager/competent authority of the authorized Cement plant/ WtE or such units certifying the total RDF received from the Project is a valid proof of compliance.
- The Implementation agency shall maintain all the statutory records, as per SWM Rules, 2016, and also conditions stipulated in Site Authorization/Consent to Establish/Operate by KSPCB if any, KSWMP/WB requirements and other project relevance statutory requirements.
- The site shall be operated in CCTV surveillance with data storage of entire contract period. For CCTV surveillance High-Definition IP based cameras in adequate numbers. As per the requirement of the ULB/KSWMP link with mobile compatibility may be provided for online monitoring of the project activities.
- The vehicles engaged for the project activities shall be equipped with Vehicles Tracking System (VTS) by equipping with GPS and online monitoring system.
- The agency is required to maintain loading and unloading weighbridge slips, e-way bill, LR copy, RDF receipt acknowledgement letter from the cement factory/ WtE facility for complete traceability of the recovered fractions.

10. 100% land recovery/project closure

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the bidder to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

# GOVERNMENT OF KERALA

**Abstract**

Local Self Government Department - Guidelines for Remediation of Legacy Waste Dumpsites through Bio Remediation - orders issued.

**DEPARTMENT**

G.O.(Rt)No.2629/2022/LSGD Dated,Thiruvananthapuram, 29-10-2022

Read 1 Letter No. 2683/C2/2022/SM dated 16.09.2022 from Executive Director Suchitwa Mission.

**ORDER**

As per the letter read above, Executive Director, Suchitwa Mission had submitted draft guidelines for implementation of project for remediation of Legacy Waste Dumpsites through Bio Remediation.

2) Government have examined the matter in detail and are pleased to approve the guidelines enclosed herewith for implementation of project for reclamation of legacy waste dumpsites through bio remediation.

(By order of the Governor)
SHIBI ABRAHAM
DEPUTY SECRETARY

**ബ്രഹ്മപുരത്തിലെയടക്കം നഗരത്തിലെ മാലിന്യ സംസ്കരണ പ്ലാന്റുകൾ നിരീക്ഷിക്കാൻ കേന്ദ്ര സംഘം**

കൊച്ചിയിലെ മാലിന്യ സംസ്കരണ പ്ലാന്റിൽ 2019-ലെ വേനൽക്കാലത്ത് തീപിടിത്തമുണ്ടായതിനെത്തുടർന്ന് ഉയർന്നുവന്ന പരാതികൾ പരിഹരിക്കുന്നതിനുള്ള നടപടികൾ നിരീക്ഷിക്കുന്നതിനായി കേന്ദ്ര സർക്കാർ ഒരു സംഘത്തെ നിയോഗിച്ചു. കേന്ദ്ര പരിസ്ഥിതി, വനം, കാലാവസ്ഥാ വ്യതിയാന മന്ത്രാലയത്തിലെ ഉദ്യോഗസ്ഥരടങ്ങുന്ന സംഘമാണ് ബ്രഹ്മപുരത്തിലെത്തിയത്. കൊച്ചി കോർപ്പറേഷൻ ഉദ്യോഗസ്ഥരുമായി സംഘം കൂടിക്കാഴ്ച നടത്തി. ബ്രഹ്മപുരത്തെ മാലിന്യ സംസ്കരണ പ്ലാന്റിന്റെ പ്രവർത്തനം വിലയിരുത്തുന്നതിനായി ദേശീയ ഹരിത ട്രൈബ്യൂണൽ (എൻ.ജി.ടി.) രൂപീകരിച്ച സമിതിയാണ് സംഘത്തെ നിയോഗിച്ചത്. കേന്ദ്ര പരിസ്ഥിതി, വനം, കാലാവസ്ഥാ വ്യതിയാന മന്ത്രാലയത്തിലെ ഡയറക്ടർ ഡോ. ഹിമാൻഷു പാഠക്, കേന്ദ്ര മലിനീകരണ നിയന്ത്രണ ബോർഡിലെ (സി.പി.സി.ബി.) ശാസ്ത്രജ്ഞൻ ഡോ. ബി. ശർമ്മ എന്നിവരടങ്ങുന്നതാണ് സംഘം. കേരള സംസ്ഥാന മലിനീകരണ നിയന്ത്രണ ബോർഡിന്റെ (കെ.എസ്.പി.സി.ബി.) പ്രതിനിധികളും സംഘത്തിലുണ്ട്. ബ്രഹ്മപുരത്തെ മാലിന്യ സംസ്കരണ പ്ലാന്റിൽ 2019 മാർച്ച് 2-നുണ്ടായ തീപിടിത്തത്തിനുശേഷം പ്രദേശത്തെ വായുവിന്റെ ഗുണനിലവാരം മോശമായതിനെത്തുടർന്ന് നിരവധി പരാതികൾ ഉയർന്നിരുന്നു. ഇതിനെത്തുടർന്ന് കൊച്ചി കോർപ്പറേഷൻ സെക്രട്ടറി നൽകിയ പരാതിയിൽ എൻ.ജി.ടി. സ്വമേധയാ കേസെടുത്തിരുന്നു. ഈ കേസിലാണ് ട്രൈബ്യൂണൽ സംഘത്തെ നിയോഗിച്ചത്. ബ്രഹ്മപുരത്തെ പ്ലാന്റിൽ നിലവിൽ കെട്ടിക്കിടക്കുന്ന മാലിന്യത്തിന്റെ അളവ്, പുതിയ മാലിന്യം കൈകാര്യം ചെയ്യുന്നതിനുള്ള സംവിധാനങ്ങൾ, പ്രദേശത്തെ വായുവിന്റെയും വെള്ളത്തിന്റെയും ഗുണനിലവാരം, പ്രദേശവാസികൾക്കുണ്ടായ ആരോഗ്യപ്രശ്നങ്ങൾ തുടങ്ങിയവ സംഘം പരിശോധിക്കും. ഇതിനുശേഷം സംഘം ട്രൈബ്യൂണലിന് റിപ്പോർട്ട് സമർപ്പിക്കും. ഈ റിപ്പോർട്ടിന്റെ അടിസ്ഥാനത്തിലാകും ട്രൈബ്യൂണൽ തുടർനടപടികൾ സ്വീകരിക്കുക.

**പരിശോധന മാനദണ്ഡങ്ങളും മാർഗ്ഗനിർദ്ദേശങ്ങളും**

- കേന്ദ്ര മലിനീകരണ നിയന്ത്രണ ബോർഡ് 2019-ൽ പുറത്തിറക്കിയ "ലാൻഡ്ഫിൽസ് ഓഫ് വിജനമായ ഓഫ് മുനിസിപ്പൽ സോളിഡ് വേസ്റ്റ്"

- കേന്ദ്ര പാർപ്പിടനഗരകാര്യ മന്ത്രാലയവും (MoHUA) നഗരകാര്യ വകുപ്പിലെ പബ്ലിക് ഹെൽത്ത് & എൻവയോൺമെന്റൽ എഞ്ചിനീയറിംഗ് ഓർഗനൈസേഷനും (CPHEEO) ചേർന്ന് 2020-ൽ പ്രസിദ്ധീകരിച്ച "സബ്ജ് മാനേജ് മിഷൻ (അർബൻ)-അഡൈസറി നോട്ട് ലാൻഡ്ഫിൽ റിഹൈബിലിറ്റേഷൻ (SBM U - Advisory on Landfill Reclamation)"

- പ്രസ്തുത വിഷയവുമായി ബന്ധപ്പെട്ട് കാലാകാലങ്ങളിൽ കേരള സർക്കാർ പുറപ്പെടുവിക്കുന്ന മാർഗ്ഗനിർദ്ദേശങ്ങൾ

**കേന്ദ്ര സംഘത്തിന്റെ സന്ദർശനത്തിനുശേഷം ബ്രഹ്മപുരത്തെ മാലിന്യ സംസ്കരണ പ്ലാന്റിൽ നടപ്പിലാക്കുന്നതിനുള്ള മാർഗ്ഗങ്ങൾ**

- 100% ശാസ്ത്രീയമായ രീതിയിൽ മാലിന്യ സംസ്കരണം (MoHUA-യും CPHEEO-യും പ്രസിദ്ധീകരിച്ച "സബ്ജ് മാനേജ് മിഷൻ (അർബൻ)-അഡൈസറി നോട്ട് ലാൻഡ്ഫിൽ റിഹൈബിലിറ്റേഷൻ" പ്രകാരം)

**മാലിന്യ സംസ്കരണ പ്ലാന്റിലെ നിർദ്ദിഷ്ട പ്രവർത്തനങ്ങൾ**

- മാലിന്യ സംസ്കരണ പ്രവർത്തനങ്ങളുടെ നിരീക്ഷണം കേന്ദ്ര സംഘത്തിന്റെ ചുമതലയിലായിരിക്കും

**നിർമാർജനം ചെയ്യേണ്ട മലിനീകരണ വിഭാഗങ്ങളുടെ അളവ് തിട്ടപ്പെടുത്തൽ**

- പൊതുവായി, നിർമാർജനം ചെയ്യേണ്ട മലിനീകരണത്തിന്റെ അളവ്(കൂമ്പാര തിട്ടയിൽ) ടോട്ടൽ സ്യൂഡോ സർവേയിലൂടെ കണക്കാക്കുന്നതാണ്. എന്നാൽ ടോട്ടൽ സ്യൂഡോ സർവേ സാധ്യമല്ലാത്ത സാഹചര്യത്തിൽ ഒരു ഖരം കൂമ്പാര തിട്ടയിൽ ഇടാനുള്ള വലിയ വ്യപ്തകണ്ടെയ്നറുകളുടെ കാര്യത്തിൽ സ്യൂഡോ സർവേ നിർബന്ധമാക്കുന്നതാണ്.

- ആവശ്യമുള്ള ചതുര, പ്ലാവെയുള്ള സർവേ ഏജൻസികളെ നിശ്ചിത നടപടിക്രമങ്ങൾ പാലിച്ച് ഇതിനായി ഏൽപ്പിക്കുന്നതാണ്. അതിനുള്ള ചെലവ് മലൂകാ ഫണ്ടിൽ നിന്ന് തന്നെ സംസ്ഥാന സർക്കാരുകളാണ് വഹിക്കേണ്ടതുമാണ്.

- മൊത്തത്തിൽ കൊണ്ടുപോകുന്ന മാലിന്യത്തിന്റെ അളവ് തന്നെ സംസ്ഥാന സർക്കാരുകൾ എസ്റ്റിമേറ്റ് പരിശോധിച്ച് അംഗീകരിക്കേണ്ടതുമാണ്.

**എസ്റ്റിമേറ്റ് തയ്യാറാക്കുന്ന പദ്ധതി ഇപ്രകാരമാണ്.**

- മൊത്തത്തിൽ നിലവിലെ അവസ്ഥ, മാലിന്യത്തിന്റെ സ്വഭാവഗതകൾ, മാലിന്യ നിക്ഷേപത്തിന്റെ കാലയളവ് തുടങ്ങിയവ വിശദമാക്കുന്ന എസ്റ്റിമേറ്റിനോടൊപ്പമുള്ള വിശദമായ റിപ്പോർട്ട് അനുബന്ധം I ൽ നൽകിയിരിക്കുന്ന പ്രൊഫോർമയിൽ തയ്യാറാക്കേണ്ടതാണ്

- അനുബന്ധം-II ൽ നൽകിയിരിക്കുന്ന മാനദണ്ഡങ്ങളുടെ വാസ്തവം അനുസരിച്ച് തയ്യാറാക്കിയത് എന്ന പ്രസ്താവന നടപ്പിലാക്കുന്നതിന് എസ്റ്റിമേറ്റ് തയ്യാറാക്കേണ്ടതാണ്.

- പ്രൊപ്പോസൽ തയ്യാറാക്കുന്നതിന്റെ ഭാഗമായി പ്രസ്തുത പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള എല്ലാത്തരം ചെലവുകളും പരിഗണിക്കേണ്ടതാണ്.

- വാർഷിക പദ്ധതിയുടെ ഭാഗമായി മുഴുവൻ എസ്റ്റിമേറ്റുകളും മലൂകാ മാനുവലുകളിൽ നിന്നും പണം വകയിരുത്തേണ്ടതുമാണ്.

**സാങ്കേതിക അനുമതി**

നിലവിലുള്ള സാങ്കേതിക അധികാരങ്ങൾ അനുസരിച്ച് തന്നെ സംസ്ഥാന വകുപ്പ്(ബോർഡ് ഇൻഫ്രാസ്ട്രക്ചർ & എസ്റ്റിമേറ്റിംഗ് വിഭാഗ്) ഒരു സ്ഥാപിത എസ്റ്റിമേറ്റിന് സാങ്കേതിക അനുമതി നൽകുകയും ഭരണനിർവഹണ പാലിക്കുന്നതിനായി ചീഫ് എഞ്ചിനീയർ എക്സിക്യൂട്ടീവ് എഞ്ചിനീയർ (സൂപ്രണ്ടിംഗ് വിഭാഗ്) ആവശ്യമായ നിയന്ത്രിക്കുകയും ചെയ്യുന്നതാണ്.

മറ്റുള്ള സംസ്ഥാന സർക്കാരുകൾ മലൂകാ മാലിന്യ നിക്ഷേപ മൊത്തത്തിൽ നിലവിലുള്ള പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള നടപടി ക്രമങ്ങൾ

**ടെണ്ടറിംഗ്**

- മലൂകാ മാലിന്യ നിക്ഷേപ മൊത്തത്തിൽ നിലവിലുള്ള പ്രവൃത്തിയുടെ വിശദമായ സ്കോപ്പ് ഓഫ് വർക്ക് നിബന്ധനകളും വ്യവസ്ഥകളും ഉൾപ്പെടെ വ്യക്തമായി പ്രതിപാദിക്കുന്ന '2 കവർ ബിഡ്ഡ് അപേക്ഷ ക്ഷണിക്കൽ'(Request for Proposal - Two Cover Bid) തയ്യാറാക്കേണ്ടതും അതത് നടപടിക്രമങ്ങൾ പാലിച്ച് പ്രസിദ്ധീകരിക്കേണ്ടതും ചെയ്യേണ്ടതാണ്.

- കേന്ദ്ര ഹൗസിംഗ്-നഗരകാര്യ മന്ത്രാലയവും (MoHUA) സെൻട്രൽ പബ്ലിക് ഹെൽത്ത് & എൻവയോൺമെന്റൽ എഞ്ചിനീയറിംഗ് ഓർഗനൈസേഷനും (CPHEEO) ചേർന്ന് പ്രസിദ്ധീകരിച്ച "സപ്ലൈ ഓഫ് ഡ്രിങ്കിങ് (ടാർഗെറ്റ്)-അക്കൗണ്ടബിൾ ഗവൺ ഡ്രാഫ്റ്റിംഗ് റിപ്പോർട്ട്" ൽ നൽകിയിരിക്കുന്ന മാർഗ്ഗനിർദ്ദേശങ്ങളെ

- <u>GUIDELINES FOR IMPLEMENTATION OF PROJECTS FOR RECLAMATION OF LEGACY WASTE DUMPSITES THROUGH BIO REMEDIATION (BIO MINING AND MANAGEMENT OF RECOVERABLES AND REJECTS)</u>

As per the provisions of Solid Waste Management Rules 2016, local bodies are mandated to remediate legacy waste dumpsites and reclaim the land based on the guidelines issued by CPCB. Remediation of legacy dumpsites involves various activities such as assessment of the nature and quantity of waste to be remediated, excavation works to open the dumps, screening and sorting to segregate the waste fractions, reuse and sale/marketing of recovered materials, scientific disposal of rejects as per the norms. The remediation of dumpsites is further directed by Honorable NGT in its order on OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. However, the progress of implementation of such projects has not been satisfactory so far. One of the main reasons is that there is a lack of clarity in the procedures to be followed for legacy waste remediation projects right from the approval of the project to the mode of execution (including sale and disposal of recovered materials) by LSGIs since the nature of such projects is not similar to the general public construction/civil works. Also, the nature, quality and quantity of material that can be recovered from an existing legacy dumpsite cannot be accurately predetermined without opening up such dumpsites and hence it is not practical to prepare a workable estimate for the same like other public works . In order to tackle these issues, Swachh Bharat Mission(Urban) and CPHEEO have issued an "Advisory on Landfill reclamation", and suitable provisions of this advisory can be adopted for the State of Kerala. In these circumstances, the Government has examined this matter in detail, and the following guidelines are issued for the implementation of projects for remediation of legacy dumpsites by Local Self Government Institutions.

**<u>Standards, guidelines and advisories to be followed</u>**

- "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" issued by Central Pollution Control Board
- "SBM-U Advisory on Landfill Reclamation" published by MoHUA and

CPHEEO

- Guidelines issued by Government of Kerala in this regard from time to time

**Models for implementing legacy waste dumpsite remediation by LSGI's**

- 100% outsourced model (As per "SBM -U Advisory on Landfill Reclamation" published byMoHUA and CPHEED)

**Implementing officer for legacy waste dumpsite remediation projects**

The implementing officer for legacy waste remediation shall be the Engineer of the LSGI

**Quantification of legacy waste to be remediated**

- The volume of legacy waste (in m3) to be remediated shall be generally assessed through Total Station Survey. If a total station survey is not feasible, a drone survey may be adopted for large dumpsites having a volume of more than 1 (One) Lakh m3.
- If required, external survey agencies may be engaged following laid down procedures and the cost for the same shall be met by LSGI from available funds.
- Contour mapping of the site shall be prepared and approved by the Engineer of the LSG

**Project Cost Estimation and Formulation by LSGI**

- Detailed report regarding the site conditions, nature of dump, history of dumping and other basic details shall be prepared in the format given in **Annexure - I**
- The estimate for biomining shall be prepared as per the specification and data given in
  - **Annexure -II**
- The overall cost for the implementation of the project shall be considered as part of the proposal.
- Project shall be taken up as per annual projects and funds from available sources shall be ear marked

**Technical Sanction**

- Technical sanction for the project shall be issued by the concerned Engineer in LSGO (LID & EW) as per the existing financial powers and necessary reporting to the Chief Technical Examiner (Finance Wing) may be ensured for compliance as per norms

**Implementation steps for remediation of legacy waste dumpsites by LSGIs**

**Tendering**

- Request for Proposals (RFPs-Two cover bid) clearly mentioning the scope of work, terms and conditions for reclamation of legacy waste dump sites shall be prepared and published as per laid down procedures.
- Conditions/eligibility criteria in the RFP shall be fixed based on the guidelines given in"**SBM-U Advisory on Landfill Reclamation"** published by MoHUA and CPHEEO
- It shall be ensured to mention in the scope of work that remediation of legacy waste dumpsites shall be undertaken as per the **"Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)"** issued by Central Pollution Control Board.
- The technical proposals received should be evaluated and technically qualified bidders shortlisted for further stage of bid approval. A Technical committee shall be formed at LSGI level for evaluation of the technical bids with the following members;
    - Secretary
    - LSGD (LID & EW) Engineer
    - Health Official (in the case of Urban local bodies)
    - Technical expert from District Suchitwa Mission
    - Representative from District Pollution Control Board
    - Other experts from academic institutions if any
- Financial bids of the technically shortlisted firms should be opened at LSGI level and approved as per procedures and norms
- Letter of Award (LoA) is to be issued to the selected contractor/agency and agreement executed.

**Execution, Supervision and preparation of bills**

- LSGI shall constitute a supervision committee consisting of LSGI Engineer and the officer in charge of monitoring waste management activity
    - LSGI shall authorise the supervision committee to monitor that the contractor correctly follows the scope of work included in the RFP document and agreement.
- The supervision committee shall inspect and monitor that the work is being carried out as per the scope defined.
- LSGI Engineer shall hand over the site and provide support for execution of work at the site by the contractor/agency
- The officer in charge of monitoring waste management shall oversee the waste management related activities such as formation of windrows, segregation of waste into various streams,ensuring pollution control measures and health matters involved in the project and shall give direction to the contractor/agency through the supervision committee.

- LSGI Engineer shall measure, record quantities by taking initial, intermediate and final levels in M-book and Check measurements shall be done by the officials of LSGD (LID & EW) as per the powers vested with in the Local Self Government Department.
- LSGI Engineer shall prepare the work bills claimed by the contractor/agency after completing stages of work detailed in the agreement and check measurement shall be made by the officials of LSGD (LID & EW) as per the powers vested within Local Self Government Department.

SPECIFICATION & OBSERVED DATA FOR REGULARATION OF LEGACY DUMPSITE THROUGH BIO REMEDIATION (Bio mining, managing recoverable and rejects)

Bio remediation (Bio mining, managing recoverable and rejects) by

a. Excavating the existing mixed unsorted garbage which underwent biological degradation in the land portion allocated and spraying with microbial inoculum for sanitising and stabilising the excavated mass, sieving them using Mechanical sieving machine or any other equipment,

b. Control of malt odour using deodorizing agent and stabilising the waste using Bio Culture for aerobic composting.

c. Eco friendly and non-polluting process in order to reduce the impact of dumping site in the adjacent areas.

d. Segregate the excavated garbage in the land portion earmarked, into as many kinds and categories as possible by mechanical means including the cost of any power or fuel consumption.

e. Creation and maintenance of infrastructure facilities and amenities for sieving, the excavated garbage, storing the segregated materials.

f. Deployment of necessary manpower, materials, equipment, tools and creation of facilities for handling, separating, segregating and storing for the operation of the plant.

g. Levelling the earth's surface by bulldozer or any other earth moving equipment

h. Providing security arrangements for the plan project site, machineries, equipment etc.

**SOCIAL IMPACT ASSESSMENT**

KSWMP

KERALA SOLID WASTE MANAGEMENT PROJECT

## 1.1 Introduction

The Social Impact Assessment (SIA) for the remediation of the dumpsite at Ugrankunnu, ward 26 (Railway station ward) of Kottarakkara Municipality, is to identify the social risks, potential impacts, mitigation measures to address such risks and finally preparing social management plan. Transect Walk and Social Screening Checklist were used as tools for identifying the risks and possible impacts. The proposed project is for remediating the dumpsite of the accumulated waste and reclaiming the abandoned land. The transect walk was conducted on 2nd and 16th of June 2023. A consultation meeting with different stakeholders including local residents, ULB functionaries, NGO representatives, ASHA, Anganwadi workers, residents' associations and line departments was held on 01-08-2023. The mitigation measures proposed are from the first-hand experience, outcome of the Key Informants Interviews (KII), FGD, transect walk, stakeholder consultation and social screening assessment, along with local's view and perception regarding dumpsite clearance.

### 1.1.1 Vulnerability Mapping

Gender, Caste, Race, Ethnicity, Religion, Occupation, Level of Knowledge, and skills etc. access of exclusion for assessing the vulnerability and social inclusion the following aspects are covered.

***Table 1.3 Vulnerability mapping details***

| Sl.No | Categories | Male | Female | Total |
|---|---|---|---|---|
| 1 | Below 6 Years | 3 | 6 | 9 |
| 2 | Differently abled Persons | 1 | 0 | 1 |
| 3 | Persons under Palliative care | 1 | 0 | 1 |
| 4 | Persons above 60 years | 6 | 8 | 14 |
| 5 | Destitute | 0 | 0 | 0 |
| 6 | Pregnant women | - | 2 | 2 |
| 7 | Women headed family | - | 6 | 6 |
| 8 | Total No of lactating mothers | - | 3 | 3 |
| 9 | Scheduled Caste Members | 7 | 8 | 15 |
| | **Total** | **18** | **33** | **51** |

*Source: ICDS and UPHC

### 1.1.2 Land

The site, in a hilly terrain is owned by Kottarakkara Municipality. An MCF, RRF, restroom, and Animal Birth Control programme office are there in the same compound. A newly constructed crematorium is also there. The dumpsite occupies 37.66 cents of the total area, has access to a high gradient CC road with single lane configuration (3 m road). On the southern side, about 150 metres from the site, there is a temple called Ugrankunnu Sree Bhadra Bhagavathi Temple and on the Northern side, 200 m away, there is a Nursing (Vijaya Nursing College) college. On the eastern side a rubber plantation and 17 residential houses are there and on the western side is MCF and RRF.

The remediation project requires additional land to accommodate heavy equipment and machines and to ensure operation of vehicles including earth movers. The ULB has already started negotiations with adjacent vacant landowner to get it on lease.

### 1.1.3 Community engagement

There are socially and economically weaker and vulnerable groups in the project area and they must be associated with the project during different stages. Focus Group Discussions (FGD) were held, and suggestions were collected from households and other stakeholders. The findings of the transect walk is also attached as last section of the social safeguard chapter.

## 1.2 Social Impact Assessment Process

The Social impacts were identified through the identification matrix, apart from these socio-economic conditions of the host communities such as Vulnerability/Livelihood/Labour issues/Gender/responsive Grievance Redressal Mechanism/Disruption of utilities etc. its impacts were analysed, and mitigation measures were formulated.

The process included application of social screening check list, stakeholder consultation, Focussed Group Discussion, key informant interviews and transect walk in the project area while preparing the F.R.

### 1.2.1 Steps involved in Social Impact Assessment

First part of SIA was baseline data collection of the specific project site (Ugrankunnu) from the ULB. The second step was stakeholder analysis with a brainstorming session at ULB by the help of service providers, elected representatives, and officials especially health Dept.

The proposed project involves various stakeholders with various roles/responsibilities. The below table 7.4 shows the stakeholder mapping

***Table 1.4 Stakeholder mapping details***

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 1 | ULB Council | Bidding with stipulated conditions, finalization, and deputing contractor/agency for remediation |
| 2 | Govt institutions like PCB, KSEB, KWA etc | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | DPMU | Monitoring and Evaluation |
| 5 | TSC/PMC | Technical support, consultation, and monitoring |
| 6 | Contractor | Execution of the Remediation work in accordance with bid conditions |
| 7 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| 8 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 9 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 10 | End recyclers | Process the inert and legacy waste safely after remediation |

In continuation with the above process, social screening, potential impact of identified social risk, mitigation measures, implementation plan, monitoring plan and social management plan. The social audit process is also proposed.

### 1.2.2 Social screening Output

The social screening with a checklist for SIA points out that the only anticipated and associated risk is with labour. No other adverse social impact on dwellings, land, livelihood, or community resources of the host and other vulnerable communities has been detected. The assessment screening indicates that the remediation of the dumpsite will have a positive impact on the living conditions of the area.

From the Key Informants Interview (KII), it was found that the present dumpsite area was used by police as well as municipal authorities, as a burial ground and for disposal of unidentified/ unclaimed dead bodies. It led to public protest and was one of the reasons for the closure of the site in 2018.

There will not be any damage to public properties or commercial establishments near the site. There are no scheduled tribes, rag pickers living near the dumpsite. Scheduled caste families are there within the

radius of 200 metres. Due to the low risk associated with the social and economic conditions of the host communities, the dumpsite can be categorized as "Moderate Risk."

### 1.2.3 Scoping of SIA

The proposed dumpsite remediation will be helpful for a healthy life. The overall development of the area will be ensured. Required action plans prepared will be beneficial to the labourers and women by ensuring Social Safeguards.

**Required Action Plans**

- Labour – Included
- Labour Influx – Included
- Gender Based Violence Action Plan – Included
- Citizen Engagement Plan – included.

### Livelihood

The proposed project will not affect the livelihood of either the ordinary or vulnerable population of the area or the HKS members. Since the dumpsite has closed for the last several years the rag pickers are not there. So, it will not affect them also.

**Land requirement**

As per the identification from social screening, there is no requirement of additional land to implement the project/remediation process

### 1.2.4 Key Findings- Potential Social Risks and impacts of the proposed project.

The following findings were identified through the process of application of various tools for social screening as described in the process.

The dumped legacy waste is a serious concern which affects the quality of life of the residents of the area. Within 200m radius of dumpsite 17 families reside, of which four belong to the SC category. Majority of the families are poor and mainly engaged in daily wage labour. During the interaction, it was observed that each family has an average of four members including kids and old people. Most of the families use well water for drinking and household purposes. Some families have KWA connection for water usage. Remediation of the dumpsite will certainly improve the quality of life of the 17 families with 62 inhabitants residing within 200 meters of it.

The only institution within 200 m from the dumpsite is a nursing college with 300 students and 50 staff members. The three college buses and the vehicles of the staff members take this road to travel on every working day from 7.30am to 9 am and 3.30 pm to 5 pm.

The Municipality plans a plastic recycling unit funded under National Urban Livelihood Mission once the dumpsite remediation is over.

The proposed dumpsite rehabilitation project will not have any adverse impact on livelihood of rag pickers, host community or HKS members. The project will not affect the livelihood activities of any local people, particularly artisans, small traders, or others. So, livelihood action plan is not required in the SMP. Tribal Development Plan is not required as there is no tribal hamlet.

There are no non-titled land users living or doing business in the proposed site. As no families have to be resettled, a resettlement plan is not relevant. An approximate of 20- 25 labours will be engaged daily, a labour influx management plan is incorporated in the SIA. The proposed project does not affect any community resources and will not cause any economic displacement, or loss of assets or resources.

There is no activity in the site after its closure, and hence the land is filled with bushes and vegetation. The compound wall, which separates the nearby RRF is cracked and is in a dangerous condition. All relevant safety precautions should be ensured during the execution of the project.

## 1.3 Labour Management Plan

### 1.3.1 Scope and structure of the Labour Management Plan

It is estimated that 2250 man-days are needed for remediation of dumpsite. The period of work is six months. Nearly 15 to 20 labourers are to be engaged in the site daily. So, there may be a labour influx. The contractor to be engaged should have a Labour License. Working hours should be regulated to eight hours. If their work time exceeds eight hours overtime allowance must be given to them. Primary basic amenities must be arranged by the contractor. (Shelter for workers, Toilet, Drinking water rest room facilities, first aid facilities, health insurance etc). The workers engaged by the contractor includes contractors' permanent workers daily wages, workers, and skilled workers. Minimum wages are to be given to them. Safety measures, food transportation etc. are to be ensured by the contractor. A wage register is to maintain by the contractor for avoiding disparity among the labours. Details of migrants' workers shall be registered and copy of the same shall be forwarded to the police station by the contractor.

### 1.3.2 Assessment of Key Potential Labour Risk

- Injuries /accidents / impairment as well as death is untoward incidents of labourers and damages to the machinery.
- Inadequate accommodation, inadequate health facility and basic amenities.
- Nonpayment of minimum wages and other eligible benefits.
- Discrimination of employment (eg. termination from employment, working condition wages or benefits)
- Engagement of Child Labour.
- Labour rights of women
- Sexual abuse at work site and security of women workers.
- Inadequate facility for pregnant women, lactating mothers, and children of work force.
- Possibility of GBV as the work site is near to existing MCF / RRF, since HKS workers are women workers.
- Denial of workers right to form workers organization.
- Misuse of GRM

### 1.3.3 Overview of Labour legislations

Following exactments are applicable to Labourers.

- Employees Compensation Act 1923.
- Contract Labour (Regulation and Abolishment Act) 1970.
- Minimum wages Act 1948.
- Payment of Wages Act 1936.
- Equal Remuneration Act 1936.
- Interstate Migrant workers (regulation Employment and Conditions of Service) Act 1974.
- Child Labour (Prohibition and Regulation) Act 1986.
- Employees State Insurance Act 1948.
- Sexual Harassment of Women at Workplace (Prevention, Prohibition, and Redressal) Act 2013.
- Industrial Dispute Act 1947.
- Trade Union Act 1926.

### 1.3.4 Responsibility Mapping

The proposed work shall be awarded to the contractor through competitive bids by the ULB. The contactor who engages labourers for civil and skilled work should take measures for protection and assistance to vulnerable group of workers (people with disabilities, migrant workers, women workers etc.) and that should be included in the work agreement. The ULB should monitor the same. The occupational health and safety should be ensured by the contractor. Training to workers to be imparted by the ULB. There must be a ULB level forum to address grievances of workers. The Labourers working in the site are to be registered.

### 1.3.5 Code of Conduct

A code of conduct needs to be incorporated in the contract terms. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct.

### 1.3.6 Transparency in contract specific terms and conditions

The contract must contain provisions for wages, working hours, Leave, other benefits, notice of termination, collective agreement that apply to the project, GRM etc.

***Table 1.5 Labour Management Plan Matrix***

| Sl.No | Activities | Target | Timeline | Means of verification | Respon sibility |
|---|---|---|---|---|---|
| 1 | To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | Three Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |
| 2 | To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | Two Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commenci ng the work at site | License and registration certificate issued by the competent Authority. | Contractor |

| | | | | | |
|---|---|---|---|---|---|
| 3 | To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |
| 4 | To display a copy of the certificate of registration at the conspicuous place on the premises where the building and other construction work is being carried on.<br><br>To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board<br><br>One notice board | As soon as the work is started.<br><br>Do | Photographs of the notice board where the license is displayed.<br><br>Do | Contractor |
| 5 | To conduct pre-employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |
| 6 | To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| 7 | To provide safe drinking water. The contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |

| | | | | | |
|---|---|---|---|---|---|
| 8 | To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| 9 | To arrange separate First Aid room at work site | Allot one specified room | To be made available during the constructio n period | Photographs of the facility | Contractor |
| 10 | To provide first Aid training to selected labours or staff members through an authorised agency. | One training with authorized agency | Within one month of commence ment of the work | Training records & Photographs | Contractor |
| 11 | To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commence ment of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |
| 12 | To establish rest room at work site or camp site | | Before the commence ment of the work | Photographs of the rest room | Contractor |
| 13 | To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commence ment of the work | Photographs of the facility, canteen register etc | Contractor |
| 14 | To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| 15 | Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |

| | | | | | |
|---|---|---|---|---|---|
| | Female members should be minimum 50%. ) | | | | |
| 16 | Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| 17 | To publish the abstract of labour laws within the premises of the labour camp.<br>The Payment of Wages Act<br>The Employee compensation Act<br>The Building and Other Construction Workers (BECS) Act<br>The Contract Labour (A&R) Act<br>The Child and Adolescent Labour (P&R) Act<br>The Maternity Benefit Act | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |
| 18 | To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| 19 | Conduct HIV/AIDS awareness programmes | As per requirement | Once in six months | Reports, photographs etc | Contractor |
| 20 | All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of license ID is to be collected | PIU |
| 21 | All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only after procurement of third-party insurance to the vehicle | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

**Budget for LMP**

| S.No | Item | Cost |
|---|---|---|
| 1 | **Labour compliance as per LMP** | [redacted] |

## 1.4 Labour Influx Management Plan

### 1.4.1 Scope and structure of Labour Influx Management Plan

Nearly 42 HKS are working in the MCF and RRF. A Nursing College is also functioning near the site. The contractor must provide halting place for the workers, Toilet, Drinking water, First aid facility etc. The remediation work shall not affect the functioning of MCF /RRF and Nursing College. Most of the HKS workers and College students are girls/women. So, precautions must be taken by the contractor for preventing GBV. The road leading to the facility is a narrow, hence precaution may be given for transportation of waste. The work shall not affect the functioning of Nursing College or MCF / MRF.

### 1.4.2 Overview of Labour influx on the project

It is estimated that 2250 Labour days needed for the remediation work. The estimated period of work is for 5 months. Nearly 15 to 20 workers shall be engaged per day.

### 1.4.3 Mapping of impact done to Labour influx

Daily 15 to 20 workers employed by contractor are expected to be at the site. There are ,17 houses near the site. 42 HKS workers are working at the MCF/ RRF. Nursing College is functioning nearly 200m from the site. Precautions must be taken by the contractor and ULB to avoid public nuisance issue and to prevent GBV.

### 1.4.4 Align the remediation work plan with the requirement of Labour

The work force to be employed includes mechanics, machine operators etc. and the migrant labourers may have to stay at the site. The possibility of involving HKS volunteers in the labour force should be explored.

### 1.4.5 Profile of the host community

There are 17 dwelling units, one Nursing College, one temple within 200 M radius of the site. The population density of the area is low.

### 1.4.6 Impact assessment

Since the work site is in an interior area, the contractor must make arrangements for the accommodation of labourers, to meet their primary needs, food, security and emergency response system etc. There must be a first aid facility in the work site. A code of conduct for the workers is also necessary. AIDS /HIV awareness must also be given to the workers. GRM system is to be established. These are to be included in the contract agreement.

***Table 1.6 Labour Influx Management Plan Matrix***

| Sl.no. | Risk | Mitigation measures | Implementation responsibility | Monitoring indicators | Monitoring responsibility |
|---|---|---|---|---|---|
| 1 | Social and Community wellbeing | There is no adverse impact | NA | NA | NA |
| 2 | Economic and Livelihood Issues | No economic and Livelihood issues. Local people may be provided job opportunities by the contractor | NA | NA | NA |
| 3 | Accommodation /labour camp | Accommodation must be arranged by the contractor | Contractor | Personal verification observations Interviews | TSC/ DPMU |
| 4 | Communicable Diseases | Screening regular medical check-up Hospital facility | Contractor | SoP for prevention of communicable diseases and health well-being on work site and Labour camp. Report on Medical Check up | TSC/ DPMU |
| 5 | Crimes | Code of conduct and SoS | Contractor | Work site complaint Register Number of cases reported, and action taken | TSC/ DPMU |
| 6 | Child Labour | Must not be allowed | Contractor and TSC | No. of child Labour issue Reported | ULB / DPMU |
| 7 | Labour licences | Contractor must have a valid Labour License. | Contractor/PIU | Number of labours having licence | DPMU |

## 1.5 Gender Based Violence Prevention Plan (GBVP)

From the site-specific field study, it was observed that there is a lack of security. So, there is possibility of vulnerability of women to violence, sexual exploitation and abuse, harassment during the dumpsite remediation. It came to the notice of TSC team that women as service providers, especially HKS members often have to work in unprotected work environment, and are susceptible to many hazards. They work in poorly maintained areas and are often exposed to violence, harassment, and abuse by unwanted elements of society. This may also affect their social security. Effective responsive mechanisms for harassment redressal at ULB level are often not enough to address such issues. Gender insensitivity needs to be addressed at all levels through intensive IEC, and BCC campaigns and capacity building programmes at ULB level. Care should be taken to prepare and disseminate information regarding Internal Complaints Redressal Committee (ICRC), emergency contact number. From the assessment on gender risks the following GBVA Plan is prepared.

***Table 1.7 GBV Action Plan***

| **Action** | **Tasks** | **Timeline** | **Primary Responsibility** | **Monitoring Indicators** | **Monitoring Responsibility** |
|---|---|---|---|---|---|
| Formation of Internal Complaints Redressal Committee (ICRC) | Work in collaboration with ICRT<br><br>Orientation training<br><br>Organize meetings.<br><br>Documentation of meetings<br><br>Information dissemination regarding ICRC | 30 Days | ULB | Minutes of formation committee meeting<br><br>Details regarding drafting of TOR and finalizing.<br><br>Reports, attendance, decisions | DPMU |

### 1.5.3 Budget

*Table 1.10 Budget for GBV and associated activities*

| S. No | Activity | Specification | Quantity | Cost (₹) |
|---|---|---|---|---|
| 1 | Sensitization program | Waste generators (Residents) on GBV | 1x [redacted] | [redacted] |
| 3 | Sensitization programs | Service providers (HKS) on GBV | 2 x [redacted] | [redacted] |
| Total | | | | [redacted] |

## 1.6 Citizen Engagement Plan

### 1.6.1 Communication and Community Engagement

Each stage of the project like planning, decision making, implementation and impact assessment will be implemented through participatory methods, engaging different community groups (Residents Associations, NGOs, Institutions, ULB, HKS) other employees and Community Based Organizations (CBOs). Social and Behavioural Change Communication (SBCC) activities would be imparted during the implementation of the project.

The social Management activities ensured the strategy for social inclusion and benefits to vulnerable communities along with gender concerns, Livelihood improvements, Proper Labour Management, and adequate provision for community engagement

***Table 1.11 Concerns of Communication and Community Engagement and Mitigation***

| **Concern** | **Mitigation** |
|---|---|
| Non-co-operation and protest. | Community participation through various SBCC activities |
| Lack of community ownership feeling | Participatory monitoring will be ensured |
| Lack of civic sense regarding waste management | Campaign, IEC materials distribution, street plays, flash mob etc. to influence public be- haviour in favour of dumpsite remediation |

### 1.6.2 Stakeholder Identification

From the field study through consultation with the community, it was identified that the major stakeholders are service providers and waste generators. There are two types of service providers, primary and secondary. HKS members, elected representatives, health officials are the primary service providers directly involved with the community in SWM processes. Other service providers come under the secondary category.

***Table 1.12 Waste generators in ULB***

| **Waste generators** | |
|---|---|
| **Category** | **Numbers** |
| Households, commercial establishments, and Public Service Institutions | 10087 |

***Table 1.13 Service providers at ULB***

|---|---|---|---|
| Ward Population | 418 | 490 | 908 |
| BPL | 16 | 19 | 35 |
| SC | 19 | 29 | 48 |
| ST | 0 | 0 | 0 |
| OBC | 114 | 133 | 247 |
| Differently Abled | 7 | 2 | 9 |

### 1.6.3 Need of the plan

Citizen engagement plan aims to actively engage with the citizens, to address their concerns and provide valuable content and support to the plan. The direct and indirect involvement of citizens during various stages of the remediation process will be helpful to ensure transparency and accountability in governance, cost effectiveness, credibility, sense of ownership, sustainability and ensured democratic participation.

### 1.6.4 Objective of the Plan

The main objectives of the plan are.

- To learn and mobilize the community.
- To create awareness regarding the relevance of the citizens engagement plan
- To initiate leadership from the community
- Democratic participation through interaction, conversation and FGDs
- To ensure quality participation and effective decision making which will ensure Citizen Engagement Plan

### 1.6.5 Stakeholder's concerns

- •The host community may not own the remediation process due to lack of awareness.
- •Inadequate Waste Management process leads to poor public health, health risks due to environmental problems (air and water pollution)
- •Lack of community engagement

### 1.6.6 Public disclosure

Information dissemination on Project details - Aim, objectives, issues, strategies, and mitigation measures, project cost, time line through different IEC tools, disclosure of helpline number and ULB website etc.

### 1.6.7 Activities proposed

- Information dissemination about the project through public announcements
- Community/citizen Awareness
- Mass media (Bit notice, print media, radio, audio-visual including social media)
- Mid media (Posters, street play, flashmob, hoardings etc)
- Interpersonal communication

### 1.6.8 Awareness to service providers

- Capacity Building
- Training programmes
- Experience sharing of successful projects.
- Exposure visits to successful project sites

### 1.6.9 Citizen Engagement Plan

The below table 7.15 shows the Citizen Engagement Plan,

*Table 1.15 Citizen Engagement Plan*

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Lack of Awareness on Project activities | Public protests | Awareness generation through SBCC (to selected community people in the ward regarding the necessity of remediation, process, cost etc.)<br>IEC Activities (Specific to remediation activities)<br>Interpersonal communication<br>Mid media<br>Print materials (Leaflet, Brochure, dangler etc.)<br>Inter/intra group communication | PIU/TSC |

# SUMMARY

**INTRODUCTION:** Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. Bio mining and bioremediation of Valakkuzhi dumpsite figures in Cluster 1. The selected dumpsite is Valakkuzhi which is falling under this cluster 1 and is located near Ward no 25 Muvattupuzha municipality, Ernakulum District.

**RATIONALE FOR THE PROPOSED SUB-PROJECT:** Muvattupuzha ULB proposes bio mining and bioremediation of the Valakkuzhi legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

**PROPOSED SUB-PROJECT DETAILS:** Muvattupuzha dumpsite is located at a distance of 2.5 km from the centre of Muvattupuzha town in western side and encompasses a total area of 5.47 acres of land. The geographical coordinates of the dumpsite are 9.993701° N, 76.560974° E. The volume of legacy waste to be remediated in the dumpsite is 55,712 Cu.m. The legacy waste is presented about 2.47 m above and 5.5 m below the ground level respectively. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts.

**APPLICABLE NATIONAL, STATE LEGISLATIONS AND TECHNICAL GUIDELINES:** To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed and followed.

**THE WORLD BANK SAFEGUARDS POLICIES, AND KSWMP ESMF**: The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are ensured.

**SUB-PROJECT SCREENING AND ITS CATEGORIZATION:** As per indicative categorization for dumpsite bio mining and bioremediation, this subproject is categorized as E1.

Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (5.47 acres) and waste spread (3.20 acres) and absence of environmentally sensitive features around, this subproject is individually considered as E2 and EIA is prepared accordingly.

**ENVIRONMENTAL BASELINE:** Physiographically, Muvattupuzha in and around topographical features, is flat terrain zone. The favourable time for remediation is between October-2023 to March-2024 non-monsoon period. As per Wind rose diagram, the predominant wind directions are blowing from West and WSW direction throughout the year. As per the geotechnical investigation, the subgrade soil was encountered at 5.5 m below the waste depth of the dumpsite and the predominant soil is gravelly clay. The dumpsite is surrounded by predominantly of Dry cultivation land use and the same will act as odour attenuation during remediation. The cultural heritage zone near dumpsites is Muvattupuzha Old Bridge at a distance of 2.0 Km in East direction. Hence, no significant physical impact to the heritages sites is envisaged during remediation. As per the district disaster management plan-2015 and flood vulnerability map the dumpsite is under flood prone zone.

**DESCRIPTION OF ENVIRONMENTAL PARAMETERS:** The analysed air pollution data indicates that the levels are within acceptable limits of NAAQs, except the $PM_{10}$ of 136 $\mu g/m_3$. The ambient Noise Levels are well within the National Ambient Noise standards for Residential Area for night time however during the night time noise equivalent (45.9 dB (A) was found to be marginally higher than the standards. The ground water quality results indicate that the dumpsite has not caused any major increase of the parameters and the quality parameters are within the IS10500:2011, except the coliforms which are found to be higher than the above said standard. Similarly, the surface water sample shows that it is not largely influenced by the dumpsite as the quality is within the limits of IS 2296, except for BOD which shows a marginal increase in value of about 4.6 mg/l and COD of 14 mg/l. The leachate monitoring data indicates, the TDS is about 143 mg/l, while the suspended solids is about 12 mg/l. The chlorides are 24.1 mg/l, while the COD, BOD are 150 mg/l and 16.4 mg/l respectively.

**SOCIO-ECONOMIC BASELINE:** Muvattupuzha Municipality has population of 30,397, literacy rate of 96.11%, Density of population of 9as per Census 2011. The dump site is situated in the land owned by the Municipality. They have full authority to plan and implement the remediation process in this land. The remediation process will be conducted by an experienced

agency decided by the Municipality with the supervision of a ULB level project implementation unit.

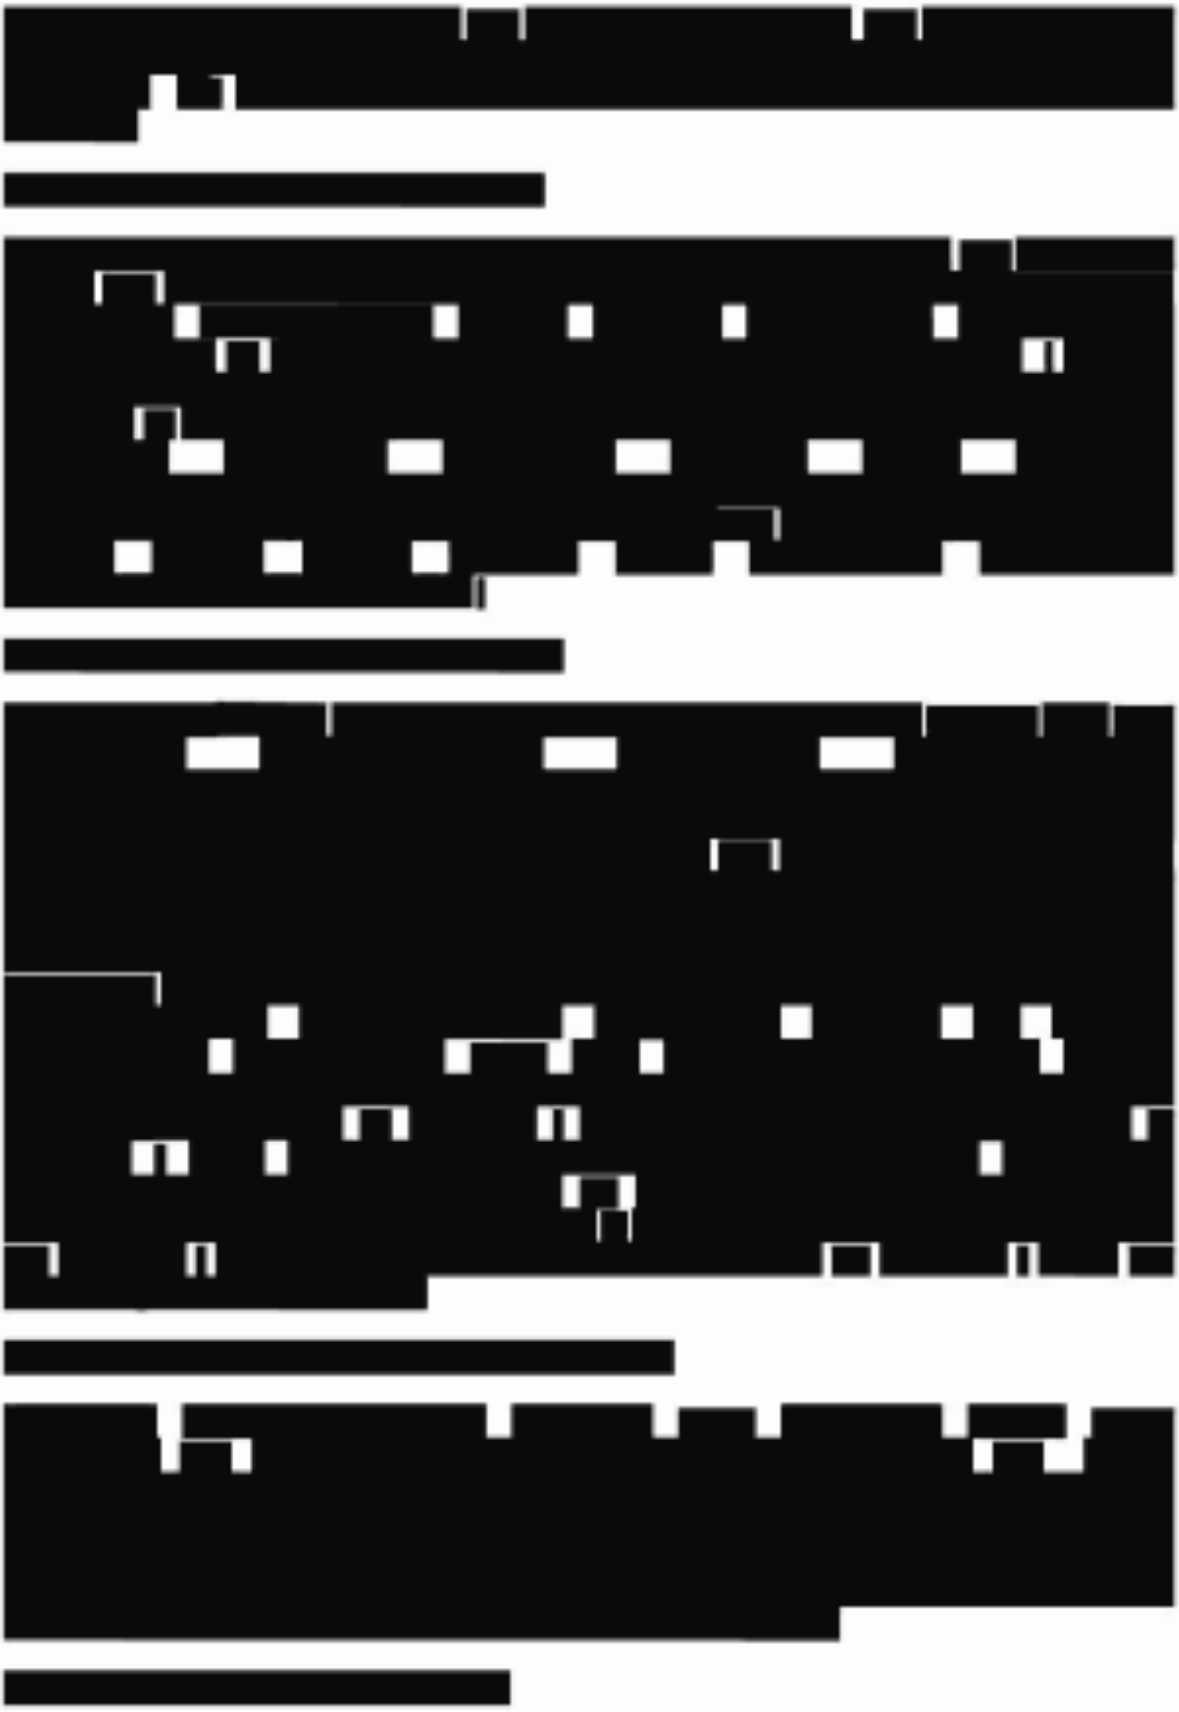
**SOCIO-ECONOMIC ENVIRONMENT:** The dumpsite remains in close proximity to 27 houses 200 metre distance and the remediation process will not affect the socio economic environment in and around the dump site in any way. Within a 200-meter radius of the dumpsite, there are houses, shops and workshops. The site is covered with a compound wall and gate.

**ANALYSIS OF ALTERNATIVES:** After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

**ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS:** Environment: During operational phase (bio-remediation), the main potential nuisances caused by a dump site are fugitive dust, odour, foul gases, smoke from the site (in case of fire), and leachate generation. Birds, vermin, and rodents, littering, noises both from machineries operating at the site and waste collection vehicles. Social: No specific social risk is identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process. It can be overcome by using adequate protective measures properly. In

**ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN:** The management plan proposed are for pre-remediation as well as during remediation stage and post remediation. The mitigation measures are recommended for impacts from air, noise, water, leachate, health and safety, OH&S aspects. The proposed monitoring plan includes leachate, surface and ground water monitoring for a period of once in three months. The cost of [redacted] is required for implementation and supervision of EMP.

**SOCIAL MANAGEMENT AND MONITORING PLAN:** The social management plan proposed are for pre-remediation as well as during remediation stage. The mitigative measures proposed addressing concern of local community about remediation work, labour management issues, health and safety risks of labours, gender discrimination.



**EMERGENCY PREPAREDNESS PLAN:** The identified emergency situations which may arise from remediation activities are fire risk in summer, occupational health and safety related risks. The Muvattupuzha police station at 3.7 km, General hospital at 3.5 km, Muvattupuzha Fire and Rescue station at 3.0 km are the nearest emergency services.

**SUPERVISION AND MONITORING:** Periodic Compliance monitoring system will be done by the contractor during remediation.

**PUBLIC CONSULTATION AND INFORMATION DISCLOSURE: A** Transect walk was carried out on 31.05.2023 covering the surrounding area of the dump site. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact. Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the process at the site. Site control measures should be enforced to prevent unauthorized personnel into the work site.

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# CHAPTER 1. INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-Lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. There are 19 dumpsites identified for remediation under the Kerala Solid Waste Management Project. Several others have been taken up for remediation directly by the ULBs. Currently, 7 dumpsites considered within the three districts, which are (Ernakulum, Alappuzha and Idukki) falling under Package B are selected by Kerala Solid Waste Management Project (KSWMP) for remediation under the project. One of the selected dumpsite is Valakkuzhi which is located near Ward no 25 Muvattupuzha municipality, Ernakulum District.

## 1.2 The rationale for the Proposed Sub-Project:

Valakkuzhi dumpsite in Muvattupuzha ULB at ward no. 25 has a total waste quantity of 55,712 Cu.m, spreading over 3.20 acres. The site is located between Latitude 9.993701° N and Longitude 76.560974° E and has an elevation of MSL +20 (m), with a gentle slope towards the south-eastern part. During monsoon season, due to the geography of the site, Leachate from waste flows downhill towards residential areas located at southern side of the site. Muvattupuzha ULB proposes bio mining and bioremediation of the Valakkuzhi legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Proposed Sub-Project Details:

Valakkuzhi dumpsite is located at a distance of 2.5 km from the centre of Muvattupuzha town in western side and encompasses a total area of approximately 5.47 acres of land. Out of this, 3.20 acres of land is covered with solid waste. The geographical coordinates of the dumpsite are 9.993701° N & 76.560974° E. It is located in ward no. 25 of the municipality. Muvattupuzha municipality holds the ownership of the dumpsite. The access road to the dumpsite is Valakkuzhi road which is at a distance of 35 m in the Northern direction. The nearest state highway (SH-41) connecting (Ernakulam-Thekkady Road) is in northern direction at a distance of 540 m and nearest national highway (NH-85) connecting (Kochi-Madurai Road) is in Southern direction at 1

km from the dumpsite. The south and west direction of the dumpsite is vacant land. Muvattupuzha river is in SE direction from the distance of 1.2 Km.

Currently, the quantity of waste dumped at this site is about 55,712 Cu.m. As of now 60 % of the area is covered with solid waste. The legacy waste is presented about 2.47 m above and 5.5 m below from the existing ground level as per the geotechnical investigation studies conducted. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues.

### 1.4 Objectives and Scope of the EIA & SIA:

As per indicative categorization for dumpsite bio mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (5.47 acres) and waste spread (3.20 acres) and absence of environmentally sensitive features around, this subproject is individually considered as E2 and EIA is prepared accordingly.

The EIA & SIA process involves the identification of the potential environmental and social issues in the project and during design interventions. The EIA & SIA further carries out impact prediction and evaluation of residual environmental and social issues of a Project. It then goes on to outline the proposed mitigation measures for residual impacts and enhancement measures for positive impacts which the Project will implement.

### 1.5 Structure of the Report:

The Consolidated EIA & SIA report has been structured into the following Chapters:

- Introduction and Project Description.
- Policy, Legal and Administrative Framework presents a review of the existing Institutions and legislation relevant to the project at the National and the State levels;
- Environmental Assessment Methodology discusses sequence of tasks carried Out in preparing EIA;
- Existing Environmental Scenario presents a consolidated picture of the existing Environmental setting of the project;
- Assessment of Potential Impacts identifies and quantifies the potential impacts on each of the environmental components due to the proposed project development;
- Analysis of Alternatives discusses the criteria for analysis of alternatives of technology for remediation.
- Mitigation Measures presents an elaborate listing of the nature of impacts on each of the environmental components and the avoidance and mitigation measures suggested.
- Public Consultation details the stages and types of public consultations carried out during the project preparation stage and people's perceptions of the project benefits and the Potential impacts.

# CHAPTER 2. POLICY AND REGULATORY FRAMEWORK

## 2.1 Applicable National, State Legislations and Technical Guidelines

**National Environmental Rules and Regulations: -**

To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed. A summary of environmental legislation/regulations relevant to the project is furnished in the following **Table-2.1**.

**TABLE: 2.1 SUMMARY OF ENVIRONMENTAL LEGISLATION/REGULATIONS**

| SR. NO | ACT / RULES | PURPOSE | APPLICABLE (YES / NO) | REASON FOR APPLICABILITY | AUTHORITY |
|---|---|---|---|---|---|
| 1 | Environment Protection Act, 1986 | To protect and improve the overall environment. This is an umbrella Act. | Yes | As all environmental notifications, rules and schedules are issued under this act. | MoEF&CC, CPCB, SPCB |
| 2 | Solid Waste Management Rules, 2016 | To manage collection, transportation, Segregation, Treatment, and disposal of solid wastes (other than Hazardous water, Plastic Waste, Bio Medical waste) | Yes | Dumpsite remediation/bio mining | MoEF&CC, CPCB, SPCB |
| 3 | Air (Prevention and Control of Pollution) Act, 1981 | To control air pollution by controlling emission of air pollutants as per the prescribed standards. | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 21 of Air (Prevention and control of Pollution) Act 1981. | State Pollution Control Board, Kerala |
| 4 | Water Prevention and Control of Pollution) Act, 1974 | To control water pollution by controlling discharge of pollutants as per the prescribed standards | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 25 of this Act. | State Pollution Control Board, Kerala |
| 5 | The Noise Pollution (Regulation and Control) | The standards for noise for day and night have been promulgated by | Yes | This act will be applicable for all construction equipment | State Pollution |

| | | | | | |
|---|---|---|---|---|---|
| | Rules, 2000 & amendments | the MoEF&CC for various activities. | | deployed at worksite and in operation. | Control Board, Kerala |
| 6 | Public Liability and Insurance Act, 1991 | Protection from accidents. | Yes | This act will be applicable for providing immediate relief to the persons affected by accident occurring during work | State Pollution Control Board, Kerala |
| 7 | Central Motor Vehicle Act 1988 | To check vehicular air and noise pollution. | Yes | This rule will be applicable to vehicles deployed for construction activities and construction Machinery. | Motor Vehicle Department |
| 8 | The Plastic Waste Management Rules, 2016 | For the storage and disposal of plastic wastes through authorized vendors. | Yes | This act will be applicable for the storage and disposal of all the plastic wastes. | State Pollution Control Board, Kerala |
| **Other Applicable Rules** | | | | | |
| 9 | Construction & Demolition, Waste Management Rules, 2016 | | | | |
| 10 | Batteries (Management and Handling) Rules, 2001 | | | | |
| 11 | E-Waste (Management) Rules, 2016 | | | | |
| 12 | Kerala Municipality Act, 1994 & Rules | | | | |
| 13 | Hazardous & Other Wastes (Management And Transboundary Movement) Rules, 2016 | | | | |
| 14 | Bio-medical Waste (Management & Handling) Rules, 1998 | | | | |

## Applicable Social and Other Legislation:

**Other Legislations applicable to Sub-Project activities under the project**

- Workmen's Compensation Act 1923 (the Act provides for compensation in case of injury by accident arising out of and during the course of employment);
- Payment of Gratuity Act, 1972 (gratuity is payable to an employee under the Act on satisfaction of certain conditions on separation if an employee has completed 5 years);
- Employees PF and Miscellaneous Provision Act 1952 (the Act provides for monthly contributions by the employer plus workers);
- Maternity Benefit Act, 1951 (the Act provides for leave and some other benefits to women employees in case of confinement or miscarriage, etc.);
- The Sexual Harassment of Women at Workplace (Prevention, Prohibition and Redressal) Act, 2013 is introduced to prevent and provide redressal of complaints of sexual harassment.
- The Protection of Women from Domestic Violence Act, 2005 defines domestic violence, describes the powers and duties of protection officers, service providers and lists the procedures for obtaining reliefs.

- Contract Labor (Regulation and Abolition) Act, 1970 (the Act provides for certain welfare measures to be provided by the contractor to contract labour);
- Minimum Wages Act, 1948 (the employer is supposed to pay not less than the Minimum Wages fixed by the Government as per provisions of the Act);
- Payment of Wages Act, 1936 (it lays down as to by what date the wages are to be paid, when it will be paid and what deductions can be made from the wages of the workers);
- Equal Remuneration Act, 1979 (the Act provides for payment of equal wages for work of equal nature to Male and Female workers and not for making discrimination against Female employees);
- Payment of Bonus Act, 1965 (the Act provides for payments of annual bonus subject to a minimum of 83.3% of wages and maximum of 20% of wages);
- Industrial Disputes Act, 1947 (the Act lays down the machinery and procedure for resolution of industrial disputes, in what situations a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing down the establishment);
- Industrial Employment (Standing Orders) Act; 1946 (the Act provides for laying down rules governing the conditions of employment);
- Trade Unions Act, 1926 (the Act lays down the procedure for registration of trade unions of workers and employers. The trade unions registered under the Act have been given certain immunities from civil and criminal liabilities);
- Child Labour (Prohibition and Regulation) Act, 1986 (the Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of child labour is prohibited in Building and Construction Industry);
- Inter-State Migrant Workmen's (Regulation of Employment and Conditions of Service) Act, 1979 (the inter-state migrant workers, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home to the establishment and back, etc.);
- The Building and Other Construction Workers Act (BOCW), 1996 is a social welfare legislation that aims to benefit workers engaged in building and Other Constructions Works.

**2.2 The World Bank Safeguards Policies, and KSWMP ESMF**

The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are summarized in the following table.

**Environmental Codes of Practices (ECoP):** The ECoPs provide guidelines for environmental management of bio-mining and bio-remediation activities which are seen to be of limited extent of impacts/risk, temporary and reversible, and readily managed with good practices during the implementation. The following key points should be considered.

**Key Points of ECop to be considered:**

- The bio-mining activities and preparatory activities shall follow the "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" published by CPCB in February 2019.

- Bio-mining methods include Tractor Tiller, Trench method, Cone Method, windrow, Thin Layer Method, etc. More appropriate may be the Cone method for legacy waste and window for relatively fresh waste.

- Leachate channelization and treatment facility shall be set up before starting the bio-mining works. Works shall take place only during the non-monsoon period; and there shall be suitable precautions to prevent any rainwater disturbing the operations (like seasonal unexpected rains, storm water, runoffs from other sources).

- Ballistic separator and trommel may be used for screening. Screened fractions into which waste is segregated include RDF, inert, Compost, and C&D wastes.

**Applicable World Bank Operational Policies:**

OP 4.01 Environmental Assessment Help to ensure the environmental and social soundness and sustainability of investment projects. Support integration of environmental and social aspects of projects in the decision-making process

OP 4.04 Natural Habitats Promote environmentally sustainable development by supporting the protection, conservation, maintenance, and rehabilitation of natural habitats and their functions.

OP 4.09 Pest Management includes training to prevent risk to human beings or animals from Bio-culture, enzymes, insecticides and such formulations used for remediation.

OP 4.11 Physical Cultural Resources (PCR) includes resources of archaeological, paleontological, historical, architectural, religious (including graveyards and burial sites), aesthetic, or other cultural significance. Assist in preserving PCR and in avoiding their destruction or damage.

WB General EHS Guidelines Recommendations of these guidelines would be incorporated in EMP & SMP and Bidding document for this sub-project.

The Environmental Management Framework (EMF) has been prepared to assist in the screening, assessment, and management of environmental risks of all solid waste management projects at an early stage during the planning and integration, mitigation hierarchy during the subproject design, implementation, and operation. The framework helps provide specific guidance on the policies and procedures to be followed for environmental assessment along with the roles and responsibilities of the implementing agencies.

# CHAPTER 3. BASELINE ENVIRONMENTAL SCENARIO

## 3.1 Project Location of the site

Muvattupuzha dumpsite is located at a distance of 2.5 km from the centre of Muvattupuzha town in western side and encompasses a total area of approximately 5.47 acres of land. Out of this, 3.20 acres of land is covered with solid waste. The coordinates of the dumpsite are 9.993701° N and 76.560974° E. It is located in ward no. 25 of the municipality. The access road to the dumpsite is Valakkuzhi road which is at a distance of 35 metre in the Northern direction. In the surrounding area of the dumpsite around 3 - 5 Households are residing within 100m radius. St. George Orthodox Syrian Church 660 m away, ST. Thomas Public School 760 m away, Kurishu Palli (St. Peter & St. Pauls) 700 m away from the project location. The google map image showing the location of Muvattupuzha dumpsite is shown below in **Figure: 3.1**.

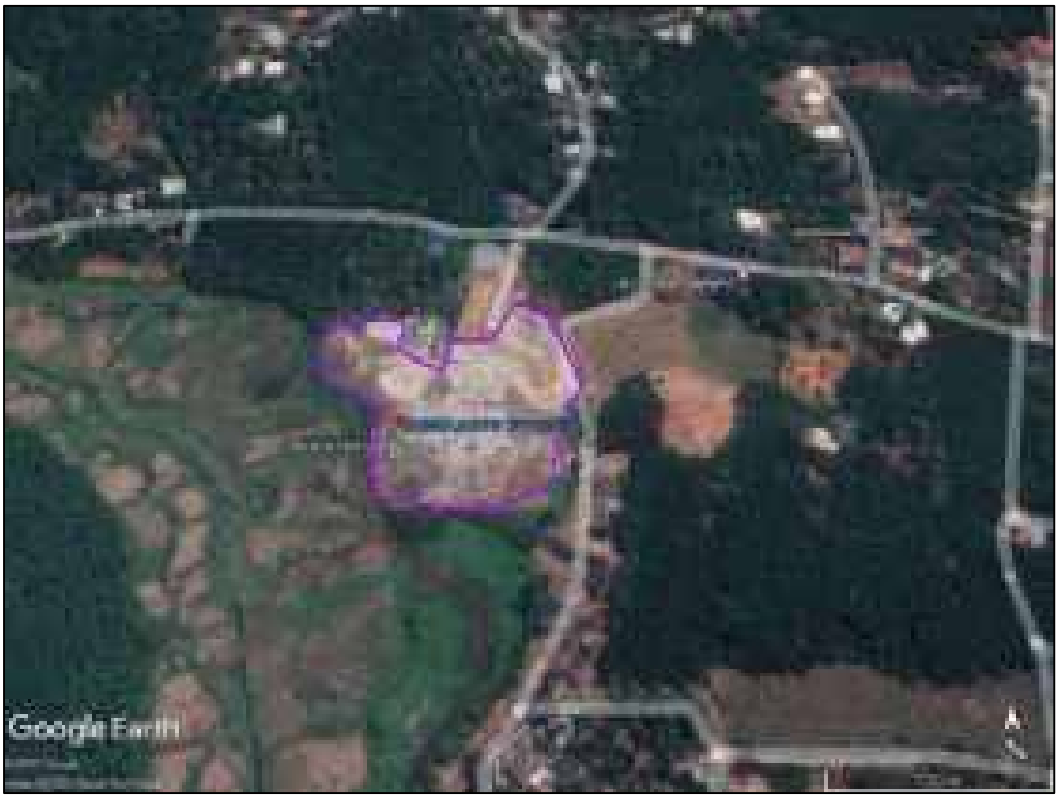

**FIGURE: 3.1 GOOGLE IMAGE SHOWING THE LOCATION OF THE EXISTING DUMPSITE AT MUVATTUPUZHA**

## 3.2. Methodology for Environmental Baseline Studies

The baseline appraisal should consider all aspects of the environment that may be altered by the proposed project. These can be categorized as physical, biological or socioeconomic attributes. The baseline should be based upon the findings of the screening and scoping studies. Surface water and sediments, groundwater, air quality, noise, soils and land use Biodiversity Socio-economic (social), cultural heritage, traffic and transport Physical Biological Socio-economic. The scope of the baseline study, including attributes that will be appraised, and the geographical extent of the analysis, will typically have been agreed with the relevant decision makers as an outcome of the scoping phase. It is important to re-emphasize that the scope (and detail) of the baseline study should be commensurate with the size and scale of the project and hence the

potential changes that the project may have upon the environment and society. The baseline study will typically be developed in three stages:

**Desktop study:** Office-based exercise during which readily available existing information (i.e. that can be used to describe the existing environment) is collected and reviewed to ensure its appropriateness for use within the EIA & SIA;
**Field study:** The stage within which additional data is captured in the field, with the intent of addressing any gaps that have been identified in the existing knowledge base; and
**Reporting stage**: Collation of the captured information into the baseline report.

The below table indicates the environmental attributes and location of monitoring.

**TABLE : 3.1 ENVIRONMENTAL ATTRIBUTES**

| S.NO | DESCRIPTION | PARAMETERS TESTED | SAMPLING LOCATION | JUSTIFICATION |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Upwind direction in North East boundary of the dumpsite. Distance 10 m from the boundary of dumpsite. | The AAQ locations were chosen based on the Wind rose data obtained for Muvattupuzha. The most predominant wind direction are from West and WSW. |
| | | | Downwind direction in West South West (WSW) boundary of the dumpsite | |
| 2 | Noise (1 Location) | Ambient Noise level [Eq] for 24 hours | Entrance of the dumpsite. Distance 10 m from the boundary of dumpsite. | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading vehicle. Please note that the site is devoid of proximity to any sensitive receptors within a 200 m radial circle . |
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, E.coli and Total coliforms (IS 10500-2012). | Surface water sampling location at 300 m distance in North West direction. | Surface water sample points are selected based on the water flow from upwards to downwards and for this site, it is North-West to South-west. |
| 4 | Ground water (2 Locations) | Pb, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, E.coli and Total coliform (IS 10500-2012). | Groundwater sampling location at 169 m distance in South East direction. | |
| | | | Groundwater sampling location at 103 m distance in South East direction. | |
| 5 | Bore Hole(1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard | Centre of the dumpsite | Volume of legacy wastes were found to be higher in |

| TABLE : 3.1 ENVIRONMENTAL ATTRIBUTES | | | | |
|---|---|---|---|---|

| | | penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, Strength compressibility (vertically-3 samples per borehole). | | the center part of the dumpsite during investigation. So the bore hole test was performed in the center. |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cynide, Chloride, Fluoride, Phenolic compounds. | South East boundary direction within the dumpsite - one point | |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | Within the dumpsite at 2 locations, one at East direction and at one at West direction. | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. So the two locations were considered for sampling. |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Poatassium (N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | 1 | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. |

### 3.3 Environmental Audit of the Existing Facilities

Inside the dumping yard, there is a Bio waste composting unit, MCF, RRF, Black Soldier Fly Unit and the resting room for the workers assigned for the collection and segregation process. There MCF and RRF are functional for dry waste management in the Valakkuzhi dumpsite, but not supported under KSWMP project. However, an environmental audit of the facility is important since is situated at the same site and might be impacted during the bio-mining activities.

| TABLE: 3.2 ENVIRONMENTAL AUDIT OF EXISTING FACILITIES | | |

### 3.4 Physiography and Climate

**Physiography**

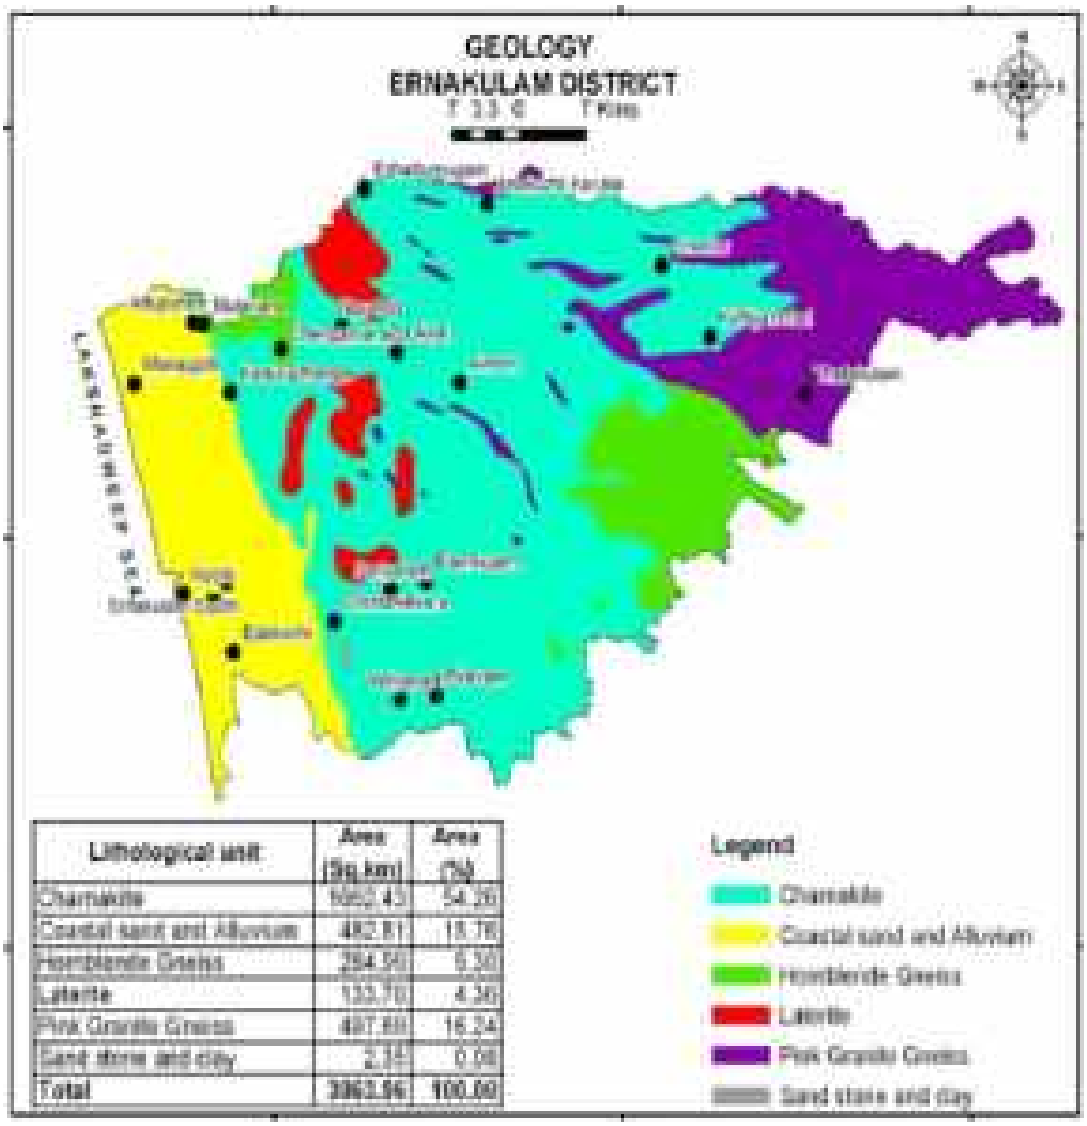
Physiographically, Muvattupuzha falls under Midland category with flat terrain zone.

**Climate**

Muvattupuzha has a tropical climate. Rainfall is significant in most months of the year, and the short dry season has little effect. As per Climate-Data.org, the average annual temperature is 27.6 °C. Precipitation here averages 3,570 mm. Most of the precipitation here falls in June-July with an average of 568 mm. The warmest month of the year is March with an average temperature of 29.4 °C. So, the favorable time for remediation is between October-2023 to March-2024 non-monsoon period. As per wind rose diagram, the most predominant wind directions are blowing from WSW and West direction. The wind rose diagram for Ernakulam is shown in **Figure: 3.2**.

**Source:** meteoblue

**FIGURE: 3.2 WINDROSE DIAGRAM FOR ERNAKULAM**



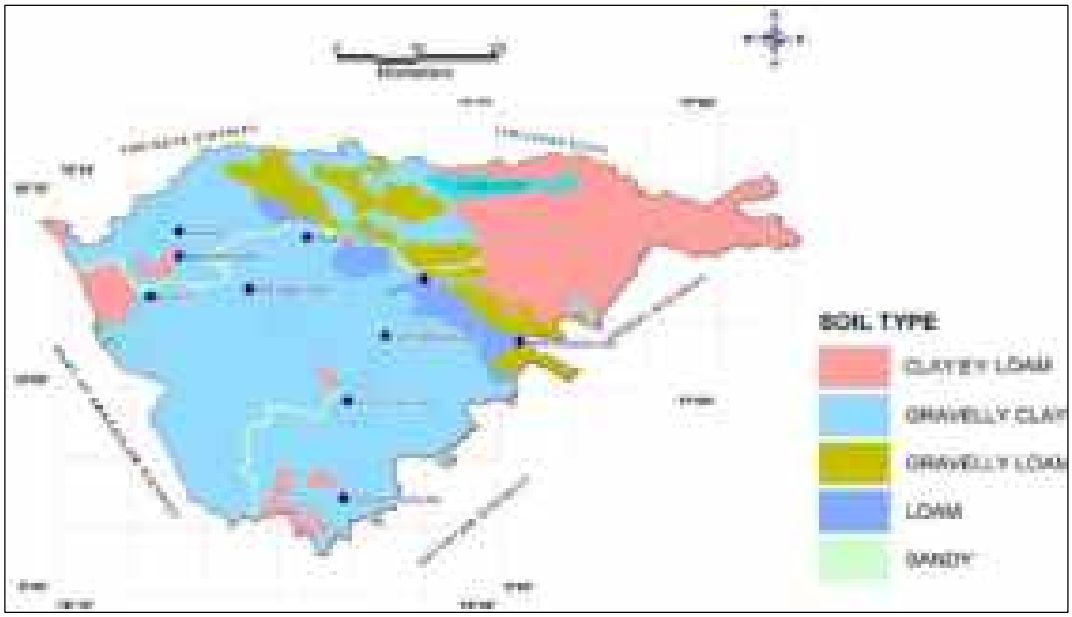
### 3.5 Hydrology, Hydrogeology, and Soil

**Hydrogeology**

The occurrence and movement of groundwater is mainly controlled by factors like physiography, geological setting, etc. The aquifer type is phreatic aquifer and groundwater table level ranging from 3.5 to 6.5 m during most of the year.

**Geology**

The geology of Muvattupuzha is predominantly of Charnockite group. The geology map of Ernakulam District is shown in **Figure: 3.3**.



| Lithological unit | Area (Sq.km) | Area (%) |
|---|---|---|
| Charnakite | 1662.43 | 54.26 |
| Coastal sand and Alluvium | 482.81 | 15.76 |
| Hornblende Gneiss | 284.56 | 9.30 |
| Laterite | 133.70 | 4.36 |
| Pink Granite Gneiss | 497.88 | 16.24 |
| Sand stone and clay | 2.34 | 0.08 |
| Total | 3063.86 | 100.00 |

**FIGURE: 3.3 GEOLOGICAL MAP OF ERNAKULAM DISTRICT**

**Soil**

As per the geotechnical investigation, the soil was encountered at 5.5 m below the waste depth of the dumpsite and the predominant soil is gravelly clay. The detailed geotechnical investigation report is enclosed in the FR. The map with different soil type of Ernakulum is shown in **Figure: 3.4**.

**Source:** CGWB, Ernakulum

**FIGURE: 3.4 MAP SHOWING SOIL TYPE OF ERNAKULAM DISTRICT**

### 3.6 Land Use & Land Cover

The highest percentage of land use and land cover falls under residential of (61%), dry cultivation (15%), commercial (2.21%), industrial (0.37%), water bodies (7.2%), and Paddy plantation (4.06%), and the remaining areas are under traffic and transport. The dumpsite is surrounded predominantly by Dry cultivation land use and the same will act as odour attenuation during remediation. The land use & land cover map of Ernakulum District is shown in **Figure: 3.5**.

**Source:** Development Plan for Muvattupuzha Town

**FIGURE: 3.5 LANDUSE & LANDCOVER MAP OF MUVATTUPUZHA MUNICIPALITY**

### 3.7 Cultural Heritage

The cultural heritage site near the dump site is Muvattupuzha Old Bridge at a distance of 2 km (The first concrete bridge in Asia). Hence, no significant physical impact to the heritages sites will be envisaged during remediation.

### 3.8 Ecology and Biodiversity

The wild faunal species present are, mainly dogs, rodents and flies are seen near the dumpsite. Also, crow, egrets, and other birds are seen feeding on the wastes. The flora mostly covers shrubs, tubers, and trees.

### 3.9 Site Connectivity

The nearest state highway (SH-41) connecting (Ernakulam-Thekkady Road) is in northern direction at a distance of 540 metre from the dumpsite. The site has an access road (Valakkuzhi Road) with a width of 3 m.

### 3.10 Natural Disasters

As per the district disaster management plan-2015 and flood vulnerability map, the dumpsite is under the most vulnerable zones.

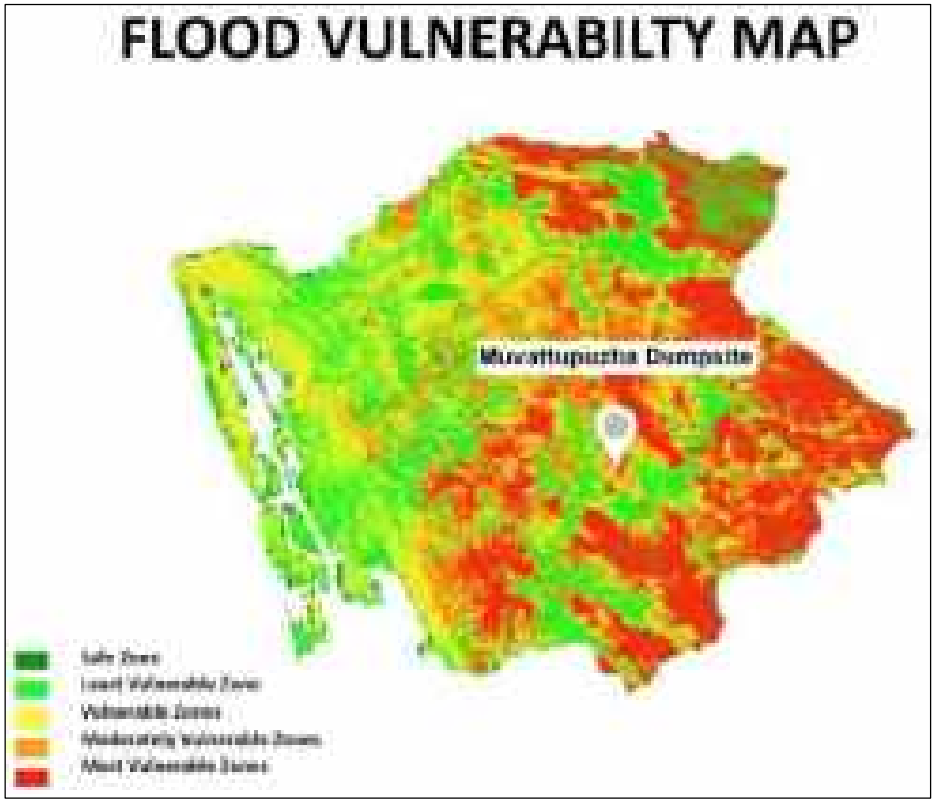


**FIGURE: 3.6 MAP SHOWING FLOOD VULNERABLITY MAP OF ERNAKULAM DISTRICT**

### 3.11 Description of Environmental Parameters

| TABLE- 3.3 DESCRIPTION OF ENVIRONMENTAL BASELINE PARAMETERS | | | |
|---|---|---|---|
| **S NO** | **ENVIRONMENTAL ASPECT** | **DISCUSSION ON BASELINE SCENARIO** | **REMARKS ON DEMAND SUPPLY GAPS (AVAILABILITY, QUALITY) & ASPECTS TO BE ADDRESSED IN THE SUBPROJECT** |
| 1 | Water Supply<br>a) Surface water<br>b) Ground Water | A) Surface water: Kadathy canal is 300 m from the site in NW direction and Surface water sample was collected and the test results showed – all parameters are well within limits except BoD.<br>B) Ground Water collected from 2 different locations (Residences within 200m radius)– all parameters are well within limits except for pH. | Site Drainage & leachate Impacts due to bio mining activity (especially during any seasonal rain) is important as far as the nearby soil & water environment are concerned. |
| 2 | Leachate | The data indicates very low concentrations of tested parameters. The heavy metals are also found to be low, hence the soil is unlikely to be contaminated by heavy metals from the waste. | |
| 3 | Air Quality | Air samples were collected from 2 locations at 20 metre from the dumpsite and results found to be well within the permissible limits | The Particulate matter $PM_{10}$ (136 $\mu g/m^3$) was found to be higher than the NAAQ standards emission. The vehicular movement of machinery and recovered material during dump site remediation will be the additional source of Air Pollution. |
| 4 | Noise Level | Noise Level monitoring samples collected at a distance of 10 m from the boundary of the dumpsite. Noise levels are well with the National Ambient Noise standards for Residential Area limit during daytime Leq. However, during night time the Noise (45.9 dB (A)) was found to be marginally higher than the standards. | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity. |

# CHAPTER 4. ANALYSIS OF ALTERNATIVES

## 4.1 Alternative 1: No Project Alternative (without Dumpsite Remediation)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.
If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.
1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.
2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.
3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.
4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.
5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

## 4.2 Alternative 2: Mode of Execution / Management Alternative

Muvattupuzha Municipality intends to complete the remediation project as earlier. However, considering the time required for mobilization, installation, sieving and handling recoverable etc., a time frame of about six months will be considered. The broad timeline chart for the execution of this project is given below Table – 4.1.

**TABLE – 4.1 TIMELINE CHART FOR EXECUTION**

| S. No. | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
|---|---|---|---|---|---|---|---|
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries , Hiring & Installation of Machineries, Electrical Works | ■ | | | | | |
| 3 | Excavation of Legacy Waste | | ■ | ■ | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | ■ | ■ | | |
| 5 | Windrow Formation & Spraying of Bio culture | | | | ■ | ■ | |
| 6 | Sieving Operations | | | | | ■ | ■ |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | ■ | ■ |
| 8 | Project Closure Activities:<br>• Levelling of Reclaimed Land using Bio-soil<br>• Handover the available infrastructure at site to the ULB<br>• Closure Report Submission to ULB, | | | | | | ■ |
| 9 | Buffer Period (Rainy Season) | | | | | | |

### 4.3 Alternative 3: Technology Alternatives

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as,

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

# CHAPTER 5. ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS

Bio mining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, bio-mining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition to the below mentioned,

(i) Drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,
(ii) Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,
(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and
(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

## 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Valakkuzhi dumpsite.

### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Bio-mining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity. However, magnitude of cumulative impacts of various dumpsite remediation might be High.

| TABLE: 5.1 ASPECTS FOR DETERMINING THE MAGNITUDE OF IMPACTS | | | | |
|---|---|---|---|---|
| **Aspects** | **Large** | **Medium** | **Small** | **Negligible** |
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite bio mining activities will be on larger extent) | A specific location within program component or site boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| Likelihood of potential impacts occurring | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

NOTE: Anticipated Project Duration - 5 to 6 months

### 5.1.2 Sensitivity of Receptor

The dumpsite is surrounded by residential buildings and dry cultivation. During the time of site assessment, some sensitive receptors within 200m from the site identified were only households. The project site lies near to residences, within a 200-meter radius, and it may cause potential impacts on air, noise, surface water, and ground water that will directly or indirectly affect over 27 families for a duration of 5 to 6 months. The sensitivity of these receptors is Medium. In addition, there is a canal which flows at a distance of 300m from the dumpsite, there is chance

of runoff and leachate towards the canal during rainy season. Hence, the sensitivity of this receptor is estimated as high.

### 5.1.3 Significance of the impact

The significance of the Sub-project impact is tabulated below: -

| TABLE: 5.2 SIGNIFICANCE OF THE PROJECT | | | |
|---|---|---|---|
| **PROJECT DETAILS** | **SENSITIVITY** | **VULNERABILITY OF RESOURCE** | **IMPORTANCE OF RESOURCE** |
| No project Impacts | High | Medium | Medium |
| Project with Bio Remediation (Bio-mining) | Low | Low | Low |

Overall, Bio mining will have a low to medium impact, with more of a positive Impact on the Environment and Human health in the longer term.

**Source-Pathway-Receptor Analysis**

A) **Source:** The source of contamination is the legacy waste remaining and being deposited at the Valakkuzhi closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is 63 years old, as dumping had started in year 1960 and still functional. The total waste volume is 55,712 cu. m with the dumpsite spread over 3.20 acres and the legacy waste is presented about 2.47 m above and 5.5 m below from the existing ground level. In addition to the landfill gas and leachate, windblown dust and litter are also considered as sources of contamination.

B) **Pathways:** The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards South East direction acts as a pathway for the uncovered waste to flow into the canal along the boundary to south eastern side, which runs through the residential areas and joins at Muvattupuzha river at 1.3 Km.

   The leachate flows with groundwater and acts as the pathway. Surface water contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals and rivers are further transported by surface waters and in this case the surface water acts as the pathway.

C) **Receptors:** Receptors are air, surface water (drain passing through residential areas) and ground water. For drinking purpose, they mainly use municipal water supply (27 nearby Households within 200 m and 5 households at 10m distance), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the nearby residences. As the dump is not contaminated by hazardous wastes, remediation would improve the pollution scenario provided the bio-earth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on

the locations of end use of fractions retrieved from bio-mining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after bio-mining activity, activities in bio-mined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post bio mining activity.

**5.2 Impacts on Air Environment**

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCF & RRF in this case), nearby communities of Ward 25.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.
- When the legacy site is opened, existing gases would get emitted. Further, any delay /unexpected stoppage of bio mining activity, might further aggravate the process of gas formation depending on waste composition, leading to odour and fire risks.

***5.3. Impacts on Water Environment***

**Ground water:**

- Borehole data indicates waste upto depth of 3.5 m to 6.5 m with hard lateritic strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. Oozing & pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during bio mining to prevent ground water contamination
- Leachate samples: BOD and COD values may impact the ground water quality in nearby residences, wells, and long term soil pollution.
- Borehole data: Dump below water table may impact water resources and wells nearby.
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

**Surface water:**

- The dumpsite experienced flooding during 2018 floods and the site is highly vulnerable to flooding. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas. Kadathy Canal is at a distance of 300 m from the dumpsite.
- Predominant slope is in the South East Direction. At Southeast direction, (end direction) there are residential households and dry vegetation. During rainy season leachate from the site flows to canal which flows through residential areas, and ends at Muvattupuzha. It is important to contain and treat leachate from the proposed bio mining activities on site. Treated leachate may be recirculated or used for other purposes.

**5.4 Impact due to Odour**

Dumpsite of organic, or partly organic waste, always results in anaerobic degradation of the waste and consequently, the production of landfill gas, consisting mainly of methane, $H_2S$, Ammonia,

and carbon dioxide. If not properly managed the gas can cause odor problems in the neighborhood and since landfill gas is a highly potent greenhouse gas it will also contribute to the increased level of greenhouse gases (GHG) in the atmosphere. Dumpsite gas may also increase the risk of fires or explosions at the landfill site and surroundings.

**5.5 Impact on Noise**

A potential nuisance is a noise from transport of vehicle and machinery operating during remediation phase of the Dumpsite and transports of waste to the Dumpsite. The topography is favorable to attenuate noise to the surroundings. The distance to nearby residential areas is at 10 m with 5 households. Hence, the impact will be higher during remediation to the residents.

**5.6 Impacts on Soil**

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as bio mining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.

- Spillover of activities to nearby road and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste bio mining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.

- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Valakkuzhi, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Valakkuzhi does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while bio mining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste), Feb 2019 and World Bank EHS Guidelines. A plan shall be prepared to auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

**5.7 Other impacts on Biodiversity - Fauna/Flora**

- There are no sensitive biodiversity areas within 10 km of the site. However, since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 25 Km from the site, there is a Neryamangalam Reserve Forest.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora: Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke.
- Disturbance to other fauna and flora on site: onsite activities including those related to MCF and RRF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Only naturally occurring plants and animals were noticed, no threatened or endangered. There is no key species identified which are listed by IUCN.

**5.8 Other Impacts on existing or proposed activities on site/s**

- There may be approvals from various agencies for bio mining activities and associated facilities; depending on utilities and uses on site & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of bio mining on existing facilities on site such as RRF, MCF, Black Soldier Fly Unit, composting yard etc. (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc.).
- Post bio mining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped, or if this is dumped elsewhere or not processed, it will lead to health and environmental issues. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health & Safety impacts on workers, communities. Also, forward linkages are considered as associated facilities/linked activities. Impacts of transportation of these fractions (traffic increase, odor, leachate, dust), impacts during rains & emergencies, handling, storage at the identified locations, reuse etc. shall be mitigated.

## Chapter 6. ENVIRONMENTAL AND SOCIAL MANAGEMENT AND MONITORING PLAN

### 6.1 Proposed Environmental Management Plan

The detailed anticipated impacts and corresponding mitigation measures/management of the impacts are given below.

**TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN**

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| *A* | **Planning and Pre-Construction Stage** | | | |
| *1* | ***Planning for bio mining facility*** | | | |
| 1 | Bio mining & Bioremediation Plan & Capacities | • Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / biomined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these biomined material in line wit the agreements with such facility owners and National, State regulations and WB EHS<br>• Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate management Plan.<br>• The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>• Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU/ULB |
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>• The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>• To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>• Grading shall be performed where necessary to provide a neat appearance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ULB |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the | • Carry out site assessments as per Guidelines for Biomining of Legacy waste Dumpsites of CPCB<br>• Consider safe biomining & gas / leachate generation from existing capped portion of the site<br>• Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means | TSC, ULB, Contractor | SPMU/DPMU/ULB |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | waste – *impact on air quality, odor, water contamination due to leachate, health and safety impacts of the people working in the site assessment* | ▪ Provision of appropriate PPE's to the team undertaking the site assessments<br>▪ Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>▪ Plan for machinery operated which will be operated by skilled operators at all times.<br>▪ Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>▪ Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | | |
| 4 | Absence / Delay in Permissions for Developing the biomining facility and associated works as per National regulations | ▪ Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labor Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes<br>*(Air Pollution) and Visual Blight due to excavation* | ▪ Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>▪ Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>▪ PPEs to be used by workers<br>▪ Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU/ULB |
| 6 | Material sourcing, transport, and stacking of construction materials *(Occupational Health and Safety issues and Air noise pollution)* | ▪ Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>▪ Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>▪ Materials shall be sourced only from approved quarries<br>▪ Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>▪ The driver should be with required license and follow speed regulations | Contractor | SPMU/DPMU/ULB |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | | ▪ Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>▪ Material transport and unloading activities should not result in noise disturbance to locals and should be during daytime<br>▪ Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>▪ Provide vehicle wheel wash area on site<br>▪ Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves.<br>▪ Proper rest area on site shall be provided with water, first aid, toilets | | |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | ▪ Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>▪ Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>▪ Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>▪ It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with landowners wherever the labour is accommodated<br>▪ Camp must not be provided in an area prone to Hazards<br>▪ Camp should be adequately at higher plinth levels to prevent water intrusion<br>▪ Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>▪ Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>▪ The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>(Refer ECOP section 06 and section 11 of EMF for KSWMP) | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. | ▪ Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in bio mining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc. | Contractor | SPMU/DPMU/ULB |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | especially in case of providing support facilities *(Impacts on Fauna / Flora)* | ▪ Identify appropriate government site to avoid land acquisition and resettlement impacts<br>▪ Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences, slope and other landuses | | |
| 9 | Contamination of groundwater due to leaching. Leachate parameters; BOD, COD, TDS, Ecoli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | ▪ During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>▪ Depending on the contractors plan for biomining of the site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ULB |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke burning, trampling/machinery | ▪ Movement routes of vehicles to be planned to avoid key fauna/flora on site<br>▪ Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU/ULB |
| 11 | Nuisance hazards to neighboring areas | ▪ Ensure proper design and adequate compound wall; high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements<br>▪ In case of waste mound and site edges are sliding or unsafe; provide engineered retention walls. | Contractor | SPMU/DPMU/ULB |
| 12 | Treatment & Disposal of wastes and rejects | ▪ Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & intert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Bioearth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any | | |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | | • Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| **B** | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| | | **Implementation of bio mining of the dumpsite** | | |
| 1 | Impact due to the vehicular movement *(Air and noise environment & Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | • Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>• All vehicles and machinery should obtain Pollution Under Control Certificates<br>• HORN PROHIBITION signpost to be erected.<br>• Rumble strips/speed breaker to be provided on access roads.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>• Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>• Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>• Avoid heavy vehicle movement through Valaikuzhi road roads during peak hours 7 a.m to 10 a.m mention: school hrs / peak hrs; and during important period / festivals when people use the road to access temple<br>• Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | Contractor, ULB | SPMIU/DPMIU/ULB |
| 2 | Impact due to the use of heavy vehicle and equipment *(Air and Noise environment)* | • Mixing equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>• Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>• Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>• Labor to be provided masks / PPEs.<br>• Construction / Biomining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighboring sensitive land uses<br>• Noise standards at operation machines are to be strictly monitored to prevent exceeding of CCII noise standards. | Contractor | SPMIU/DPMIU/ULB |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | | ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>▪ Using modern, well-maintained and regularly serviced vehicles.<br>▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>▪ Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>▪ As Muvattupuzha dumpsite has sensitive receptors and settlement areas within 150m of it, noisy works shall be stopped from 22:00 to 06:00.<br>▪ Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>▪ Avoid noisy activities/machines near South side of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>▪ Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities *(water environment)* | ▪ Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>▪ Vehicle washing or maintenance near water bodies are to be avoided.<br>▪ Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ULB |
| 4 | Leachate and Runoff from biomining activities *(Soil contamination and groundwater contamination)* | ▪ Provide site cut off drain around the site to divert off stormwater from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>▪ Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>▪ Ensure stormwater drains will lead to drain outlets<br>▪ Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area<br>▪ Provide proper treatment of leachate and stormwater that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by biomining activities like excavation and waste segregation and stabilization | Contractor | SPMU/DPMU/ULB |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | | ▪ The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>▪ The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>▪ Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>▪ Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>▪ Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>▪ Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | | |
| 5 | Soil decontamination from accumulated waste levels<br>*(Impact on leachate, odor)* | ▪ Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bioculture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>▪ Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>▪ Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU/ULB |
| 6 | Excavation of waste from the waste mound<br>*(Health and safety impacts)* | ▪ The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>▪ Machinery operated for excavation should be operated by skilled operators at all times.<br>▪ Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes. | Contractor | SPMU/DPMU/ULB |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | | ▪ Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>▪ In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>▪ When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | | |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles *(Air, Odour nuisances; spills and littering impacts on Air, Water, Land)* | ▪ All vehicles shall carry only approved load of weight<br>▪ Regular cleaning of roads & drains and removal of spills if any.<br>▪ All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>▪ Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>▪ Adopt required measures as per CPCB guidelines, and site specific safety requirements. | Contractor | SPMU/DPMU/ULB |
| 8 | Occupational health and safety impacts of the workers during the biomining & construction of support facilities:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, biocultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects | ▪ Avoid direct & double handling of wastes through avoidance measures(suitable planning & equipments), engineering controls & use PPEs<br>▪ Work area & Labour camps shall be provided with First Aid and other related activities.<br>▪ Emergency Preparedness plans shall be prepared and implemented for all manpower working centers and its field extension centers.<br>▪ An Environment Health & Safety policy shall be prepared and implemented<br>▪ Adequate manpower shall be provided & manager & staff shall listen and act upon the manpower related grievances.<br>▪ Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles<br>▪ Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed with out slip, trip, fall especially on waste, leachate or trenches<br>▪ Proper training will be provided regarding the maintenance of health<br>▪ Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper handwash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>▪ First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>▪ Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker | Contractor, ULB | SPMU/DPMU/ULB |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | • Allergies from pathogen and airborne dust *(Air environment, Health impacts)* | to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>▪ Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>▪ Measures such as deferred timings and stretch break to be adopted<br>▪ Secure all installations from unauthorized intrusion and accident risks;<br>▪ Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every days start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipments, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>▪ EHS specialist with adequate experience & third party supervision are important for biomining activity<br>▪ Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>▪ Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>▪ Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas;<br>▪ Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>▪ Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br>▪ Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & | | |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | | safe kept before activity start near thoseIn close proximity to this location, there is a transformer. Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>▪ All workers shall be registered as per prevalent labor laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>▪ Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractors person/insurance agent<br>▪ While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>▪ While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>▪ Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>▪ A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>▪ No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor<br>▪ All works related to working at heights will be undertaken only during the daytime when sufficient sunlight is available;<br>▪ Use of temporary fall protection measures and outer edges of any elevated work surfaces, such as handrails and toe boards to prevent materials from being dislodged will be done;<br>▪ All excavation activities to be conducted in supervision of the site contractor;<br>▪ Proper signage and lights to be provided in all work or activity areas & work permit system to be ensured.<br>▪ All records on emergencies, accidents, workers & their duty schedule, important site events, waste storage & disposal etc shall be maintained on site. All accidents including Indicative, Serious and Severe accidents to be recorded. All severe & serious accidents to be reported to the Bank & procedures followed for root cause analysis & Corrective Action Plans prepared and implemented, as per Banks Incident Reporting Tool | | |

**TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN**

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 9 | Risk of fire due to conditions leading to spontaneous combustion *(Air environment, disturbance to communities and workers, health impacts, safety issues)* | ▪ Follow CPCB Directions (May 26, 2022) Directions under Section 5 of EP Act (1986) – for Implementation of SWM Rules 2016 – regdg Fire Incidents at MSW Dumpsites (https://cpcb.nic.in/openpdffile.php?id=UHVibGljYXRpb25GaWxlLzQyNDRfMTY1NDE2Mzk3N19tZWRpYXBob3RvNzYxMi5wZGY= ), LSGD Kerala Government GO on Fire Safety of MRF, MCFs (for the MRF on site if used for storage of wastes)and other Regulations, guidelines applicable<br>▪ Divide the site & plan for work in each area/quadrant as per work plan & prepare fire safety plan & emergency response plan in line with EIA Annexure 3; and National/State regulations & WB EHS<br>▪ Examine the site everyday by experienced Fire Safety / OHS personnel for any smokes<br>▪ Avoid conditions that can lead to spontaneous combustion such as:<br>o Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard<br>o Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.<br>▪ Design the facility for access by firefighting equipment, including clear aisles among waste heaps or work areas and access to adequate water supply.<br>▪ Ensure workers are briefed of fire hazard & its management<br>▪ No unauthorized entry shall be permitted to the site; including of workers during holidays, nighttime, or hours other than normal work hours under the supervision of site engineer / supervisor. Fencing and barricades with proper signage boards indicating “trespassers not allowed”<br>▪ The following activities should be implemented to prevent fires from occurring at the facility<br>o adequate fire-fighting equipment should be made available on-site and stored in an accessible manner,<br>o all operating staff should be trained and able to manage fire outbreaks at any part of the facility.<br>o clear signage should be established to inform workers and the public that flammable liquids are not permitted on the site. This should be reinforced by advice to customers at the gatehouse and inspection of loads at the organic reception area.<br>o Approved quantities of combustible contaminants that have been separated (such as tires and plastic bottles) should be stockpiled in small piles or windrows.<br>o all fuels or flammable solvents for operational use should be stored in an appropriately ventilated and secure store (at appropriate height). This store should be located away from the biomining, storage, and processing areas. | Contractor, ULB | SPMU/DPMU |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| | | ○ all flammable liquids should be stored within a bund that can hold 110% of the volume of the flammable liquids stored there so that any release of raw or burning fuel cannot cause a fire in the combustible organics present on the site or have an impact on contaminating stormwater.<br>▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented throughout the biomining activity in line with National State regulations, guidelines and international good practices<br>▪ Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.<br>▪ Contain all local smokes/small fires inside the dump asap. Fire brigade help shall be sought on all smokes/fires outside the dump<br>▪ Ash from fires to be contained at the earliest within the site using bunds or screens, rather than allowing to disturb nearby receptors. Early clearing and disposal of such ash at TSDF to be ensured.<br>▪ Provide contact details of Fire Department & ambulance other essential emergency services on site & ensure training to the workers by such service providers | | |
| 10 | Construction of new facilities in retrieved land | ▪ The excavated site shall be protected from any dumping during or after the biomining activity and shall be reserved for SWM activities in line with SWM Rules 2016<br>▪ Any new facility under KSWMP to be constructed on the retrieved land, shall follow EMF procedures & National State regulations | ULB | SPMU/DPMU |
| 11 | Pest / Vermin Control & Visual impacts (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted; preferably in coordination with Health section of ULB & local Health Center<br>▪ Communities around shall be made aware of possible pest menace & ULB shall support those in need with required pest management measures and offered health checkups<br>▪ Biopesticides / biological control shall be followed. However, biopesticides, or bio cultures used shall be tested to ensure the presence of no banned chemicals or hazardous materials<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used<br>▪ Visual blight to be curtailed by screens, proper lighting, housekeeping, leachate management | Contractor, ULB | DPMU, SPMU |
| 12 | Odour nuisance | ▪ Waste with a strong odor to be covered immediately they are emptied from vehicles.<br>▪ Control and manage leachate treatment to minimize odor.<br>▪ Provide buffers screens to curtail odor from reaching surrounding communities especially to North side of site. | Contractor, ULB | DPMU, SPMU |

**TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN**

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Using natural deodorizers such as lemongrass, eucalyptus etc. and planting fragrant flowering plants around the site to mask odor. | | |
| 13 | Storage, Collection, Transport, Treatment & Disposal of wastes and rejects | • Storage, Collection, Treatment, treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste<br>• Storage, Collection, Transport, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc); & adequate protection shall be made to prevent such impacts even during rains / disasters<br>• Waste handling shall be inline with existing regulations & guidelines & avoid health & safety impacts<br>• No material is allowed to remain on site after the contract period<br>• Adequate fire safety arrangements & awareness & training to workers shall be ensured on site & at disposal / treatment areas for wastes in discussion with Local Fire Brigade to prevent any fire on legacy waste site or retrieved & stored wastes or that is transported<br>• Vehicles movement shall be tracked by ULB to ensure disposal of material/rejects/inerts in designated or agreed area & are in line with schedule; using GPS.<br>• Given that the access road is used by the public, it is imperative to implement the required safety precautions and environmental protection measures when transporting the waste. | Contractor, ULB | DPMU, SPMU |
| 14 | Other activities | • No activity other than biomining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>• If existing MCF shall be used for soring biomining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after biomining works shall be after proper cleaning / washing & disposal of all rejects/inerts & tools to ensure good housekeeping & no H&S impacts<br>• If existing MCF shall be used by the ULB for storing dry wastes from Town, during biomining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 15 | Energy Efficiency & Water Use efficiency | • All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & biomining / construction techniques<br>• Landscaping & green belts to use local / indigenous plants & trees<br>• Waste water and Leachate to be treated & recycled/reused | Contractor | ULB |
| **C** | **Future Site Usage (EMP shall be updated in line with EMF & used if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Biomining, but of the future facility operator & ULB** | | | |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| 1 | Future use of the biomined site: Green Park, MCF, MRF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | ▪ ULB to ensure that the site will not be used for future dumping.<br>▪ Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around.<br>▪ ULB shall plan the future use of the site shall be in consultation with the communities.<br>▪ Phase 1 Environmental Assessment to be caried out, EA for existing facilities & EIA for proposed development in line with EMF in case this is proposed to be developed under KSWMP<br>▪ All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF/MRF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment, a nuisance to biodibersity, communities, Health impacts)* | ▪ The movement route shall be scheduled for each vehicle.<br>▪ Enforce speed limits applicable and make drivers aware of this<br>▪ Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule; preferably using GPS<br>▪ Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles<br>▪ Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards<br>▪ Proper lubrication shall be provided to minimize squeaking noise due to friction<br>▪ Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br>▪ The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public<br>▪ Traffic will be managed at the site by providing adequate space for parking of vehicles<br>▪ Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design<br>▪ No waste or material shall be disposed in any place other than the designated area; including water bodies, coasts/forests, or sensitive areas. | Future Facility operator | ULB |
| 3 | Exhaust emissions *(Air impacts)* | ▪ No idling of vehicles on site.<br>▪ Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed | Future Facility operator | ULB |
| 4 | Plying of vehicles through kutcha / unsurfaced roads and idling *(Air pollution: SPM, CO, CO2)* | ▪ Vehicle movement shall be well planned – through topped roads. In case of necessity to move through Kutcha roads, ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Future Facility operator | ULB |

| TABLE: 6.1 PROPOSED ENVIRONMENTAL MANAGEMENT PLAN | | | | |
|---|---|---|---|---|
| **S No** | **Probable Negative Impacts** | **Mitigation Measures** | **Implementation Responsibility** | **Monitoring Responsibility** |
| 5 | Impact on the ambient noise quality during the operations<br>*(Noise, nuisance to sensitive receptors, health impacts)* | ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines;<br>▪ Using modern, well-maintained and regularly serviced vehicles;<br>▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>▪ Provision of earmuffs and ear protection to workers and employees in high noise areas | Future Facility operator | ULB |
| 6 | Occupational health and safety impacts of the workers:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust | ▪ All OHS and CHS measures to be followed in line with applicable regulations, guidance<br>▪ Workers & communities shall be made aware of OHS, CHS risks and impacts & mitigation measures adopted<br>▪ Emergency management plan to be prepared & followed<br>▪ Workers shall be appropriately trained or OHS during construction & Operation of all future facilities | Future Facility operator | ULB |
| 7 | Pest / Vermin Control (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted<br>▪ Biopesticides / biological control shall be followed.<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used | Future Facility operator | ULB |
| 8 | Fire Safety | ▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations, guidelines and international good practices | Future Facility Operator | ULB |
| 9 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

**Disposal phase of By-products from Bio-mining process:**

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within a three-month period, penalties will be imposed on the contractor.

## 6.2 Disaster Management and Emergency Preparedness

A disaster is a catastrophic situation in which suddenly, people are plunged into helplessness and suffering and, as a result, need protection, clothing, shelter, medical and social care, and other necessities of life. In the case of Dumpsite remediation, Disaster Management Plan is aimed to ensure the safety of life, protection of the Environment, protection of installation, restoration of the remediation process, and salvage operations in this order of priorities.

For effective implementation of the Disaster Management Plan, it should be widely circulated and personnel training is to be provided through rehearsals/drills. The disaster management Plan consists of Onsite Emergency Plan and an offsite Site Emergency plan, which is outlined here for Emergency Preparedness. The list of emergency helpline services is mentioned in the Table below.

**TABLE: 6.2 LIST OF EMERGENCY HELPLINE SERVICES**

| Sl. No. | Emergency Services | Distance from the dumpsite |
|---|---|---|
| 1 | Muvattupuzha Police Station | 3.7 Km |
| 2 | Muvattupuzha Fire Station | 3 Km |
| 3 | General Hospital | 3.5 Km |

### 6.2.1 Approach to DMP

The objective and approach of the Disaster Management Plan is to make use of the combined resources of the plant and the outside services to achieve the following:

- Effect the rescue and medical treatment of casualties;
- Safeguard other people;
- Minimize damage to property and the environment;
- Initially contain and ultimately bring the incident under control;
- Identify any dead;
- Provide for the needs of relatives;
- Provide authoritative information to the news media;
- Secure the safe rehabilitation of the affected area;
- Preserve relevant records and equipment for the subsequent inquiry into the cause and circumstances of the emergency.

In effect, it is to optimize operational efficiency to rescue rehabilitation and render medical help and to restore normalcy. Disaster Management Plan should include Emergency Preparedness Plan, Emergency Response Team, Emergency Communication, Emergency Responsibilities, Emergency Facilities, and Emergency Actions.

**Identified Emergency Situations**

Major disasters which can affect the remediation process are as follows:

- Floods due to heavy rainfall
- Fire risk in summer
- Occupational and health risks during the remediation process
- Safety-related accidents during the remediation process

**Proposed Organizational Structure for Disaster Management Plan**

**Response team:** Setup an Emergency Organization. Emergency Organization includes the senior executive (head of EO as a Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

- All Incident control would be reported to the Site Controller. Each Incident Controller organizes a team responsible for controlling the incident with the personnel under his control.
- **Shift In-charge** would be the reporting officer, who would bring the incident to the notice of the Incidence Controller and Site Controller.
- **Emergency Coordinators** would be appointed who would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential and support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.
- In each shift, the electrical supervisor, in charge, and other maintenance staff would be drafted for emergency operations. In the event of power or communication system failure, some of the staff members in the office/facility would be drafted and their services would be utilized as messengers for quick passing of communications.

### 6.3 Proposed Monitoring Plan

The proposed monitoring plan is presented in table below,

**TABLE -6.3 PROPOSED MONITORING PLAN AND FREQUENCY**

| Monitoring media/parameters | Items and parameters | Frequency | Location |
|---|---|---|---|
| **Ambient Air Quality** | PM10, PM2.5, NOx, CH4, CO, Ammonia | Quarterly (1 sample) | 2 point |
| **Noise** | Leq Day and Night | Monthly | 2 point |
| **Health safety Hazards** | Medical records, documentation of injuries and accidents, Health and safety assessments | As and when accident/injury occurs | Incident reports |
| **Leachate** | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins | Quarterly | 2 point |
| **Groundwater quality** | | Quarterly | 8 points |

| | | | |
|---|---|---|---|
| **Surface water quality** | Parameters will be defined and sampling, preservation, and analysis of water will be carried out following those stipulated in the subsections below and Standards Methods for Testing Water and wastewater, 21st edition, published by American Public Health Association (2005). | Quarterly | 6 points. 2 upstream and 4 downstream |

### 6.4 Estimated Budget for Implementation and Supervision of EMP

The estimated capital cost of [redacted] is required for budget provision for implementation and supervision of EMP. The remediation will be only during shorter time duration and hence the recurring cost won't be incurred. The estimated cost particulars for EMP is mentioned below.

| TABLE -6.4 ESTIMATED BUDGET FOR EMP | |
|---|---|
| **Particulars** | **Capital Cost (In Lakhs)** |
| Dust Mitigation Measures Including site barricading, water sprinkling and Wheel Washing, leachate management | [redacted] |
| Mobile Toilet, Pest Control, Disinfectant | [redacted] |
| Medical cum First Aid facility | [redacted] |
| PPE for workers & welfare, Fire Fighting Equipment | [redacted] |
| Monitoring / testing (air, noise, water, soil, leachate) | [redacted] |
| **Total** | [redacted] |

# CHAPTER 7 INSTITUTIONAL ARRANGEMENTS

## 7.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organisation will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU.

## 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for HKS (Health & Hygiene, source level waste segregation and source level treatment, Fire and Safety)
- Training program for ULB Councilors and Ward convener (Proposed SWM project plan of KSWMP)
- Training program for Political and trade union leaders (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for Residence Association leaders (Health, Hygiene different composting methods and source level waste segregation, littering of waste, Public Health, Fire and Safety)

- Training program for workers of Municipal Sanitary workers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for school / college students (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for ULB officials (Proposed SWM project plan of KSWMP, proposed policies, existing policies etc... to improve the existing pattern into zero waste concept of the municipality)
- Training program for School children, Parents and Teachers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Massive awareness campaign on 5R (Reuse, Recycle, Repurpose, Reduce and Refuse)

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

## 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

# CHAPTER 8. PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

## 8.1 Approach to Public Consultation

**KSWMP** have developed a detailed strategy and installed various inclusive mechanisms in the different stages of the remediation process considering the project affected persons, families, and commercial establishments.

As the initial step, a **Transect walk** was carried out on **31.05.2023** covering the surrounding area of the dump site. The aim of the transect walk was to assess the site and gather information about its location, potential social risks, existing infrastructure and the impact on surrounding communities. The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions and systems by observing, asking, listening, looking and producing a transect diagram. Information collected can be used to reveal land use practices, hazards and vulnerabilities to inform disaster mitigation and water management.

Ward level Consultation Meetings will be conducted before the commencement of remediation in the leadership of ward councilors by engaging the representatives from different resident's associations, commercial establishments and other institutions in the ward for explaining about the remediation process and thereby to gain public support and cooperation. This shall be conducted 30 days prior to the commencement of the work. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact.

## 8.2 Information Disclosure

Warning sign boards and project information boards with full details of grievance Redressal mechanism along with all related contact details will be installed at site during the remediation process at the site. Site control measures should be enforced to prevent unauthorized personnel from entering the work site. Work zones should be delineated around specific bore holes, excavations and other areas that may pose the risk of potential exposure to the hazards.

## 8.3 Information Education and Communication (IEC Plan)

| Target Audience | Activity | Topic | Responsibility | Monitoring |
|---|---|---|---|---|
| 1.Inhabitants near by the Dumpsite (27 Families)<br><br>2.Shops | 1 One to one interaction<br><br>2. Group meetings<br><br>3.Video presentation of dumpsite remediation process through whatsapp. | 1.Process of dumpsite remediation<br><br>2.Risks involved in the process<br><br>3. Possible mitigation measures<br><br>4. Listen their concerns & discussion on its remedies<br><br>5. Awareness creation for the community support and participation for smooth implementation of the Bio | Contractor | PIU/TSC/DPMU/DPMC |

| | | | | |
|---|---|---|---|---|
| | | mining process and timely completion of bio mining activity.<br><br>6.Discussion on traffic arrangement | | |
| HKS, Sanitation workers, Workers in MCF & Windrow compost Plant | 1.Interactive sessions<br>2. Distribution of pamphlets<br>3. Video presentation of dumpsite remediation process through whatsapp groups of the affected persons . | 1. Process of dumpsite remediation<br>2.Risks involved in the process<br>3.Possible mitigation measures<br>4. Discussion on traffic arrangements<br>5. Listen their concerns & discussion on its remedies<br>6. Health and safety measures | Contractor | PIU/TSC/DPMU/DPMC |

# ANNEXURE -I

**INITIAL ENVIRONMENTAL EXAMINATION**

**(To be prepared for each subproject)**

Checklist to be followed for Environmental Screening during the Initial Environmental Assessment Stage has been provided below:

**Subproject Details**

| | |
|---|---|
| **Name of Subproject:** | Valakkuzhi Solid Waste Dumpsite (Muvattupuzha) Remediation by Biomining |
| **Subproject Components:** | Dumpsite Remediation by Bio-mining |
| **Subproject Location (City / Town/ Village with ward numbers):** | Valakuzhi Paipra Panchayath, Ward 25, Muvattupuzha |

**Stage 1: Exclusion List**

**Is the Project Excluded from Consideration due to the following:**

| ***Sl No:*** | ***Non-permissible Activities*** |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |

*(This space can be used to add details on the above, reason for exclusion from the Project etc.)*

*This dumpsite remediation project involves 1. (i) no construction in demarcated Forest areas or protected areas or their buffers, (ii) no construction of landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) no treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). 2. NO activities which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas, 3. No activities with (i) any impact on or due to Dams or embankments (ii) and projects will not purchase, store and use Banned Pesticides.*

*Hence, not excluded*

*Proceeding to Stage 2 Screening*

**Stage 2: Environmental Screening Checklist**

| Project Details | | |
|---|---|---|
| **Sl.No** | **Components** | **Details** |
| 1 | Project components | Dumpsite Remediation by Bio-mining |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities / associated facilities) | Bioremediation of Valakuzhi Dumpsite: - A total station survey was conducted to determine the quantity of legacy waste, revealing a total of 55,712 cubic meters. |
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination) Site Survey No:/s (attach map) with ownership details, Geographical co-ordinates of the site location [including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | Location: Valakuzhy Paipra Panchayath, Ward 25<br>Survey No: (902/15A/2,902/11B/2,902/11A/5,545/3,545/6/2,545/6/1)<br>Ownership – Muvattupuzha Municipality<br>Land use – Solid Waste Management facility<br>Geographical Coordinates: Latitude: 9.99414 $^{0}$ N<br>Longitude: 76.561345 $^{0}$ E<br>Earthquake zone: III<br>Cyclone: Moderate<br>Access road of width 3 m (Valakkuzhi Road)<br>Dumpsites have existed since the year 1950. |
| **4** | Land Area proposed to be used: Location wise (in sq km / sq m) | Current total land area of 3.20 acres will be fully remediated through bio-mining. |
| **5** | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | For domestic usage 2 KLD will be met from a private supplier. |
| **6** | Power Required and Source of Power | No DG set requirement for this sub-project. Electricity connection is available within the site.<br>Source: KSEB |

***Baseline Environmental Conditions***

| *Sl. No* | *Environmental Aspects* | *Yes* | *No* | *Details (include distance in Km, info on its importance)* |
|---|---|---|---|---|
| 1 | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | | |
| *(i)* | Critically Vulnerable Coastal Areas (CVCAs), Eco-sensitive Areas (ESAs) | | ✓ | No Critically Vulnerable Coastal Areas and Eco sensitive Areas in the study area |
| *(ii)* | Cultural Heritage site, Protected monuments - listed by ASI/State | ✓ | | Old Muvattupuzha bridge– 2 Km away |
| *(iii)* | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species? If Yes, which is the area? | | ✓ | No Eco-Sensitive Areas in the study area |
| *(iv)* | Other Wetlands/ Mangrove/ Estuarine Region | | ✓ | There is no Wetlands/ Mangrove/ Estuarine Region in the study area |
| *(v)* | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | ✓ | There is no Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves in the study area |
| *(vi)* | Other Sensitive Environmental Components listed in EMF | | ✓ | There is no other Sensitive Environmental Components in the study area as listed in EMF |
| *(vii)* | Drinking water source, upstream and downstream uses of rivers, etc | ✓ | | Muvattupuzha River – 1.2 Km, SE direction from the dumpsite. |
| *(viii)* | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | ✓ | The location is not in a low lying area and not in a CRZ region. |
| *(ix)* | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | ✓ | | 27 houses within 200 m of the dumpsite. |
| *2* | Is the site in Critical / Overexploited Groundwater Block. Provide the level of the groundwater table | | ✓ | asper the ground water booklet of ernakulam district general Water level ranges from 3.5 to 6.5 metres. |
| *3* | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | ✓ | | Fire accident occurred twice in the dumpsite. Bio-mining will be carried out by considering the fire control and safety measures.<br>The site is highly vulnerable to Flooding. |
| *4* | Describe the type of soil and vegetation on site | ✓ | | Gravelly Clayey soil is the most predominant soil type, presence of vegetation ( shrubs ) |

| *Sl. No* | *Environmental Aspects* | *Yes* | *No* | *Details (include distance in Km, info on its importance)* |
|---|---|---|---|---|
| *5* | Is the site present in the flood plains as recorded in the last 100 years? Provide the HFL level of the site/region | | ✓ | Site is located in a flood prone area. |
| *6* | Existing pollution/contamination or degradation on site | ✓ | | Dumpsites have existed since the year 1950. |
| *7* | Any other remark on baseline condition | ✓ | | Based on the baseline study data for AAQ, except Particulate matter all other parameters are within the permissible standards, surface and groundwater, indicating that the respective results are well within permissible limits. The noise analysis indicates, during night time the Noise was found to be marginally higher than the standards |

***Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils***

| *Sl. No* | *Impacts on Land / Soil Environment* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| *8* | Total extend of land to be covered/built | ✓ | | The existing dumpsite area of 3.20 acres will be remediated by bio-mining. |
| *9* | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | | ✓ | The existing dumpsite area of 3.20 acres will be remediated by bio-mining. |
| *10* | Extend of Land to be remediated | ✓ | | The existing dumpsite area of 3.20 acres will be remediated by bio-mining. |
| *11* | Extend of land expected to be under green belt | | ✓ | Currently the dumpsite has no greenbelt. The Area of 3.20 acres will be fully remediated and utilized for further use by ULB. |
| *12* | Will the proposed project cause the following on Land / Soil: | | | After bio-mining the land will be remediated and will have a positive impact on the land and soil. |
| *(i)* | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | ✓ | No Impact on Surrounding Environmental Conditions due to the proposed sub-project. |
| *(ii)* | Substantial removal of Top Soil (mention area in sq.m) | ✓ | | The dumpsite has legacy wastes of 5.5 m below and 2.47 m above existing ground level. However, the legacy waste combined with soil will be remediated till the depth of 5.5 m below ground level. |
| *(iii)* | Any degradation of land / eco-systems expected due to the project? | | ✓ | No land use change or ecosystem change due to implementation of this project |

| Sl. No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| | | | | since the land will be reclaimed. |
| (iv) | Loss or impacts on Cultural/heritage areas/properties | | ✓ | No impacts or loss of cultural/ heritage areas/properties due the implementation of the project |
| (v) | Does the project activity involve cutting and filling/ blasting etc? | | ✓ | The project activity does not involve any cutting, filling or blasting. The bio-mining sub-project involves only excavation of wastes which are to be remediated. |
| (vi) | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | ✓ | | Waste is about 5.5 m below Ground Level which is to be excavated and remediated. So there is a change in topography. |
| (vii) | Will the project involve any quarrying/ mining etc? | | ✓ | The project does not involve quarrying/ mining |
| (viii) | Will the project / any of its components contaminate or pollute the Land? | | ✓ | The existing dumpsite will be remediated and utilized for further use, henceforth there won't be any contamination to the land. |
| (ix) | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | ✓ | Due to the proposed bioremediation, the site will be remediated and biodiversity of the surroundings will be enhanced and it will have a positive impact in the longer term. |
| (x) | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | ✓ | The proposed subproject involves only remediation through bio-mining. Hence no negative impact to the land. |

| Sl. No | Impacts on Air and Noise Environment | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 13 | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | ✓ | | The process of bioremediation may cause dust emission from process and vehicle movement which shall be managed using effective mitigative measures |
| 14 | Will the project cause or increase pollution due to GHG emissions? | ✓ | | Chances of GHG emissions due to un-stabilized waste. |
| 15 | Will the project cause or increase odor nuisance? | ✓ | | The process of bioremediation may cause odour during remediation for the shorter time duration, which shall be managed by effective mitigative measures |
| 16 | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | ✓ | | Fire accident occurred once in the dumpsite. |
| 17 | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | | ✓ | Project activity stage (during the process of bioremediation, the noise may arise due to |

| Sl. No | Impacts on Air and Noise Environment | Yes | No | Details/Remarks |
|---|---|---|---|---|
| | | | | vehicular movements & working of machineries). The proposed mitigation measures will ensure the ambient noise within the permissible limits. The duration of work will be 8 hours/day. |

| Sl. No | Impacts on Water Environment | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 18 | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | ✓ | The proposed remediation will only enhance the groundwater/surface water quality in the long term. |
| 19 | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | | ✓ | The proposed remediation will only enhance the groundwater/surface water quality in the long term. |
| 20 | Chances of Pollution of Water bodies/groundwater wells, nearby or downstream | | ✓ | The proposed remediation will only enhance the groundwater/surface water quality in the long term. |
| 21 | Will the activities proposed at the site(s) hinder natural drainage | | ✓ | No, the proposed remediation activity does not hinder natural drainage. |
| 22 | Will the activities proposed at the site(s) decrease permeability/rainwater percolation | | ✓ | The proposed remediation will clear the legacy wastes and the land will be remediated. After remediation the permeability/rainwater percolation of the soil will be increased. |

| Sl. No | Impacts on Biodiversity and Host Communities | Yes | No | Details/Remarks |
|---|---|---|---|---|
| 23 | Will the project necessitates cutting of Trees / Loss of Vegetation | | ✓ | Cutting of trees is not required for the proposed remediation activity. |
| 24 | Will the project necessitate substantial removal of Top Soil (mention area in sqm) | ✓ | | The dumpsite has legacy wastes of 5.5 m below ground level and 2.47 m above ground level. However, the legacy waste combined with soil will be remediated till the depth of 5.5 m below ground level. |
| 25 | Any degradation of land / eco-systems expected due to the project? | | ✓ | The proposed process of bio-mining ensures that there will be no degradation of the land. |
| 26 | Will the project result in Health & Safety Risks in the neighborhood including the release of toxic gases, leachate, accident risks | | ✓ | There are 27 households 200 m from the dumpsite. Hence, bioremediation should be conducted considering proper mitigation measures and |

| *Sl. No* | *Impacts on Biodiversity and Host Communities* | *Yes* | *No* | *Details/Remarks* |
|---|---|---|---|---|
| | | | | occupational health and safety conditions to the labourers and neighborhood will be ensured. |
| *28* | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | | ✓ | There is a habitable area at a distance of 200 m from the dumpsite. The noise pollution will be minimal outside of the premises during remediation. |
| *29* | Potential disruption to common property, accessibility, traffic disruptions, conflicts, or disruption to the local community within the subproject area? | | ✓ | No disruption, there will be a marginal increase in traffic of medium sized vehicle (trucks) due to the forward linking of recovered products from dump site (i.e. For compost, plastic and other recyclable waste). |

# ANNEXURE II: FIRE RISK ASSESSMENT

**Objectives:**

The important elements of fire risk Management planning can be classified as:

- Identifying the disaster potential scenarios and advance planning to combat and minimize the damage.
- Vulnerable zone delineation.
- Assessment of loss probability and its severity.
- To deal with such emergencies expeditiously.
- Warning, protective actions like evacuation of personnel.
- To contain the disaster by isolating the area, firefighting etc.
- To make efforts to return to normal condition when the situation is controlled.

*Causes of fire and Risk:*

| Ignition (heat) sources | Fuel Sources | Oxygen Sources |
|---|---|---|
| Lit cigarettes/ butts, matches, lighters<br>Improperly stored batteries<br>Bushfire<br>Self-heating piles<br>Hot loads/contaminated waste<br>Hot work operations<br>Arson<br>Lightning<br>Fires from neighbouring activities<br>Faulty electrical wires | Flammable liquids, gases and solids<br>Combustible goods and waste (e.g. CRWM[3])<br>Contamination in CRWM storage<br>Dry and unmanaged vegetation | Oxidising chemicals such as oxy-acetylene sets, bleach, hydrogen peroxide, nitrates<br>Physical introduction of oxygen through unbaling or turning of loose piles |

**Fire Prevention & Management Plan**

It is a strategy well evolved, organized and rehearsed to contain the adverse effects of a possible disaster. It aims to mobilize the internal resources and use these with minimal dependence on external agencies for the following purposes:

- To control and contain incidents.
- To safeguard employees and people in the vicinity.
- To inform employees, the general public and the authorities about the hazards/risks assessed, safeguards provided, residual risk, if any, and the role to be played by them in the event of disaster.
- To effect rescue and treatment of casualties.
- To prevent recurrence of such a disaster.
- To establish machinery for review, rectification/modification of the emergency

- To ensure safety of workers before personnel re-enter and resume work.
- To work out a plan with all provisions to handle and to provide for emergency preparedness and the periodic rehearsal of the plan.

**Pre-Disaster Stage**

The prevention of disaster is of vital importance and is the moral responsibility of each and every individual employed in the dumpsite site. It can be prevented by observance of precautionary and preventive measures. During pre-disaster stage following points will be followed to avert the occurrence of disaster:

The emergency operation procedures of the dumpsite site will be written down, so that no confusion is caused in the event of an emergency taking place.

- To reduce the probabilities of accidental leakage of methane.
- Smoking will be prohibited in the areas where handling of dumpsite will be done. “NO SMOKING” boards will be prominently displayed in Local Language ie., Malayalam and English languages.
- All electrical wiring, fittings, cables, equipment will be checked periodically. Temporary wiring will not be permitted to be installed inside the dumpsite area. No inflammable material including papers, Oils, wooden racks will be stored within 1 meter of any electrical fittings. No unauthorized person will be allowed to tamper with electrical fittings.
- Welding, Burning, cutting, Chipping, soldering work, etc. will only be carried out by authorized persons.
- Necessary compliance with various Statutory Guidelines and other relevant instructions as issued from time to time will be done by the contractor.
- The Safety Department will arrange to educate all concerned regarding operational hazards of non-compliance of the safety guidelines. They will also provide necessary guidance and support in proper implementation of the program. They will also arrange mock exercises periodically.
- The Safety Department will display important telephone numbers and instructions in Mizo & English languages. The Security Control Room located at the dumpsite site will be equipped with the following:
- Sufficient number of copies of On-Site Disaster/Emergency Management Plan.
- Master plan of the dumpsite site indicating vital locations and possible sources of disaster.
- Important Telephone numbers
- Emergency lights (portable) and Wireless sets if required and possible).
- First Aid boxes

**Disaster Stage**

The most probable disaster which may occur at the dumpsite site is because of accidental leakage and fire. To control leakage and fire the following measures/precautions will be taken at the dumpsite site:

The guidelines as given below for the protection of fire will be followed:

• The dumpsite’s fire protection will consist of structural solutions, fire extinguishing systems and fire alarm systems. The fire extinguishing system will consist of the fire system with fire pumps, distribution pipelines, hydrants and fire hoses and the portable extinguishers.

• The fire alarm system will be a part of the primary systems and take care of the places which are unmanned or will not have any fixed fire extinguishing system.

• The major operation areas shall be equipped with fixed smoke detectors, $CO_2$ extinguishers near the door in the control room.

• All the rooms in the office shall be equipped with fixed smoke detectors.

• The ventilation rooms shall be equipped with fixed smoke detectors. One $CO_2$ extinguisher will be located near the door to the ventilation room.

• The fire alarm and detection system shall be designed, installed, maintained and tested according to relevant standards.

• The water for firefighting shall be stored in the fire water tank (water reservoir).

• CO2 fire extinguishers contain extinguishing carbon dioxide which either by it or under expected conditions of use gives off CO2 to prevent fire.

• Dry fire extinguishers contain an extinguishing medium which either by itself or under expected conditions of use will give fine powder to prevent fire to get oxygen.

• As soon as a fire takes place inside the premises of dumpsite, action to be taken by various persons/officials

**Post Disaster Stage**

After the incident a report will be prepared regarding occurrence of event/losses incurred and recommendations thereof for restoration of normalcy

**Reporting of Accidents**

Situation in totality will be studied thoroughly, investigated with respect to the cause of the incident, extent of loss of life and property and a detailed report prepared by the individual/team nominated by dumpsite site authorities for this purpose. Based on the investigation report, rescue team would finalize time bound programmes for implementation of corrective measures proposed and regularly monitor the progress thereafter. Rescue, medical and welfare operations would be continued by the concerned agencies.

**Fire Standards and Facilities:**

Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.

Below equipment and their required quantities should be strategically positioned according to the site's specifications.

- Fire extinguisher (A, B, C powder): It will be used to immediately put off fire caused by wood, Paper and textiles, flammable liquids and flammable gases. Commonly can be placed anywhere inside the site
- Fire extinguisher (Foam spray): Mainly used to put off the fire caused by flammable liquids. It should be placed in diesel storage area, lubricant storage area and DG sets.
- Fire extinguisher ($Co_2$): Mainly used to put off the fire caused by Electrical short circuit. It should be placed near the control panel room/operation room.
- Fire bucket filled with sand: It should be placed near the diesel storage area

To ensure rapid response in case of a fire, it's essential to have a water tanker filled with water, equipped with a fire-fighting hose, readily accessible along with the portable motor. The presence of this equipped

water tanker ensures timely and effective action during fire emergencies. All requirements in line with National / State regulations and as advised y the Local Brigade shall be arranged & followed

The following points to be considered for assessing the fire risk and procedure to mitigate it.

1. Identification of Fire Hazards: The first step involves identifying potential fire hazards in the premises. These hazards could include sources of ignition (e.g., electrical equipment), combustible materials (e.g., flammable liquids, paper, cardboard), and other factors that could contribute to the outbreak of a fire.
2. Assessment of Risk: Once the hazards are identified, the next step is to assess the level of risk associated with each hazard. This involves evaluating the likelihood of a fire occurring and the potential consequences if a fire were to break out.
3. Escape Routes: Since operational phase occurs in an open environment, the need for conventional escape routes in the event of a fire emergency may not be required.
4. Fire Safety Measures: The assessment reviews existing fire safety measures in place, such as fire alarms, firefighting equipment, and fire suppression systems. Proper assembly point is required in case of fire break out
5. Emergency Procedures: The assessment evaluates the effectiveness of emergency procedures and evacuation plans in the event of a fire, ensuring that workers can safely evacuate the premises.
6. Fire Training and Awareness: The assessment considers the level of fire safety training provided to workers and the awareness of fire hazards and evacuation procedures.
7. Record-Keeping: Detailed records of the assessment process, findings, and recommended actions are maintained for future reference and regulatory compliance.
8. Recommendations: Based on the assessment, the fire risk assessor provides recommendations for improving fire safety, which may include installing additional fire safety equipment, conducting training programmes, or implementing any changes to reduce fire risks.
9. Review and Updates: Fire and risk assessments should be regularly reviewed and updated to account for any changes in the premises or regulations.

Fire and risk assessments play a crucial role in preventing fires and minimizing their impact if they occur. They are particularly important for dumpsites and other places with a higher risk of fire hazards to ensure the safety and well-being of workers.

## Executive Summary

The Solid Waste Management Rules of 2016 directed Urban Local Bodies to clear legacy waste dumps as well as existing operational dumpsite down to pre-existing ground level through a process called bioremediation or bio mining, which refers to an environment-friendly technique to separate soil and recyclables from legacy waste.

The Muvattupuzha dumpsite is located at a distance of 2.5 km from the centre of Muvattupuzha town in western side and encompasses a total area of 5.47 acres of land. The geographical coordinates of the dumpsite are 9.993701° N, 76.560974° E. The volume of legacy waste to be remediated in the dumpsite is 55,736.66 Cu.m. The legacy waste is present about 2.47 m above and 5.5 m below the ground level. Hence, bioremediation of the dumpsite is essential to mitigate the environmental impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues.

The subproject site has been screened for potential impacts due to proposed activity of dumsite remediation. Based on Environmental screening report and baseline consideration, potential odour nuisance and air borne microbial contamination, the activity may have moderate environment impacts to the surroundings during remediation period. Considering all the above factors, also the time extent of the impact during remediation stage and the mitigation measures proposed, the sub-project has been considered as E2 category.

The favourable time for remediation is non-monsoon period. As per the geotechnical investigation, the subgrade soil was encountered at 5.5 m below the waste depth of the dumpsite and the predominant soil is clayey. The dumpsite is surrounded by predominantly of dry cultivation land use and the same will act as odour attenuation during remediation. The cultural heritage zone near dumpsites is Muvattupuzha Old Bridge at a distance of 2 km in East direction. Hence, no significant physical impact to the heritages sites is envisaged during remediation. The total number of vehicles that will be operational at the dumpsite is 5 numbers per day which increase the traffic load by only 0.1% per hour and reducing the impacts to negligible. As per the district disaster management plan-2015 and flood vulnerability map the dumpsite is under flood prone zone.

Muvattupuzha Municipality has population of 30,397, literacy rate of 96.65%. The dump site is situated in the land owned by the Municipality. The remediation process will be conducted by an experienced agency decided by the KSWMP with the supervision of a ULB level project implementation unit. The entire process will be monitored by the KSWMP district level unit with the technical assistance of the TSC. The dumpsite remains in close proximity to 5-7 houses within 200 metre distance and the remediation process will not affect the socio-economic environment in and around the dump site in any way. The site is covered with a compound wall and gate.

After a comprehensive assessment, it has been determined that Bio-mining – reclamation/recovery of land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite. The cost of Bio-mining is [redacted] per $m^3$ as per the estimate.

During operational phase (bioremediation), the main potential nuisances caused by a dump site are fugitive dust, odour, foul gases, smoke from the site (in case of fire), and leachate generation. Birds, vermin, and rodents, littering, noises both from machineries operating at the site and waste collection vehicles. No specific social risk is identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process. It can be overcome by using adequate protective measures.

The mitigation measures are recommended for impacts from air, noise, water, leachate, health and safety, OH&S aspects. The proposed monitoring plan includes leachate, surface and ground water monitoring for a period of once in three months. The cost of [redacted] is required for implementation and supervision of EMP and SMP. The social management plan proposed are for pre-remediation as well as during remediation stage. The mitigative measures proposed addressing concern of local community about remediation work, labour management issues, health and safety risks of labours, gender discrimination.

Periodic Compliance monitoring system will be done by the contractor during remediation. A Transect walk was carried out on 31.05.2023 covering the surrounding area of the dump site. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact. Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the process at the site. Site control measures should be enforced to prevent unauthorized personnel into the work site.

## 1.0 Introduction

The issue of municipal solid waste management in Urban India has become one of the foremost concerns during last couple of decades. Kerala state has 93 ULBs including six Corporations.

The primary environmental issue currently faced by the municipal authorities in Kerala revolves around a longstanding existing legacy waste dumpsite. The state has a long history of more than three decades of continuous dumping of both bio- and non- biodegradable wastes. Though the waste dumping activity has been stopped, the dumpsite remains as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Improper management of such sites pose significant environmental, social, and economic challenges for the communities and ecosystems in the vicinity.

In view of the environmental and social issues connected with dumpsites, the SWM Rules 2016, directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the remediation projects of legacy waste dumpsites in the ULBs. As part of the project, in phase -1, the existing dumpsite of Muvattupuzha ULB was proposed for remediation.

For arriving at a methodology for remediating the legacy waste in the dumpsites, as per the Project Implementation Manual, a feasibility study outlining the technical, economic, and socio- environmental factors has been carried out. As a result of the feasibility study that involved detailed field investigations & assessment, and market sounding, the method proposed for remediation of legacy waste dumpsite is biomining, which will ensure long-term sustainability and environmentally sound treatment, which is found technically feasible, economically viable, and socially acceptable. The details of various steps involved in the feasibility study are described in the following sections.

## 2.0 General Description about the Project

Muvattupuzha, Ernakulam in the State of Kerala is experiencing the issues of treatment and disposal of MSW. The common solid waste management facility of the Muvattupuzha Municipality is located within 5.47 acres of land in Valakuzhi (9.993701"N, 76.560974"E). The legacy dumpsite is also located at this common solid waste management facility. This is the only dumpsite present in the ULB.

This waste dumpsite at Muvattupuzha needs to be remediated scientifically and the land is to be reclaimed for productive use. This feasibility report outlines the status including the environmental and social aspects. The feasibility report also examines various remediation options and suggests the most feasible option for the given context for the purpose of availing for the closure of the dumpsite by Muvattupuzha Municipality.

## 3.0 Profile of ULB- Muvattupuzha Municipality

### 3.1 Location

Muvattupuzha Municipality is located at latitude 9.993701°N and longitude 76.560974°E and is located on the central part of the district as shown in **Figure 3.1**. Total geographical area of Muvattupuzha municipality is 13.18 Sq. Km.the Municipality is divided into 28 administrative ward.

**Figure 3.1 Location Map of Muvattupuzha ULB**

### 3.2 Demographic & Socio-Economic Status

The municipality has a total population of 30,397 of which 15,010 are males while 15,387 are females as per Census 2011 indicating a Sex Ratio of 1,025 against state average of 1,084. The overall literacy rate of Muvattupuzha town is 96.65% which is higher than state average of 94.00 %. *(Source: Census Data 2011)*

**Table 3.1 Workforce Participation Details, Muvattupuzha**

| Category | Total | Male | Female |
|---|---|---|---|
| Main Workers | 9,916 | 7,588 | 2,328 |
| Cultivators | 207 | 189 | 18 |
| Agriculture Labourer | 219 | 176 | 43 |
| Household Industries | 211 | 160 | 51 |
| Other Workers | 9,279 | 7,063 | 2,216 |

| Category | Total | Male | Female |
|---|---|---|---|
| Marginal Workers | 840 | 492 | 348 |
| Non-Working | 19,641 | 6,930 | 12,711 |

### 3.3 Connectivity

Muvattupuzha town is well connected to neighboring local bodies and towns through National Highways, State Highways, and other Major and minor road networks. National Highway 85 passes through the municipality, about 7.36 kms of NH 85 is occupied within the municipality. The Main Central Road (MC Road) section of about 6.45 kms is also passing through the municipality.

Muvattupuzha is connected by National Highway No. 85 to Ernakulam and Kothamangalam and by State Highway 8. Muvattupuzha connects Thodupuzha Muvattupuzha – Theni Highway SH—45.

The nearest major railway station, Aluva is located 32 kms from the town center, which is second largest railway station in Ernakulam. And nearest airport is Kochi International airport located 34 kms away from the town. The town is well connected by water way network which brings a wide opportunity of inland navigation.

**Figure 3.2 Road Map of Ernakulam Showing Major Connectivity of Muvattupuzha Town**

### 3.4 Climatic Condition

Muvattupuzha has a tropical climate. The average annual temperature is 27.6 °C in Muvattupuzha. Precipitation here averages 3,579 mm.

Summer season beings from March and ends in May. The climate in Muvattupuzha during the season is moderately hot and humid. Like all other places in Kerala, Muvattupuzha experiences heavy showers during the monsoon season. The catchment area has very high humidity of more than 80%. The data is presented in **Table 3.2.**

**Table 3.2 Meteorological data for Muvattupuzha**

| | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sept | Oct | Nov | Dec |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Avg. Temp °C | 25.6 | 26.7 | 27.6 | 27.1 | 26.1 | 24.7 | 24.3 | 24.3 | 24.7 | 24.7 | 24.7 | 24.9 |

## 3.5 Ground Water Level

The vicinity of the project area has a few households. The site is surrounded by paddy field and the water table is high. According to information published by the CGWB, the Government of India, the water level in Muvattupuzha fluctuates from 3.53 to 6.54 MBGL.

## 3.6 Land use

Land use survey record revealed that the predominant land use of Muvattupuzha Municipality is residential. 60.43% of the total area is under residential use. Existing land use analysis shows following breakups as shown in table below:

**Table 3.3 Land use Pattern of Muvattupuzha Municipality**

| S. No | Land use | Area Ha | % |
|---|---|---|---|
| 1 | Residential | 796.45 | 60.43 |
| 2 | Commercial | 29.18 | 2.21 |
| 3 | Industrial | 4.91 | 0.37 |

*Source: CSP, Muvattupuzha, 2009*

The details of analysis of land use survey and the resultant findings of existing land use are given hereunder.

- About 60.43 percent of the total geographical region is residential.
- Substantial coverage of water bodies and agricultural land.
- Agricultural land consists of dry as well as wet land. Rubber is the principal crop followed by paddy, coconut and tapioca.

## 4.0 Detailed Description of the Dumpsite

### 4.1 Physical Feature of the Site

The dumpsite is located approximately 2.5 km west of the centre of Muvattupuzha town, in ward no 25 and has an area of approximately 5.47 acres of land. The dumps site is not very far from human settlement. The coordinates of the dumpsite are 9°59’ 29" N & 76°43’ 42” E. Muvattupuzha municipality owns the dumpsite land. The Dumpsite is surrounded by residential dwellings (5 nos.) on eastern direction. South and west direction from the dumpsite is vacant land. Muvattupuzha River flows south-eastern side of the dumpsite at the distance of 1.2 km.

The exact date of start of the dumpsite is not available with the municipality; however, it is learnt during field visit that it started in the year 1960. Presently, the quantity of waste dumped at this site is about 55,736.66 cum as per records available with the ULB. As of now 3.2 acres of the area of the 5.47 acres is covered with waste. The legacy waste is present till about 5.5m below and 2.47 m above the ground level. There are high chances of water being contaminated in this area due to leachate percolation.

**Figure 4.1 Photographs of Muvattupuzha Dumpsite**

**Table 4.1 Salient Features of Muvattupuzha Dumpsite during Site Visit**

| Particulars | Details |
|---|---|
| Name of Dumpsite | Valakkuzhi dumpsite |
| Location of Dumpsite | Ward No. 25 of the municipality |
| Co-ordinates of Dumpsite | Latitude:- 9.993628 N<br>Longitude:- 76.561114 E |
| Distance from the central part of the town | 2.5 km |
| Area of dumpsite | 5.47 Acres |
| Waste of the dumpsite | 5.5 m below and 2.47m above |
| Ownership of dumpsite land | Municipality |
| Distance from nearby features- residential, school, offices, temples, institutions, industry etc.) | Residential and other structures within 100 m from the site |
| Start date of dumpsite | 1960 |
| Utilities on site | Electricity connection is available |
| Details of manpower and vehicles available in dumpsite | 45 persons and 6 Vehicle |
| Site demarcated | Site is currently demarcated with a boundary wall. |
| Details of weighbridge available at dumpsite | No weighbridge at site |
| Plant adjacent to dumpsite details | Nil |
| Availability of electrical power | 440 LV grid available at 100m from site |
| Availability of water for process | Water available from nearby stream at 100m, drinking water to be supplied by tanker |

## 4.2 Surrounding Features of the Dumpsite

The immediate surrounding land use of the dumpsite is rubber plantation. Within 200 m radial vicinity a few households (5 to 7 numbers) exist. The LV line is available at dumpsite, hence

it is convenient for setting up the bio-mining facilities. Site has proper access through a 5 m wide road.

## 4.3 Information on Site Management

This section describes the current management of the dumpsite in terms of agency responsibility, profile of workers and numbers, nature of work the labour force in engaged in, Waste pickers and other category of workers at the site

**Agency responsible for current management of the dumpsite:** Dumpsite is present within the common solid waste management area of the Muvattupuzha Municipality. An MCF, RRF & BSF Larva composting are working near to the dumpsite. MCF is operated by Cris Global traders who are appointed as Haritha sahaya sthapanam.

**Profile of workers and numbers:** Total number of 36 HKS workers & 14 workers (Provided by the agency) have been appointed on a daily basis for the operation of MCF, RRF and waste collection.

**Nature of work the labour force in engaged:** HKS workers and workers appointed by the agency are involved in the collection, segregation, and forward linkage of the non-bio waste. And they are also involved in the collection of bio waste from the Market, institutions, and households.

## 4.4 Relevance in local or regional SWM plans

The 5.47 acres of land after reclamation may be productively used by the ULB as it deems fit. The ULB may consider its use as a waste recycling park in which case the non-biodegradable waste from the ULB shall be brought to this facility and materials collection facilities and processed for further use. The project may be funded under the KSWMP project.

## 4.5 Litigation status of the Site

There is no litigation against the site. Whereas there is letter from State Pollution control board dated on 06/05/2023 Regarding “Direction imposing Environmental compensation for Non-compliance Act, 1986.” (Ref: 1. Soild waste management Rule 2016; The Hon’ble NGT order dated 16.01.2019 in OA No.606/2018; 3. Hearing notice no. PCB/HO/RULES/SWM EKM/2018 (Vol 2) dated 16.03.2022, Hearing conducted on 25.03.2022.

## 5.0 Scope of Work

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Muvattupuzha includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (100% land recovery – Biomining, capping, partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the ESMF developed for projects envisaged under KSWMP.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Delineation of baseline assessment, impact & risk assessment, mitigations measures, Environmental Management & monitoring plan, budget for EMP, EMOP, institutional responsibilities for implementing monitoring and reporting
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport,
- Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 Objectives:

- To remediate the dumpsite by 31st March 2024.
- To reclaim 100% area and by eliminating the chances of dump fires, leachate generation, and foul odor.

- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.
- To increase nearby social value and benefit the citizens.

## 6.0 Detailed Investigation Strategy

### 6.1 Investigation Strategy

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below:

- Bore hole upto a depth of 10 m and collection of 3 (nos) samples from the soil at interval of 1.5 m depth.
- Waste analysis viz., leachate sample from 1 location and physical analysis from 2 (nos) location, and chemical analysis from 1 (nos) location.
- Environmental baseline analysis surface water 1 (nos) location and ground water samples from 2 (nos) location (Well Water Samples -1 up gradient, 1 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location.

### 6.2 Investigation Plan

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

**Table 6.1 Detailed Investigation Plan**

| S.No | Parameters | Sampling Nos |
|---|---|---|
| 1 | **Geotechnical investigation** | |
| A | Bore Holes up to 10m depth(1No./2Hectare) (as per CPHEEO) | 1 |
| B | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | 1 |
| 2 | **Waste & Environmental Analysis** | |
| A | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyside, Chloride, Fluoride, Phenolic compounds. | 3 |
| B | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | 2 |

| S.No | Parameters | Sampling Nos |
|---|---|---|
| C | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Poatassium(N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor. | 1 |
| D | Ground water (well water samples-1 up gradient, 2 down gradient)-(shallow and deep wells) Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012) | 3 |
| E | Surface water (pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | 1 |
| F | Ambient Air Quality (Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise level (E(P)) for 24 hours. | 1 |

## 6.3 Sampling Methodology

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

**Table 6.2 Detailed Investigation Plan Executed for Waste Dumpsite at Muvattupuzha**

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Upwind direction in Northeast boundary of the dumpsite. Distance 10 m from the boundary of dumpsite.<br>Downwind direction in West Southwest (WSW) boundary of the dumpsite. | The AAQ locations were chosen based on the Windrose data obtained for Muvattupuzha. The most predominant wind direction is from West and West-Southwest. |
| 2 | Noise (1 Location) | Ambient Noise level (E(P)) for 24 hours | Entrance of the dumpsite. Distance 10 m from the boundary of dumpsite. | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading vehicle. Please note that the site is devoid of |

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | | | proximity to any sensitive receptors within a 200 m radial circle. |
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | Nearby surface water within 100m from the dumpsite. | No alternative surface water sources were identified during sampling. |
| 4 | Ground water (2 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | Wells within vicinity of the dumpsite | No alternative ground water sources were identified during sampling. |
| 5 | Bore Hole (1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | Centre of the dumpsite | Volume of legacy wastes were found to be higher in the centre part of the dumpsite during investigation. So, the bore hole test was performed in the centre. |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cynide, Chloride, Fluoride, Phenolic compounds. | 3 | |

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | 2 | |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium(N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | | |

For the borehole investigation, the samples were collected by rotary drilling a 150mm bore hole using a fast rig attached to a drag bit. The soil drillings are removed by a circulating bentonite slurry which also aids in keeping the side walls stable. An SPT sampler was driven in to collect the representative samples, which is carefully packed in double walled polythene bags, sealed, and sent to laboratory for testing. Standard penetration tests were conducted on soil at every 1.5m depth and the number of blows to achieve 300mm penetration were noted. Fractions recovered from the mining of legacy waste were tested, especially for the presence of toxic metals and organic contaminants.

The total quantity of waste present in the waste dump is calculated based on the topographic study executed by ULB (for calculating quantum of waste above ground level) and the results of borehole investigation (for calculating the quantum of waste below ground level).

### 6.4 Analysis and Interpretation of Exploratory Data

The baseline condition of the waste dumpsite at Muvattupuzha, has been assessed through the geotechnical investigation and Waste & Environmental baseline assessment executed through M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Polluchem Laboratories (P) Ltd respectively. The results of Topographical survey conducted by ULB in the year 2022 also considered for the analysis. Results of topographic survey conducted by ULB, Geotechnical investigation report, waste and Environmental analysis are enclosed as **Annexures 1 to 4.**

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 29/05/2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 01.06.2023 and was completed on 04.06.2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 03.06.2023 by M/s Polluchem Laboratories (P) Ltd.

### 6.4.1 Topographic Survey Results

Topographic survey was conducted by ULB itself in the year 22/05/2022 towards assessing the quantum of the waste present in the dumpsite above the ground level. The Topographical survey report is presented in **Annexure 1**. The inference of the Topographical survey is as follows;

- Topographical Survey Map shows Approximate 3.20 acres of land used for waste dumping.
- Maximum height of waste dump above soil is 2.47 m
- Estimated waste volume is 31,995.18 Cum. (Above ground level density of waste is 0.904 T/cum as per the characterization study results presented in subsequent sections)

### 6.4.2 Geotechnical Exploratory Details

The geotechnical investigation at the dumpsite at Kurianmala, Muvattupuzha, Ernakulam district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 10 m (5.5.00 in waste after that 4.5 m soil). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples. The full geotechnical report is appended as **Annexure 2**. The major inference of the geotechnical investigations is as follows;

- In the borehole investigation it was asserted that the depth of the waste column below ground level is 5.50.m.

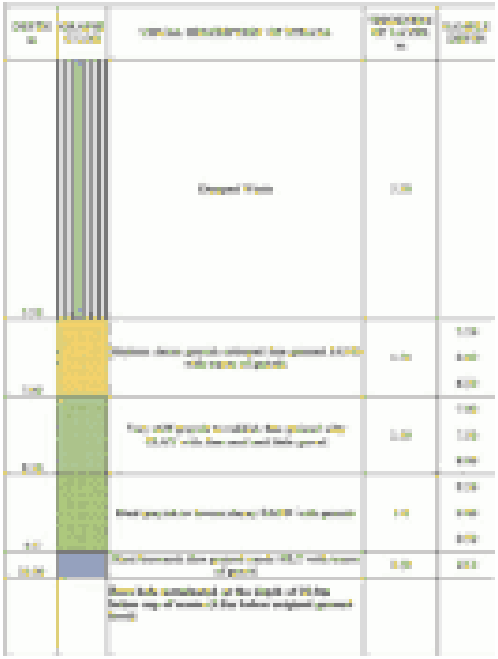

**Figure 6.1 Borehole Strata obtained for Muvattupuzha Dumpsite**

- The base soil has a plasticity index greater than 10 with clay and silt fractions account for more than 40%, which makes it suitable for the sub-base.
- The safe bearing capacity of the soil is 150 KPA, implying that the maximum height of fill may be about 15 m. During excavation, the side slopes should be maintained at 1:3.
- The Cation Exchange Capacity (CEC) of the soil is 11.03 meq/100gm.

### 6.4.3 Estimated Total Quantity of Waste

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). As detailed under section 6.4.1 the estimated quantity of the waste above the ground level is 31,995.18 Cum.

Quantity of waste below the ground level is estimated as **23,741.48 Cum**. The quantity of waste below ground level may vary as per actual site conditions. We recommend taking 4 more bore holes for estimating exact quantity or the assessment of quantity below ground level may be included in the contractor's scope. Thus, the total legacy waste present in the Muvattupuzha dumpsite is calculated as below:

**Table 6.3 Total Waste Quantification for Muvattupuzha Dumpsite**

| Sl no | Name of Dumpsite | Quantity of Waste present above the Ground level | Quantity of Waste present below the Ground level | Total quantity of legacy waste to be managed |
|---|---|---|---|---|
| 1 | Muvattupuzha | 31,995.18 Cum | 23,741.48 Cum | 55,736.66 Cum |
| | | 28,923.64 T | 21,462.30 T | 50,385.94 T |

### 6.4.4 Legacy Waste Characterization

The characteristics of the legacy waste were assessed by collecting a 15kg sample. The legacy waste samples were collected on 09/08/2023 by M/s Matters lab (P) Ltd. The assessment of waste characteristics. was done based on the results of the analysis. The details of the physical characteristics are provided in the tables below. The detailed legacy waste characterisation reports are enclosed as **Annexure 3.**

**Table 6.3 Grain Size Analysis of Legacy Waste (total weight of sample taken 15 kg)**

| Sieve Size (mm) | Percentage Retained |
|---|---|
| 80 | 3.8 |
| 37.5 | 7.3 |
| 10 | 25.4 |
| 4 | 22.9 |
| Pan | 40.6 |

**Table 6.4 Characterisation of Waste Material Retained in Each Sieve**

| Test/ Parameters | Waste Material Retained on each sieve in % | | | |
|---|---|---|---|---|
| | 80mm | 37.5 mm | 10mm | 4mm |
| Plastic Waste | 16.9 | 7.7 | 3 | 5.9 |
| Cloth | 69.7 | 0.2 | 0.8 | Nil |
| Glass | Nil | 3.3 | 1.2 | 0.2 |
| Wood | Nil | 4 | 9.2 | Nil |
| C&D | Nil | Nil | Nil | Nil |
| Bio Fraction | Nil | Nil | Nil | Nil |
| Gravel | 13.4 | 84.6 | 83.2 | 93.4 |
| Metal | Nil | 0.3 | 2.6 | 0.5 |

**Table 6.5 By Product Composition**

| Particular | Percentage of Composition (%) |
|---|---|
| RDF | 8.81 |
| Recyclable | 0.80 |
| Inert | 49.80 |
| Compost Soil Enricher | 40.60 |

**Table 6.6 Physical Characteristics of Waste**

| Sl no | Parameter | Test Method | Unit | Value |
|---|---|---|---|---|
| 1 | Moisture@105°C | ASTM D 2216 | % | 12.4 |
| 2 | Bulk Density | USEPA | kg/m3 | 904 |
| 3 | Density | USEPA | g/cm3 | 0.8974 |

**Table 6.7 Chemical Analysis**

| SL No | Parameters tested | Test Method | Unit | Result |
|---|---|---|---|---|
| 01 | pH@25°C | USEPA | .. | 8.02 |
| 02 | Biodegradable Factor | USEPA | % | 3.7 |
| 03 | Total carbon | USEPA 9060A | % | 4.6 |
| 04 | Phosphorus(P) | USEPA | % | 0.041 |
| 05 | Nitrogen(N) | USEPA | % | 0.31 |
| 07 | Potassium(K) | USEPA | % | 0.0630 |
| 08 | C/N Ratio | USEPA | .. | 14.8:1 |

*Note : The average Nitrogen, Phosphorus and Potassium (NPK) content in the legacy waste samples are far lower than 0.5, 0.4 and 0.5 as specified by the Fertilizer Control Order (FCO) 1985 for city compost and hence cannot be used as compost. The carbon: nitrogen ratio is 14.8:1 which is much lesser than the specified standard. This could be due to the materials being exposed to sun and air over the years or that the carbon content may have leached into the ground through leachate during the rainy season. Another possible contributor to the reduced carbon levels could be multiple fire incidents at the site. Although the material has very less carbon content, the NPK value can be enriched by adding additives like poultry litter. The enriched material can be given to farmers or used for horticulture purposes.*

### 6.4.5. Soil Conditions of the Dumpsite

As it is an unlined dumpsite, there is a probability of finding traces of contaminant from waste and leachate in the underlying soil. Since it is an uncontrolled disposal site, the mixed waste contains different types of pollutants which may eventually have an impact on the soil. Results

of soil analysis of the samples taken from the borehole in the Kurimala dumpsite is as shown below:

**Table 6.8: Chemical analysis of soil extracted from borehole at Muvattupuzha dumpsite**

| Sl. No | Parameter | Result | US (NY State-Codes, rules and regulations) Industrial Use |
|---|---|---|---|
| 1 | Cadmium (Cd) mg/Kg | <5.0 | 60 |
| 2 | Chromium (Cr) mg/Kg | 121.8 | 800 (Hexavalent) 6800 (Trivalent) |
| 3 | Copper (Cu) mg/Kg | 123.8 | 10000 |
| 4 | Nickel (Ni) mg/Kg | 82.9 | 10000 |
| 5 | Lead (Pb) mg/Kg | 59.9 | 3900 |
| 6 | Zinc (Zn) mg/Kg | 944.3 | 10000 |
| 7 | Mercury (Hg) mg/Kg | <0.1 | 5.7 |
| 8 | Arsenic (As) mg/Kg | 10.0 | 16 |

While comparing results of the report with the US Industrial Use benchmark, it is observed that the values are significantly low and within the benchmark values. Bioremediation may be carried out to reduce traces of heavy metals in soil and for site clearance. The location may be used as a site for Industrial use like setting-up SWM facilities. However, the solution may be considered after proper soil and groundwater investigation post dump-clearing stage.

### 6.4.6 Leachate Characterization and Quantification

There is no leachate collection/management system in the dumpsite. To address the concern of contamination of the groundwater and soil due to uncontrolled dumping, leachate samples are picked for analysis. The data is presented in **Annexure 4**. The data indicates that the TDS is about 143 mg/l while the suspended solids is about 12 mg/l. The chlorides are 12 mg/l, while the COD, BOD are 150mg/l and 16.4 mg/l respectively. The sample do not indicate any traces of contamination hence the soil is unlikely to be contaminated by heavy metals from waste.

**Table 6.9 Leachate characteristics at Muvattupuzha Dumpsite**

| Parameters tested | Test method | Results |
|---|---|---|
| Sampling Location | N-9 °59'23.582" E +76°33'51.031 | |
| pH | IS 3025 (P) 11 –1983RA2017 | 6.65 |
| Total Dissolved Solids (Inorganic) | IS 3025 (P) 16 – 1984RA2017 | 143 mg/l |

| Parameters tested | Test method | Results |
|---|---|---|
| Total Suspended Solids | IS 3025 (P) 15 – 1984RA2017 | 12 mg/l |
| Chloride as Cl- | IS 3025 (P) 32 – 1988RA2014 | 24.1 mg/l |
| C O D | IS 3025 (P) 58 -2006RA2017 | 150 mg/l |
| B O D (3 days at 27O C) | IS 3025 (P) 44 – 1993 RA 2014 | 16.4 mg/l |
| Total Kjeldhal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 11.3 mg/l |
| Ammoniacal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 8.14 mg/l |
| Phenolic Compound asC6H5OH | IS 3025 (P) 43-1992 RA2014 | BDL(MDL- 0.01 mg/l) |
| Fluoride as F | IS 3025 (P) 60 -2008RA2014 | 0.54 mg/l |
| Cyanide as CN- | IS 3025(P) 27-1986RA2014 | BDL(MDL- 0.01 mg/l) |
| Nickel as Ni | IS 3025 (P) 54– 2003RA2014 | BDL(MDL- 0.01 mg/l) |
| Cadmium as Cd | IS 3025 (P) 41– 1992RA2014 | BDL(MDL- 0.001 mg/l) |
| Lead as Pb | IS 3025 (P) 47– 1994RA2014 | BDL(MDL- 0.01 mg/l) |
| Copper as Cu | IS 3025 (P) 42– 1992RA2014 | BDL(MDL- 0.01 mg/l) |
| Mercury as Hg | IS 3025 (P) 48 – 1994RA2014 | BDL(MDL- 0.001 mg/l) |
| Zinc as Zn | IS 3025 (P) 49 – 1994RA2014 | BDL(MDL- 0.01 mg/l) |
| Total Arsenic as As | IS 3025 (P) 37– 1988RA2014 | BDL(MDL- 0.01 mg/l) |

*BDL- Below Detection Level, MDL- Minimum Detection Level*

All the heavy metals are significantly low or below detectable limits. The ground water quality results (presented under ESIA Section indicate that the dumpsite has not caused any major increase in pollution levels and the quality parameters are within the IS10500:2012.

### 6.4.7 Environmental Baseline

The environmental baseline was assessed from the analytical results of air, surface &groundwater, noise and leachate. The samples by M/s Pollutchem Laboratories (P) Ltd. The Environmental baseline was analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the ESIA Section in **Annexure 5.**

### 6.4.8 Risk Assessment

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and pathogens. Proper containment and management of leachate are essential to prevent water pollution.

The analysis of surface water reveals that all the parameters are within the acceptable limit, except it is slightly acidic and the dissolved oxygen content is less than prescribed limit, so also the BoD is greater than the allowable limit, indicating that the water contains organic load.

**Table 6.10 Risk Assessment- Surface Water**

| Risk Assessment | |
|---|---|
| **source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite -BOD Higher than the acceptable limits |
| **Pathway** | Water/Run off |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | High BOD Indicates the water is highly polluted and it is harmful to ecosystem as fish and other aquatic life may suffocate in oxygen-depleted waters. Also it will contain more Pathogen and make the water unfit for human and animal |

**Ground Water**: Pollutants from dumpsite can infiltrate into underlying groundwater, particularly if the dumpsite is not adequately lined or if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

The analysis of ground water samples taken at one location reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 5.51, which is in a slightly acidic range which can make the water not fit for any industrial purpose as it is more corrosive.

**Table 6.11 Risk Assessment - Ground water**

| Risk Assessment | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite - pH is acidic in nature |
| **Pathway** | Water, Soil |
| **Receptor** | Human, Animals, Aquatic life, and flora fauna |
| **Risk** | Possible risk to human health are;<br>• Diarrhea<br>• Nausea and Vomiting<br>• Abdominal Pain<br>• Weakness<br>• Organ Damage<br>Possible risk to flora<br>It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increases the availability of some elements to toxic levels, particularly aluminium and manganese. |

**Air**: Dumpsites may emit pollutants into the air through fire at dumpsites or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens, etc. to be ensured.

**Table 6.12 Risk Assessment - Air**

| **Risk Assessment** | |
|---|---|
| **source** | Legacy waste Dumpsite |
| **Pollutant** | Within the limits |
| **Pathway** | Air |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | No Anticipated risk |

**Soil**: Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

**Table 6.13 Risk Assessment - Soil**

| **Risk Assessment** | |
|---|---|
| **source** | Legacy waste Dumpsite |
| **Pollutant** | Heavy metals |
| **Pathway** | soil |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health: Soil that contain substance such as heavy metals which may be toxic to human can pass those substances on to human through crop uptake leading to unsafe foods.<br>Possible risks to animals: when farm animals consume the plant grown from contaminated soil it affected the health of animal.<br>Possible risk to flora: Soil pollution may after plant metabolism and reduce crop yield, also the trees and plants that absorb the soil contaminants enter into the food chain. |

**Bioaccumulation in Biota**: Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the land and minimizing the exposure of organisms to contaminated environments

**Table 6.14 Risk Assessment - Bioaccumulation in Biota**

| Risk Assessment | |
|---|---|
| source | Legacy waste Dumpsite |
| Pollutant | Leachate and heavy metals |
| Pathway | Air, water and soil |
| Receptor | Human, Animals, flora and fauna |
| Risk | Possible risks to human health, animal flora and fauna<br>Accumulated of contaminants in plants and animals indirectly through food chain affects human health |

## 7.0. Evaluation of Remediation Techniques

Reclamation of existing unmanaged municipal waste dumpsites is becoming a key requirement for ULB's in India as unscientific and unplanned methods of waste disposal in non-engineered landfills have led to lot of environmental issues including soil and ground water contamination, uncontrolled landfill gas emissions into the atmosphere and exposure to disease vectors and scavengers. The Hon'ble NGT seized with these problems across the country has ordered that the respective authorities to remedy this at the earliest.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

Remediation of waste dumpsite is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

- Environment Enhancement - reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.
- Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
- Land - Dumpsite land becomes available for utilizing same for the establishment of other Waste Management Facilities.
- Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels.

For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- Baseline study of heavy metals; subsurface soils and water; rainfall; soil type; surface hydrology; topography; wind direction etc. Shall be studied prior to bioremediation.
- Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows:

## 7.1 Bio-Mining – Reclamation/Recovery of Land 100%

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc for the end use of the recovered fractions.

**Phase 1: Stabilization**

The legacy waste is formed into equal-sized windrows, and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture, and eliminates pathogens

**Phase 2: Sorting & Segregation**

In this phase, stabilized legacy waste is sorted/ segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/ circular rotatory sieves and manpower

**Phase 3: Disposal & Utilization**

In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries

| | |
|---|---|
| Salient Features | • 100% land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>• Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>• Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>• Compliance to SWM Rules and NGT orders.<br>• Improvement in aesthetics and quality of life & health. |
| Applicability | • The ownership is well defined.<br>• Working space is available in the dumpsite.<br>• Linkage for utilization by-products is available |

## 7.2 Capping Without Land Recovery

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the capped legacy waste.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas post monitoring period.<br>• Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years.<br>• Capped area needs to be inspected periodically for settlement due to physical, chemical, and biological transformation, leachate generation, erosion and naturally occurring invasion by deep-rooted vegetation.<br>• Recurring expenditure will be incurred for regular maintenance. On July 17, 2019 the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio- mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>• SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | • Simple & robust, least expensive method among various available technologies |

## 7.3 Capping with Partial Land Recovery

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can be linked to relevant buyers and the inert material will be capped over lower footprints, with well-designed slopes to prevent further degradation of the environment.

The top layer of capped material may also be provided with gas collection wells and pipes to trap the methane and the collected gasses are typically passed through an oxidation layer of passive venting or flared. If the gas quantity is substantial then, power generation may be a possibility. The capped area should have drains to collect the surface water flow as well as any leachate that may be generated. Such leachate is collected and treated in leachate treatment plants.

The reclaimed land may be covered with loamy soil that has plants with high transpiration rates. The plants do not permit the ingress of water into the soil thereby reducing the possibility of leachate generation. The plants and soil microbes also behave as oxidation layer. The soil is compacted and maintained with gentle slopes with 1:3. Contour drains may be provided to divert the water away from the soil thereby preventing ponding of water. The reclaimed land may be covered with solar panels to generate renewable energy during the period of observation following the post closure.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>• Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>• Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |
| Applicability | • Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>• Lack of linkage for disposal of inert<br>• Recovery land for public use is not a priority |

## 7.4 Selection of Remediation Option

Selection of the applicable method/type or technique is based on the factors like salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land 100% & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for 100% land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Moreover, as per Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping.

However, after the bioremediation municipality wants to use the land for setting up of Material Collection Facility and Resource Recovery Facility or to be used as deemed fit by ULB. Hence backfilling of the site with bio-earth and inert is planned.

For the execution of dumpsite bio-mining two strategies can be adopted.

- *In-situ biomining*: Here the biomining is carried out within the premises of the dumpsite after clearing the waste and reaching the original ground level or in level with the land adjoining the dumpsite. The advantage is that only the finished products are moved out of the premises, inerts may be used for gradation and filling up low lying areas within the site, or in a newly developed sanitary landfill. This is quite economical when legacy waste quantities are significant. The possibility of gaseous emissions, noise and odor and formation of leachate exist as the processing takes place at the site. The location would remain affected for the time till all waste are processed.
- *Ex Situ biomining:* In small dumpsites, or where the area is a constraint, the entire waste is excavated and taken away to an alternate location for processing. The work in the dumpsite can be completed quickly and the disturbance due to the excavation can be minimized. The cost of transportation of the whole waste adds to the cost of bio-mining. But since the process plant can serve multiple locations, economies of scale may be achieved and may also compensate for the added transport cost.

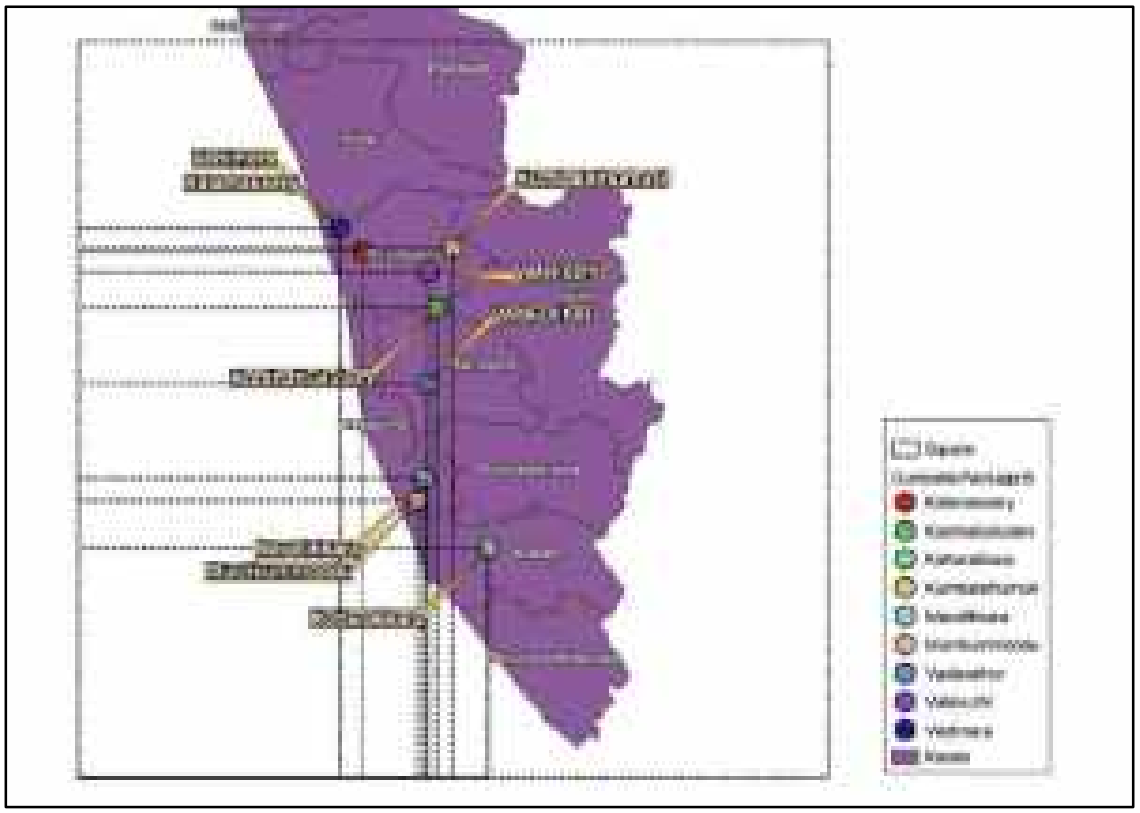

**Figure 7.1 Location of Other Dumpsites nearby**

## 8.0 Technical Description of the Selected Option

### 8.1 Methodology

The legacy waste dumpsite reclamation through bio-mining with recovery of land 100% involves

Phase 1: stabilization

Phase 2: sorting & segregation

Phase 3: disposal & utilization

Phase 4: Back filling of boulders and inerts

### 8.2 Selection of Machineries

The type of machinery, capacity, and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend

on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type of machinery available for the bio mining are as follows:

- Stationary screening machinery and
- Mobile/compact machinery

### 8.2.1 Stationary Screening Machinery

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen, and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process
- Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

### 8.2.2 Mobile/Compact Screening Machinery

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation

***Structure***: The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity

***Screening Mechanism***: The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

***Separation System***: Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

***Treatment Process***: In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

***Transport***: Quick and easy folding of conveyor helps in quick setup time.

***Discharge height***: Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land 100%) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of

stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, stationary trommel machine shall be the optimum screening machinery It may be noted that the contractor is required to propose and arrange for all necessary requirements to complete the works in the stipulated time and standards

## 8.3 System Requirements

The following are the infrastructural facilities required for setting up of machineries and equipment in biomining of a dumpsite: These are required irrespective of the option of in-situ or ex-situ processing.

- Fencing and secure entrance gate
- Security and reception office
- Weighing bridge
- Records room
- Laboratory
- Medical room
- Workers' area
- Parking for vehicles (heavy earth equipment, trucks, etc.) with tire washing facility.
- Administrative building
- Fire control unit
- Toilet–bath complex, with personnel protection equipment (PPE) storage room)
- Overhead water tank
- Leachate collection and treatment unit
- Environmental monitoring unit
- Segregation and processing area
- Temporary storage area for rejects, domestic hazardous waste and sanitary waste
- Material storage area
- Waste drying and windrow area.
- DG set

The total area required is about 900 sqm in an in-situ biomining plant. Temporary construction power at 440V needs to be obtained from KSEB. This can be easily availed as there is an existing electrical infrastructure passing through the site. A 440V, 125KVA electrical line

needs to be established for the project. Water storage tanks needs to be provided for the duration of the project. The water may be supplied by tankers. Labour will reside in Muvattupuzha and commute daily to the site, hence no labour sheds are envisaged during this project. The requirements are only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards.

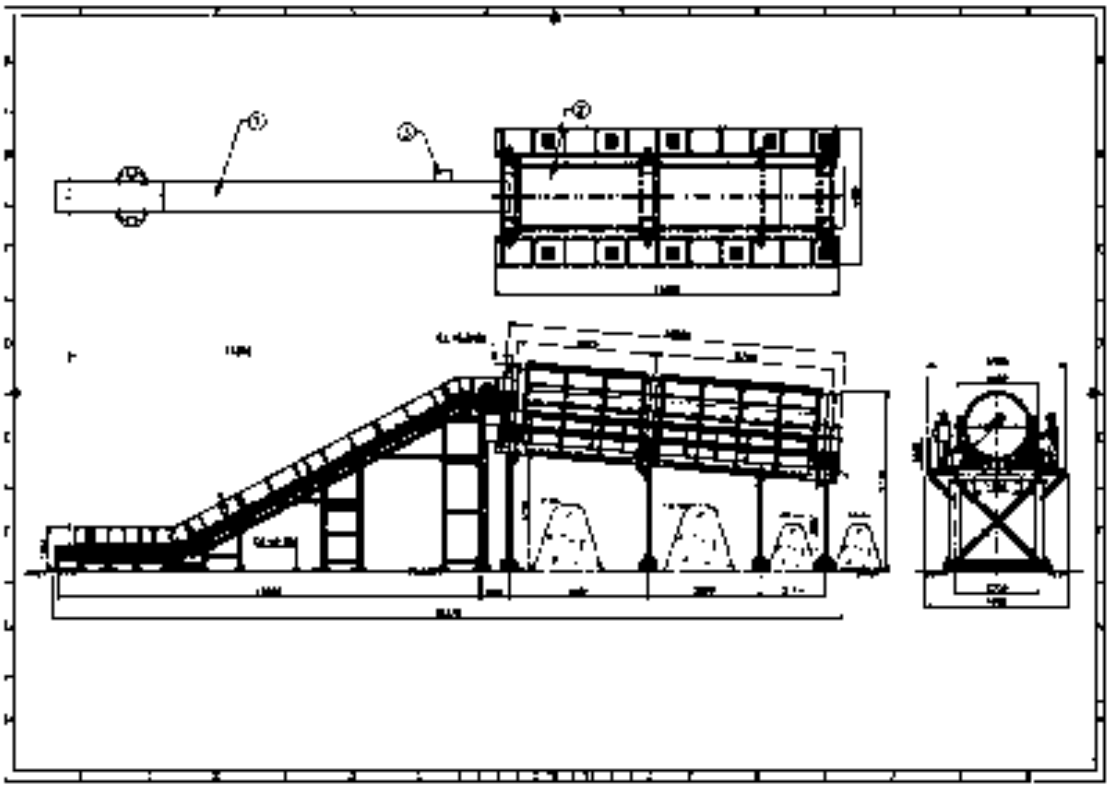

**Figure 8.1 Schematic of the Segregation System**

## 8.4 Site Reclamation Requirement

As detailed under section 6, the Muvattupuzha Dumpsite has waste spread of approx.3.2 acres of the 5.47 acres of land with a max of waste dump height 2.7m from the ground level. Estimated volume of waste above the ground level is: 31,995.18 cum which will be around 28,923.64 MT by taking density as 0.904 T/cum. *(Source: Topographical survey result for the Muvattupuzha Dumpsite conducted in the year 2022 by ULB)*

In the borehole investigation it was ascertained that the depth of waste column below ground level is 5.5.m and the quantity of waste below ground level is estimated 23,741.48 Cum as detailed under section 6. *(Source: Borehole investigation survey conducted by KSWMP through Matter Labs for the Muvattupuzha Dumpsite in June 2023)*

Since the ULB intends to use the land recovered after bioremediation, backfilling of the bio-earth and inert material obtained after the biomining is proposed. Land shall be reclaimed i.e.

all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the bidder to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

## 9.0 Scope of Disposal Including Location of Disposal for RDF, Bio Soils, Inert etc

### 9.1 Utilization of By Products

The details of the utilization of aggregates/by–products screened out by processing of the stabilized legacy waste are provided in the table below

**Table 9.1 By Product Composition**

| By–products | Percentage Composition | Quantity (Cum) | Utilization/Linkage/Usage |
|---|---|---|---|
| RDF | 8.81 | 4911.95 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. |
| Recyclable | 0.80 | 444.11 | Recyclables will be sold to authorized recyclers |
| Inert | 49.80 | 27755.69 | Can be utilized for filling at the site itself |
| Compost/ Soil Enricher | 40.60 | 22629.08 | Can be used as a soil enricher and given to farmers. The same cannot be sold as fertilizer unless it is enriched with carbon content to meet the standards suggested by FCO for city compost |

The **Table 9.1** details the expected recovered items in line with the investigation results present. However, during the execution stage, the bidder is required to analyse each recovered fraction at least every 15 days and report submitted to the concerned authority. It is to be noted that the RFB document should cover necessary clause in this regard.

The screened compost materials having size less than 4 mm shall be heaped to form windrows, the compost should be enriched to the FCO standards and its amendments from time to time. The materials shall be tested for carbon content and NPK values during execution of works, the materials may be sold to farmers depending on the test outcomes. If the compost materials

are not meeting with the standards, the same shall be used as bio-earth/ soil enricher for refilling within site itself.

Inert is coarse fraction (10mm to -35mm) received from the landfill mining of MSW. It is comprising stones, construction debris, ceramics, some decomposed organic matter. This is helpful in backfilling in the site or can be used as a subgrade material for highways, low land filling. It can also be used as cover for landfills.

RDF / SCF consists largely of combustible components of such wastes, as non-recyclable plastics (not including PVC), paper cardboard, cotton, labels, and other corrugative materials. These fractions are separated by different processing steps, such as screening, air classification, ballistic separation, separation of ferrous and non-ferrous materials, glass, stones and other foreign materials and sometimes shredding into a uniform size, in order to produce a homogeneous material which can be used as substitute for fossil fuels in e.g. cement plants, lime plants, coal fired power plants or as reduction agent in steel furnaces. The calorific value of the RDF should be higher than 1500kcal/kg for co-processing.

The RDF fraction from the site, once dried and shredded can be compacted and carried for disposal to RDF / SCF power plants or cement factories which can use this material in their kiln for burning if it meets the specification for SC/RDF.

The nearest cement Industry that can accept the RDF / SCF from Muvattupuzha City is located near Trichy, Tamil Nadu at a distance of 365 kms from the Dumpsite site. The other sites are at Karnataka between 740km to 1074km, while cements plants at Andhra are at 740km to 900kms.

**Table 9.2 Distance to potential RDF / SCF users**

| Name of the cement plant | Location | State | Distance from Kochi (KM) |
|---|---|---|---|
| Dalmia Bharath | Ariyalur | Tamilnadu | 458 |
| Dalmia Bharath | Dalmiapuram | Tamilnadu | 424 |
| ACC | Wadi | Karnataka | 1,075 |
| Chettinad | Karikazhi | Tamilnadu | 315 |
| Chettinad | Kallur | Tamilnadu | 386 |
| Dalmia Bharath | Belagavi | Karnataka | 956 |
| JK | Muddapur | Karnataka | 965 |
| Dalmia Bharath | Kadapa | Karnataka | 739 |
| Bharathi VICAT | Kalburgi | Karnataka | 1,074 |
| JSW | Kurnool | Andhra Pradesh | 901 |
| Bharathi VICAT | Kadapa | Andhra Pradesh | 739 |
| Ultratech | Tadipatri | Andhra Pradesh | 815 |
| Zuari | Yerraguntla | Andhra Pradesh | 877 |

## 10. 0 Estimated Project Cost

The details of the estimated cost for bio-mining the legacy waste dumpsite is provided in the table below:

**Table 10.1 Details of Estimated Project Cost**

| Sl. No. | Activity | Rate/ m3 | Quantity (m3) | Amount (INR) |
|---|---|---|---|---|
| 1 | **Bio-mining Operations** | | | |
| a | Processing the Waste | [redacted] | [redacted] | [redacted] |
| 2 | **Disposal Cost** | | | |
| a | Disposal of RDF | [redacted] | [redacted] | [redacted] |
| b | Disposal of Compost/ Soil enricher | [redacted] | [redacted] | [redacted] |
| c | Sale of recyclables | [redacted] | [redacted] | [redacted] |
| d | Disposal of Inert | [redacted] | [redacted] | [redacted] |
| | Total | | | [redacted] |
| | E& S Safeguards from ESIA | | | [redacted] |
| | Contractors Profit and Overheads at 15% | | | [redacted] |
| | Net Cost | | | [redacted] |
| | Average Cost Index for Kerala based on DSR 2018 is –1.35 at present. Considering the same, the Grand Total | | | [redacted] |
| | Cost per m3 | | | [redacted] |

*Note: It is to be noted that the total quantity of the waste is assessed based on the investigation test results and variation in the quantity of the same is expected during the execution stage. Hence RFB should include sufficient clauses to incorporate this expected quantity variation under the rate quoted by the contractor.*

## 10.1 Revenue from the Project

The anticipated sources of revenue from the processing of the legacy waste dumpsite are by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at free cost and transportation cost to be borne by the ULB/ contractor.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable.
- Paucity of time and limited storage space.

## 10.2 Funding for Project

The estimated cost of [redacted] for the project Dumpsite Remediation. The sources and funding pattern is given below:

**Table 10.2 Sources of funds in Crores**

| Sl no | Item wise funding pattern | | | |
|---|---|---|---|---|
| | Item | External (70%) (INR) | State Govt (30%) (INR) | Total Cost (INR) |
| 1 | Dumpsite remediation for the Muvattupuzha | [redacted] | [redacted] | [redacted] |

## 11.0 Project Implementation Plan

Muvattupuzha Municipality intends to complete this project as early as possible. However, considering the time required for mobilisation, installation, sieving and handling recoverable etc, a time frame of about 05- 06 months is considered.

## 11.1 Timeline

The broad timeline for the execution of this project is given below.

**Table 11.1 Project Timeline**

| TIMELINE CHART FOR EXECUTION | | | | | | | |
|---|---|---|---|---|---|---|---|
| S. No. | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries, Hiring & Installation of Machineries, Electrical Works | ■ | | | | | |
| 3 | Excavation of Legacy Waste | | ■ | ■ | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | ■ | ■ | | |
| 5 | Windrow Formation & Spraying of Bio culture | | | | ■ | ■ | |
| 6 | Sieving Operations | | | | | ■ | ■ |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | ■ | ■ |
| 8 | Project Closure Activities:<br>Levelling of Reclaimed Land using Bio-soil<br>Handover the site to the ULB<br>Closure Report Submission to ULB, | | | | | | ■ |

**Timeline is indicative*

## 11.2 Contract Model

***Execution Method:***

Design, Build, Operate and disposal/Management of by-products/aggregates with -zero residues and 100% land recovery. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

***Working Model***

- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for setting up the facility to the Contractor.
- Electricity connection to be under contractor's scope.
- Electricity charges for the usage of the plant to be paid by contractor
- ULB may facilitate the disposal/Utilization of By-products and contractor is responsibility for disposal of RDF, recyclables, and aggregates.

*Note: The authority has put stringent selection criteria and it is expected that the onboarded contractor has sufficient experience and qualified technically to avoid contract failure. The client will have a proactive contract management and monitoring system in place to address any potential issues for successful completion of the contract*

## 12 Benefits of the Project

The project benefits of dumpsite remediation at Muvattupuzha are:

- Reclamation of Land: An area of 5.47 acres will be reclaimed which can be used for resetting SWM facilities or any other use deemed fit by the ULB.
- Environmental Protection: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity
- Health Improvement: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- Enhanced Water Quality: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to safe drinking water.
- Aesthetic and Social Benefits: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- Operational & Life cycle Aspects - Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through a bio-mining process.

## 13. Conclusion

- The activities of the bio-mining will require 5-6 months. An area of **5.47 acres** will be reclaimed and will be used for setting up other solid waste management facilities in future.
- The land will be reclaimed and recovered through the biomining process, and this will be done by ensuring environmental safeguards.
- For the optimum screening of the **55,736.66 m3** of legacy waste, mobile / compact screening machinery shall be used.
- Favourable site conditions for bio-mining:
  - Optimum width of the road is available for movement of the vehicles.
  - Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
  - Piped water supply is available at the dumpsite.
- The project activity requires "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, CPCB 2018 guidelines for legacy waste management, NGT orders, KSPCB norms, World Bank guidelines and KSWMP ESMF and other regulatory rules & norms Environmental & Social safeguards:
  - The project attracts E2 Environmental category based on the project activities and status of the environment baseline.
  - Site specific Environmental Assessment and Environmental Management Plan has been developed.
  - The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is [redacted]

# GEOTECHNICAL EXAMINATION OF DUMPSITE UNDER PACKAGE B OF KSWMP AT KURIAMALA, MUVATTUPUZHA, ERNAKULAM DISTRICT

| | | |
|---|---|---|
| Client (For MatterLab) | : | IPE Global Ltd. |
| Address | : | 2nd Floor, 16/3878-3879, Kavanatt Building, Kanayannoor Village, Kakkanad, Ernakulam, Kerala - 628030 |
| Contact Person | : | Mr. Ranbir Dey |
| Project No | : | GT-221 |
| Project Name | : | Geotechnical examination of dumpsite under package B of KSWMP at Kuriamala, Muvattupuzha, Ernakulam District. |
| Owner | : | KSWMP |
| Project Location | : | Kuriamala, Muvattupuzha, Ernakulam District |
| Tel / Fax No | : | - |

## LIST OF ANNEXURES

Appendix I : Borelogs

Appendix II : Laboratory Test Results

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technological advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Kuriamala, Muvattupuzha, Ernakulam district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was needed to be bored at the site as per the requirements of the project. The initial site visit was done on 23rd May 2023. During the site visit it was observed that the dumpsite is situated in a flat terrain with a few residential homes around on one side and open fields on another side. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 01st June 2023 and was completed on 04th June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

## 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along with Mr. Ajit Kumar Nayan and Mr. Ravi Kumar of IPE Global during the third week of May 2023, in order to collect the information regarding the site prior to mobilizing the equipment for drilling.

The location of the dumpsite is situated a flat terrain with a few residential homes around on one side and open fields on another side.

**Figure 1** : Location of the borehole drilled at the dumpsite.

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste in the landfill.

### 4.2 Drilling equipment

Mechanical drilling machine was used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

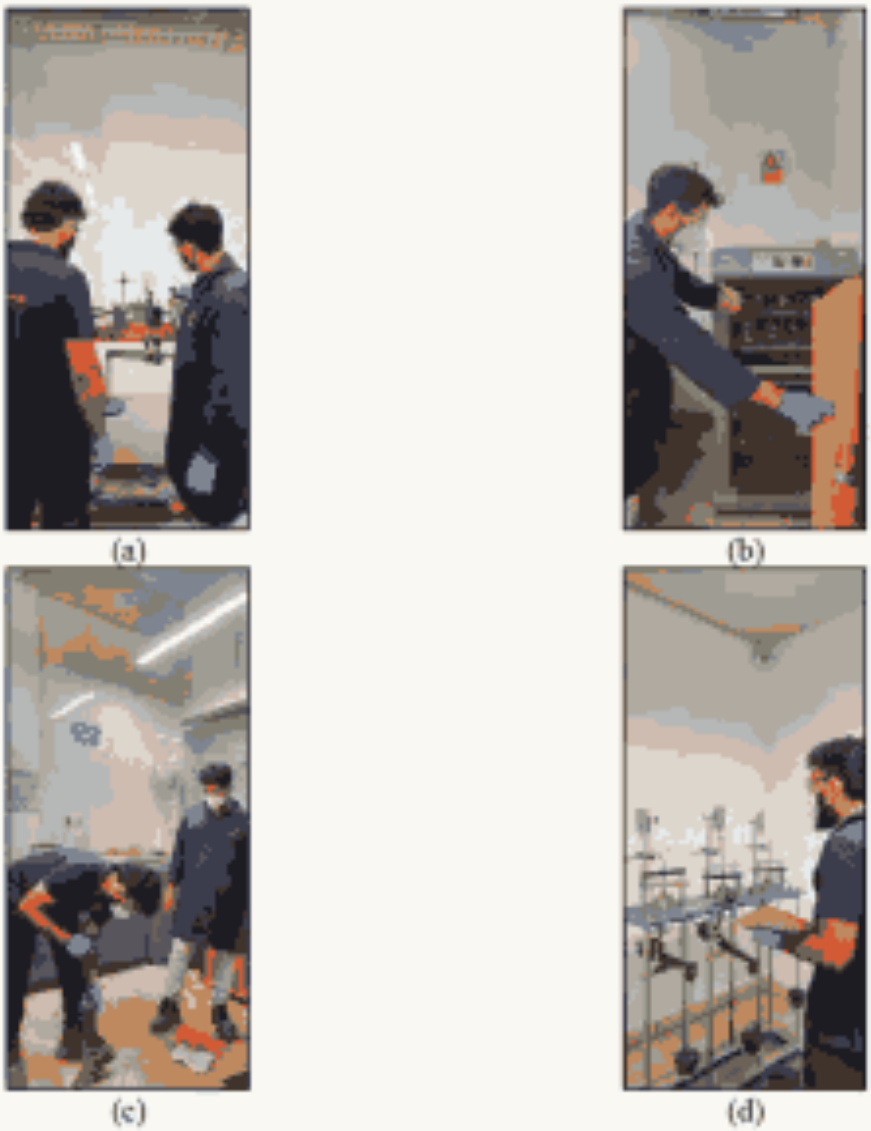
### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.



**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log - commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing are presented in **Appendix II**.

(a) (b) (c) (d)

**Figure 2 :** Laboratory tests performed at MatterLab.

## 6 SUMMARY

The geotechnical investigation of the original ground below the waste at the dumpsite at Kurianala, Muvattupuzha, Ernakulam district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 10.0m (5.5m in waste and 4.5m in the ground). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples.

Based on the investigations carried out, it is observed that the original ground below the dumped waste comprises a 3m thick layer of sandy clay layer underlain by a 1.5m thick layer of clayey sand. As per the information provided by the client, the waste in the dumpsite needs to be excavated, segregated using a few machinery and the inert material left after the bio-mining needs to be dumped within the site. As informed by the client, during the process of bio-mining the waste would be excavated from one feasible location of the site and transferred to another location of the site. During these operations, any temporary storage waste in the form of heaps should be carried out ensuring the stability of the sloping face of the waste. It is suggested that for slopes with a height ≤ 1.5 m the angle of face should not be steeper than 45°. For slopes of a height greater than 1.5 m the slope should be limited to 30°

to horizontal or flatter. It is not advisable to use slope heights > 5 m without a proper stability analysis. If the inert material is being disposed at the site with no further plans of transporting it or transferring it, it is recommended to compact the material into layers using an 8-10 T roller with compacted lift thickness not exceeding 300 mm.

**The Safe Bearing Capacity (SBC)** is calculated as per IS 6403:1981 (Reaffirmed 2021). For any temporary structures planned at the site, the **recommended allowable bearing pressure** for isolated footings at a minimum depth of 1.0 m below **original ground level** is **100 kPa.** For any slope stability calculations involving the natural ground, the parameters presented in the summary sheet of laboratory results can be used.

The above recommendations are made based on the subsoil profile and laboratory test results obtained on the samples collected from the site. If there is any variation in soil profile during execution, fresh recommendation may be obtained from M/s Matter Material Testing & Research Laboratory (P) Ltd. or from a qualified and experienced geotechnical engineer.

## Sample Details

| | | | |
|---|---|---|---|
| Received Date: | 13/06/2023 | Client Sample Ref.*): | Soil (UDS-2), BH 01, Depth 6.50m |
| Work Order ID: | ML23/W-02007 | Sample Submitted By.*): | Geotechnical Division |
| Sample ID: | ML23/W-02007/03 | Source*): | BH 01, Depth 5.50m |
| Date Sampled: | 04/06/2023 | Sampled By*): | Geotechnical Division |
| Sampling Method: | IS: 2132 - 1986 | Sample Size(kg): | 5 Approx |
| Sample Location*): | Kuttamala, Muvattupuzha, Ernakulam District | Date Tested : | 16/06/2023 - 17/06/2023 |
| Sample Cert. No: | - | Test Method Variation: | None |
| Lot No / Lot Size: | - | Lab Sample Desc.: | Soil (UDS-2), BH 01, Depth 6.50m |
| Tested By: | DK/GK | Client Sample Desc.: | Soil (UDS-2), BH 01, Depth 6.50m |
| Test Location: | MatterLab - Kozhikode | | |

## Test Results

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Mould volume | | $V_m$ (cm$^3$) | 1000 | | | | |
| Test No. | | | 1 | 2 | 3 | 4 | 5 |
| Mass of mould | | $W_m$ (g) | 4063 | | | | |
| Mass of mould + compacted sample | | W (g) | 5879 | 6049 | 6169 | 6139 | 6029 |
| Mass of sample | | | 1816 | 1986 | 2106 | 2076 | 1966 |
| Wet density | $(W-W_m)/V_m$ | $\rho_w$ (Mg/m$^3$) | 1.82 | 1.99 | 2.11 | 2.08 | 1.97 |
| Mass of wet sample | | W (g) | 426.3 | 422.8 | 413.7 | 443.6 | 445.8 |
| Mass of dry sample | | W (g) | 393.6 | 388.5 | 368.7 | 390.9 | 389.9 |
| Moisture content | $[(W_2-W_3)/W_3]x100$ | m (%) | 8.3 | 10.1 | 11.9 | 13.6 | 15.4 |
| Dry density | $\rho_w/[1+m/100]$ | $\rho_d$ (Mg/m$^3$) | 1.68 | 1.81 | 1.89 | 1.83 | 1.71 |

Method: IS 2720 : Part 7 : 1980

| | |
|---|---|
| Maximum dry density, g/cc: | 1.89 |
| Optimum moisture content, %: | 13 |
| Material retained on 20mm,%: | 0 |
| Sample used: | Single |
| Size of mould: | 1000cm$^3$ |
| Weight of rammer: | 2.6 kg |

Report No: ML23/W-02007/156
Issue No: 1
Report Date: 21/06/2023

| | |
|---|---|
| Client: | IPE Global |
| Address: | Kavanat Building, Kanayannoor Village, Kakkanad, Ernakulam, Kerala - 682030 |
| Contact: | Mr. Ranabir Dey |
| Project No: | - |
| Project Name: | Geotechnical Investigation at Dumpsite in Kurlamala, Muvattupuzha |
| Consultant: | - |
| Owner: | KSWMP |
| Contractor: | - |
| Project Location: | Kurlamala, Muvattupuzha, Ernakulam District |
| Tel / Email: | - |

## Sample Details

| | | | |
|---|---|---|---|
| Received Date: | 19/06/2023 | Client Sample Ref.*: | Soil (UDS-5), BH 01, Depth 9.00m |
| Work Order ID: | ML23/W-02007 | Sample Submitted By: | Geotechnical Division |
| Sample ID: | ML23/W-02007/156 | Source*: | BH 01, Depth 9.00m |
| Date Sampled: | 04/06/2023 | Sampled By: | Geotechnical Division |
| Sampling Method*: | IS: 2132 - 1986 | Sample Size(kg): | 5 Approx |
| Sample Location*: | Kurlamala, Muvattupuzha, Ernakulam District | Date Tested : | 19/06/2023 - 19/06/2023 |
| Sample Cert. No: | - | Test Method Variation: | None |
| Lot No / Lot Size: | - | Lab Sample Desc.: | Soil (UDS-5), BH 01, Depth 9.00m |
| Tested By: | GK/DK | Client Sample Desc.*: | Soil (UDS-5), BH 01, Depth 9.00m |
| Test Location: | MatterLab - Kozhikode | | |

## Test Results

| Test Method | Test/Parameters | Result | Specification |
|---|---|---|---|
| IS 2720 (Part 17) - 1986 Falling Head Method | Permeability at 27°C, cm/s | 8.25 E-04 | - |

For and on behalf of Matter Lab

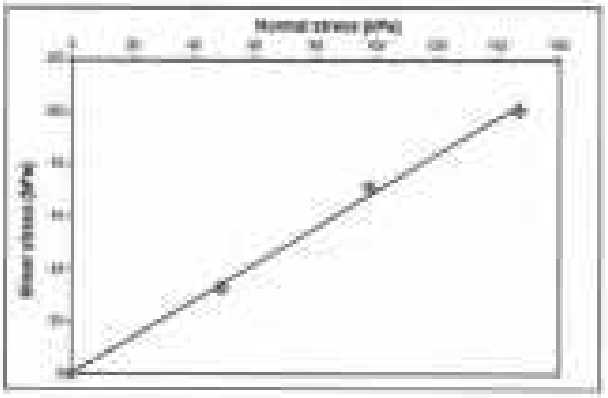
## Test Results



Methods: IS 2720 (Part 13)-1986

| | |
|---|---|
| Area of specimen ($cm^2$) | 36 |
| Height of specimen (mm) | 25 |
| Rate of strain (mm/min) | 1.25 |
| Test Condition | Unconsolidated Drained |
| Bulk Density ($Mg/m^3$) | 1.54 |
| Moisture content (%) | 7.4 |
| Dry Density ($Mg/m^3$) | 1.43 |

| Load increment | Applied Normal Stress (kPa) | Maximum Shear Stress (kPa) | Displacement at Max. Stress (mm) |
|---|---|---|---|
| 1 | 49 | 92.9 | 3.2 |
| 2 | 98 | 71.2 | 2.8 |
| 3 | 147 | 192.9 | 3.6 |

Cohesion Intercept (C'), kPa: 0

Angle of Internal Friction (Φ'): 37°

ANIL POTTINGAL
DGM / Quality Manager

For NABL on behalf of MatterLab

## Comments

*Information provided by client

Material tested was passing 4.75 mm test sieve, reconsolidated at maximum achievable density and moisture content

Contour Map- Muvattupuzha Dumpsite

Proposed Operation Plan

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the contractor to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

## 1. Introduction

Social safeguard aspects during dump site remediation mainly focusing on meaningful stakeholder engagement, understanding stakeholder's risk perception, and restoring them to a safe and environmentally sustainable state. It involves a series of systematic social actions which include social inclusion, effective labor management, and prevention of gender violence during the process, successive rehabilitation of the affected people and reduction of health risk of the host community. The bio mining process of Muvattupuzha municipal dumpsite has been included in the World Bank supported KSWMP

## 2. Muvattupuzha Municipality

Muvattupuzha is a town in the midlands directly to the east of Kochi in Ernakulum district, Kerala. It is located about 36 km from downtown Kochi, and is a growing urban center in central Kerala. Muvattupuzha is bordered by the Kottayam district on the southern side and the Idukki district on the eastern side. Muvattupuzha lies on the intersection between MC Road and National Highway 49. Muvattupuzha town is also the starting point of the Muvattupuzhayar (Muvattupuzha river), which is a confluence formed by three rivers, the Thodupuzhayar, Kaliyar, and Kothayar. The municipality has an area of 13.18 sq km and is divided into 28 electoral wards. Total population of the ULB is 30,397 (as per Census 2011). At present, the jurisdiction of Muvattupuzha town has 4 nos. day care, 35 nos. Anganwadi, 4 lower primary school, 3 upper primary school, 5 high school, 5 higher secondary school, 2 Degree College, 1 government hospital and some private nursing homes and also private doctor clinics. Socio-Economic profile of Muvattupuzha is presented below in the **Table** 1

Table 1 Socio Economic Profile Data

| **Socio Economic Profile Data** | |
|---|---|
| District Name | Ernakulum |
| Sub District Name | Muvattupuzha |
| Town Name | Muvattupuzha |
| Total Population of Town | 30397 |
| Total Male Population of Town | 15010 |
| Total Female Population of Town | 15387 |
| Total Scheduled Castes Population of Town | 1588 |

| | |
|---|---|
| Total Scheduled Castes Male Population of Town | 821 |
| Total Scheduled Castes Female Population of Town | 767 |
| Total Scheduled Tribes Population of Town | 139 |
| Total Scheduled Tribes Male Population of Town | 79 |
| Total Scheduled Tribes Female Population of Town | 60 |

Table 2 Socio Economic Profile Data ***Source: Census handbook of Ernakulum 2011***

## 3. Muvattupuzha Dumpsite

The dumpsite is in Valakkuzhi specifically in Ward 25. Total land owned by the Municipality is 5.47 Acres in which 3.2 Acres are covered by waste. The site falls within the jurisdiction of Muvattupuzha Municipality in Ernakulum district, Muvattupuzha Taluk. The GPS coordinates of the site are 9.993628 "N 76.561114"E. Dumping was started approximately 50 years back and closed in 2022 due to public protest. Estimated quantity of legacy waste to be removed is 31995.18 cum based on the study conducted by the ULB. The dumpsite is located inside the existing common solid waste management facility of ULB. An MCF and an RRF are working inside this facility. The MCF is situated in the dump site area with a safe distance of 50m from the site. Remediation process will not affect the physical assets of the MCF.

## 4. Socio economic baseline of Host community

It is identified that there are 27 households, 1 shop, 1 Godown and a workshop situated within the 200 meters from the dumpsite. 23 migrant laborers of KRIS GLOBAL are engaged in the waste management units located in the dump site. 12 HKS workers are also engaged in the segregation process in the MCF. The dumpsite has enough road access and thus there will not be any disruption to the public properties and commercial establishments nearby the site. There are no scheduled tribes, rag pickers and other vulnerable communities living near the dumpsite.

## 5. Vulnerability mapping of Host community

There are no scheduled tribes, rag pickers are living near the dumpsite. The dumpsite is near 5 households which are the vulnerable communities. 23 migrant laborers of KRIS GLOBAL are working there, in which 17 workers are female. 12 HKS workers (all are female) are also engaged in the segregating process here.

| Sl.No | Particulars | Number |
|---|---|---|
| 1 | Number of Senior citizen residing Near dumpsite | 30 |
| 2 | Number of single women staying near the dumpsite | 1 |
| 3 | Number of persons with disabilities | 2 |
| 4 | Number of persons with severe disease | 0 |
| 5 | Number of persons with respiratory issues | 3 |
| 6 | Number of Kids | 20 |

*Source: Secondary data from ward level health officer*

## 6. Data Collection

### 6.1 Social Screening Checklist

The social screening has been conducted with a social and tribal screening checklist to identify the potential social risks anticipated during dumpsite remediation. Major findings during the screening process are shown below.

- The dumpsite is located inside the existing common solid waste management facility of ULB. An MCF and RRF are working inside this facility.
- A bio waste processing unit is also functioning inside the compound which is being operated by a private agency Kris Global.
- Municipality is planning for establishing a bio medical waste collection unit also in the same compound after remediation process.
- Solid waste dumping at this place is currently stopped now due to the public protest. It is identified that there are chances of public protest at the initial stage against dumpsite remediation
- The dumpsite remains in close proximity to five houses within a 50-meter distance.
- There will not be any adverse social impacts on dwellings, land, labour, livelihood, and community resources of host communities.
- Land acquisition or land loss is not applicable here for the execution of the work.
- There are no scheduled tribes, rag pickers living near the dumpsite.

- Since there is not much risk with respect to the social and economic conditions of the host communities, the dumpsite can be categorized into “Moderate Risk”.

### 6.2 Transect walk

A transect walk was conducted in and around the dumpsite on 31.05.2023. The aim of the transect walk was to assess the site and gather information about its location, potential social risks, existing infrastructure, and the impact on surrounding communities. The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions, and systems by observing, asking, listening, looking and producing a transect diagram. Information collected can be used to reveal land use practices, hazards, and vulnerabilities to inform disaster mitigation and water management.

### 6.3 Site specific Observations from Transect walk and social screening

- 27 households are found with the diameter of 200 meters from the dumpsite, also observed five houses within a 50-meter distance. The residents living in these houses are still exposed to potential health risks associated with waste disposal activities.

- 23 migrant laborers, deputed by the agency Kris Global and 12 HKS workers are working here in the waste processing units located in this site.

- There is no complaints registration system functioning in the dumpsite.

- No rag pickers are associated with the dumpsite so that there are no livelihood risks for rag pickers in this context.

- There is no requirement for government, forest, or private land acquisition for the dumpsite remediation project. The currently designated plot or right-of-way has enough space for the transportation of inert waste or mobilization of machineries and materials.

- The total scheduled tribal population in the ULB is 139, but there are no scheduled tribes staying near the dumpsite, and no impact on their land, customary rights, or livelihoods of tribes is observed.

- It is understood from the interaction with the host community that, public Protest against the dumpsite remediation may be expected during the bio mining process.

- It is informed that, there was a severe public protest happened from the nearby resident’s association and the Dumping yard Virudha Samithi, against the functioning of dumpsite.

### 6.4 Focused Group Discussion

FGD was conducted on 10-11-2023 in the Municipal Hall with the residents living near to the dumpsite. Concerned social and Communication experts from TSC, DPMC, and DPMU along

with dumpsite remediation expert participated. Communication expert from TSC presented the detailed activities that are going to be done as part of remediation. In the discussion that followed, people shared their concerns. Concerned expert cleared the doubts and all the anticipatory risks and precautionary measures we are planning explained.

## 7. Stakeholder Analysis

There are 27 households, 1 shop, 1 Godown and a workshop situated within the 200 meters from the dumpsite. ULB has received lot of complaints against this site since 2010 onwards. Complaint is mainly from the secretary of Royal Residents Association, Mudavoor P.O, and Muvattupuzha. Another association is also formed in the Municipality in the name of "Dumping Yard Viruddha Janakeeya Samithi" consisting of 8 members. They have also filed lot of complaints against the site. These protests are mainly against the odor spreading out from the site and against issues due to the flies. The remediation process requires collaboration with these stakeholders, ULB officials and workers.

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| **Service Providers** | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like PCB, KSEB, KWA etc | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | DPMU | Monitoring and Evaluation |
| 5 | TSC/PMC | Technical support and consultation |
| 6 | Contractor | Execution of the Remediation process |
| 7 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| **Community** | | |
| 8 | 23 Workers in the RRF, MCF and Bio waste processing unit appointed by Kris Global and 12 HKS workers | Support and cooperation for the remediation process |

| | | |
|---|---|---|
| 9 | Members of 27 HHs in the 200 m radius of the dumpsite | Support and cooperation for the remediation process |
| 11 | Labors of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 12 | Rag Pickers | Participation in informal collection to strengthen the collection process to prevent further dumping |
| 12 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 13 | Owner of the Workshop and Grocery shop | Cooperating with the remediation process |
| 14 | Scrap dealers | Informal participation in NBD waste management to prevent further dumping after remediation |
| 15 | End recyclers | Process the inert and legacy waste safely after remediation |

Table 3 Stakeholder Details

## 8. Positive social impacts after remediation

**a) Enhanced quality of life**

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing nearby the dumpsite, the project can contribute to an improved sense of well-being. Also it results to a clean and hygienic work environment for the workers engaged in MCF and RRF.

**b) Livelihood and employment of vulnerable community**

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

**c) Economic opportunities**

After remediating the site, the Municipality is planning to enhance the capacity of the MCF and RRF to process more non bio degradable waste and to set up a centralized waste management unit to process the bio degradable waste. These projects will create more job opportunities to the people who are looking for employment in waste management sector. Remediation create new opportunities for economic development in the area. The cleaned-up land can potentially be used

for new construction, commercial development, or recreational activities. Remediation process will help to increase property values for surrounding residents.

**d) Access to service**

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the exiting site.

## 9. Expected social impacts during the dumpsite remediation

- There are 27 Households found within the diameter of 200 meters from the dumpsite. Among them, 5 Households are observed 50 meters near to the site. Health and safety issues may arise to the households during the process. Also, there are chances of occurrence of GBV/SEA incidents as there is an influx of labors for remediation.

- 23 contract labors (16 males and 17 females) and 12 HKS workers are working in the MCF, RRF and Bio composting unit located in the Dump site compound. Health risk are there to these workers during the remediation process unless they adopt proper health and safety measures. Also chances of GBV/SEA incidents prevails.

- Chances social protest during the execution of remediation from Royal resident's association and 'Dumping yard Virudha Janakeeya Samithi', exclusively constituted against the functioning of dumpsite.

- Chances of Spreading of communicable diseases

## 10. Suggestions/recommendations

- Effective FGD'S should be conducted with the host community, political leaders, community influencers, ULB councilors, members of action council regarding the remediation process and the benefits of dumpsite remediation.

- Visiting similar project site with the selected members from the host community will be helpful to create a positive thinking about remediation process among the local people.

- A bio waste processing unit, MCF and RRF are currently functioning in the dump site compound. The remediation process will not affect these facilities in any way as there is enough space for vehicle movements and machinery fixing. So there will not be any livelihood loss for the workers engaged in these units.

- Arrangements shall be made for proper fencing and Noise barriers to safeguards the 5 households which is at the Close proximity of the dumpsite

- Safe and gender friendly washrooms and changing rooms should be made available to safeguard the women workers.

- A detailed and effective IEC plan needs to be prepared to address the social safeguard requirements and the expected social protests from the host community.

## 11. Scoping of Social Impact Assessment and required Action plans

All the social risks were identified through the social screening and Transect walk conducted at site. Since there are families and institutions in the close proximity of the dumpsite, below shown action plans have been formulated to be followed at site

- Labour Management Plan

Maximum of 15 labors are expected to be engaged in remediation process at a time. A detailed labor Management plan has been prepared and attached as Annexure.

- Labor Influx Management Plan

Since 27 families are residing in 200 m Households there are chances of influx issues. A detailed labor Influx Management plan has been prepared and attached as Annexure.

- Preventive GBV Action plan

Since an MCF, RRF and Bio waste processing units are functioning inside the dumpsite and close proximity to households there are high chance of occurrence GBV incidents. A detailed GBV action plan has been prepared and attached as Annexure.

- Citizen Engagement Plan

Being a socially sensitive area with past protest history, public protest might have happened during the execution period of the project. A detailed citizen engagement plan has been prepared and attached as Annexure.

## 12. Conclusion

The report on Social Screening and Transect walk covers a comprehensive analysis on existing conditions and potential social impacts that may arise during the remediation of the Valakkuzhi dumpsite in Muvattupuzha Municipality. The vulnerabilities identified, the risks to be mitigated, observations and suggestions raised during screening and transect walk are elaborated in this report. As there are 27 households residing within 200 meters of the site, there are chances of residential impact. The history of fire incidents highlight the need for careful planning and implementation to ensure the safety and well-being of the community. The dumpsite has enough road access, thus there will not be any disruption to the public properties and commercial establishments nearby the site. Since there is not much risk with respect to the social and economic conditions of the host communities, the dumpsite can be categorized into “Moderate Risk”. The assessment of social screening indicates that the dumpsite remediation can create a positive impact in the living conditions of the host community.

**ANNEXURE-1**

# CITIZEN ENGAGEMENT PLAN

## 1. Stakeholder identification

As part of social safeguard initiatives for the Bioremediation of dumpsite at Muvattupuzha, the social experts of TSC, DPMC and DPMU conducted brainstorming exercises with locals, functionaries of Muvattupuzha Municipality, Suchithwa Mission. A detailed list of primary and secondary stakeholders is prepared on the basis of these exercises.

### 1.1 Waste Generators

The dumpsite is located in Valakkuzhi specifically in Ward 25. It covers an area of 4 acres. The dumpsite is located inside the existing common solid waste management facility of ULB. An MCF and an RRF are working inside this facility. Municipality is planning to establish a bio medical waste collection unit also in the nearby area. The identified waste generators are as follows.

| Sl.No | Waste Generators |
|---|---|
| 1 | General Households |
| 2 | Shops |
| 3 | Institutions |
| 4 | Commercial establishments |

**Table 4: Waste Generators**

### 1.2 Service Providers

The identified service providers of the dumpsite are as follows:

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| Service Providers | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like PCB,KSEB,KWA etc. | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | DPMU | Monitoring and Evaluation |

| | | |
|---|---|---|
| 5 | TSC/PMC | Technical support and consultation |
| 6 | Contractor | Execution of the Remediation process |
| 7 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| Community | | |
| 8 | 23 Workers in the RRF,MCF and Bio waste processing unit appointed by Kris Global and 12 HKS workers | Support and cooperation for the remediation process |
| 9 | Members of 27 HHs in the 200 m radius of the dumpsite | Support and cooperation for the remediation process |
| 11 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 12 | Rag Pickers | Participation in informal collection to strengthen the collection process to prevent further dumping |
| 12 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 13 | Owner of the Workshop and Grocery shop | Cooperating with the remediation process |
| 14 | Scrap dealers | Informal participation in NBD waste management to prevent further dumping after remediation |
| 15 | End recyclers | Process the inert and legacy waste safely after remediation |

## 2. Need of the plan

Citizen engagement as part of the proposed bioremediation of dumpsite in Muvattupuzha municipality aims to facilitate two-way communication between the project and its stakeholders to make better informed decisions. Such an engagement will certainly pave the way for better implementation of the project, and it will ensure public participation in trouble shooting at all the stages of the implementation of the project.

## 3. Objective of the plan

The citizen engagement plan for the proposed dump site remediation is prepared with following objectives.

- To create a conducive environment for the smooth implementation of the proposed bioremediation of the dumpsite by promoting constructive dialogues between the project and its stakeholders.
- To ensure stakeholder participation in the planning, implementation, and monitoring of the sub-project.
- To suggest appropriate activities with a monitoring plan and an expected budget for engaging the stakeholders with the motive of enhancing their ownership in the project through increased participation.

## 4. Stakeholder concern

### 4.1 Waste Generators

- The waste collection may get delayed/stopped due the remediation process.

### 4.2 Service Providers

- Major concerns of the service providers which must be addressed by the citizen's engagement plan can be summarized as follows.

- Livelihood of SWM workers currently working in the dumpsite may get affected.
- The policy makers and decision leaders of the Muvattupuzha Municipality are unaware about the urgency and importance of remediating the dumpsite. Their improved involvement through proper sensitization is essential to the effective implementation.

- SWM related Service providers/HKS of Muvattupuzha Municipality should be trained and motivated for proper timely collection, segregation and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the future.

## 5. Activities proposed

### 5.1 Community/citizen Awareness

- Focus group discussions to host community
- Organize exposure visit for the identified members from host community and council members
- Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency.
- Sensitization programs to nearby vendors
- Periodic FGD's with the Royal resident's association and 'Dumping yard Viruddha Janakeeya Samithi' members

### 5.2 Awareness to Service providers

- Sensitization on the bio-remediation activity is to be conducted for the Muvattupuzha Municipal Council and officials prior to the commencement of the actual bio-remediation process.
- Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc.
- Orientation to the Service providers/HKS of Muvattupuzha Municipality
- Sensitization meetings to the local and district level police officials on the proposed bioremediation of dumpsite and anticipated issues and action required.
- Sensitization programs to Fire Force, and PCB regarding dumpsite remediation.
- Orientation regarding the dumpsite remediation process and its benefits to local community

## 6. Citizen Engagement Plan Matrix

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Lack of Awareness on Project activities | Non co-operation from Community/stakeholders | Awareness campaigns / sensitization programs to the stakeholders | ULB/PIU/DPMU/DPMC/ TSC |
| 2 | Delay in decision making and timely support from the ULB | To establish transparency and building confidence in the project commitments to ULB | Sensitization on bioremediation activities for the | PIU/TSC |

| | | | | |
|---|---|---|---|---|
| | | elected members and officials | Muvattupuzha Municipality council and staffs before the commencement of the remediation | |
| 3 | GRM committee | Delay in the execution of remediation work | Constitution of a project level GRM Committee to take-up any social issues raised at site level | PIU/ULB/DPMU/TSC |
| 4 | To understand the actual operational plans (Time of operations,Mechineries involved, number of workers, actions to be initiated for dust /odor/and sound pollution, vehicle movements) | To inform actual plan of operation to the host community and prevent any social & environmental issues and plan mitigation measures | Meeting with the contractor to understand the plan of operation, number of labors going to involve, duration of the work | PIU/TSC/DPMU |

**Budget**

| S. No | Activity | Specifications | Quantity | Cost |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activity is to be conducted for the Municipal Council and officials prior to the commencement of the actual bio-remediation process | Half day Programme for Councilors and Health Staff | 1 | [redacted] |
| 2 | Sensitization meeting to host community | Half day Programme by incorporating all host community members | 2 | [redacted] |
| 3 | Formation of GRM committee at local level | Committee formation | 1 | [redacted] |

| | | | | |
|---|---|---|---|---|
| | to take up any issue raised at site level and help to resolve an emergency. | | | |
| 4 | Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc. | One to one interaction | As required | [redacted] |
| 5 | Organize exposure visit incorporating the GRM members and council members | Exposure visit to Alappuzha | 15 participants-1programme | [redacted] |
| 6 | Orientation to the Service providers/HKS of Municipality and | Half day programme | 2 | [redacted] |
| 7 | Issue based one to one meeting with Govt institutions like PCB,KSEB,KWA, Health Department | One to one | As required | [redacted] |
| 8 | Orientation to the Media persons on the proposed remediation dumpsite. | Half day programme | 1 | [redacted] |
| 9 | Sensitize the local and district level police officials on the proposed bioremediation and anticipated issues and action required | One to one interaction | As required | [redacted] |
| 10 | Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency. | Committee formation | 1 | [redacted] |
| **Total** | | | | [redacted] |

# LABOUR MANAGEMENT PLAN

## 1. PROJECT TITLE:

Project for the remediation of Valakkuzhi dumpsite in ward 25 of owned by Muvattupuzha Municipality

## 2. PROJECT AREA

The dumpsite is located in Valakkuzhi specifically in Ward 25. It covers an area of 4 acres and falls within the jurisdiction of Muvattupuzha Municipality in Ernakulum district, Muvattupuzha Taluk. The GPS coordinates of the site are 9.993628 "N 76.561114"E.

## 3. SCOPE AND STRUCTURE OF THE LABOUR MANAGEMENT PLAN

The scope of the LMP shall be as outlined in the World Bank's ESMF. The engagement will be planned as an integral part of the project's social assessment and project design and implementation. This document has 10 chapters. This chapter viz., chapter 1 served as introduction. Scope and structure of LMP is provided in chapter 2. An overview of labour use in the project is presented in chapter 3. Key potential labour risks are listed in chapter 4. Legislative framework governing labour employment in India/Kerala is discussed in chapter 5. Implementation Arrangements, policies and procedures follow in the subsequent chapter. Grievance redressal mechanism, contractor management are presented in the last chapters.

## 4. OVERVIEW OF LABOUR USE ON THE PROJECT

### 4.1 Details of Labors

The proposed remediation process at Valakkuzhi requires following category and number labors

| Sl.No | Equipment | Category of labors | Required No.of labors |
|---|---|---|---|
| 1 | One trammel | Labors for waste segregated purpose | 5 |
| 2 | One excavator | Operator | 1 |
| 3 | One JCB | Operator | 1 |
| 4 | Two small tippers | drivers | 2 |
| | | Helpers | 2 |

| | | | |
|---|---|---|---|
| 5 | | Supervisor | 1 |
| **Total Labors** | | | 12 |

**4.2 Working Hours**: 8 hours per shift

**4.3 Type of Engagement**: Contract

## 5. ASSESSMENT OF KEY POTENTIAL LABOUR RISKS

### 5.1 Project Activities:

The bioremediation of the dumpsite at Valakkuzhi includes the following activities;

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement
- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

### 5.2 Key Labor Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.

- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female SWM workers are engaged.
- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form workers organizations, etc.
- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

## 6. BRIEF OVERVIEW OF LABOUR LEGISLATION: TERMS AND CONDITIONS

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |

| | | |
|---|---|---|
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10. | Industrial Disputes Act 1947: | the Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

## 7. RESPONSIBILITY MAPPING

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring laborers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing laborers, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the laborers. The ULB will actively monitor the contractor's compliance with legal and welfare requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

## 8. CODE OF CONDUCT

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured;

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)

- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favours or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)
- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favours, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

## 9. SYSTEMATIZING THE CODE OF CONDUCT

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

## 10. TRANSPARENCY IN CONTRACT SPECIFIC TERMS AND CONDITIONS

All contracts must contain

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism

**LABOUR MANAGEMENT PLAN MATRIX**

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |

| | | | | |
|---|---|---|---|---|
| proportionate to the number of labour force deployed. (By the Contractor) | | | | |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on.<br><br>To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board<br><br>One notice board | As soon as the work is started.<br><br>Do | Photographs of the notice board where the license is displayed.<br><br>Do | Contractor |
| To conduct pre-employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |

| | | | | |
|---|---|---|---|---|
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the construction period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |

| | | | | |
|---|---|---|---|---|
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. Female members should be minimum 50%. ) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| Constitution of ICC (minimum members to be four. The presiding member should be | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |

| | | | | |
|---|---|---|---|---|
| a senior female employee) | | | | |
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act<br>2. The Employee compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act<br>5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |

| | | | | |
|---|---|---|---|---|
| Benefit Act ☑ | | | | |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| Conduct HIV/AIDS awareness programs | As per requirement | Once in six months | Reports, photographs etc | Contractor |
| All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of licence ids to be collected | PIU |
| All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only after procurement of third-party insurance to the vehicle | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

# PREVENTIVE GBV ACTION PLAN

## 1. Sub project information

Bioremediation of existing dumpsite in ward 25 of Muvattupuzha Municipality

### 1.1 Details of labors

The project is under pre planning stage. ULB has to finalize contactor/Agency for Remediation. So the exact number of Labors are not available. But approximately we can expect maximum of 15 labors

| | |
|---|---|
| Total number of labors | : 12(Approx.) |
| Category of labors (Age/sex/gender) | : Not available |
| Data of migrant labors, if any | : Not available |

## 2. GBV Issues likely to be identified at site

1. Issues against female workers at sit
2. Lack of safe and Gender friendly toilets at work sites
3. Disparity in work and wages based on gender
4. Threat of GBV or Sexual Exploitation Abuse (SEA) incidents to female members of the host community

## 3. Activities under GBV Action plan

1. **Formation of Internal Complaints Committee**
   The committee should be Presided by a senior women and more than half of the total Committee members should be women. There should be an external member who has experience in dealing with issues related to women. Preferably a Social Worker /Advocate/NGO Representative.

2. **Placing of ICC informatory boards at Work site**

| | | | |
| EMERGENCY CONTACT NUMBER | | | |

**Table 5 Model format for ICC**

3. **Gender Sensitization trainings for Labors**

The Project expect around 12 labors will be employed in a day and women participation in the labor force is limited, even the project is taking precaution to protect and prevent any GBV incidence at the site. Taking into consideration all these aspects, the project plan to conduct a half day sensitization program in the following subjects, viz. the type of GBV, the action to be taken by the victim, the laws and the support organizations which extend support to the victim of GVB and the role of ICC and their contact details etc.

4. **Sensitization for female host community members**

The citizen engagement plan has proposed an activity of host community meeting in which the importance and expected social risk of GBV will be discussed and the mitigation measures inbuilt in the project will be elaborated to the host community members especially to the women.

5. **Allocation of Gender friendly and safe toilet facilities for women**

Project has taken special care to arrange a separate toilet, wash and rest facility for female workers to protect their privacy and safety, and the same has to be arranged by the contractor.

6. **Keeping of wage register at site to restrict wage disparity based on gender**

The project actively opposes gender-based wage disparity at any site funded under the KSWMP-supported SWM project. To ensure gender parity in various aspects such as wages, division of labor, and facilities, an appropriate monitoring mechanism, such as a wage register, should be maintained for the scrutiny of the project implementers.

7. **Details of GBV Service Providers identified**

The government of Kerala has constituted a help desk under Kudumbasree to support or to prevent and extend support to the GBV victims, and their details are given below.

Kudumbasree Snehitha Gender Help Desk

Contact Number – 0484-2428745

Toll free number - 180042555678

**Preventive GBV Implementation plan Matrix**

| Sl No | Activity | Timeline | Primary Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Formation of Internal complaint committee | Pre-Construction Phase. | TSC/Contractor | DPMU |
| 2 | Placing of ICC informatory Board at worksite | Pre-Construction Phase. | Contractor | DPMU/TSC |
| 3 | Gender sensitization Training to labors | During Construction | Contractor/TSC | DPMU |
| 4 | Group Discussion with female host community members | Pre-Construction Phase. | TSC/ULB | DPMU |
| 5 | Ensuring Gender friendly and safe toilet facilities | Construction stage | Contractor | DPMU |
| 6 | Keeping Wage Register at site | Construction stage | Contractor | DPMU |

**Budget**

| Sl No | Particulars | Cost |
|---|---|---|
| 1 | Placing of ICC Informatory board on work site | [redacted] |
| 2 | Gender sensitization trainings to labor | [redacted] |
| 3 | FGD among female host community members | [redacted] |

# SUMMARY

**INTRODUCTION:** Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. The selected dumpsite is Vedimara which is located near Ward no 10 North Paravur municipality, Ernakulum District.

**RATIONALE FOR THE PROPOSED SUB-PROJECT:** North Paravur ULB proposes bio mining and bioremediation of the Vedimara legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

**PROPOSED SUB-PROJECT DETAILS:** North Paravur dumpsite is located at a distance of 2 km from the centre of North Paravur town in western side and encompasses a total area of 1.89 acres of land. The geographical coordinates of the dumpsite are 10.150518° N & 76.242212° E. The volume of legacy waste to be remediated in the dumpsite is 22896.86 Cu m. The legacy waste is presented about 6.75 m below and 2.33 m above the ground level respectively. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts.

**APPLICABLE NATIONAL, STATE LEGISLATIONS AND TECHNICAL GUIDELINES**: To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed.

**THE WORLD BANK SAFEGUARDS POLICIES, AND KSWMP ESMF**: The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are ensured.

**SUB-PROJECT SCREENING AND ITS CATEGORIZATION:** As per indicative categorization for dumpsite bio mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (1.89 acres) and waste spread (1.25 acres) and environmentally sensitive features around this subproject is individually considered as E2 and EIA is prepared accordingly.

**ENVIRONMENTAL BASELINE:** Physio-graphically, North Paravur in and around topographical features falls under relatively flat terrain, western side of the Municipality is bounded by lagoons and

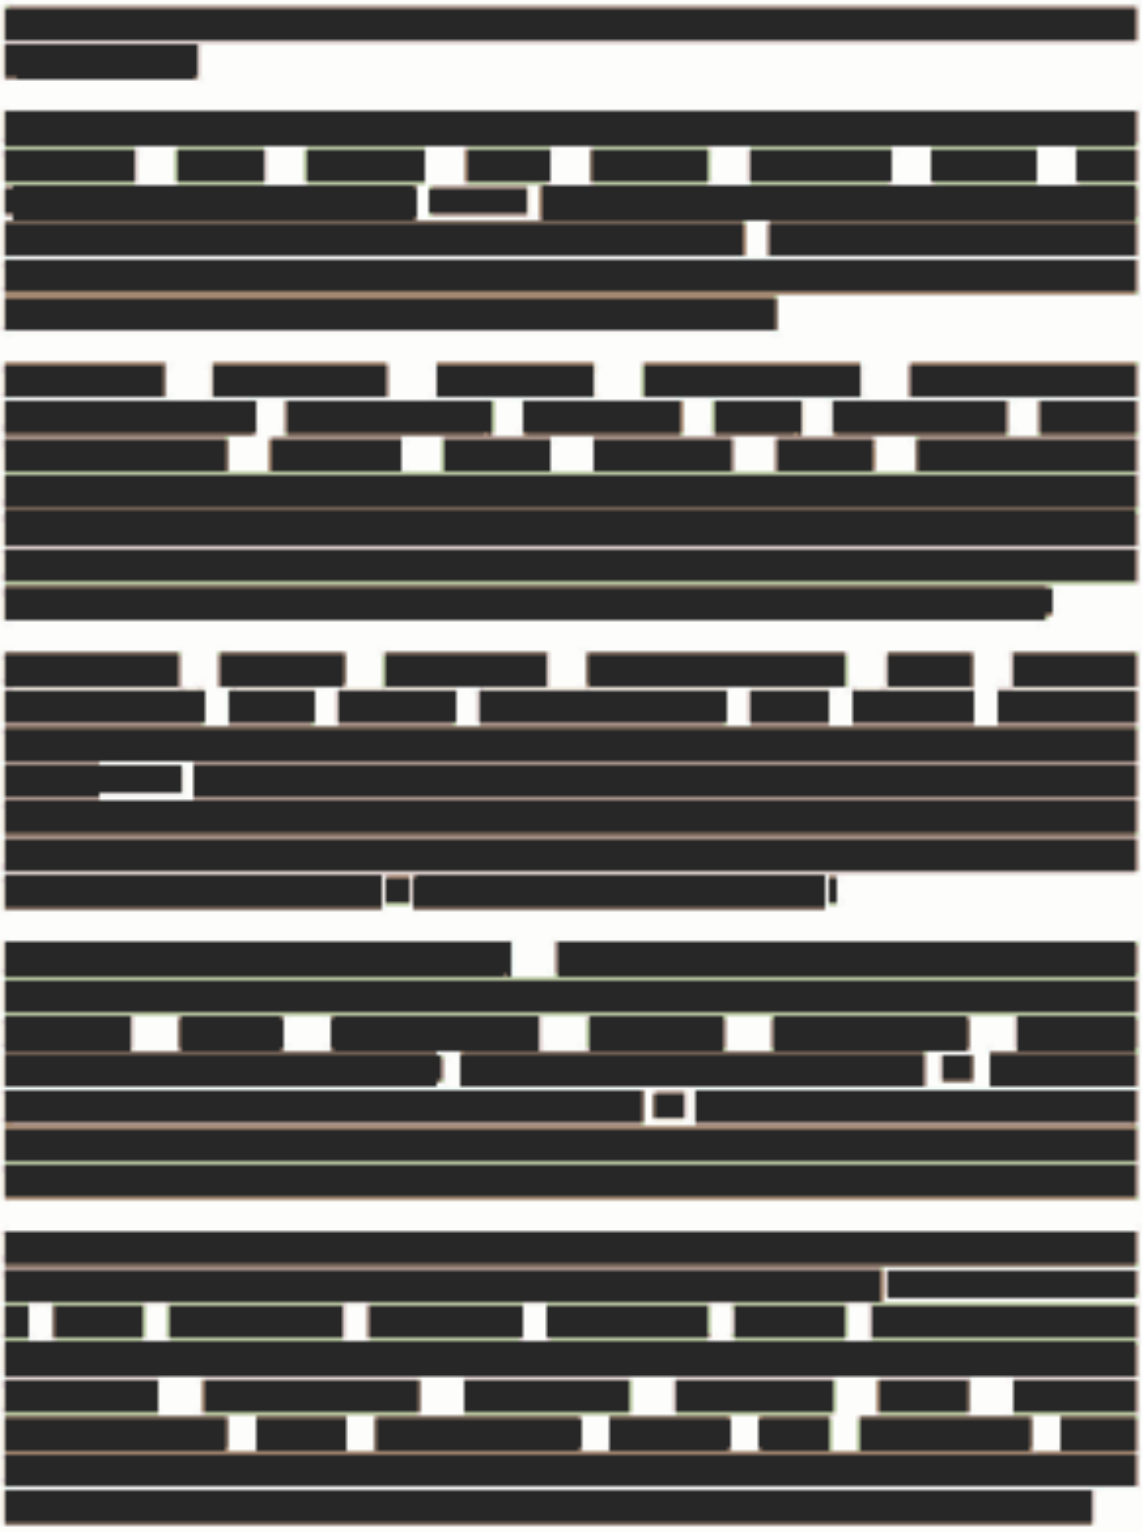
backwaters, north is bounded by Paravur River. The favourable time for remediation is between October-2023 to March-2024 non-monsoon period. As per Wind rose, the predominant wind directions are blowing from SW and WSW direction throughout the year. As per the geotechnical investigation, the subgrade soil was encountered at 6.75 m below the waste depth of the dumpsite and the predominant soil is clayey Loam. In the South and West side of the dumpsite by predominantly of Dry cultivation land use and the same will act as odour attenuation during remediation. The cultural heritage zone near dumpsites is famous St. Thomas Kottakkavu Church 2.63 Km away, Paravur Lewish Synagogue 2.31 Km away, Paravur Market 2.42 Km, Paliyam Palace 3.0 Km away, Muziriz Heritage 6.71 Km from the dumpsite. Hence, no significant physical impact to the heritages sites is envisaged during remediation. As per the district disaster management plan-2015 and flood vulnerability map the dumpsite is not under flood prone zone.

**DESCRIPTION OF ENVIRONMENTAL PARAMETERS:** The analysed air pollution data indicates that the levels are within acceptable limits of NAAQs for all the parameters except $PM_{10}$ – 141µg/m3. Noise Level monitoring samples collected at entrance of the dumpsite. The ambient Noise levels Leq are above the National Ambient Noise standards for Residential area both day and night time. The ground water quality results indicate that the dumpsite has not caused any major increase of the parameters and the quality parameters are within the IS10500:2011, except the TDS and Electrical Conductivity which are found to be higher than the above said standard. Similarly, the surface water sample shows that it is not largely influenced by the dumpsite as the quality is within the limits of IS 2296, except for except TDS and Electrical Conductivity. The leachate monitoring data indicates, TDS is about 16900mg/l while the suspended solids is about 540mg/l, respectively.

**ANALYSIS OF ALTERNATIVES**: After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

**ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS:** Environment: During operational phase (bio-remediation), the main potential nuisances caused by a dump site are fugitive dust, odour, foul gases, smoke from the site (in case of fire), and leachate generation. Birds, vermin, and rodents, littering, noises both from machineries operating at the site and waste collection vehicles. Social: No specific social risk is identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process. It can be overcome by using adequate protective measures properly. In connection with the dumpsite only one family is residing in an aerial distance of 200 m and the remediation process will not affect them in any way.

**ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN:** The management plan proposed are for pre-remediation as well as during remediation stage. The mitigation measures are recommended for impacts from air, noise, water, leachate, health and safety, OH&S aspects. The proposed monitoring plan includes leachate, surface and ground water monitoring for a period of once in three months. The cost of [redacted] is required for implementation and supervision of EMP.



**EMERGENCY PREPAREDNESS PLAN:** The identified emergency situations which may arise from remediation activities are fire risk in summer, occupational health and safety related risks. The North Paravur police station at 1.5 km, Taluk hospital at 1.2 km, North Paravur Fire and Rescue station at opposite to the dumpsite are the nearest emergency services. Periodic Compliance monitoring system will be done by the contractor during remediation.

**PUBLIC CONSULTATION AND INFORMATION DISCLOSURE: A** Transect walk was carried out on 06.06.2023 covering the surrounding area of the dump site. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact. Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the process at the site. Site control measures should be enforced to prevent unauthorized personnel into the work site.

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# CHAPTER 1

# INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-Lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio-mining of multiple Legacy Waste Dumpsites in various districts. There are 19 dumpsites identified for remediation under the Kerala Solid Waste Management Project. Several others have been taken up for remediation directly by the ULBs. Currently, 7 dumpsites considered within the three districts, which are (Ernakulum, Alappuzha and Idukki) falling under Package B are selected by Kerala Solid Waste Management Project (KSWMP) for remediation under the project. This report deals with the ESIA of Vedimara dumpsite, located near Ward no 10 of North Paravur municipality, Ernakulum District.

## 1.2 The Rationale for the Proposed Sub-Project:

Vedimara dumpsite has a total waste quantity of 22896.86 cum, spreading over 1.25 acres. The site is located between Lat- 10.150518° N and Long - 76.242212° E and has an elevation of MSL +10 (m), with a gentle slope towards the North West part. During monsoon season, due to the slope of the site, there is runoff towards the North-West side of site along the boundary of dumpsite, which is enclosed with compound wall. North Paravur ULB proposes bio-mining and bioremediation of the Vedimara legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio-mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Proposed Sub-Project Details

Vedimara dumpsite is located at a distance of 1.74 km from the center of North Paravur town in western side and encompasses a total area of approximately 1.89 acres of land, waste spread over an area of 1.25 acres, owned by the Municipality. The coordinates of the dumpsite are, $10.150518^0$ N & $76.242212^0$ E. It is located in ward no. 10 of the municipality. Aluva – Paravur Highway is at 60 m in southern side of the dumpsite, which enable connectivity to the rest of the municipal area. Dumpsite and main road is connected by 60 m long access road, which has 3m width.

Currently, the quantity of waste dumped at this site is about 22896.86 As of now 65 % of the area is covered with solid waste. Height of the waste heap is 2.33 m above and 6.75 m below the existing ground level. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues, etc.

## 1.4 Objectives and Scope of the EIA & SIA:

As per indicative categorization for dumpsite bio-mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (1.89 acres) and waste spread (1.25 acres) and absence of environmentally sensitive features around, this subproject is individually considered as E2, and EIA is prepared accordingly.

The EIA & SIA process involves the identification of the potential environmental and social issues in the project and trying to address them during design interventions. The EIA & SIA further carries out impact prediction and evaluation of residual environmental and social issues of a Project. It then goes on to outline the proposed mitigation measures for residual impacts and enhancement measures for positive impacts which the Project will implement. The objectives of this document are to:

## 1.5 Structure of the Report:

The Consolidated EIA & SIA report has been structured into the following Chapters:

- Introduction and Project Description.
- Policy, Legal and Administrative Framework presents a review of the existing Institutions and legislation relevant to the project at the National and the State levels
- Environmental Assessment Methodology discusses sequence of tasks carried Out in preparing EIA;
- Existing Environmental Scenario presents a consolidated picture of the existing Environmental setting of the project;

- Assessment of Potential Impacts identifies and quantifies the potential impacts on each of the environmental components due to the proposed project development;
- Analysis of Alternatives discusses the criteria for analysis of alternatives of technology for remediation.
- Mitigation Measures presents an elaborate listing of the nature of impacts on each of the environmental components and the avoidance and mitigation measures suggested.
- Public Consultation details the stages and types of public consultations carried out during the project preparation stage and people's perceptions of the project benefits and the Potential impacts;

# CHAPTER 2

# POLICY AND REGULATORY FRAMEWORK

## 2.1 Applicable National, State Legislations and Technical Guidelines

**National Environmental Rules and Regulations: -**

To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed. A summary of environmental legislation/regulations relevant to the project is furnished in the following **Table-2.1**.

*Table 2.1 Summary of Environmental Legislation /Regulations*

| Sl. No. | Act / Rules | Purpose | Applicable (Yes / No) | Reason for Applicability | Authority |
|---|---|---|---|---|---|
| 1 | Environment Protection Act, 1986 | To protect and improve the overall environment. This is an umbrella Act | Yes | As all environmental notifications, rules and schedules are issued under this act | MoEF &CC, CPCB, SPCB |
| 2 | Solid Waste Management Rules, 2016 | To manage collection, transportation, Segregation, Treatment, and disposal of solid wastes (other than Hazardous waste, Plastic Waste, Bio Medical waste) | Yes | Dumpsite remediation/bio mining | MoEF &CC, CPCB, SPCB |
| 3 | Air (Prevention and Control of Pollution) Act, 1981 | To control air pollution by controlling emission of air pollutants as per the prescribed standards | Yes | Yes, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 21 of Air (Prevention and control of Pollution) Act 1981 | State Pollution Control Board, Kerala |
| 4 | Water Prevention and Control of Pollution) Act, 1974 | To control water pollution by controlling discharge of pollutants as per the prescribed standards | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 25 of this Act | State Pollution Control Board, Kerala |
| 5 | The Noise Pollution (Regulation and Control) Rules, 2000 & amendments | The standards for noise for day and night have been promulgated by the MoEF&CC for various activities | Yes | This act will be applicable for all construction equipment deployed at worksite and its operation | State Pollution Control Board, Kerala |
| 6 | Public Liability and Insurance Act, 1991 | Protection from accidents | Yes | This act will be applicable for providing immediate relief to the persons affected by accident occurring during work | State Pollution Control Board, Kerala |
| 7 | Central Motor Vehicle Act 1988 | To check vehicular air and noise pollution | Yes | This rule will be applicable to vehicles deployed for | Motor Vehicle Department |

| | | | | | |
|---|---|---|---|---|---|
| | | | | construction activities and construction Machinery. | |
| 8 | The Plastic Waste Management Rules, 2016 | For the storage and disposal of plastic wastes through authorized vendors. | Yes | This act will be applicable for the storage and disposal of all the plastic wastes. | State Pollution Control Board, Kerala |
| **Other applicable Rules** | | | | | |
| 9 | Construction & Demolition, Waste Management Rules, 2016 | | | | |
| 10 | Batteries (Management and Handling) Rules, 2001 | | | | |
| 11 | E- Waste (Management) Rules, 2016 | | | | |
| 12 | Kerala Municipality Act, 1994 & Rules | | | | |
| 13 | Hazardous & Other Wastes (Management And Transboundary Movement) Rules, 2016 | | | | |
| 14 | Bio-medical Waste (Management & Handling) Rules, 1998 | | | | |

**Applicable Social and Other Legislation**

**Other Legislations applicable to Sub-Project Activities Under the Project**

- Workmen's Compensation Act 1923 (the Act provides for compensation in case of injury by accident arising out of and during the course of employment);
- The Sexual Harassment of Women at Workplace (Prevention, Prohibition and Redressal) Act, 2013 is introduced to prevent and provide redressal of complaints of sexual harassment.
- Contract Labor (Regulation and Abolition) Act, 1970 (the Act provides for certain welfare measures to be provided by the contractor to contract labour);
- Minimum Wages Act, 1948 (the employer is supposed to pay not less than the Minimum Wages fixed by the Government as per provisions of the Act);
- Payment of Wages Act, 1936 (it lays down as to by what date the wages are to be paid, when it will be paid and what deductions can be made from the wages of the workers);
- Equal Remuneration Act, 1979 (the Act provides for payment of equal wages for work of equal nature to Male and Female workers and not for making discrimination against Female employees);
- Industrial Disputes Act, 1947 (the Act lays down the machinery and procedure for resolution of industrial disputes, in what situations a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing down the establishment);
- Child Labour (Prohibition and Regulation) Act, 1986 (the Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of child labour is prohibited in Building and Construction Industry);

- The Building and Other Construction Workers Act (BOCW), 1996 is a social welfare legislation that aims to benefit workers engaged in building and Other construction Works.

## 2.2 The World Bank Safeguards Policies, and KSWMP ESMF

The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are summarized in the following table.

**Environmental Codes of Practices (ECoP):** The ECoPs provide guidelines for environmental management of bio-mining and bio-remediation activities which are seen to be of limited extent of impacts/risk, temporary and reversible, and readily managed with good practices during the implementation. The following key points should be considered.

**Key Points of ECoP to be considered:**

- The bio-mining activities and preparatory activities shall follow the "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" published by CPCB in February 2019.
- Bio-mining methods include Tractor Tiller, Trench method, Cone Method, windrow, Thin Layer Method, etc. More appropriate may be the Cone method for legacy waste and window for relatively fresh waste.
- Leachate channelization and treatment facility shall be set up before starting the bio-mining works. Works shall take place only during the non-monsoon period; and there shall be suitable precautions to prevent any rainwater disturbing the operations (like seasonal unexpected rains, storm water, runoffs from other sources).
- Ballistic separator and trommel may be used for screening. Screened fractions into which waste is segregated include RDF, inert, Compost, and C&D wastes.

**Applicable World Bank Operational Policies**

OP 4.01 Environmental Assessment Help to ensure the environmental and social soundness and sustainability of investment projects. Support integration of environmental and social aspects of projects in the decision-making process

OP 4.04 Natural Habitats Promote environmentally sustainable development by supporting the protection, conservation, maintenance, and rehabilitation of natural habitats and their functions.

OP 4.09 Pest Management includes training to prevent risk to human beings or animals from Bio-culture, enzymes, insecticides and such formulations used for remediation.

OP 4.11 Physical Cultural Resources (PCR) includes resources of archaeological, paleontological, historical, architectural, religious (including graveyards and burial sites),

aesthetic, or other cultural significance. Assist in preserving PCR and in avoiding their destruction or damage. PCR

WB General EHS Guidelines Recommendations of these guidelines would be incorporated in EMP & SMP and Bidding document for this sub-project.

The Environmental Management Framework (EMF) has been prepared to assist in the screening, assessment, and management of environmental risks of all solid waste management projects at an early stage during the planning and integration, mitigation hierarchy during the subproject design, implementation, and operation. The framework helps provide specific guidance on the policies and procedures to be followed for environmental assessment along with the roles and responsibilities of the implementing agencies.

# CHAPTER 3

# ENVIRONMENTAL AND SOCIAL BASELINE

## 3.1 Project Location of the site

North Paravur dumpsite is located at a distance of 2 km from the center of North Paravur town in western side and encompasses a total area of approximately 1.89 acres of land. Out of this, 1.25 acres of land is covered with solid waste. The coordinates of the dumpsite are 10.150518° N and 76.242212° E. It is located in ward no. 10 of the municipality. Aluva – Paravur Highway at 60 m in southern side of the dumpsite, which enable connectivity to the rest of the municipal area. In the surrounding area of the dumpsite around 40 Households are residing within 100m radius. St. Joseph Cottolengo Church at 180 m and KV LP School - about 322 m away from the project location. The google map image showing the location of Vedimara dumpsite is shown below in **Figure: 3.1.**

*Figure 3.1 Vedimara Dumpsite Location Map*

## 3.2 Methodology for Environmental Baseline Studies

The baseline appraisal should consider all aspects of the environment that may be altered by the proposed project. These can be categorized as physical, biological or socioeconomic attributes. The baseline should be based upon the findings of the screening and scoping studies. Surface water and sediments, groundwater, air quality, noise, soils and land use Biodiversity Socio-economic (social), cultural heritage, traffic and transport Physical Biological Socio-economic. The scope of the baseline study, including attributes that will be appraised, and the geographical extent of the analysis, will typically have been agreed with the relevant decision makers as an outcome of the scoping phase. It is important to re-emphasize that the scope (and detail) of the baseline study should be commensurate with the size and scale of the project and hence the potential changes that the project may have upon the environment and society. The baseline study will typically be developed in three stages:

**Desktop study:** Office-based exercise during which readily available existing information (i.e. that can be used to describe the existing environment) is collected and reviewed to ensure its appropriateness for use within the EIA & SIA;

**Field study:** The stage within which additional data is captured in the field, with the intent of addressing any gaps that have been identified in the existing knowledge base; and

**Reporting stage**: Collation of the captured information into the baseline report.
The below table indicates the environmental attributes and frequency of monitoring.

*Table 3. 1 Environmental Attributes*

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Upwind direction in North East boundary of the dumpsite. Along the boundary of dumpsite.<br>Downwind direction in West South West (WSW) along the boundary of the dumpsite | The AAQ locations were chosen based on the Windrose data obtained for North Puravur. The most predominant wind direction are from West and WSW. |
| 2 | Noise (1 Location) | Ambient Noise level [E(P)] for 24 hours | At the Entrance of the dumpsite. | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading vehicle. Please note that the site is devoid of |

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | | | proximity to any sensitive receptors within a 200 m radial circle. |
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, CN, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | Surface water sampling location at 300 m distance in Northern direction. | Surface water sample points are selected based on the water flow from upwards to downwards and for this site, it is-West to East |
| 4 | Ground water<br><br>(3 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, CN, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliforms (IS 10500-2012). | Groundwater sampling location within the dumpsite in the eastern side.<br>Groundwater sampling location at 25 m distance in South West direction.<br>Groundwater sampling location at 45 m distance in South West direction. | In our study area, the electrical conductivity of the groundwater samples varied between 280- 1100 µS/cm during monsoon, which is higher than the permissible limit. The Ground water sample within the dumpsite for TDS is 715mg/L which is above the permissible limit. High values of TDS in groundwater are generally not harmful to human beings but high concentration of these may affect persons, who are suffering from kidney and heart diseases. |
| 5 | Bore Hole (1 location) | Permeability test-IN-2 hectares (as per CPHEEO Manual); standard penetration test SPT and collection of UDS-Soil investigation - classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength | Centre of the dumpsite | Volume of legacy wastes were found to be higher in the center part of the dumpsite during investigation. So the bore hole test was performed in the center. |

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | compressibility (vertically- 3 samples per borehole). | | |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016); Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (as N), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | South east side of the dumpsite | The test results shows that PH is 4.77 which shows high concentration of volatile fatty acids (VFAs). |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | Within the dumpsite at 2 locations, one at East direction and at one at West direction. | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. So the two locations were considered for sampling. |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | 1sampling location | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. |

## 3.3 Environmental Audit of the Existing Facilities

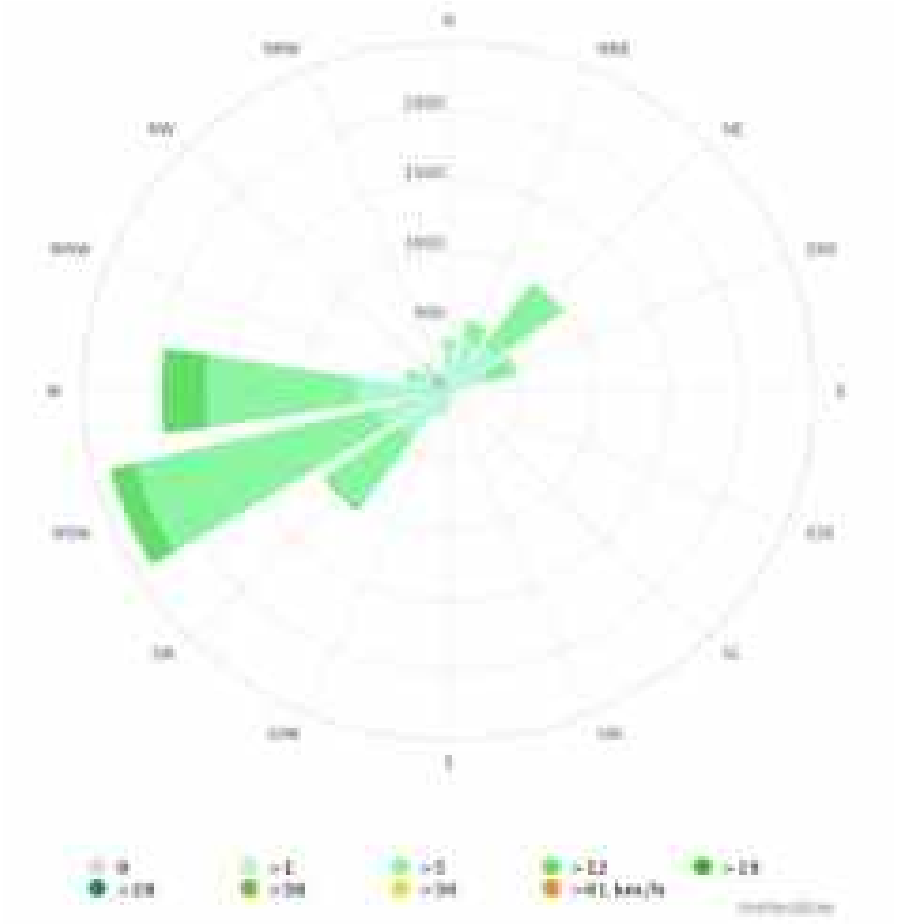
There is two functional MCFs for dry waste within the Vedimara dumpsite.

There are 2 MCFs. Windrow composting and Vermin composting within the dumpsite, which are not supported under KSWMP subproject. However, an environmental audit of the facility is important as this may be used as an associated facility to which some recyclables may be channelized to and is situated at the same site and might be impacted during the bio-mining activities.

*Table 3. 2 Environmental Audit of Existing facilities*

| Sl. No. | Aspects | Remarks |
|---|---|---|
| 1 | Structural Characteristics | **1. MCF**<br>Area - approx. 37.2 (in Sq. m)<br>Buffer/setback around the MCF – 3 ft<br>Distance from waste pile of dumpsite- 5 m.<br>Roof: (GI Sheet Roof, Good condition)<br>Floor (Cement Floor, Good Condition)<br>Walls: (Concrete, Good Condition)<br>Doors & windows: Not Available, dust emission and odor can impact the MCF facility.<br>**2. MCF**<br>Area - approx. 81.8 (in Sq. m)<br>Buffer/setback around the MCF – 3 ft<br>Distance from waste pile of dumpsite- 5 m.<br>Roof: (GI Sheet Roof, Good condition)<br>Floor (Cement Floor, Good Condition)<br>Walls: (Concrete, Good Condition)<br>Doors & windows: Not Available, dust emission and odor can impact the MCF facility.<br>**3. Windrow Compost**<br>Distance from waste pile of dumpsite - adjacent.<br>Roof: (GI Sheet Roof, Good condition)<br>Floor (Cement Floor, not in good Condition)<br>Walls: (Concrete, Good Condition)<br>Doors & windows: Not Available, dust emission and odor can impact the Windrow compost facility.<br>**4. Vermin compost**<br>Distance from waste pile of dumpsite- 10 m.<br>Roof: (GI Sheet Roof, Good condition)<br>Walls: (Concrete, Good Condition)<br>Doors & windows: Not Available, dust emission and odor can impact the Vermin compost facility. |
| 2 | Functional Characteristics | Activities in the MCFs, Windrow and Vermin Composting Unit: Functional<br>Materials and condition of stacking: NIL<br>Activities spilling out onto the dumpsite: Yes<br>Access: Common access for MCFs, Windrow Composting, Vermin Composting & Dumpsite. All are in the same premises.<br>Total No: of workers – 10 |
| 3 | Facilities | Parking area-NIL<br>Loading/unloading Area- NIL<br>Storage room & area: Yes |

| | | |
|---|---|---|
| | | Worker snack/rest areas: Yes<br>Worker / other washrooms & sewerage: Yes<br>Water supply for Cleaning, Washroom: Yes<br>Greenbelt: NIL |



## 3.4 Physiography and Climate

**Physiography**

The entire municipal area is relatively flat terrain, western side of the Municipality is bounded by lagoons and backwaters, north is bounded by Paravur River. The land in and around the dumpsite is a relatively flat and low-lying area.

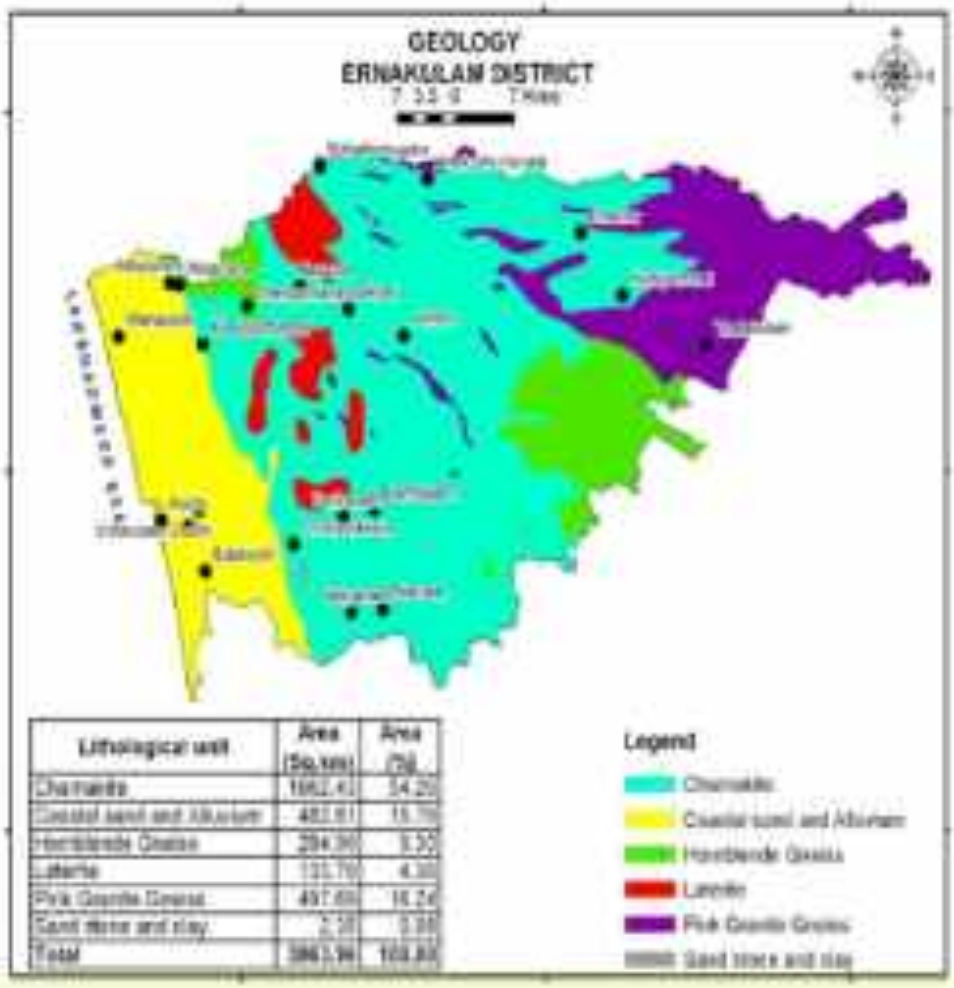
**Climate**

North Paravur is a coastal town located in the Ernakulam district of Kerala. It experiences a tropical climate characterized by high humidity, warm temperatures, and significant rainfall. The average annual temperature is 27.5 °C in North Paravur. Precipitation here averages 357 cm. Most of the precipitation here falls in June-July. The warmest month of the year is March with an average temperature of 32 °C. January the coldest month, with temperatures averaging 23 °C. So, the favorable time for remediation is between October-2023 to March-2024 non-monsoon period. The figure 3.2 shows the average temperatures and precipitation. The predominant wind directions are blowing from WSW and West direction. The Wind Rose Diagram for Ernakulam is shown in **Figure 3.2.**

**Source:** meteoblue

*Figure 3.2 Wind Rose Diagram*

## 3.5 Hydrology, Hydrogeology, and Soil



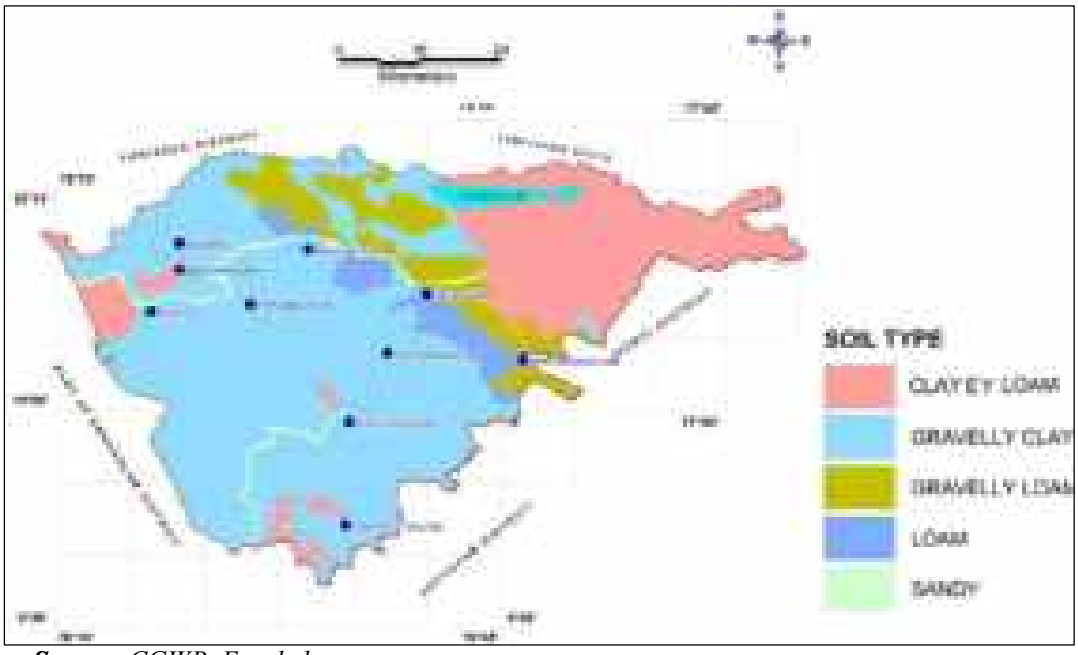
### Hydrogeology

The occurrence and movement of groundwater is mainly controlled by factors like physiography, geological setting, etc. The aquifer type is phreatic aquifer and groundwater table level ranging from 3.5 to 6.5 m during most of the year.

### Geology

The geology of North Paravur is predominantly of Coastal sand and Alluvium group. The geology map of Ernakulam District is shown in **Figure: 3.3.**

*Figure 3.3 Geology Map of Ernakulam District*



| Lithological unit | Area (Sq.km) | Area (%) |
|---|---|---|
| Charnockite | 1662.41 | 54.20 |
| Coastal sand and Alluvium | 482.61 | 15.70 |
| Hornblende Gneiss | 284.30 | 9.30 |
| Laterite | 133.70 | 4.30 |
| Pink Granite Gneiss | 497.60 | 16.24 |
| Sand stone and clay | 3.28 | 0.26 |
| Total | 3063.90 | 100.00 |

*Source: Aquifer mapping and management plans for hard rock terrains, Ernakulam district, Kerala (agp: 2018-19)*

**Soil**

As per the geotechnical investigation, the soil was encountered at 6.75 m below the waste depth of the dumpsite and the predominant soil is clayey Loam. The detailed geotechnical investigation report is enclosure in the FR. The map showing soil type of Ernakulum is shown in **Figure: 3.4.**

*Figure 0.4 Map showing Soil Type of Ernakulam District*

***Source:*** *CGWB, Ernakulum*

## 3.6 Land Use & Land Cover

The land use survey of 2010 revealed that the predominant land use of North Paravoor Municipality is residential. 64.52% of the total area is under residential use. The land use Map is shown in Figure 3.5. The glaring aspect of existing land use of North Paravur municipality is blessed with potential resources such as agriculture land and water bodies.

Paravur was once famous in the district for its traditional industries like coir, handlooms and agriculture. Paravur was small countryside hamlet famous its unique variety of rice known as Pokali as well as extensive backwater fishing. The western parts are coastal areas with cultivations like Prawn and Pokkali Rice. The eastern parts are fertile lands. The Dumpsite is in the mixed commercial area with residential buildings around the site connected by Vedimara Fire Station Road on the northern side and Aluva-Paravur Road on the southern side.

*Figure 3.3 North Paravur Landuse Map*
*Source: Local Self Government Department Planning: lsmsplanning.kerala.gov.in)*

## 3.7 Cultural Heritage

North Paravur is considered as a significant place in terms of cultural, social and economic importance of Kerala history, famous St. Thomas Kottakkavu Church, Paravur Jewish Synagogue, Paravoor Market, Puliyam Palace, Muziriz Heritage area are the few examples. The Muziris Heritage Project encompasses monuments, archaeological sites and the very landscape that illustrates a significant era in the history of Kerala. The evolution of the Muziris Heritage Site has been greatly influenced by its natural environment. The Muziris Heritage Site (MHS) stretches across from the municipality of North Paravur in Ernakulam district to that of Kodungallur in Thrissur district. Palium Palace, also known as Palium Nalukettu, is a historic palace located in Chendamangalam, near North Paravur in the Ernakulam district of Kerala. Chendamangalam is situated about 4.5 kilometers north of North Paravur. The palace is a significant historical and cultural landmark in the region, along with some important religious sites like Mookambika Temple, Kannakulangara Temple, St. Thomas Jacobite Syrian Church, Nonniyakavu Temple etc. But there are no such sites located within 1-meter radius from the dumpsite, hence, no significant physical impact to the heritages sites is envisaged during remediation.

*Figure 3.6 Heritage Map of North Paravur*

*Source- https://townplanning.kerala.gov.in/2022/02/14/ernakulam-notified-heritage-area/*

## 3.8 Ecology and Biodiversity

The land has one of the highest densities of coconut trees. The land also boasts a wide range of other birds and animals. The kingfisher is a common bird in this land and others include black bulbul (depending on the season), brown falcon, woodpecker, sparrow, ravens, pigeons, African fish eagle and cuckoos. The land also has goats, dogs, rodents and flies seen near to the dumpsite. The flora includes shrubs, tubers, and trees.

## 3.9 Site Connectivity

The Dumpsite is adjacent to the Fire Station Road. The existing road to the dumpsite is only 3 meters wide, which is insufficient for accessing large transportation vehicles required for the remediation project. However, there is an alternative road on the north side of the dumpsite, which is 7 meters wide. It is recommended to reopen this road before commencing bio mining operations to facilitate the transportation of construction materials. The approach roads to the dumpsite are municipality roads and the width of the roads are 3.00 m. The dumpsite can be accessed from both north (Fire Station Road) and south (Aluva - Paravur Road) side.

## 3.10 Natural Disasters

As per the district disaster management plan-2015 and from flood vulnerability map the dumpsite location is not under flood prone zone.

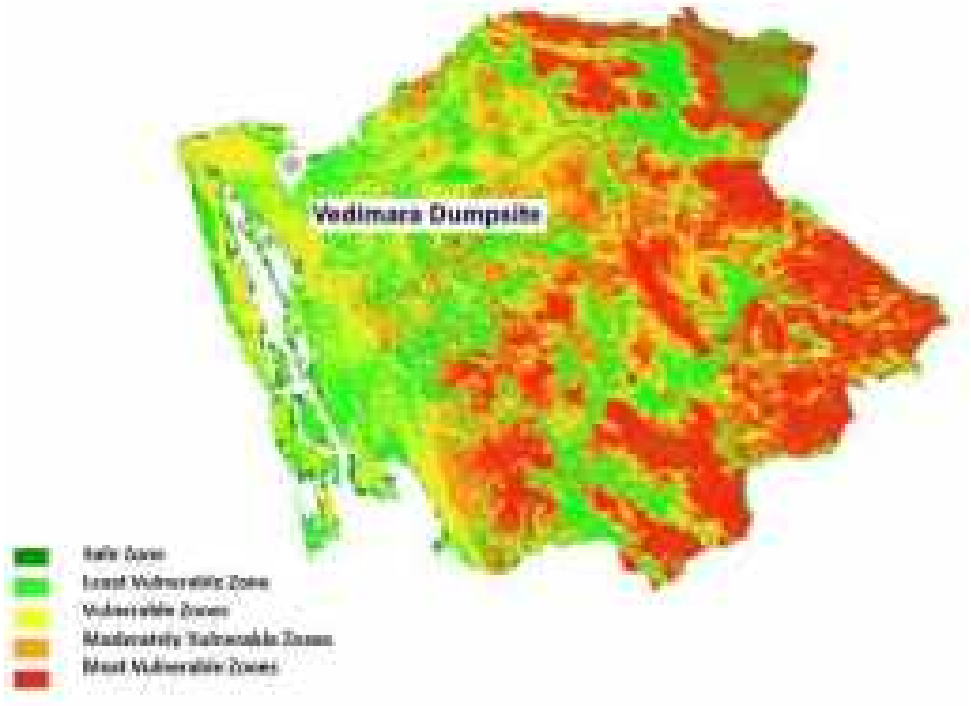


*Figure 3.7 Map Showing Flood Vulnerability Map of Ernakulam District*

## 3.11 Description of Environmental Parameters

***Table- 3.3 Description of Environmental Baseline Parameters***

| Sl. No. | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| | Water Supply<br>a) Surface water<br>b) Ground Water | A) Surface water: Paravur River is 300 m from the site in North direction and Surface water sample was collected and the test results showed – all parameters are well within limits except TDS and Electrical Conductivity.<br>B) Ground Water collected from 3 different locations (Residences within 200m radius)– all parameters are well within limits except for TDS and Electrical Conductivity. | Site Drainage & leachate Impacts due to bio-mining activity (esp during any seasonal rain) is important as far as the nearby soil & water environment are concerned. |

| Sl. No. | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| .2 | Leachate | The data indicates that the TDS is about 16900mg/l while the suspended solids is about 540mg/l. The chlorides are high at 6267.50 mg/l. The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from the waste. | |
| .3 | Air Quality | Air samples were collected from 2 locations within the dumpsite and results found to be well within the permissible limits except $PM_{10}$ – 141µg/m3 | The Air Quality Index (AQI) value of 127 falls within the "Moderate" range (101-200), in location A1, which indicates that air quality might cause discomfort to sensitive groups such as people with respiratory issues, heart disease, children, and the elderly. |
| .4 | Noise Level | Noise Level monitoring samples collected at entrance of the dumpsite. The ambient Noise levels Leq are above the National Ambient Noise standards for Residential area both day and night time. The noise levels are influenced by the public roads passing nearby, also the population within the vicinity. | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity. |

# CHAPTER 4

# ANALYSIS OF ALTERNATIVES

## 4.1 Alternative 1: Zero or No Project Alternative (without Dumpsite Remediation)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.

If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.

1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.

2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.

3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.

4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.

5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

## 4.2 Alternative 2: Mode of Execution / Management Alternative

North Paravur Municipality intends to complete the remediation project as earlier. However, considering the time required for mobilization, installation, sieving and handling recoverable etc., a time frame of about six months will be considered. The broad timeline chart for the execution of this project is given below **Table – 4.1.**

*Table 4.1 Timeline Chart for Execution*

| S. No. | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
|---|---|---|---|---|---|---|---|
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries, Hiring & Installation of Machineries, Electrical Works | ■ | | | | | |
| 3 | Excavation of Legacy Waste | | ■ | ■ | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | ■ | ■ | | |
| 5 | Windrow Formation & Spraying of Bio culture | | | | ■ | ■ | |

| | | | | | | |
|---|---|---|---|---|---|---|
| 6 | Sieving Operations | | | | | |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | |
| 8 | Project Closure Activities:<br>• Levelling of Reclaimed Land using Bio-soil<br>• Handover the available infrastructure at site to the ULB<br>• Closure Report Submission to ULB, | | | | | |
| 9 | Buffer Period (Rainy Season) | | | | | |

## 4.3 Alternative 3: Technology Alternatives

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

# CHAPTER 5

# ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS

Bio mining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, bio-mining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition to the below mentioned,

(i) Drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,

(ii) Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,

(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and

(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

## 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Vedimara dumpsite.

### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Bio-mining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;

- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table 5.1. Magnitude is assessed as medium, considering shorter duration of the activity. However, magnitude of cumulative impacts of various dumpsite remediation might be High.

Table 5.1: Aspects for Determining the Magnitude of Impacts

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite biomining activities will be on larger extent) | A specific location within program component or site boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| Likelihood of potential impacts occurring | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

NOTE: Anticipated Project Duration - 5 to 6 months

### 5.1.2 Sensitivity of Receptor

The sensitivity of a receptor shall be determined based on a review of the population (including proximity/ numbers/ vulnerability) and the presence of features on the site or the surrounding area.

In the surrounding area of the dumpsite around 40 Households are residing within 100m radius (with 10 Households within 10 m). St. Joseph Cottolengo Church at a distance of 180 m, KV LP School at a distance of 322 m, Fire & station at a distance of 20 m. Hence sensitivity of receptors may affect the bioremediation process of the dump site and can be categorized as High Vulnerable receptor capacity to absorb proposed changes or/and moderate opportunities for mitigation.

### 5.1.3 Significance of the impact

The significance of the project impact is tabulated below: -

| Project Details | Sensitivity | Vulnerability of Resource | Importance of Resource |
|---|---|---|---|
| No project Impacts | Medium | Medium | Medium |
| Project with Bio Remediation (Biomining) | High | Low | Low |

Overall, Bio mining will have a medium impact, with more of a positive Impact on the Environment and Human health in the longer term.

**Source-Pathway-Receptor Analysis**

A) **Source**: The source of contamination is the legacy waste remaining and being deposited at the Vedimara closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is +20 years old, as dumping had started in year 1997(Non-functional). The total waste volume is 22896.86 cu. m with the dumpsite spread over 1.25 acres and the legacy waste is seen about 2.33 m above and 6.75 m below from the existing ground level. In addition to the landfill gas and leachate, windblown dust and litter are also considered as sources of contamination.

B) **Pathways**: The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. The rainwater flowing off the dumpsite along the slope towards North west direction acts as a pathway for the uncovered waste to flow along the boundary of the dumpsite in the North eastern side. Since, the dumpsite is enclosed by boundary, runoff to the nearby river is not possible unless there is any leakage.

The leachate flows with groundwater and acts as the pathway. Surface water contaminants like run-off from the dumpsite, leachate and windblown dust and litter that

reach nearby surface water bodies like canals and rivers are further transported by surface waters and in this case the surface water acts as the pathway.

**C) Receptors:**

Receptors are air, surface water (drain passing through residential areas) and ground water. For drinking purpose, they mainly use municipal water supply (40 nearby Households within 200 m and 10 households at 10m distance), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the nearby residences. As the dump is not contaminated by hazardous wastes, remediation would improve the pollution scenario provided the bio-earth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from bio-mining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after bio-mining activity, activities in bio-mined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post biomining activity.

## 5.2 Impacts on Air Environment

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCFs in this case), nearby communities of Ward 10.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.

## 5.3 Impacts on Water Environment

**Ground water**

- Borehole data indicates waste depth is of 6.75m with clayey strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. With the slope of the dumpsite, this tends to get accumulated at low-lying gradients and flows into drain up to 300 m and joins at Paravur river. Oozing & pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during bio-mining to prevent ground water contamination

- Leachate samples: BOD, COD, TDS exceeding limits may impact the ground water quality in nearby residences, wells, and long term soil pollution.
- Borehole data: Dump below water table may impact water resources and wells nearby.
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

**Surface water**

- The dumpsite experienced flooding during 2018 floods and the site is not vulnerable to flooding as per KSDMA Map. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas. Paravur River is at a distance of 300 m from the dumpsite.
- Predominant slope is in the North west Direction. At eastern and southern direction, (end direction) there are residential households and dry vegetation. It is important to contain and treat leachate from the proposed bio-mining activities on site. Treated leachate may be recirculated or used for other purposes.

## 5.4 Impact due to Odour

Dumpsite of organic, or partly organic waste, always results in anaerobic degradation of the waste and consequently, the production of landfill gas, consisting mainly of methane, H2S, Ammonia, and carbon dioxide. If not properly managed the gas can cause odor problems in the neighborhood and since landfill gas is a highly potent greenhouse gas it will also contribute to the increased level of greenhouse gases (GHG) in the atmosphere. Dumpsite gas may also increase the risk of fires or explosions at the landfill site and surroundings.

## 5.5 Impact on Noise

A potential nuisance is a noise from transport of vehicle and machinery operating during remediation phase of the Dumpsite and transports of waste to the Dumpsite. The topography is favorable to attenuate noise to the surroundings. The distance to nearby residential areas is at 10m with 10 households. Hence, the impact will be higher during remediation to the residents.

## 5.6 Impacts on Soil

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as bio-mining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.

- Spillover of activities to nearby road and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste bio-mining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.

- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Vedimara, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Vedimara does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while bio-mining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste), Feb 2019) and World Bank EHS Guidelines. A plan shall be prepared to auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

## 5.7 Other impacts on Biodiversity - Fauna/Flora

- Since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 29 Km from the site, there is a Malayatoor Reserve Forest and Cherai - Vypin Belt at 8 Km from the dumpsite.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora: Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke.
- Disturbance to other fauna and flora on site: onsite activities including those related to MCFs may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species identified which are listed by IUCN.

## 5.8 Other Impacts on existing or proposed activities on site/s

- There may be approvals from various agencies for bio-mining activities and associated facilities; depending on utilities and uses on site & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of bio-mining on existing facilities on site such as the MCFs and composting units, etc. (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post bio-mining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped, or if this is dumped elsewhere or not processed, it will lead to health and environmental issues. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health & Safety impacts on workers, communities. Also, forward linkages are considered as associated facilities/linked activities. Impacts of transportation of these fractions (traffic increase, odor, leachate, dust), impacts during rains & emergencies, handling, storage at the identified locations, reuse etc. shall be mitigated.

# CHAPTER 6

# ENVIRONMENTAL AND SOCIAL MANAGEMENT AND MONITORING PLAN

## 6.1 Proposed Environmental and Social Management Plan

The detailed anticipated impacts and corresponding mitigation measures/management of the impacts are given below.

Table 6.1: *Proposed Environmental Management Plan*

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| *A* | **Planning and Pre-Construction Stage** | | | |
| *1* | | *Planning for biomining facility* | | |
| 1 | Bio-mining & Bioremediation Plan & Capacities | • Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / bio-mined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these bio-mined material in line with the agreements with such facility owners and National, State regulations and WB EHS<br>• Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate Management Plan.<br>• The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>• Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU/ ULB |
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>• The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>• To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>• Grading shall be performed where necessary to provide a neat appearance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ ULB |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air* | • Carry out site assessments as per Guidelines for Bio-mining of Legacy Waste Dumpsites of CPCB<br>• Consider safe bio-mining & gas / leachate generation from existing capped portion of the site<br>• Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means | TSC, ULB, Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *quality, odor, water contamination due to leachate, health and safety impacts of the people working in the site assessment* | ▪ Provision of appropriate PPE's to the team undertaking the site assessments<br>▪ Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>▪ Plan for machinery operated which will be operated by skilled operators at all times.<br>▪ Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>▪ Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | | |
| 4 | Absence / Delay in Permissions for Developing the biomining facility and associated works as per National regulations | ▪ Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labor Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes<br>*(Air Pollution) and Visual Blight due to excavation* | ▪ Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>▪ Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>▪ PPEs to be used by workers<br>▪ Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU/ ULB |
| 6 | Material sourcing, transport, and stacking of construction materials<br>*(Occupational Health and Safety issues and Air noise pollution)* | ▪ Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>▪ Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>▪ Materials shall be sourced only from approved quarries<br>▪ Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>▪ The driver should be with required license and follow speed regulations<br>▪ Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>▪ Material transport and unloading activities should not result in noise disturbance to locals and should be during daytime<br>▪ Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>▪ Provide vehicle wheel wash area on site<br>▪ Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves. | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ Proper rest area on site shall be provided with water, first aid, toilets | | |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | ▪ Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>▪ Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>▪ Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>▪ It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with landowners wherever the labour is accommodated<br>▪ Camp must not be provided in an area prone to Hazards<br>▪ Camp should be adequately at higher plinth levels to prevent water intrusion<br>▪ Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>▪ Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>▪ The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>(Refer ECOP section 06 and section 11 of EMF for KSWMP) | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. especially in case of providing support facilities *(Impacts on Fauna / Flora)* | ▪ Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in biomining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>▪ Identify appropriate government site to avoid land acquisition and resettlement impacts<br>▪ Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences, slope and other landuses | Contractor | SPMU/DPMU/ ULB |
| 9 | Contamination of groundwater due to leaching. Leachate parameters; BOD, COD, TDS, Ecoli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | ▪ During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>▪ Depending on the contractors plan for bio-mining of the site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ ULB |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke burning, trampling/machinery | ▪ Movement routes of vehicles to be planned to avoid key fauna/flora on site<br>▪ Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 11 | Nuisance hazards to neighboring areas | • Ensure proper design and adequate compound wall, high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements<br>• In case of waste mound and site edges are sloping or unsafe, provide engineered retention walls. | Contractor | SPMU/DPMU/ ULB |
| 12 | Treatment & Disposal of wastes and rejects | • Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & inert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventoried and quantified, including Biearth, rejects, inerts. These shall be treated and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertilizer Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>• Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| **B** | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| | | **Implementation of bio-mining of the dumpsite** | | |
| 1 | Impact due to the vehicular movement<br>*(Air and noise environment & Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | • Vehicles and machinery are to be maintained so that emissions conforms to National Ambient air quality standards.<br>• All vehicles and machinery should obtain Pollution Under Control Certificates.<br>• HORN PROHIBITION signpost to be erected.<br>• Rumble strips/speed breaker to be provided on access roads.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>• Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>• Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements<br>• Avoid heavy vehicle movement through Vishnupur road roads during peak hours 7 a.m to 10 a.m (entrance/exit hrs / peak hrs, and during important period / festivals when people use the road to access temple<br>• Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents | Contractor, ULB | SPMU/DPMU/ ULB |
| 2 | Impact due to the use of heavy vehicle and equipment *(Air and Noise environment)* | • Mining equipment (in case of construction of ancillary facilities) should be well tested and be equipped with a dust-removal device.<br>• Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>• Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>• Labor to be provided masks / PPEs<br>• Construction / Bio-mining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighboring sensitive land uses | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>▪ Using modern, well-maintained and regularly serviced vehicles.<br>▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>▪ Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>▪ As North Parvoor dumpsite has sensitive receptors and settlement areas within 150m (10 houses within 10 m radius) of it, noisy works shall be stopped from 22:00 to 06:00.<br>▪ Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>▪ Avoid noisy activities/machines near South side of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>▪ Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities<br>*(water environment)* | ▪ Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>▪ Vehicle washing or maintenance near water bodies are to be avoided.<br>▪ Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ ULB |
| 4 | Leachate and Runoff from biomining activities<br>*(Soil contamination and groundwater contamination)* | ▪ Provide site cut off drain around the site to divert off storm water from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>▪ Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>▪ Ensure storm water drains will lead to drain outlets<br>▪ Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area<br>▪ Provide proper treatment of leachate and storm water that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by bio-mining activities like excavation and waste segregation and stabilization<br>▪ The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>▪ The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>▪ Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>▪ Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>▪ Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | | |
| 5 | Soil decontamination from accumulated waste levels *(Impact on leachate, odor)* | ▪ Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bioculture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>▪ Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>▪ Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU/ ULB |
| 6 | Excavation of waste from the waste mound *(Health and safety impacts)* | ▪ The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>▪ Machinery operated for excavation should be operated by skilled operators at all times.<br>▪ Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>▪ Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>▪ In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>▪ When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | Contractor | SPMU/DPMU/ ULB |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles *(Air, Odour nuisances; spills and littering impacts on Air, Water, Land)* | ▪ All vehicles shall carry only approved load of weight<br>▪ Regular cleaning of roads & drains and removal of spills if any.<br>▪ All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>▪ Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>▪ Adopt required measures as per CPCB guidelines, and site specific safety requirements. | Contractor | SPMU/DPMU/ ULB |
| 8 | Occupational health and safety impacts of the workers during | ▪ Avoid direct & double handling of wastes through avoidance measures (suitable planning & equipment), engineering controls & use PPEs<br>▪ Work area & Labour camps shall be provided with First Aid and other related activities. | Contractor, ULB | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | the biomining & construction of support facilities:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, biocultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | ▪ Emergency Preparedness plans shall be prepared and implemented for all manpower working centers and its field extension centers.<br>▪ An Environment Health & Safety policy shall be prepared and implemented<br>▪ Adequate manpower shall be provided & manager & staff shall listen and act upon the manpower related grievances.<br>▪ Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles<br>▪ Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed without slip, trip, fall especially on waste, leachate or trenches<br>▪ Proper training will be provided regarding the maintenance of health<br>▪ Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper hand wash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>▪ First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>▪ Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>▪ Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>▪ Measures such as deferred timings and stretch break to be adopted<br>▪ Secure all installations from unauthorized intrusion and accident risks;<br>▪ Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every day start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipment, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>▪ EHS specialist with adequate experience & third party supervision are important for bio-mining activity<br>▪ Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>▪ Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>▪ Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas;<br>▪ Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>▪ Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will | | |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | reduce the accidents due to electrical short circuit.<br>▪ Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near those In close proximity to this location, there is a transformer. Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>▪ All workers shall be registered as per prevalent labor laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>▪ Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractor's person/insurance agent<br>▪ While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>▪ While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>▪ Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>▪ A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>▪ No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor<br>▪ All works related to working at heights will be undertaken only during the daytime when sufficient sunlight is available;<br>▪ Use of temporary fall protection measures and outer edges of any elevated work surfaces, such as handrails and toe boards to prevent materials from being dislodged will be done;<br>▪ All excavation activities to be conducted in supervision of the site contractor;<br>▪ Proper signage and lights to be provided in all work or activity areas & work permit system to be ensured.<br>▪ All records on emergencies, accidents, workers & their duty schedule, important site events, waste storage & disposal etc shall be maintained on site. All accidents including Indicative, Serious and Severe accidents to be recorded. All severe & serious accidents to be reported to the Bank & procedures followed for root cause analysis & Corrective Action Plans prepared and implemented, as per Banks Incident Reporting Tool | | |
| 9 | Risk of fire due to conditions leading to spontaneous combustion<br>*(Air environment, disturbance to communities and workers, health impacts, safety issues)* | ▪ Follow CPCB Directions (May 26, 2022) Directions under Section 5 of EP Act (1986) – for Implementation of SWM Rules 2016 – regdg Fire Incidents at MSW Dumpsites (https://cpcb.nic.in/openpdffile.php?id=UHVibGljYXRpb25GaWxlLzQyNDRfMTY1NDE2Mzk3N19tZWRpYXBob3RvNzYxMi5wZGY= ), LSGD Kerala Government GO on Fire Safety of MRF, MCFs (for the MRF on site if used for storage of wastes)and other Regulations, guidelines applicable<br>▪ Divide the site & plan for work in each area/quadrant as per work plan & prepare fire safety plan & emergency response plan in line with EIA Annexure 3; and National/State regulations & WB EHS<br>▪ Examine the site everyday by experienced Fire Safety / OHS personnel for any smokes<br>▪ Avoid conditions that can lead to spontaneous combustion such as: | Contractor, ULB | SPMU/DPMU |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ○ Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard<br>○ Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.<br>▪ Design the facility for access by firefighting equipment, including clear aisles among waste heaps or work areas and access to adequate water supply.<br>▪ Ensure workers are briefed of fire hazard & its management<br>▪ No unauthorized entry shall be permitted to the site; including of workers during holidays, nighttime, or hours other than normal work hours under the supervision of site engineer / supervisor. Fencing and barricades with proper signage boards indicating "trespassers not allowed"<br>▪ The following activities should be implemented to prevent fires from occurring at the facility<br>○ adequate fire-fighting equipment should be made available on-site and stored in an accessible manner,<br>○ all operating staff should be trained and able to manage fire outbreaks at any part of the facility.<br>○ clear signage should be established to inform workers and the public that flammable liquids are not permitted on the site. This should be reinforced by advice to customers at the gatehouse and inspection of loads at the organic reception area.<br>○ Approved quantities of combustible contaminants that have been separated (such as tires and plastic bottles) should be stockpiled in small piles or windrows.<br>○ all fuels or flammable solvents for operational use should be stored in an appropriately ventilated and secure store (at appropriate height). This store should be located away from the bio mining, storage, and processing areas.<br>○ all flammable liquids should be stored within a bund that can hold 110% of the volume of the flammable liquids stored there so that any release of raw or burning fuel cannot cause a fire in the combustible organics present on the site or have an impact on contaminating storm water.<br>▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented throughout the bio mining activity in line with National State regulations, guidelines and international good practices<br>▪ Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.<br>▪ Contain all local smokes/small fires inside the dump asap. Fire brigade help shall be sought on all smokes/fires outside the dump<br>▪ Ash from fires to be contained at the earliest within the site using bunds or screens, rather than allowing to disturb nearby receptors. Early clearing and disposal of such ash at TSDF to be ensured.<br>▪ Provide contact details of Fire Department & ambulance other essential emergency services on site & ensure training to the workers by such service providers | | |
| 10 | Construction of new facilities in retrieved land | ▪ The excavated site shall be protected from any dumping during or after the bio mining activity and shall be reserved for SWM activities in line with SWM Rules 2016<br>▪ Any new facility under KSWMP to be constructed on the retrieved land, shall follow EMF procedures & National State regulations | ULB | SPMU/DPMU |
| 11 | Pest / Vermin Control & Visual impacts | ▪ Regular cleaning and approved pest control measures to be adopted; preferably in coordination with Health section of ULB & local Health Center | Contractor, ULB | DPMU, SPMU |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | (Odour, flies, rodent / other pest menaces) | ▪ Communities around shall be made aware of possible pest menace & ULB shall support those in need with required pest management measures and offered health checkups<br>▪ Bio-pesticides / biological control shall be followed. However, bio-pesticides, or bio cultures used shall be tested to ensure the presence of no banned chemicals or hazardous materials<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used<br>▪ Visual blight to be curtailed by screens, proper lighting, housekeeping, leachate management | | |
| 12 | Odour nuisance | ▪ Waste with a strong odor to be covered immediately they are emptied from vehicles.<br>▪ Control and manage leachate treatment to minimize odor.<br>▪ Provide buffers screens to curtail odor from reaching surrounding communities especially to North side of site.<br>▪ Using natural deodorizers such as lemongrass, eucalyptus etc. and planting fragrant flowering plants around the site to mask odor. | Contractor, ULB | DPMU, SPMU |
| 13 | Storage, Collection, Transport, Treatment & Disposal of wastes and rejects | ▪ Storage, Collection, Treatment, treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste<br>▪ Storage, Collection, Transport, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc); & adequate protection shall be made to prevent such impacts even during rains / disasters<br>▪ Waste handling shall be inline with existing regulations & guidelines & avoid health & safety impacts<br>▪ No material is allowed to remain on site after the contract period<br>▪ Adequate fire safety arrangements & awareness & training to workers shall be ensured on site & at disposal / treatment areas for wastes in discussion with Local Fire Brigade to prevent any fire on legacy waste site or retrieved & stored wastes or that is transported<br>▪ Vehicles movement shall be tracked by ULB to ensure disposal of material/rejects/inserts in designated or agreed area & are in line with schedule; using GPS.<br>▪ Given that the access road is used by the public, it is imperative to implement the required safety precautions and environmental protection measures when transporting the waste. | Contractor, ULB | DPMU, SPMU |
| 14 | Other activities | ▪ No activity other than bio mining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>▪ If existing MCF shall be used for storing bio mining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after bio mining works shall be after proper cleaning / washing & disposal of all rejects/inserts & tools to ensure good housekeeping & no H&S impacts<br>▪ If existing MCF shall be used by the ULB for storing dry wastes from Town, during bio mining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 15 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & bio mining / construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water and Leachate to be treated & recycled/reused | Contractor | ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| C | **Future Site Usage (EMP shall be updated in line with EMF & need if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Bio mining, but of the future facility operator & ULB** | | | |
| 1 | Future use of the bio mined site: Green Park, MCF, MRF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | • ULB to ensure that the site will not be used for future dumping.<br>• Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around.<br>• ULB shall plan the future use of the site shall be in consultation with the communities.<br>• Phase 1 Environmental Assessment to be carried out, EA for existing facilities & EIA for proposed development in line with EMF in case that is proposed to be developed under KSWMP<br>• All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF/MRF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment, a nuisance to biodiversity, communities, Health impacts)* | • The movement route shall be scheduled for each vehicle.<br>• Enforce speed limits applicable and make drivers aware of this.<br>• Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule; preferably using GPS.<br>• Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles.<br>• Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards.<br>• Proper lubrication shall be provided to minimize squeaking noise due to friction.<br>• Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br>• The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public.<br>• Traffic will be managed at the site by providing adequate space for parking of vehicles.<br>• Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design.<br>• No waste or material shall be disposed in any place other than the designated area; including water bodies, coasts/forests, or sensitive areas. | Future Facility operator | ULB |
| 3 | Exhaust emissions<br>*(Air impacts)* | • No idling of vehicles on site.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed | Future Facility operator | ULB |
| 4 | Plying of vehicles through kutcha / unsurfaced roads and idling<br>*(Air pollution- SPM, CO, CO2)* | • Vehicle movement shall be well planned – through topped roads. In case of necessity to move through Kutcha roads, ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Future Facility operator | ULB |
| 5 | Impact on the ambient noise quality during the operations<br>*(Noise, nuisance to sensitive receptors, health impacts)* | • Strictly adhering to designated working hours (day time); Sensetizing construction truck drivers and equipment operators to switch off idle engines;<br>• Using modern, well-maintained and regularly serviced vehicles;<br>• Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>• Provision of earmuffs and ear protection to workers and employees in high noise areas. | Future Facility operator | ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 6 | Occupational health and safety impacts of the workers:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | ▪ All OHS and CHS measures to be followed in line with applicable regulations, guidance<br>▪ Workers & communities shall be made aware of OHS, CHS risks and impacts & mitigation measures adopted<br>▪ Emergency management plan to be prepared & followed<br>▪ Workers shall be appropriately trained or OHS during construction & Operation of all future facilities | Future Facility operator | ULB |
| 7 | Pest / Vermin Control (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted<br>▪ Biopesticides / biological control shall be followed.<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used | Future Facility operator | ULB |
| 8 | Fire Safety | ▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations, guidelines and international good practices | Future Facility Operator | ULB |
| 9 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

### 6.1.1 Disposal phase of By-products from Bio-mining process:

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within a three-month period, penalties will be imposed on the contractor.

## 6.2 Disaster Management and Emergency Preparedness

A disaster is a catastrophic situation in which suddenly, people are plunged into helplessness and suffering and, as a result, need protection, clothing, shelter, medical and social care, and other necessities of life. In the case of Dumpsite remediation, Disaster Management Plan is aimed to ensure the safety of life, protection of the Environment, protection of installation, restoration of the remediation process, and salvage operations in this order of priorities.

For effective implementation of the Disaster Management Plan, it should be widely circulated and personnel training is to be provided through rehearsals/drills. The disaster management Plan consists of Onsite Emergency Plan and an offsite Site Emergency plan, which is outlined here for Emergency Preparedness. The list of emergency helpline services is mentioned in the Table below.

**TABLE: 6.2 LIST OF EMERGENCY HELPLINE SERVICES**

| Sl. No. | Emergency Services | Distance from the dumpsite |
|---|---|---|
| 1 | North Paravur Police Station | 1.5 Km |
| 2 | North Paravur Fire and Rescue Station | Opposite to dumpsite |
| 3 | Paravur Taluk Headquarters Hospital | 1.2 Km |

### 6.2.1 Approach to Disaster Management Plan (DMP)

The objective and approach of the Disaster Management Plan is to make use of the combined resources of the plant and the outside services to achieve the following:

- Effect the rescue and medical treatment of casualties;
- Safeguard other people;
- Minimize damage to property and the environment;
- Initially contain and ultimately bring the incident under control;
- Identify any dead;
- Provide for the needs of relatives;
- Provide authoritative information to the news media;
- Secure the safe rehabilitation of the affected area;

- Preserve relevant records and equipment for the subsequent inquiry into the cause and circumstances of the emergency.

In effect, it is to optimize operational efficiency to rescue rehabilitation and render medical help and to restore normalcy. Disaster Management Plan should include Emergency Preparedness Plan, Emergency Response Team, Emergency Communication, Emergency Responsibilities, Emergency Facilities, and Emergency Actions.

#### 6.2.1.1 Identified Emergency Situations

Major disasters which can affect the remediation process are as follows:

- Floods due to heavy rainfall
- Fire risk in summer
- Occupational and health risks during the remediation process
- Safety-related accidents during the remediation process

#### 6.2.1.2 Proposed Organizational Structure for Disaster Management Plan

**Response team:** Setup an Emergency Organization. Emergency Organization includes the senior executive (head of EO as a Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

- All Incident control would be reported to the Site Controller. Each Incident Controller organizes a team responsible for controlling the incident with the personnel under his control.
- **Shift In-charge** would be the reporting officer, who would bring the incident to the notice of the Incidence Controller and Site Controller.
- **Emergency Coordinators** would be appointed who would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential and support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.
- In each shift, the electrical supervisor, in charge, and other maintenance staff would be drafted for emergency operations. In the event of power or communication system failure, some of the staff members in the office/facility would be drafted and their services would be utilized as messengers for quick passing of communications. All these personnel would be declared as essential personnel.

## 6.3 Proposed Monitoring Plan

The proposed monitoring plan is presented in table below,

| TABLE -6.3 PROPOSED MONITORING PLAN AND FREQUENCY | | | |
|---|---|---|---|
| **Monitoring media/parameters** | **Items and parameters** | **Frequency** | **Location** |

| | | | |
|---|---|---|---|
| **Ambient Air Quality** | PM10, PM2.5, NOx, CH4, CO, Ammonia | Quarterly (1 sample) | 2 point |
| **Noise** | Leq Day and Night | Monthly | 2 point |
| **Health safety Hazards** | Medical records, documentation of injuries and accidents. Health and safety assessments | As and when accident/injury occurs | Incident reports |
| **Leachate** | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC)<br>Dioxins<br>• Heavy Metals (As per the schedule II of SWM rules 2016) | Quarterly | 2 point |
| **Groundwater quality** | Parameters will be defined and sampling, preservation, and analysis of water will be carried out following those stipulated in the subsections below and Standards Methods for Testing Water and wastewater, 21st edition, published by American Public Health Association (2005). | Quarterly | 8 points |
| **Surface water quality** | | Quarterly | 6 points, 2 upstream and 4 downstream |

## 6.4 Estimated Budget for Implementation and Supervision of EMP

The estimated capital cost of [redacted] is required for budget provision for implementation and supervision of EMP. The remediation will be only during shorter time duration and hence the recurring cost won't be incurred. The estimated budget for implementation & supervision of EMP is shown in the table below.

| Sl. No. | Particulars | Capital Cost (lakhs) |
|---|---|---|
| 1 | Dust Mitigation measures including site barricading, Water sprinkling, wheel washing and leachate management | [redacted] |
| 2 | Mobile toilet, Pest Control, Disinfectant | [redacted] |
| 3 | Medical cum First Aid Facility | [redacted] |
| 4 | PPE Workers & Welfare, Firefighting Equipment | [redacted] |
| 5 | Monitoring & Testing (Air, Noise, Water, Soil, Leachate) | [redacted] |
| | **Total** | [redacted] |

# CHAPTER 7

# INSTITUTIONAL ARRANGEMENTS

## 7.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organisation will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU.

## 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for HKS (Health & Hygiene, source level waste segregation and source level treatment, Fire and Safety)
- Training program for ULB Councilors and Ward convener (Proposed SWM project plan of KSWMP)
- Training program for Political and trade union leaders (Health, Hygiene and source level waste segregation, Fire and Safety)

- Training program for Residence Association leaders (Health, Hygiene different composting methods and source level waste segregation, littering of waste, Public Health, Fire and Safety)
- Training program for workers of Municipal Sanitary workers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for school / college students (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for ULB officials (Proposed SWM project plan of KSWMP, proposed policies, existing policies etc... to improve the existing pattern into zero waste concept of the municipality)
- Training program for School children, Parents and Teachers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Massive awareness campaign on 5R (Reuse, Recycle, Repurpose, Reduce and Refuse)

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

## 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

# ANNEXURES

## ANNEXURE I : INITIAL ENVIRONMENT AND SOCIAL EXAMINATION

### 1. Environmental Screening Form

Checklist to be followed for Environmental Screening during the Initial Environmental Assessment Stage has been provided below:

**Subproject Details**

| | |
|---|---|
| **Name of Subproject:** | Vedimara Solid Waste Dumpsite Reclamation by Bio mining |
| **Subproject Components:** | Dumpsite remediation using Bio-mining approach |
| **Subproject Location (City / Town/ Village with ward numbers):** | Vedimara, North Paravur Municipality, Ward 10 |

**Stage 1: Exclusion List**

**Is the Project Excluded from Consideration due to the following:**

| *Sl No:* | *Non-permissible Activities* |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |

*(This space can be used to add details on the above, reason for exclusion from the Project etc.)*

This dumpsite remediation project involves 1. (i) no construction in demarcated Forest areas or protected areas or their buffers, (ii) no construction of landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) no treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). 2. NO activities which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas, 3. No activities with (i) any impact on or due to Dams or embankments (ii) and projects will not purchase, store and use Banned Pesticides.

Hence, not excluded :
Proceeding to Stage 2 Screening

**Stage 2: Environmental Screening Checklist**

| Project Details | | |
|---|---|---|
| **Sl.No** | **Components** | **Details** |
| 1 | Project components | Solid Waste Dumpsite Reclamation by Bio-mining |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities / associated facilities) | North Paravur Solid Waste Dumpsite Reclamation by Bio-mining -<br>A total station survey and geo technical survey was conducted to determine the quantity of legacy waste, revealing a total of 22896.86 cubic meters. |
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination)<br>Site Survey No:/s (attach map) with ownership details, Geographical co-ordinates of the site location [including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | **Location:** Vedimara, North Paravur Municipality, Ward 10<br>**Ownership –** North Paravur Municipality<br>**Landuse –** Existing Solid Waste Management facility<br>**Geographical Coordinates:** Latitude: 10° 9'2.46" N<br>Longitude: 76°14'31.73" E<br>**Earthquake zone**: III<br>**Cyclone:** Moderate<br>Access road of width 4m (Vedimara Fire Station Road)<br>Dumpsites have existed since 1997 |
| **4** | Land Area proposed to be used: Location wise (in sq km/sq m) | Utilized for Dumpsite: ~5100 sq. m |
| **5** | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | For domestic usage 2 KLD will be met from a private supplier |
| **6** | Power Required and Source of Power | No DG set requirement for this sub-project. Electricity connection is available within the site. Source: KSEB |

***Baseline Environmental Conditions***

| *Sl. No* | *Environmental Aspects* | *Yes* | *No* | *Details (include distance in Km, info on its importance)* |
|---|---|---|---|---|
| 1 | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | | |
| *(i)* | Critically Vulnerable Coastal Areas (CVCAs), Eco-sensitive Areas (ESAs) | | ✓ | No Critically Vulnerable Coastal Areas and Eco sensitive Areas in the study area |
| *(ii)* | Cultural Heritage site, Protected monuments - listed by ASI/State | | ✓ | Paliam Palace – about 2.5 Km away |
| *(iii)* | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species?<br>If Yes, which is the area? | | ✓ | No Eco-Sensitive Areas in the study area |
| *(iv)* | Other Wetlands/ Mangrove/ Estuarine Region | | ✓ | There is no Wetlands/ Mangrove/ Estuarine Region in the study area |
| *(v)* | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | ✓ | There is no Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves in the study area |
| *(vi)* | Other Sensitive Environmental Components listed in EMF | | ✓ | There is no other Sensitive Environmental Components in the study area as listed in EMF |
| *(vii)* | Drinking water source, upstream and downstream uses of rivers, etc.. | ✓ | | Open Well - 10 m away in the household adjacent to the dumpsite. GWL – 3m from the ground level.<br>Paravur River – 300 m away from the dumpsite |
| *(viii)* | Low-lying areas/areas of Tidal Influence (provide CRZ details) | ✓ | | Site is in low-lying area with the gentle slope tend towards NW side, site does not falls in CRZ area |
| *(ix)* | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | ✓ | | within the radius 200m there are households(with 10 Households at 10m), St. Joseph Cottolengo Church 180 m Residential units – Adjacent the dumpsite ab KV LP School - about 322 m |
| *2* | Is the site in Critical / Overexploited GroundWater Block. Provide the level of the groundwater table | | ✓ | As per groundwater booklet average ground water level 3m |
| *3* | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | | ✓ | The site is not vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, etc. |
| *4* | Describe the type of soil and vegetation on site | | | Alluvial Soil, presence of vegetation (trees, shrubs) |
| *5* | Is the site present in the flood plains as recorded in the last 100 years? Provide the HFL level of the site/region | | ✓ | Site is not located in a flood prone area. |
| *6* | Existing pollution/contamination or degradation on site | ✓ | | Dumpsite existing from 1997, 20 years legacy waste is accumulated causing degradation in sitesite Facingg leachate issue. |

| *Sl. No* | *Environmental Aspects* | *Yes* | *No* | *Details (include distance in Km, info on its importance)* |
|---|---|---|---|---|
| *7* | Any other remark on baseline condition | | ✓ | Based on the baseline study data for AAQ, except Particulate matter all other parameters are within the permissible standards, surface and groundwater, indicating that the respective results are well within permissible limits except TDS and Electrical conductivity. The noise analysis indicates, during night time the Noise was found to be marginally higher than the standards |

***Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils***

| *Sl. No* | *Impacts on Land / Soil Environment* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| *8* | Total extend of land to be covered/built | | | Total Land: 1.89 Acres, 1.25 Acres to be remediated |
| *9* | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | | | Quantity of legacy waste: 22896.86 cum. |
| *10* | Extend of Land to be remediated | | | 1.25 Acres |
| *11* | Extend of land expected to be under green belt | | | Green belt of 20m should be provided |
| *12* | Will the proposed project cause the following on Land / Soil: | | | After bio-mining the land will be remediated and will have a positive impact on the land and soil. |
| *(i)* | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | ✓ | No Impact on Surrounding Environmental Conditions |
| *(ii)* | Substantial removal of Top Soil (mention area in sqm) | | ✓ | Presence of solid waste beneath the ground level combined with soil is to be excavated for the bio-mining process.<br>Total Area - ~5100 sq. m |
| *(iii)* | Any degradation of land / eco-systems expected due to the project? | | ✓ | No land use change or ecosystem change due to implementation of this project since the land will be reclaimed. |
| *(iv)* | Loss or impacts on Cultural/heritage areas/properties | | ✓ | No impacts or loss of cultural/ heritage areas/properties due the implementation of the project since the existing one is at a distance of 2.5 Km from the dumpsite. |
| *(v)* | Does the project activity involve cutting and filling/ blasting etc? | | ✓ | It is bio-mining of existing solid waste only |
| *(vi)* | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | | ✓ | Waste heap is 2.33 m above and 6.75 below Ground Level which is to be excavated. |
| *(vii)* | Will the project involve any quarrying/ mining etc? | | ✓ | The project does not involve quarrying/ mining |
| *(viii)* | Will the project / any of its components contaminate or pollute the Land? | | ✓ | The land remains unaffected by the process of bio-mining, as evidenced by the absence of any discernible impacts observed during our assessment |

| *Sl. No* | *Impacts on Land / Soil Environment* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| *(ix)* | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | ✓ | Positive impact to the environment. |
| *(x)* | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | ✓ | Bio-mining will be conducted following the necessary mitigation measures. Hence, no impacts |

| *Sl. No* | *Impacts on Air and Noise Environment* | *Yes* | *No* | *Details/Remarks* |
|---|---|---|---|---|
| *13* | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | ✓ | | The process of bioremediation may cause dust emission from process and vehicle movement which shall be managed using effective mitigative measures |
| *14* | Will the project cause or increase pollution due to GHG emissions? | ✓ | | Chances of GHG emissions due to un-stabilised waste. |
| *15* | Will the project cause or increase odor nuisance? | ✓ | | The process of bioremediation may cause odour which shall be managed using effective mitigation measures |
| *16* | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | ✓ | | Chances of GHG emissions due to un-stabilised waste. |
| *17* | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | ✓ | | Project activity stage (during the process of bioremediation due to vehicular movements& working of machineries). |

| *Sl. No* | *Impacts on Water Environment* | *Yes* | *No* | *Details/Remarks* |
|---|---|---|---|---|
| *18* | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | ✓ | The proposed remediation will only enhance the groundwater/surface water quality in the long term. |
| *19* | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | | ✓ | The proposed remediation will only enhance the groundwater/surface water quality in the long term. |
| *20* | Chances of Pollution of Water bodies/groundwater wells, nearby or downstream | | ✓ | Open well is about 10m away. Hence, proper leachate treatment and waste disposal is necessary |
| *21* | Will the activities proposed at the site(s) hinder natural drainage | | ✓ | No, the proposed remediation activity does not hinder natural drainage. |
| *22* | Will the activities proposed at the site(s) decrease permeability/rainwater percolation | | ✓ | No impacts to the permeability/rainwater percolation of site |

| *Sl. No* | *Impacts on Biodiversity and Host Communities* | *Yes* | *No* | *Details/Remarks* |
|---|---|---|---|---|
| *23* | Will the project necessitates cutting of Trees / Loss of Vegetation | | ✓ | Cutting of trees is not required. |
| *24* | Will the project necessitate substantial removal of Top Soil (mention area in sqm) | | ✓ | Presence of solid waste, no topsoil.<br>Excavation of legacy waste – |

| *Sl. No* | *Impacts on Biodiversity and Host Communities* | *Yes* | *No* | *Details/Remarks* |
|---|---|---|---|---|
| | | | | 22896.86 cum |

# ANNEXURE II: FIRE RISK ASSESSMENT

## Objectives

The important elements of fire risk Management planning can be classified as:

- Identifying the disaster potential scenarios and advance planning to combat and minimize the damage.
- Vulnerable zone delineation.
- Assessment of loss probability and its severity.
- To deal with such emergencies expeditiously.
- •. Warning, protective actions like evacuation of personnel.
- To contain the disaster by isolating the area, firefighting etc.
- To make efforts to return to normal condition when the situation is controlled.

*Table 8.4 Causes of Fire and Risk*

| Ignition (heat) sources | Fuel Sources | Oxygen Sources |
|---|---|---|
| Lit cigarettes/ butts, matches, lighters<br>Improperly stored batteries<br>Bushfire<br>Self-heating piles<br>Hot loads/contaminated waste<br>Hot work operations<br>Arson<br>Lightning<br>Fires from neighbouring activities<br>Faulty electrical wires | Flammable liquids, gases and solids<br>Combustible goods and waste (e.g. CRWM[1])<br>Contamination in CRWM storage<br>Dry and unmanaged vegetation | Oxidising chemicals such as oxy-acetylene sets, bleach, hydrogen peroxide, nitrates<br>Physical introduction of oxygen through unbaling or turning of loose piles |

## Fire Prevention & Management Plan

It is a strategy well evolved, organized and rehearsed to contain the adverse effects of a possible disaster. It aims to mobilize the internal resources and use these with minimal dependence on external agencies for the following purposes:

To control and contain incidents.

- To safeguard employees and people in the vicinity.

- To inform employees, the general public and the authorities about the hazards/risks assessed, safeguards provided, residual risk, if any, and the role to be played by them in the event of disaster.
- To effect rescue and treatment of casualties.
- To prevent recurrence of such a disaster.
- To establish machinery for review, rectification/modification of the emergency
- To ensure safety of workers before personnel re-enter and resume work.
- To work out a plan with all provisions to handle and to provide for emergency preparedness and the periodic rehearsal of the plan.

## Pre-Disaster Stage

The prevention of disaster is of vital importance and is the moral responsibility of each and every individual employed in the dumpsite site. It can be prevented by observance of precautionary and preventive measures. During pre-disaster stage following points will be followed to avert the occurrence of disaster:

The emergency operation procedures of the dumpsite site will be written down so that no confusion is caused in the event of an emergency taking place.

- To reduce the probabilities of accidental leakage of methane.
- Smoking will be prohibited in the areas where handling of dumpsite will be done. NO SMOKING boards will be prominently displayed in Local Language ie Malayalam and English languages.
- All electrical wiring, fittings, cables, equipment will be checked periodically. Temporary wiring will not be permitted to be installed inside the dumpsite area. No inflammable material including papers, Oils, wooden racks will be stored within 1 meter of any electrical fittings. No unauthorized person will be allowed to tamper with electrical fittings.
- Welding, Burning, cutting, Chipping, Soldering work, etc will only be carried out by authorized persons.
- Necessary compliance with various Statutory Guidelines and other relevant instructions as issued from time to time will be done.
- The Safety Department will arrange to educate all concerned regarding operational hazards of non-compliance of the safety guidelines. They will also provide necessary

guidance and support in proper implementation of the program. They will also arrange mock exercises periodically.

- The Safety Department will display important telephone numbers and instructions, in Mizo & English languages. The Security Control Room located at the dumpsite site will be equipped with the following –
- Sufficient number of copies of On-Site Disaster/Emergency Management Plan.
- Master plan of the dumpsite site indicating vital locations and possible sources of disaster.
- Important Telephone numbers
- Emergency lights (portable) and Wireless sets if required and possible).
- First Aid boxes
- Stretchers, blankets and other essential items at the fire station under the charge of Fire Services Dep't

## Disaster Stage

The most probable disaster which may occur at the dumpsite site is because of accidental leakage and fire. To control leakage and fire the following measures/precautions will be taken at the dumpsite site:

The guidelines as given below for the protection of fire will be followed:

- The dumpsite's fire protection will consist of structural solutions, fire extinguishing systems and fire alarm systems. The fire extinguishing system will consist of the fire system with fire pumps, distribution pipelines, hydrants and fire hoses and the portable extinguishers.
- The fire alarm system will be a part of the primary systems and take care of the places which are unmanned or will not have any fixed fire extinguishing system.
- The major operation areas shall be equipped with fixed smoke detectors, CO2 extinguishers near the door in the control room.
- All the rooms in the office shall be equipped with fixed smoke detectors.
- The ventilation rooms shall be equipped with fixed smoke detectors. One CO2 extinguisher will be located near the door to the ventilation room.
- The fire alarm and detection system shall be designed, installed, maintained and tested according to relevant standards.
- The water for firefighting shall be stored in the fire water tank (water reservoir).

- $CO_2$ fire extinguishers contain extinguishing carbon dioxide which either by it or under expected conditions of use gives off $CO_2$ to prevent fire.
- Dry fire extinguishers contain an extinguishing medium which either by itself or under expected conditions of use will give fine powder to prevent fire to get oxygen.
- As soon as a fire takes place inside the premises of dumpsite, action to be taken by various persons/officials

## Post Disaster Stage

After the incident a report will be prepared regarding occurrence of event/losses incurred and recommendations thereof for restoration of normalcy

## Reporting of Accidents

Situation in totality will be studied thoroughly, investigated with respect to the cause of the incident, extent of loss of life and property and a detailed report prepared by the individual/team nominated by dumpsite site authorities for this purpose. Based on the investigation report, rescue team would finalize time bound programmes for implementation of corrective measures proposed and regularly monitor the progress thereafter. Rescue, medical and welfare operations would be continued by the concerned agencies.

## Conclusion:

Removing the current legacy waste at the dump site via bio-mining will be extremely useful to the residents of the area. This can also eliminate the threat of summer fires and protect water supplies from contamination caused by excess leachate during the wet season. This will undoubtedly improve the quality of life for local communities while avoiding health problems caused by pollution. It is planned to conduct an awareness class for all these neighboring institutions and houses on the process of bio mining.

## Executive Summary

North Paravur is a Municipality located in the western part of Ernakulam district. The primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing the dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Consequently, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project for the remediation of legacy waste dumpsites in all the ULBs of Kerala. As part of the project, in phase I the existing dumpsite at North Paravur, Ward No. 10, Vedimara was proposed for remediation.

The North Paravur Municipality has an area of 9.02 sq.km with 29 wards. The municipality, with the financial and technical support of KSWMP, has proposed to remediate the existing legacy waste dumpsite located in around 1.5 acres of land in Ward No. 10, Vedimara and to recover land for future developmental activities. The Vedimara dumpsite was used for dumping municipal solid waste from the year 1985 to 2018. The dumping of solid waste was stopped once the ULB level windrow compost plant was set up. Considering the impending threat of fire hazards and leachate issues, the Municipal Council has proposed the remediation of legacy dumpsite as a priority and to utilize the remediated land for setting up other solid waste management facilities. Since the cessation of dumping activities in 2018, only sweeping waste from towns and streets were dumped at the facility daily and has now been discontinued.

The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. To assess the quantity & composition of legacy waste & also evaluate the environmental baseline of the dumpsite, samples from representative locations were collected and analyzed for various parameters viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Groundwater and Surface Water. As part of the study, detailed site investigations were carried out for; – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical and Environmental Analysis by M/s Poluchem laboratories.

From the results of the investigations, the total estimated quantity of legacy waste is around 23332.83 Cum. (Above GL 11860 Cum and Below GL 11472.83Cum)

As per the SWM Rules 2016, selection of an applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out, and based on the detailed assessment of different parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, stationary trommel screening

machineries shall be optimum for processing the legacy waste within the stipulated timeline of 31st March 2024.

The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project attracts moderate social risks based on the social mapping, transect walk and consultation with the people living around the proposed project site to assess the problems associated with the legacy waste dumpsite and the impact during the execution of the project.

The activities of bio-mining will commence from Oct 2023 and are expected to end by March 2024. An area of 1.25 acres will be reclaimed and will be utilized for setting up other solid waste management facilities. Total cost of the project is [redacted]

## 1.0 Introduction

The issue of municipal solid waste management in Urban India has become one of the foremost concerns during the last couple of decades.

The primary environmental issue currently faced by the municipal authorities in Kerala revolves around a longstanding existing legacy waste dumpsite. It has a long history of more than three decades of continuous dumping of both bio- and non- biodegradable wastes. Though the waste dumping activity has been stopped, the dumpsite remains as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Improper management of such sites pose significant environmental, social, and economic challenges for the communities and ecosystems in the vicinity.

In view of the environmental and social issues connected with dumpsites, the SWM Rules 2016, directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the remediation projects of legacy waste dumpsites in all the ULBs. As part of the project, in phase -1, the existing dumpsite of North Paravur ULB was proposed for remediation.

For arriving at a methodology for remediating the legacy waste in the dumpsites, as per the Project Implementation Manual, a feasibility study outlining the technical, economic, and socio- environmental factors has been carried out. As a result of the feasibility study that involved detailed field investigations & assessment, and market sounding, the method proposed for remediation of legacy waste dumpsite is biomining, which will ensure long-term sustainability and environmentally sound treatment, which is found technically feasible, economically viable, and socially acceptable. The details of various steps involved in the feasibility study are described in the following sections.

## 2.0 General Description about the Project

North Paravur is experiencing the issues of treatment and disposal of Municipal Solid Waste. The entire common solid waste facilities of the North Paravur Municipality is located within 2.4 acres of land (10.150518N ,76.242212E). The legacy dumpsite is also located within this common solid waste processing facility. This is the only dumpsite present in the ULB.

This waste dumpsite at North Paravur needs to be remediated scientifically and the land is to be reclaimed for productive use. This feasibility report outlines the status including the environmental and social aspects. The feasibility report also examines various remediation options and suggests the most feasible option for the given context for the purpose of availing for the closure of the dumpsite by North Paravur Municipality.

## 3.0 Profile of ULB- North Paravur Municipality

### 3.1 Location

North Paravur Municipality is located at latitude 10.150518N ,76.242212E and is located on the northern part of the district as shown in **Figure 3.1**. Total geographical area of North Paravur Municipality is 9.02 sq.km with 29 wards.

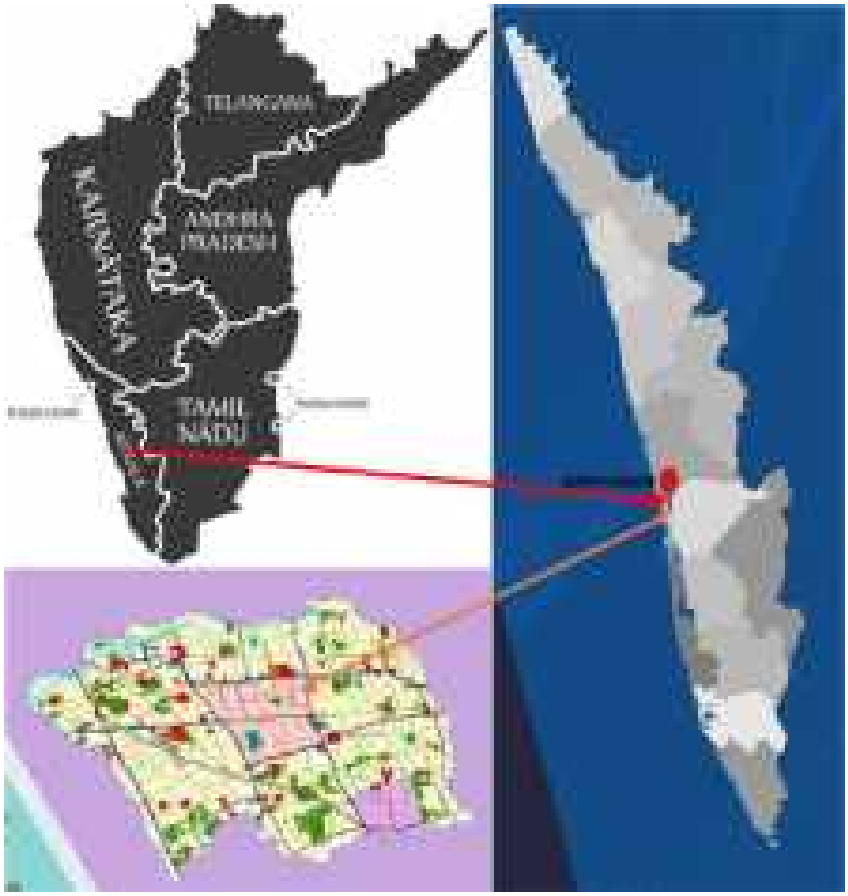

**Figure 3.1 Location Map of North Paravur ULB**

### 3.2 Demographic & Socio-Economic Status

The North Paravur municipality has a total population of 31,503 of which 15,060 are males while 16,443 are females as per report released by Census of India 2011 indicating a Female Sex Ratio is of 1,092 against state average of 1,084. The overall literacy rate of North Paravur Town is 96.8 %. The ULBs portrays a literacy rate higher than state average of 94.00 %. The workforce participation details of Kothamangalam ULB is presented in Table below;

*Source; Census Data 2011*

**Table 3.1 Workforce Participation Details, North Paravur**

| Category | Total | Male | Female |
|---|---|---|---|
| Main Workers | 9139 | 9139 | 9139 |
| Cultivators | 6924 | 6924 | 6924 |
| Agriculture Labourer | 2215 | 2215 | 2215 |
| Household Industries | 22 | 22 | 22 |
| Other Workers | 19 | 19 | 19 |
| Marginal Workers | 3 | 3 | 3 |
| Non-Working | 28 | 28 | 28 |

*Source: Census of India 2011*

## 3.3 Connectivity

North Paravur is an emerging suburb of Kochi City which is nearly 22 km from the city centre and 16 km from city. in Ernakulam district in Kerala. The city and its adjourning villages are famous for its legacy in ancient Chera Empire, being the erstwhile capital city.

The nearest railway station. Aluva railway station is located 14.66 kms from the town centre. which is second largest railway station in Ernakulam. And nearest airport is Cochin International airport located 19.88 kms away from the town. The town is well connected by water way network which brings a wide opportunity of inland navigation.

## 3.4 Climatic Condition

All parts of Ernakulam district including North Paravur have a wet monsoon type of climate. Entire district experiences heavy rainfall during the southwest monsoon season followed by northeast monsoon. During the other months the rainfall is considerably less. March, April and May are the hottest months. December to February are the coldest months. The overall meteorological condition of Ernakulam District is presented in Table 3.2

**Table 3.2 Meteorological Condition of Ernakulam District**

| Meteorological Parameter | Details |
|---|---|
| Temperature | The mean monthly maximum temperature ranges from 28.1 to 31.4°C and the minimum ranges from 23.2 to 26 °C. The maximum temperature occurs during March and April months and the minimum temperature occurs during December and January months. |

| | |
|---|---|
| Relative Humidity | The humidity ranges from 68 to 89% during morning hours and 64 to 87% during evening hours. The maximum humidity is observed during May to October months. |
| Evaporation | Evaporation is more during summer months of January to April and it is low during the rainy months May to August. The maximum rate of 4.8 mm per day is recorded in March and the lowest rate of 2.6 mm is recorded during July |
| Wind | The wind speed ranges from 6.7 to 10.9 km/hour with mean speed of 9.1 km/hour. The wind speed is high during the period from March to September |

**Source: Groundwater Information Booklet of Ernakulam District published by Central Ground Water Board**

## 3.5 Ground Water Level

The vicinity of the project area has few households. From monitoring wells dispersed across the state, the depth to water level is observed in the months of April, August, November, and January. According to information published by the CGWB, the Government of India, the water level in North Paravur fluctuates from 0.8 to 0.82 MBGL.

## 3.6 Land use

The land use map of the Paravur Municipality and the neighbouring Panchayats is shown:

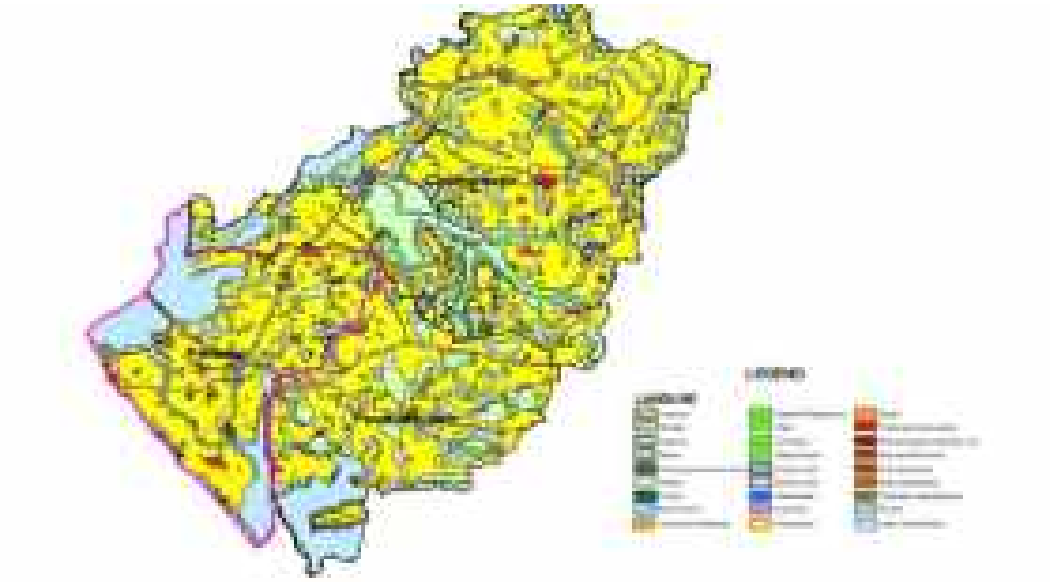

**Figure 3.2 Existing Landuse Map of North Paravur Municipality prepared by Town and country Planning department 2021**

From the above map it can be concluded that the predominant land use of North Paravur Municipality is Residential with 56% of the total geographical area. The area under water body comes second, with 23.8% of the total geographical area. The two back waters of Paravur, the T.S.Canal & Ponds within Municipal area constitute the water body area. The agricultural area in percentage of total geogrpahical area comes about 13.33%, which is in third position after land uses like residential and waterbody.

*Source: Development Plan North Paravur 2021, prepared by Town and country Planning*

## 4.0 Detailed Description of the Dumpsite

Vedimara facility, the main processing unit for solid waste for the municipality is a dumping yard, due to the malfunctioning of the system. A part of the bio-waste brought is been processed through windrow composting or vermicomposting. There are facilities for non-degradable wastes, but waste is found dumped everywhere as forward linkage is not proper.

## 4.1 Physical Feature of the Site

North Paravur dumpsite is located approximately 2.2 km from the centre of the town in western side and encompasses an area of approximately 1.25 acres of land. The dumps site is not very far from human settlement. The coordinates of the dumpsite are 10.151089"N & 76.242185"E. It is located in Ward No. 10 of the municipality. North Paravur municipality holds the ownership of the dumpsite. The dumpsite is surrounded by houses from north-western directions. In South-eastern direction, Majid Noor. North-eastern side of the dumpsite is Panikkarachan temple. West, cottelengo church is present. The Periyar river sub stream flows North-eastern side of the dump site within the distance of 300 m.

The exact date for start of the dumpsite was not available with municipality; however approximately it had started in the year of 1985, the information has been gathered during field visit. Presently, almost 60 % of the area is covered with solid waste. The dumping has been irregular with no proper liner system.

**Figure 4.1 Photographs of North Paravur Dumpsite**

**Table 4.1 Salient Features of North Paravur Dump Site during Site Visit**

| Particulars | Details |
|---|---|
| Name of Dumpsite | North Paravur dumpsite |
| Location of Dumpsite | Ward No. 10 of the municipality |
| Co-ordinates of Dumpsite | Latitude: - 10.151089°N<br>Longitude: - 76.242185°E |
| Distance from the central part of the town | 2.2 km |
| Area of dumpsite | 1.25 Acres |
| Average height of dumpsite | Above the Ground level 2.33 m & 6.75 m below the Ground Level |
| Ownership of dumpsite land | Municipality |
| Distance from nearby features- residential, school, offices, temples, institutions, industry etc.) | There are a Residential and other structures within 25 metres from the site |
| Start date of dumpsite | 2001 |
| Utilities on site | Electricity connection is available |
| Details of manpower and vehicles available in dumpsite | 46 HKS & 6 Vehicles |
| Site demarcated | Site is currently demarcated with boundary wall. |
| Details of weighbridge available at dumpsite | No weighbridge at site |
| Road width | 2.7 |
| Plant adjacent to dumpsite details | Vermicompost, Windrow compost |

## 4.2 Information On Site Management

This section describes the current management of the dumpsite in terms of agency responsibility, profile of workers and numbers, nature of work the labour force in engaged in, Waste pickers and other category of workers at the site.

**Agency responsible for current management of the dumpsite:** Currently, the dumpsite is closed and non-functional. A MCF existing nearby the Municipality, which is at Pallithazham is functioning on a temporary basis . About 46 HKS workers are engaged for collection of Waste. The MCF is being handled by 30 Workers from Clean Kerala company Limited who segregate the dry waste.

**Profile of workers and numbers:** About 46 HKS workers are engaged for collection of Waste. The MCF is being handled by 30 Workers from Clean Kerala company Limited who segregate the dry waste.

**Nature of work the labour force in engaged:** HKS workers are involved for collection and CKCL workers are engaged in Segregation of dry Waste.

**Waste pickers and other category of workers at the Site:** The waste is segregated with help of contract labourers. Recovered materials is collected by the Clean Kerala Company. Non recovered materials will be put in the dumpsite.

### 4.3 Relevance in local or regional SWM plans

The ULB is planning to utilise the reclaimed dumpsite land for the construction of a state of art Material Recovery Facility. The non-biodegradable waste from the ULB shall be brought to this facility and material collection facilities and processed for further use. The project may be funded under the KSWMP project.

### 4.4 Litigation status of the Site

The NGT has established norms and guidelines for addressing legacy waste (O.A No 606/2018), which refers to accumulated waste at dumpsites that have been in operations for an extended period. These norms aim to mitigate the environmental and health hazards associated with such waste.

## 5.0 Scope of Work

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at North Paravur includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.

- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation optimum land recovery – Biomining, Capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile-compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the ESMF developed for projects envisaged under KSWMP.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Delineation of baseline assessment, impact & risk assessment, mitigations measures, Environmental Management & monitoring plan, budget for EMP, EMOP, institutional responsibilities for implementing monitoring and reporting
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport,
- Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

### 5.1 Objectives:

- Maximum reclamation of the area and by eliminating the chances of dump fires, leachate generation, and foul odor.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.
- To increase nearby real estate/social value and benefit the citizens.

## 6 Detailed Investigation Strategy

### 6.1 Investigation Strategy

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below;

- Bore hole upto a depth of 10 m and collection of 3 (nos) samples from the soil at interval of 1.5 m.

- Waste analysis viz., leachate sample from 1 (no) locations and physical analysis from 2 (nos) locations, and chemical analysis from 1 (no) location.
- Environmental baseline analysis surface water 1 (nos) location and ground water samples from 3 (nos) locations (Well Water Samples -1 up gradient, 2 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location

## 6.2 Investigation Plan

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

| S.no | Parameters | Sampling Nos |
|---|---|---|
| 1 | **Geotechnical Investigation** | |
| A | Bore Holes up to 10m depth(1No. /2 Hectare) (as per CPHEEO) | 1 |
| B | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, Strength compressibility (vertically-3 samples per borehole). | 1 |
| 2 | **Waste & Environmental Analysis** | |
| A | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammoniacal nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | 1 |
| B | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | 2 |
| C | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium(N-P-K), Total carbon, C/N ratio, calorific value, Biochemical and Biodegradable factor. | 1 |
| D | Ground water (well water samples-1 up gradient, 2 down gradient)- (shallow and deep wells) Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, E Coli and Total coliform (IS 10500-2012). | 3 |
| E | Surface water (pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, E Coli and Total coliforms (IS 10500-2012). | 1 |
| F | Ambient Air Quality (Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3). | 2 |

| S.no | Parameters | Sampling Nos |
|---|---|---|
| | Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | |
| G | Ambient Noise level [E(P)] for 24 hours. | 1 |

## 6.3 Sampling Methodology

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

**Table 6.1 Detailed Investigation Plan Executed for Waste Dumpsite at North Paravur**

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Within the Dumpsite<br>Dumpsite boundary | The AAQ locations were chosen based on the Windrose data.Two Ambient Air quality monitoring stations were installed within 100 metre distance from the dumpsite in upwind and downwind direction |
| 2 | Noise (1 Location) | Ambient Noise level [E(P)] for 24 hours | Entrance of the dumpsite | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading vehicles. |
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | Adjacent thodu in 200 m aerial distance | Adjacent thodu sampling was considered.No alternative surface water sources were identified during sampling. |

| S.No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 4 | Ground water (3 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | Well water of nearby nearest house in 200 aerial distance | Nearest ground water source in downstream direction |
| 5 | Bore Hole(1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | Centre of the dumpsite | Volume of legacy wastes were found to be higher in the centre part of the dumpsite during investigation. So, the bore hole test was performed in the centre. |
| 6 | Waste Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammoniacal nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | Within the dumpsite | The legacy waste was found to be older and no access to all points. Hence sampling location were chosen also based on the accessibility. |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | | |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium(N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | | |

For the borehole investigation, the samples were collected by rotary drilling a 150mm bore hole using a fast rig attached to a drag bit. The soil drillings are removed by a circulating bentonite slurry which also aids in keeping the side walls stable. An SPT sampler was driven in to collect the representative samples, which is carefully packed in double walled polythene bags, sealed, and sent to laboratory for testing. Standard penetration tests were conducted on soil at every 1.5m depth and the number of blows to achieve 300mm penetration were noted. Fractions recovered from the mining of legacy waste should be tested, especially for the presence of toxic metals and organic contaminants.

The total quantity of waste present in the waste dump is calculated based on the topographic study executed by ULB (towards calculating quantum of waste above ground level) and the results of borehole investigation (towards calculating the quantum of waste below ground level).

## 6.4 Analysis and Interpretation of Exploratory Data

The baseline condition of the waste dumpsite at North Paravur, has been assessed through the geotechnical investigation and Waste & Environmental baseline assessment executed through M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Polluchem Laboratories (P) Ltd respectively. The results of Topographical survey conducted in the year 2022 also considered for the analysis. The signed reports of all analysis are enclosed as Annexures as detailed below;

Annexure 1 – Topographical survey report

Annexure 2 –Geotechnical Survey report

Annexure 3- Waste Characterization study report

Annexure 4 - Waste & Environmental baseline assessment reports

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 23rd May 2023. 2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 10th June 2023 and was completed on 11th June 2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 25th May2023 by M/s Polluchem Laboratories (P) Ltd.

### 6.4.1 Topographic Survey Results

Topographic survey was conducted by ULB itself in the year 2023 towards assessing the quantum of the waste present in the dumpsite above the ground level. The Topographical survey report is presented in **Annexure 1**. The inference of the Topographical survey is as follows;

- Topographical Survey Map shows Approximate 1.25acres of land used for waste dumping.
- Maximum height of waste dump above soil is 2.33 m
- Estimated waste volume above GL is 11,860 cum which will constitute 9488 T of waste (density of waste is 0.8 T/cum as per the characterization study results presented in subsequent sections)

### 6.4.2 Geotechnical Exploratory Details

The geotechnical investigation at the dumpsite at North Paravur, Ernakulam district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 12 m (6.75 in waste after that 5.25 m soil). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples. The full geotechnical report is appended as **Annexure** 2. The major inference of the geotechnical investigations are as follows;

- In the borehole investigation it was asserted that the depth of waste column below ground level is 6.75m

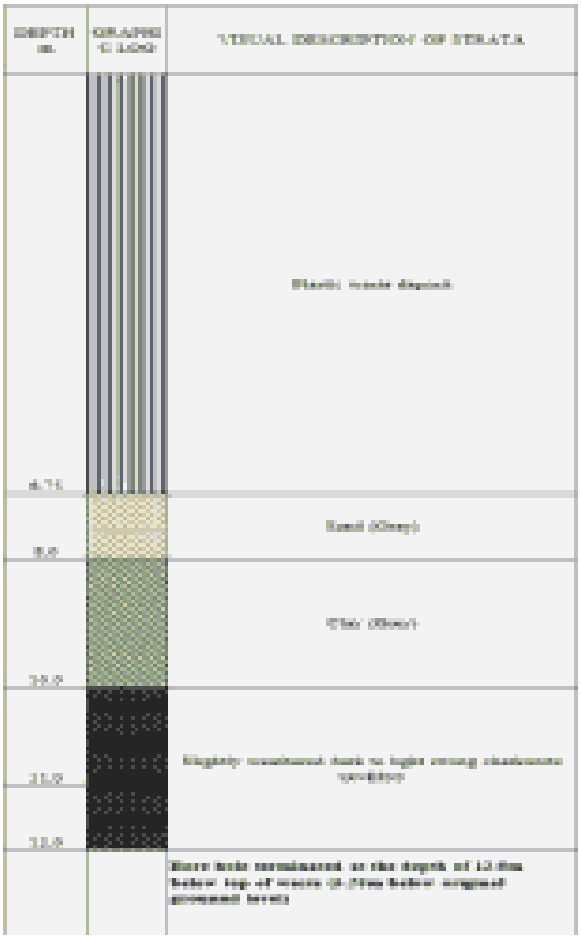

**Figure 6.1 Borehole Strata Obtained for North Paravur Dumpsite**

- The soil exhibited a plasticity index is 15. The base soil has a plasticity index greater than 10 and the clay and silt fractions account to more than 40%, which makes it a good soil for the subbase.
- The clay fraction is 26%.
- The pre-consolidation pressure is b 145 KPa.
- The permeability value is 1.28 E-05.
- The Cation Exchange Capacity (CEC) of the soil is 14.6 meq/100gm

### 6.4.3 Estimated Total Quantity of Waste

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). As detailed under section 6.4.1 the estimated quantity of the waste above the ground level is **11,860 Cum**.

Quantity of waste below the ground level is estimated as **11,472.84 Cum**. The quantity of waste below ground level may vary as per actual site conditions.

Thus the total legacy waste present in the North Paravur dumpsite is calculated as below;

**Table 6.2 Total Waste Quantification for North Paravur Dumpsite**

| Sl no | Name of Dumpsite | Quantity of Waste present above the Ground level | Quantity of Waste present below the Ground level | Total quantity of legacy waste to be managed |
|---|---|---|---|---|
| 1 | North Paravur | 11,860 Cum | 11472.84 Cum | 23,332.84 Cum |
| | | 9,488 T | 9178.27 T | 18666.27 T |

### 6.4.4 Legacy Waste Characterization

The characteristics of the legacy waste were assessed by collecting a 15kg sample. The legacy waste samples were collected on 10/06/2023 by M/s Matters lab (P) Ltd. The assessment of waste characteristics. was done based on the results of the analysis. The details of the physical characteristics are provided in the tables below: The detailed legacy waste characterisation reports are enclosed as **Annexure 3**

**Table 6.3 Grain Size Analysis of Legacy Waste (total weight of sample taken 15 kg)**

| Sieve Size (mm) | Percentage Retained |
|---|---|
| 80 | 0 |
| 37.5 | 16 |
| 10 | 41.5 |
| 4 | 21.1 |
| Pan | 21.4 |

**Table 6.4 Characterisation of Waste Material Retained in Each Sieve**

| Test/ Parameters | Waste Material Retained on each sieve in % | | |
|---|---|---|---|
| | 37.5 mm | 10mm | 4mm |
| Plastic Waste | 9.6 | 2.5 | 0 |
| Cloth | 1.4 | 0 | 0 |
| Glass | 0 | 0.2 | 0 |
| Wood | 3 | 18.4 | 0 |
| C&D | 0 | 0 | 0 |
| Bio Fraction | 0 | 0 | 0 |
| Gravel | 86 | 78.6 | 100 |
| Metal | 0 | 0.3 | 0 |

**Table 6.5 By Product Composition**

| Particular | Percentage of Composition (%) |
|---|---|
| RDF | 11.04 |
| Inert | 67.56 |
| Compost Soil Enricher | 21.40 |

**Table 6.6 Physical Characteristics of Waste**

| Sl no | Parameter | Test Method | Unit | Value |
|---|---|---|---|---|
| 1 | Moisture@105°C | ASTM D 2216 | % | 12.4 |
| 2 | Bulk Density | USEPA | kg/m3 | 0.8974 |
| 3 | Density | USEPA | g/cm3 | 904 |

**Table 6.7 Chemical Analysis**

| Sl No | Parameters tested | Test Method | Unit | Result |
|---|---|---|---|---|
| 01 | pH@25°C | USEPA | .. | 7.98 |
| 02 | Biodegradable Factor | USEPA | % | 2.4 |
| 03 | Total carbon | USEPA 9060A | % | 3.4 |
| 04 | Phosphorus(P) | USEPA | % | 0.031 |
| 05 | Nitrogen(N) | USEPA | % | 0.18 |
| 07 | Potassium(K) | USEPA | % | 0.045 |
| 08 | C/N Ratio | USEPA | .. | 18.8:1 |

*Note : The average Nitrogen, Phosphorus and Potassium (NPK) content in the legacy waste samples picked from the site is 0.18, 0.031, 0.045, respectively by weight. This is far lower than 0.8, 0.4 and 0.8 as specified by the Fertilizer Control Order (FCO) 1985 for city compost and hence cannot be used as compost. The carbon: nitrogen ratio is 18.8:1 which is much lesser than the specified standard. This could be due to the materials being exposed to sun and air over the years or that the carbon content may have leached into the ground through leachate during the rainy season. Another possible contributor to the reduced carbon levels could be multiple fire incidents at the site. Although the material has very less carbon content, the NPK value can be enriched by adding additives like poultry litter. The enriched material can be given to farmers or used for horticulture purposes.*

### 6.4.5. Soil Conditions of the Dumpsite

As it is an unlined dumpsite, there is a probability of finding traces of contaminant from waste and leachate in the underlying soil. Since it is an uncontrolled disposal site, the mixed waste contains different types of pollutants which may eventually have an impact on the soil. Results of soil analysis of the samples taken from the borehole in the Vedimara dumpsite is as shown below:

**Table 6.8: Chemical analysis of soil extracted from borehole at North Paravur dumpsite**

| Sl. No | Parameter | Result | US (NY State-Codes, rules and regulations) Industrial Use |
|---|---|---|---|
| 1 | Cadmium (Cd) mg/Kg | <5.0 | 60 |
| 2 | Chromium (Cr) mg/Kg | 115.8 | 800 (Hexavalent) 6800 (Trivalent) |
| 3 | Copper (Cu) mg/Kg | 55.9 | 10000 |
| 4 | Nickel (Ni) mg/Kg | 48.9 | 10000 |
| 5 | Lead (Pb) mg/Kg | 33.9 | 3900 |
| 6 | Zinc (Zn) mg/Kg | 386.3 | 10000 |
| 7 | Mercury (Hg) mg/Kg | <0.1 | 5.7 |
| 8 | Arsenic (As) mg/Kg | 7.0 | 16 |

While comparing results of the report with the US Industrial Use benchmark, it is observed that the values are within the SLB values. Bioremediation may be carried out to reduce traces of heavy metals in soil and for site clearance. Though the concentration of Cadmium makes the land unsuitable for residential use, industrial land use may be promoted. The location may be used as a site for the SWM facilities like Material Collection and Resource Recovery Facility. However, the solution may be considered after proper soil and groundwater investigation post dump-clearing stage.

### 6.4.6 Leachate Characterization and Quantification

There is no leachate collection/management system in the dumpsite. To address the concern of contamination of the groundwater and soil due to uncontrolled dumping, leachate samples are picked for analysis. The data is presented in **Annexure 4**. The data indicates that the TDS is about 23000mg/l while the suspended solids is about 864mg/l. The chlorides are high at 12535

mg/l, while the COD, BOD are 88000mg/l and 20000mg/l respectively. The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from waste.

**Table 6.9 Leachate characteristics at North Paravur Dumpsite**

| Parameters tested | Test method | Results |
|---|---|---|
| Sampling Location | N-9 °59'23.582" E -76°33'51.031 | |
| pH | IS 3025 (P) 11 –1983RA2017 | 4.77 |
| Total Dissolved Solids (Inorganic) | IS 3025 (P) 16 – 1984RA2017 | 16900 mg/l |
| Total Suspended Solids | IS 3025 (P) 15 – 1984RA2017 | 540 mg/l |
| Chloride as Cl- | IS 3025 (P) 32 – 1988RA2014 | 6267.5 mg/l |
| C O D | IS 3025 (P) 58 -2006RA2017 | 76000 mg/l |
| B O D (3 days at 27O C) | IS 3025 (P) 44 – 1993 RA 2014 | 43000 mg/l |
| Total Kjeldhal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 3540 mg/l |
| Ammoniacal Nitrogen as N | IS 3025 (P) 34 – 1988 RA2014 | 1406.7 mg/l |
| Phenolic Compound asC6H5OH | IS 3025 (P) 43-1992 RA2014 | 16.84 mg/l |
| Fluoride as F | IS 3025 (P) 60 -2008RA2014 | 2.56 mg/l |
| Cyanide as CN- | IS 3025(P) 27-1986RA2014 | BDL(MDL- 0.01 mg/l) |
| Nickel as Ni | IS 3025 (P) 54– 2003RA2014 | BDL(MDL- 0.01 mg/l) |
| Cadmium as Cd | IS 3025 (P) 41– 1992RA2014 | BDL(MDL- 0.001 mg/l) |
| Lead as Pb | IS 3025 (P) 47– 1994RA2014 | BDL(MDL- 0.01 mg/l) |
| Copper as Cu | IS 3025 (P) 42– 1992RA2014 | 3.54 mg/l |
| Mercury as Hg | IS 3025 (P) 48 – 1994RA2014 | BDL(MDL- 0.001 mg/l) |
| Zinc as Zn | IS 3025 (P) 49 – 1994RA2014 | 2.6 mg/l |
| Total Arsenic as As | IS 3025 (P) 37– 1988RA2014 | BDL(MDL- 0.01 mg/l) |

*BDL- Below Detection Level, MDL- Minimum Detection Level*

All the heavy metals are significantly low or below detectable limits. The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from waste.

### 6.4.7 Environmental Baseline

The environmental baseline was assessed from the analytical results of air, surface & groundwater, noise and leachate. The samples by M/s Polluchem Laboratories (P) Ltd. The Environmental baseline was analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the ESIA Section in **Annexure 5**

### 6.4.8 Risk Assessment

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and

pathogens. Proper containment and management of leachate are essential to prevent water pollution.

The analysis of surface water reveals that all the parameters are within the acceptable limit and the dissolved oxygen content is less than prescribed limit, so also the BOD is greater than the allowable limit, indicating that the water contains organic load.

**Table 6.10 Risk Assessment- surface water**

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite -BOD Higher than the acceptable limits |
| **Pathway** | Water/Run off |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | High BOD Indicates the water is highly polluted and it is harmful to the ecosystem as fish and other aquatic life may suffocate in oxygen-depleted waters. Also it will contain more Pathogen and make the water unfit for human and animal |

**Ground Water**: Pollutants from dumpsite can infiltrate into underlying groundwater, particularly if the dumpsite is not adequately lined or if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

The analysis of ground water samples taken at one location reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 5.61, which is in a slightly acidic range which can make the water not fit for any industrial purpose as it is more corrosive.

**Table 6.11 Risk Assessment - Ground water**

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite - pH is acidic in nature |
| **Pathway** | Water ,soil |
| **Receptor** | Humsn, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health are;<br>• Diarrhea<br>• Nausea and Vomiting |

| | |
|---|---|
| | • Abdominal Pain<br>• Weakness<br>Possible risk to flora<br>It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increases the availability of some elements to toxic levels, particularly aluminium and manganese. |

**Air**: Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens, etc. to be ensure

**Table 6.12 Risk Assessment - Air**

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Within the limits |
| **Pathway** | Air |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | No Anticipated risk |

**Soil**: Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

**Table 6.13 Risk Assessment - Soil**

| **Risk Assessment** | |
|---|---|
| **source** | Legacy waste Dumpsite |
| **Pollutant** | Heavy metals |
| **Pathway** | soil |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health: Soil that contains substances such as heavy metals which may be toxic to humans can pass those substances on to humans through crop uptake leading to unsafe foods. |

| | |
|---|---|
| | Possible risks to animals: when farm animals consume the plant grown from contaminated soil it affected the health of animal<br>Possible risk to flora: Soil pollution may after plant metabolism and reduce crop yield, also the trees and plants that absorb the soil contaminants enter into the food chain |

**Bioaccumulation in Biota**: Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the land and minimizing the exposure of organisms to contaminated environments.

**Table 6.14 Risk Assessment - Bioaccumulation in Biota**

| **Risk Assessment** | |
|---|---|
| source | Legacy waste Dumpsite |
| Pollutant | Leachate and heavy metals |
| Pathway | Air,water and soil |
| Receptor | Human, Animals, flora and fauna |
| Risk | Possible risks to human health, animal flora and fauna<br>Accumulated of contaminants in plants and animals indirectly through food chain affects human health |

## 7. Evaluation of Remediation Techniques

Reclamation of existing unmanaged municipal waste dumpsites is becoming a key requirement for ULB's in India as unscientific and unplanned methods of waste disposal in non-engineered landfills have led to lot of environmental issues including soil and ground water contamination, uncontrolled landfill gas emissions into the atmosphere and exposure to disease vectors and scavengers. The Hon'ble NGT seized with these problems across the country has ordered that the respective authorities to remedy this at the earliest.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

Remediation of waste dumpsite is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

- Environment Enhancement - reduction in greenhouse gas emissions, soil pollution, groundwater contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.
- Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
- Land - Dumpsite land becomes available for utilizing the same for the establishment of other Waste Management Facilities.
- Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled, or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels

For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- Baseline study of heavy metals; subsurface soils and water; rainfall; soil type; surface hydrology; topography; wind direction etc. Shall be studied prior to bioremediation
- Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

Alternative analysis for the various dumpsite remediation options are detailed in following section.

## 7.1 Bio-Mining – Reclamation/Recovery of Land

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

| | |
|---|---|
| Salient Features | • Land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>• Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>• Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>• Compliance to SWM Rules and NGT orders.<br>• Improvement in aesthetics and quality of life & health. |
| Applicability | • The ownership is well defined.<br>• Working space is available in the dumpsite.<br>• Linkage for utilization by-products is available |

## 7.2 Capping Without Land Recovery

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas.<br>• Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor |

| | |
|---|---|
| | pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years<br>• Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep- rooted vegetation.<br>• Recurring expenditure will be incurred for regular maintenance. On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio- mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>• SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | • Simple & robust, least expensive method among various available technologies |

## 7.3 Capping with Partial Land Recovery

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bioremediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can be linked to relevant buyers and the inert material will be capped over lower footprints, with well-designed slopes to prevent further degradation of the environment.

The reclaimed land may be covered with loamy soil that has plants with high transpiration rates. The plants do not permit the ingress of water into the soil thereby reducing the possibility of leachate generation. The plants and soil microbes also behave as oxidation layer. The soil is compacted and maintained with gentle slopes with 1V to 3 H. Contour drains may be provided to divert the water away from the soil thereby preventing ponding of water. The reclaimed land may be covered with solar panels to generate renewable energy during the period of observation following the post closure.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>• Ensures short -term sustainability and environmentally sound treatment of legacy waste. |

| | |
|---|---|
| Applicability | • Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area<br>• Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>• Lack of linkage for disposal of inert<br>• Recovery land for public use is not a priority |

## 7.4 Selection of Remediation Option

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Moreover, as per Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping

However, after the bioremediation municipality wants to use the land for setting up of Material Collection Facility and Resource Recovery Facility. Hence backfilling of the site with boulders and inert are planned.

For the execution of dumpsite bio-mining two strategies can be adopted;

- *Insitu biomining*: Here the biomining is carried out within the premises of the dumpsite after clearing the waste and reaching the original ground level or in a land adjoining the dumpsite. The advantage is that only the finished products are moved out of the premises, inerts may be used for gradation and filling up low lying areas within the site, or in a newly developed sanitary landfill. This is quite economical when legacy waste quantities are significant. The possibility of gaseous emissions, noise and odor and formation of leachate exist as the processing takes place at the site. The location would remain affected for the time till all waste are processed.
- *Ex Situ biomining:* In small dumpsites, or where the area is a constraint, the entire waste is excavated and taken away to an alternate location for processing. The work in the dumpsite can be completed quickly and the disturbance due to the excavation can be minimized. The cost of transportation of the whole waste adds to the cost of bio mining. But since the process plant can serve multiple locations, economies of scale may be achieved and may also compensate for the added transport cost.

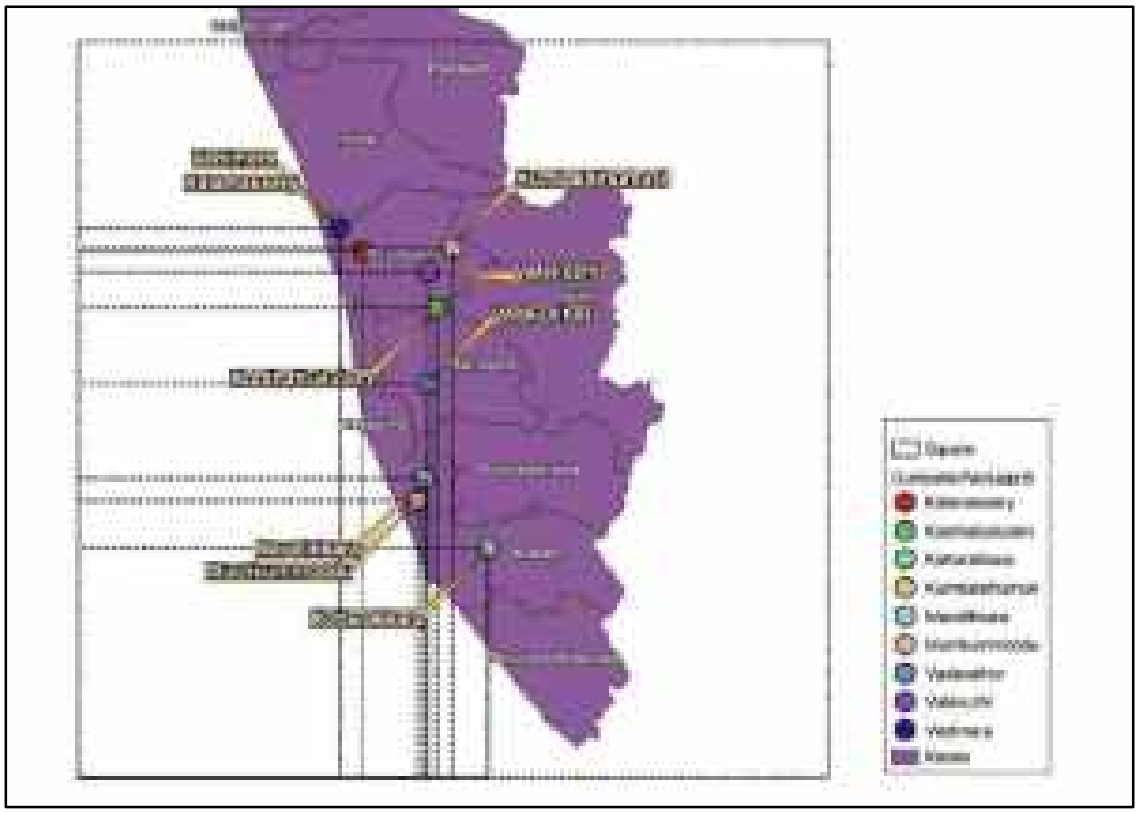

**Figure 7.1 Location of Other Dumpsites nearby**

## 8.0 Technical Description of the Selected Option

### 8.1 Methodology

The legacy waste dumpsite reclamation through bio-mining with recovery of land involves

Phase 1: stabilization

Phase 2: sorting & segregation

Phase 3: disposal & utilization

Phase 4: Back filling of boulders and inerts

### 8.2 Selection of Machineries

The type of machinery, capacity and type of screens to stabilize the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type of machinery available for the bio mining are as follows:

- Stationary screening machinery and
- Mobile/compact machinery

### 8.2.1 Stationary Screening Machinery

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process
- Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

### 8.2.2 Mobile/Compact Screening Machinery

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation

***Structure***: The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity

***Screening Mechanism***: The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

***Separation System***: Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

***Treatment Process***: In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

***Transport***: Quick and easy folding of conveyor helps in quick setup time.

***Discharge height***: Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, stationary trammel machine shall be the optimum screening machinery

## 8.3 System Requirements

The following are the infrastructural facilities required for setting up of machineries and equipment in biomining of a dumpsite: These are required irrespective of the option of in-situ or ex-situ processing.

- Fencing and secure entrance gate
- Security and reception office
- Weighing bridge
- Records room
- Laboratory
- Medical room
- Workers' area
- Parking for vehicles (heavy earth equipment, trucks, etc.) with tire washing facility.
- Administrative building
- Fire control unit (detailed methodology for fire management plan)
- Toilet–bath complex, with personnel protection equipment (PPE) storage room)
- Overhead water tank
- Leachate collection and treatment unit
- Environmental monitoring unit
- Segregation and processing area
- Temporary storage area for rejects, domestic hazardous waste and sanitary waste
- Material storage area
- Waste drying and windrow area.
- DG set

The total area required is about 900 sqm in an in situ biomining plant. The process shed needs to be covered building. Temporary construction power at 440V needs to be obtained from KSEB. This can be easily availed as there is an existing electrical infrastructure passing through the site. A 440V, 125KVA needs to be established for the project. Water storage tanks needs to be provided for the duration of the project. The water may be supplied by tankers. Labour will reside in North Paravur and commute daily to the site, hence no labopur sheds are envisaged during this project. The requirements are only indicative, and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards.

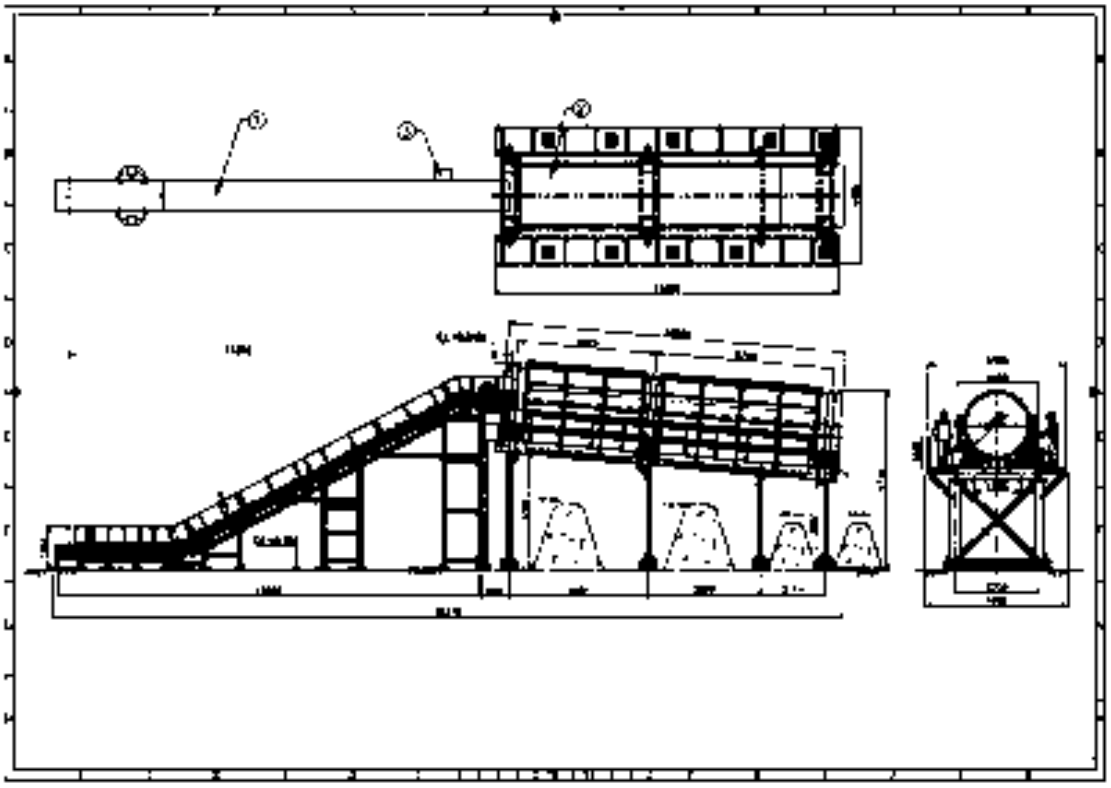

**Figure 8.1 Schematic of the Segregation System**

## 8.4 Site Reclamation Requirement

As detailed under section 6 the North Pravur Dumpsite have waste spread of Approx.1.25 acres of land with a max of waste dump height 2.33 m above the ground level. Estimated volume of waste above the ground level is: 11860 cum which will be around 9488 MT. *(source: Topographical survey result for the North paravur Dumpsite conducted in the year 2022 by ULB)*

In the borehole investigation it was asserted that the depth of the waste column below ground level is 6.75 .m and the quantity of waste below ground level is estimated 11472.84 Cum as detailed under section 6. *(source: Borehole investigation survey conducted by KSWMP through Matter Labs for the North Paravur Dumpsite on June 2023)*

Since the ULB intends to use the land recovered after bioremediation, backfilling of the boulders and inert material obtained after the bio inning is inevitable.

# 9.0 Scope of Disposal Including Location of Disposal for RDF, Bio Soils, C & D Waste, And Others as Per Local Demands

## 9.1 Utilization of By Products

The details of the utilization of aggregates/by–products screened out by processing of the stabilized legacy waste are provided in the table below

**Table 9.1 By Product Composition**

| By-products | Percentage Composition | Quantity (Cum) | Utilization/Linkage/Usage |
|---|---|---|---|
| RDF | 11.04 | 2575.62 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. |
| Inert | 67.56 | 15764.73 | Can be utilized for filling at the site itself |
| Compost Soil Enricher | 21.40 | 4993.49 | Can be used as a soil enricher and given to farmers. The same cannot be sold as fertilizer unless it is enriched with carbon content to meet the standards suggested by FCO for city compost |
| Total | 100 | 23332.84 | |

The **Table 9.1** details the expected recovered items in line with the investigation results present. However, during the execution stage, the bidder is required to analyse each recovered fraction at least every 15 days and report submitted to the concerned authority. It is to be noted that the RFB document should cover necessary clause in this regard.

RDF / SCF consists largely of combustible components which are shredded into a uniform size, in order to produce a homogeneous material which can be used as substitute for fossil fuels in e.g. cement plants, lime plants, coal fired power plants or as reduction agent in steel furnaces. The calorific value of the RDF should be higher than 1500kcal/kg for use in cement plants.

The nearest cement Industry that can accept the RDF from North Paravur City is located near Trichy, TamilNadu at a distance varying between approx 360 kms from the Dumpsite site. The other sites are at Karnataka between 740km to 1074km, while cements plants at Andhra are at 740km to 900kms.

**Table 9.2 Distance to potential RDF / SCF users**

| Name of the cement plant | Location | State | Distance from Kochi (KM) |
|---|---|---|---|
| Dalmia Bharath | Ariyalur | Tamilnadu | 458 |
| Dalmia Bharath | Dalmiapuram | Tamilnadu | 424 |
| ACC | Wadi | Karnataka | 1,075 |
| Chettinad | Karikazhi | Tamilnadu | 315 |
| Chettinad | Kallur | Tamilnadu | 386 |
| Dalmia Bharath | Belagavi | Karnataka | 956 |
| JK | Muddapur | Karnataka | 965 |
| Dalmia Bharath | Kadapa | Karnataka | 739 |
| Bharathi VICAT | Kalburgi | Karnataka | 1,074 |
| JSW | Kurnool | Andhra Pradesh | 901 |

| | | | |
|---|---|---|---|
| Bharathi VICAT | Kadapa | Andhra Pradesh | 739 |
| Ultratech | Tadipatri | Andhra Pradesh | 815 |
| Zuari | Yerraguntla | Andhra Pradesh | 877 |

Based on the chemical analysis the waste material has less than as suggested by the Fertiliser Control Order (FCO). The screened compost materials having size less than 4 mm shall be heaped to form windrows, the leachate from excavation shall be used for enriching the compost qualities to the FCO standards and its amendments from time to time. The materials shall be tested for carbon content and NPK values during execution of works, the materials may be sold to farmers depending on the test outcomes. If the compost materials are not meeting with the standards, the same shall be mixed with good earth sourced from external sources to form uniform mix having a density of minimum 2400 kg/cubic meter and shall be used for refilling within site itself.

Inert is coarse fraction received from the landfill mining of MSW. It is comprising stones, construction debris, ceramics, some decomposed organic matter. This is helpful in backfilling in the site or can be use as a subgrade material for highways, low land filling. It can also be used as cover for landfills.

## 10 Estimated Project Cost

The details of the estimated cost for bio-mining - recovery of land by remediating legacy waste dumpsite is provided in the table below:

**Table 10.1 Details of Estimated Project Cost**

| Sl. No. | Activity | Rate/ m3 | Quantity (m3) | Amount (INR) |
|---|---|---|---|---|
| 1 | **Bio-mining Operations** | | | |
| a | Processing the Waste | [redacted] | [redacted] | [redacted] |
| 2 | **Disposal Cost** | | | |
| a | Disposal of RDF | [redacted] | [redacted] | [redacted] |
| b | Disposal of Compost/ Soil enricher | [redacted] | [redacted] | [redacted] |
| c | Disposal of Inert | [redacted] | [redacted] | [redacted] |
| | Total (1+2) | | | [redacted] |
| | E & S Safeguards from ESIA | | | [redacted] |
| | Contractors Profit and Overheads at 15% | | | [redacted] |
| | Net Cost | | | [redacted] |
| | Average Cost Index for Kerala based on DSR 2018 is ~1.35 at present. Considering the same, the Grand Total | | | [redacted] |
| | Cost per m3 | | | [redacted] |

### 10.1 Revenue from the Project

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at free cost and transportation cost also not borne by the cement industries.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable

### 10.2 Funding for Project

The estimated cost of INR [redacted] for the project Dumpsite Remediation. The sources and funding pattern is given below:

**Table 10.2 Sources of funds in Crores**

| Sl no | Item wise funding pattern | | | |
|---|---|---|---|---|
| | Item | External (70%) (INR) | State Govt.(30%) (INR) | Total Cost (INR) |
| 1 | Dumpsite remediation for the North Paravur | [redacted] | [redacted] | [redacted] |

## 11.0 Project Implementation Plan

North Paravur Municipality intends to complete this project as early as possible. However, considering the time required for mobilisation, installation, sieving and handling recoverable etc, a time frame of about 06 months is considered.

### 11.1 Timeline

The broad timeline for the execution of this project is given below.

**Table 11.1 Project Timeline**

| TIMELINE CHART FOR EXECUTION | | | | | | | |
|---|---|---|---|---|---|---|---|
| S. No. | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
| 1 | Planning & Mobilization | | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries , Hiring & Installation of Machineries, Electrical Works | | | | | | |
| 3 | Excavation of Legacy Waste | | | | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | | | | |
| 5 | Windrow Formation & Spraying of Bio culture | | | | | | |
| 6 | Sieving Operations | | | | | | |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | | |
| 8 | Project Closure Activities:<br>Levelling of Reclaimed Land using Bio-soil<br>Handover the available infrastructure at site to the ULB<br>Closure Report Submission to ULB, | | | | | | |

## 11.2 Contract Model

***Execution Method:***

Design, Own, Operate and disposal/Management of by-products/aggregates with zero residues and maximum land recovery. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

***Working Model***

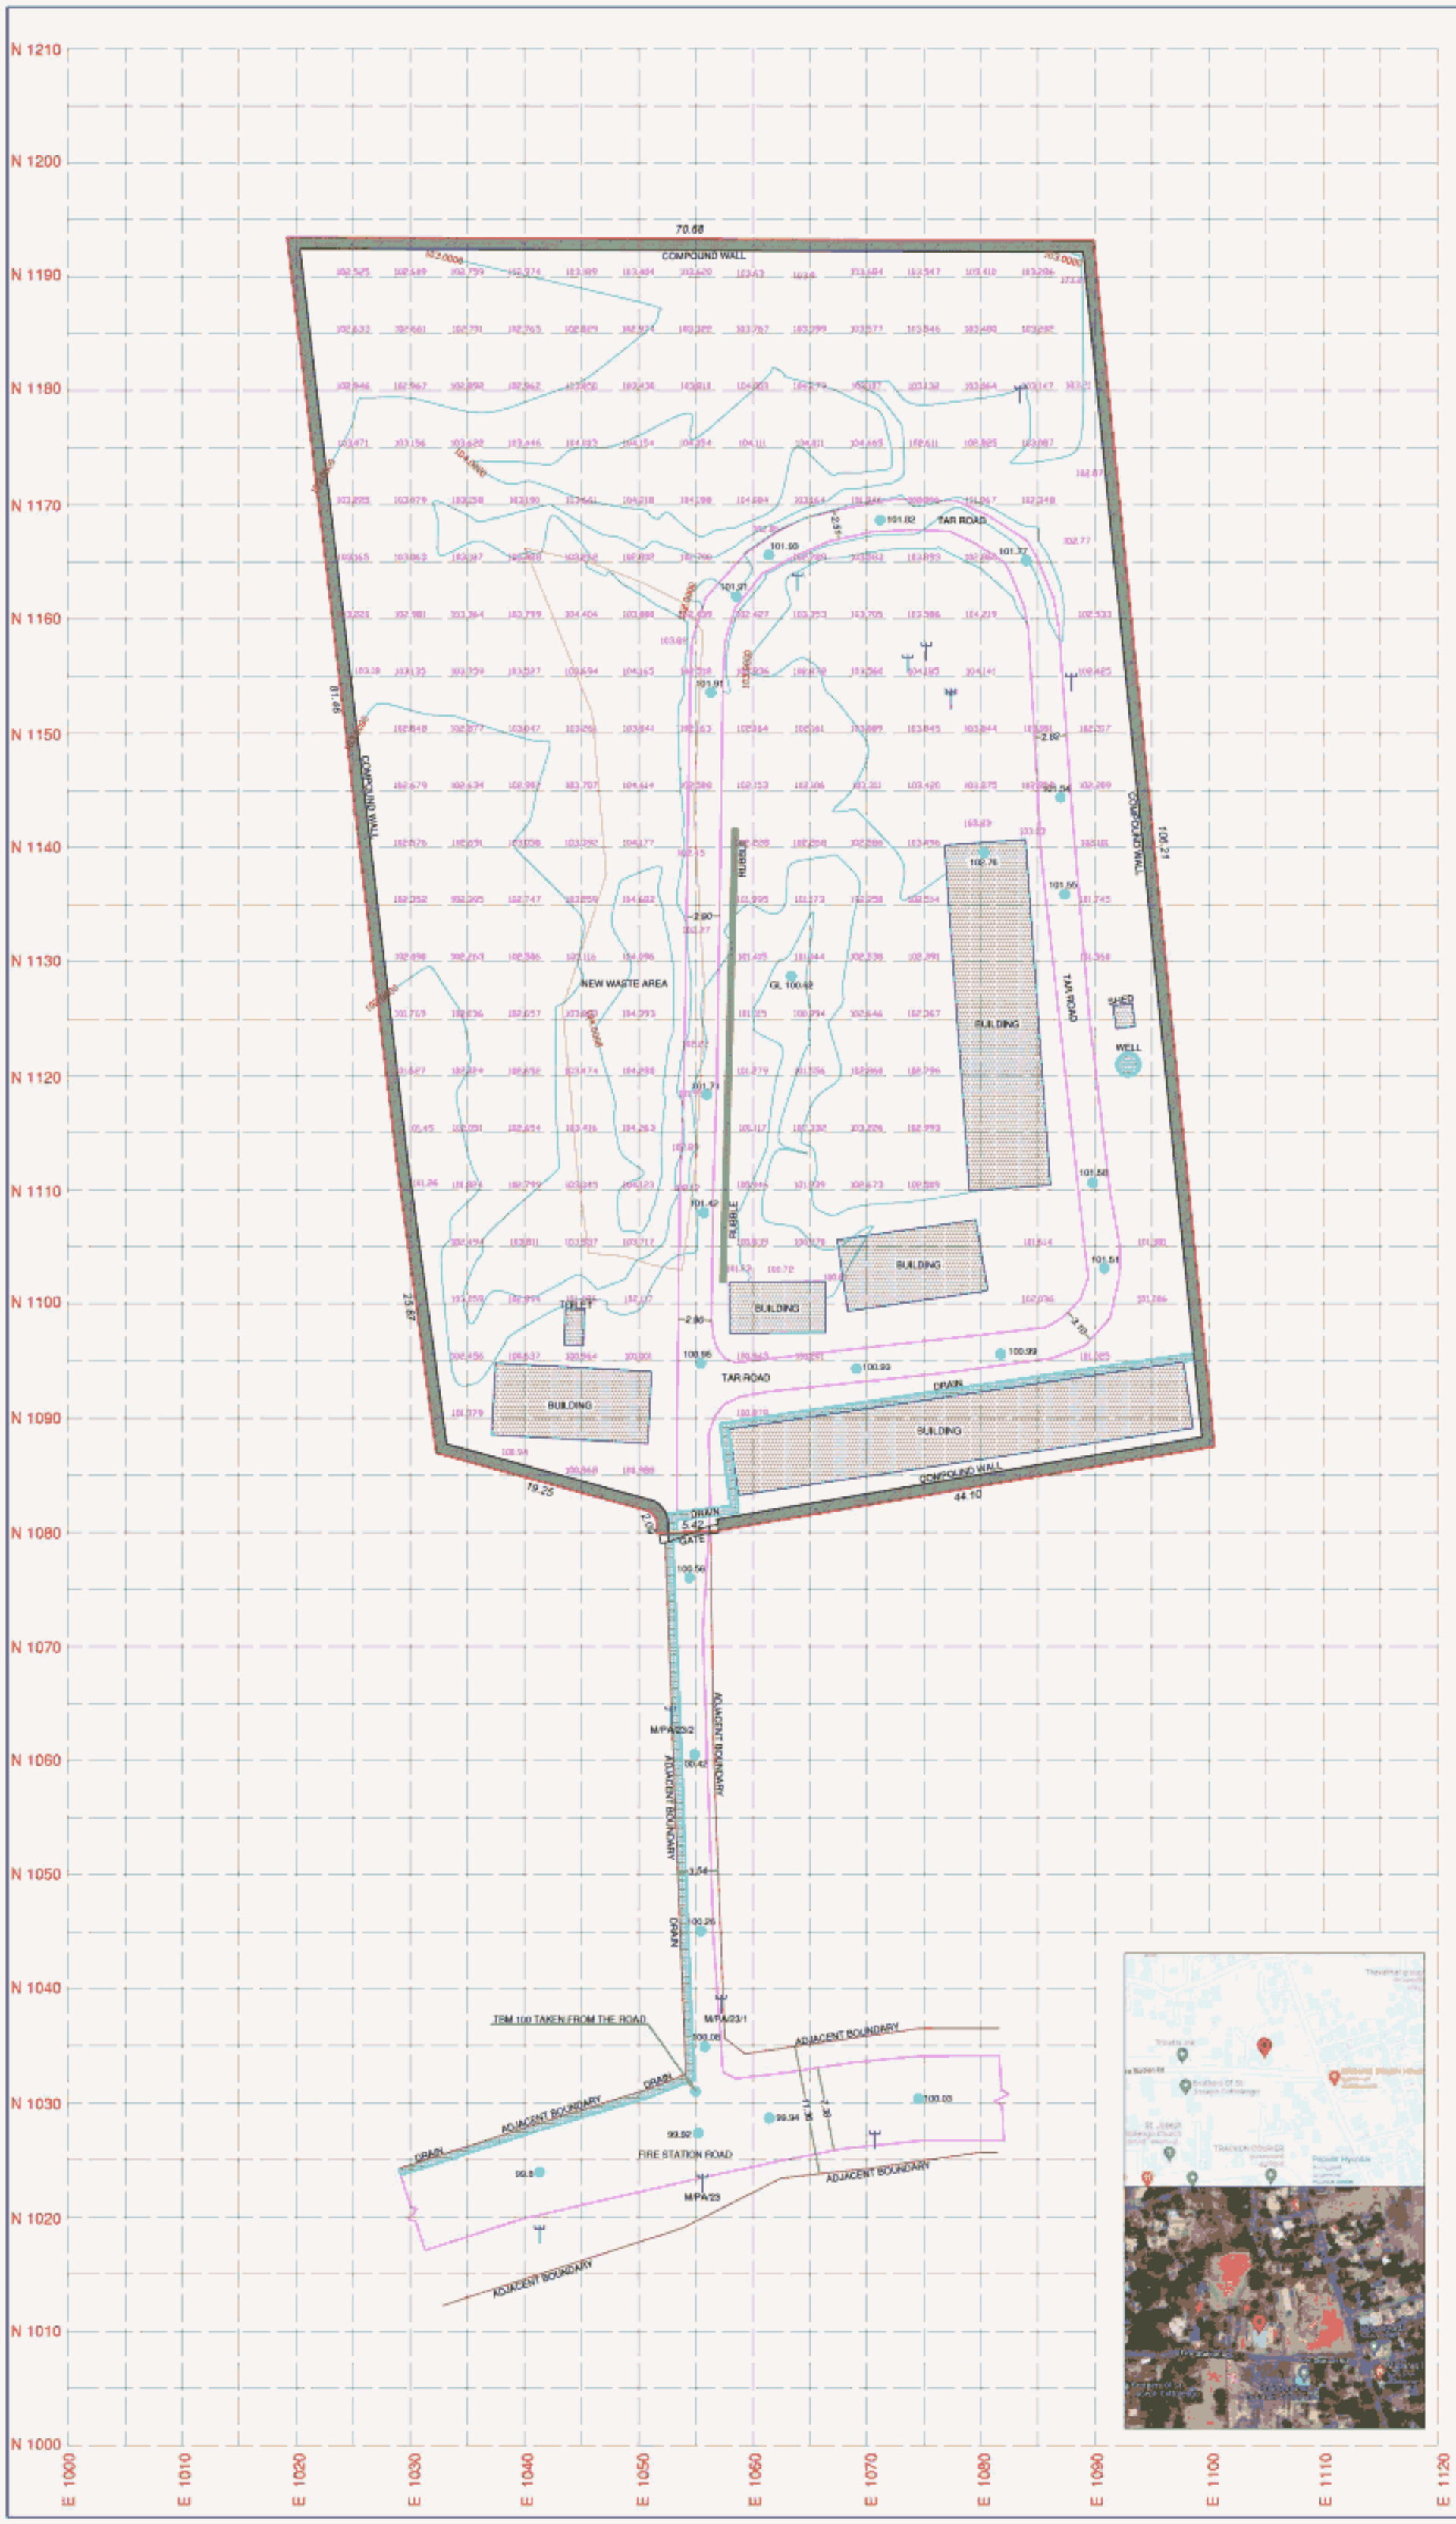
- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for setting up the plant to the Contractor.
- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- ULB shall facilitate the disposal/Utilization of By-products and contractor is responsibility for disposal of RDF, recyclables and aggregates

## 12 Benefits of the Project

The project benefits of dumpsite remediation at North Paravur are;

- Reclamation of Land: An area of 1.25 acres will be reclaimed which can be used for resetting SWM facilities of ULB
- Environmental Protection: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity
- Health Improvement: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- Enhanced Water Quality: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to safe drinking water.
- Aesthetic and Social Benefits: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- Operational & Life cycle Aspects - Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through a bio-mining process.

## 13. Conclusion



- The activities of the bio-mining will be commenced from December 2023 to Mar 2024. An area of **1.25 acres** will be reclaimed and will be used for setting up other solid waste management facilities in future.
- Optimum of the land will be reclaimed and recovered through the biomining process, and this will by ensuring environmental safeguards.
- For the optimum screening of the **23332.83 m3** of legacy waste, mobile / compact screening machinery shall be used.
- Favourable site conditions for bio-mining:
    - Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
    - Piped water supply is available at the dumpsite.
- The project activity requires “Site Authorization, Consent to Establish and Consent to Operate” from KSPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, NGT orders, KSPCB norms, World Bank guidelines and KSWMP ESMF and other regulatory rules & norms Environmental & Social safeguards:

- The project attracts E2 Environmental category based on the project activities and status of the environment baseline.
- Site specific Environmental Assessment and Environmental Management Plan has been developed.
- The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.

- Total cost of the project is Rs [redacted]

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Vedimara, North Paravoor, Ernakulam district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 23rd May 2023. During the site visit, it was observed that the dumpsite is situated with people living around the dumpsite. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 10th June 2023 and was completed on 11th June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

# 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along with Mr. Ajit Kumar Nayan and Mr. Ravi Kumar of IPE Global during the fourth week of May 2023, in order to

collect the information regarding the site prior to mobilizing the equipment for drilling. It was observed that there is habitation situated around the dumpsite at this location. At the point of location of borehole, a 1.0m depth of waste was cleared before drilling.

**Figure 1** : Location of the borehole drilled at the dumpsite.

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste in the landfill.

### 4.2 Drilling equipment

Mechanical rotary drilling machine was used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Extraction of Cores:**

The core samples were extracted from the core barrels in a manner to prevent disturbances to the core. All the pieces of cores were sequentially numbered from top to bottom. Arrows indicating the lower end of the piece are marked on each core. Rock classification in terms of weathering and state of fractures and strength is carried out in the following manner. Tabulations given in below explain it briefly.

**Table 1: Rock Classification**

| Terms | Description | Grade |
|---|---|---|
| Fresh | No visible sign of rock material weathering; perhaps slight discoloration on Minor discontinuity surfaces. | I |
| Slightly Weathered | Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discoloured by weathering. | II |
| Moderately Weathered | Less than half of the rock material is decomposed or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as core stones. | III |
| Highly Weathered | More than half of the rock material is decomposed or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as core stones | IV |
| Disintegrated Rock | All rock material is decomposed and / or disintegrated to soil. The original mass structure is still largely intact. | V |
| Residual Soil | All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported. | VI |

-As per IS 4464-1985 (Reaffirmed 2004)

It should be understood that all grades of weathering may not be seen in a given rock mass and that in some cases a particular grade may be present to a very small extent. Distribution of the various weathering grades of rock material in the rock mass may be related to the porosity of the rock material and the presence of open discontinuities of all types in the rock mass.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log the commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of

each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 2** and the complete results of laboratory testing are presented in **Appendix II**.

**Table 2: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |
|---|---|---|---|

## 6 SUMMARY

The geotechnical investigation of the original ground below the waste at the dumpsite at Vedimara, North Paravoor, Ernakulam district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 12.0m (6.75m in waste and 5.25m in the ground). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples.

Based on the investigations carried out, it is observed that below the dumped waste, a 1.3m thick sandy layer is present, followed by a 2.0m thick layer of silt with sand which is resting on a highly weathered strong biotite gneiss with an average core recovery of 20% for the depth of cutting of 2.0m. As per the information provided by the client, the waste in the dumpsite needs to be excavated, segregated using a few machinery and the inert material left after the bio-mining needs to be dumped within the site. As informed by the client, during the process of bio-mining the waste would be excavated from one feasible location of the site and transferred to another location of the site. During these operations, any temporary storage waste in the form of heaps should be carried out ensuring the stability of the sloping face of the waste. It is suggested that for slopes with height ≤ 1.5 m the angle of face should not be steeper than 45°. For slopes of height greater than 1.5 m the slope should be limited to 300 to horizontal or flatter. It is not advisable to use slope heights > 5 m without a proper stability analysis. If the inert material is being disposed at the site with no further plans of transporting it or transferring it, it is recommended to compact the material into layers using an 8-10 T roller with compacted lift thickness not exceeding 300 mm.

**The Safe Bearing Capacity (SBC)** is calculated as per IS 6403:1981 (Reaffirmed 2021). For any temporary structures planned at the site, the **recommended allowable bearing pressure** for isolated footings at a minimum depth of 1.0 m below **original ground level** is **50 kPa.** The ground profile consists of a clay layer of 2.0 m thickness underlain by rock. Hence, long term consolidation settlement may be a concern if the original ground is subjected to pressure appreciably greater than it has experienced before. The parameters obtained from the consolidation test of the soil at 2.75 m Appendix II can be used to evaluate the settlements of the ground. For any slope stability calculations involving the natural ground, the parameters presented in the summary sheet of laboratory results can be used.

The above recommendations are made based on the subsoil profile and laboratory test results obtained on the samples collected from the site. If there is any variation in soil profile during execution, fresh recommendation may be obtained from M/s Matter Material Testing & Research Laboratory (P) Ltd. or from a qualified and experienced geotechnical engineer.

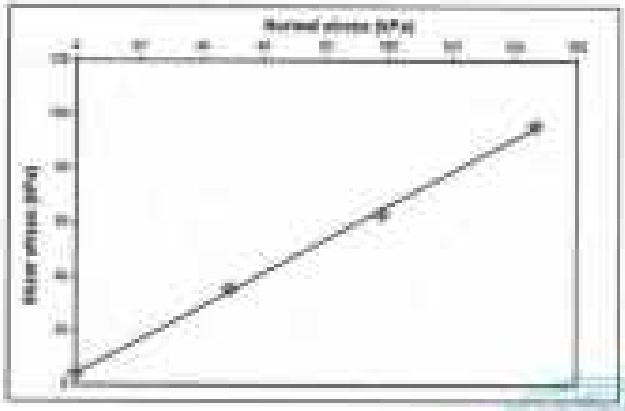
| **Test Location:** | MatterLab - Kozhikode | **Lab Sample Desc.:** | Soil (UDS-3), BH 01, Depth 0.50m |
| **Tested By:** | MV | **Client Sample Desc.:** | Soil (UDS-3), BH 01, Depth 0.50m |

### Test Results



Method: IS 2720 (Part 13)-1986

| | |
|---|---|
| Area of specimen ($cm^2$) | 36 |
| Height of specimen (mm) | 20 |
| Rate of strain (mm/min) | 1.25 |
| Test Condition | Unconsolidated Drained |
| Bulk Density ($Mg/m^3$) | 1.70 |
| Moisture content (%) | 16 |
| Dry Density ($Mg/m^3$) | 1.46 |

| Load Increment | Applied Normal Stress (kPa) | Maximum Shear Stress (kPa) | Displacement at Max. Stress (mm) |
|---|---|---|---|
| 1 | 49 | 85.4 | 2.0 |
| 2 | 98 | 63.2 | 1.8 |
| 3 | 147 | 95.9 | 3.6 |

Cohesion Intercept (C'), kPa: 4

Angle of Internal Friction (ϕ'): 32°

For and on behalf of MatterLab

### Comments

*Information provided by client

Material tested was passing 4.75 mm test sieve, recompacted at maximum achievable density and moisture content

All work carried out at Matter Lab, and subsequent work conducted in accordance with, accepted terms and conditions of Matter Lab.
This document may not be reproduced except in full, except with the prior written approval of the issuing laboratory.
Tested results relate only to the samples tested.

- **Survey Map and Contour Map**

- **Proposed Operational Plan**

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the contractor to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to biweekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

## 1. Introduction

The Vedimara Dumpsite is situated at the ward No.10 of North Paravur Municipality in the Ernakulam District. The Dumping has started here in the year of 1997 onwards. This screening report provides an update about the Vedimara dump site, based on the findings from the social screening and transect walk. The report addresses the current situation at the dumpsite, potential social impacts due to the implementation of the project, recent fire incidents, remediation efforts, the quantity of legacy waste, the dumpsite's location within the solid waste management facility, and the complaints received from nearby communities.

## 2. North Paravoor Municipality- Brief Profile

North Paravoor is a town in the midlands directly to the east of Kochi in Ernakulam district, Kerala. North Paravoor, formerly known as Paravur or Parur, is a municipality and suburb in Ernakulam district in the Indian state of Kerala. It is a northern suburb of the city of Kochi and is situated around 20 km from the city centre. The coastal highway NH-66 Panvel-Kanyakumari passes through this town. The National Waterway-3 Kollam-Kottapuram passes through the west end of the taluk. Total population of the ULB is 31,503 (as per Census 2011). North Paravoor Municipality is located at latitude 10.15°N and longitude 76.23°E and is located on the western part of the district.

## 3. Vedimara Dumpsite

North Paravur dumpsite is located at a distance of 2 km from the centre of North Paravur town in western side and encompasses an area of approximately 1.25 acres of land. The dumpsite is not very far from human settlement. The coordinates of the dumpsite are, 76.242212 E & 10.150518 N. It is located in ward no. 10 of the municipality. North Paravur municipality holds the ownership of the dumpsite. The dumpsite is surrounded by highway from north-western directions. Dumping was started in this site in 1985 and stopped in the month of April 2023. As of now 50 % of the area is covered with solid waste. Presently, the quantity of waste dumped at this site is about 11,860 cum m as per the records available with the ULB.

*Table 3.0.1 Project Information*

| PROJECT INFORMATION | |
|---|---|
| **Location of the sub-project** | Dumpsite Remediation-Vedimara, North Paravoor |
| **GPS coordinate of the Site** | 10. 150518, 76. 242212 |
| **Name of the sub-project** | North Paravoor Solid Waste Dumpsite Reclamation by Bio mining |
| **Name of ULB** | Paravoor |
| **District** | Ernakulam |

| | |
|---|---|
| **Taluk** | Paravoor |
| **Total population in the ULB** | 31503 |
| **Proposed dumpsite area (in acres)** | 1.25 |
| **Land Use and Other Details** | Land Use: Solid Waste Management<br>Ward Name: Vedimara |

## 4. Socio economic baseline of Host community

It is observed that, there are 40 households, a church with a rehabilitation centre for differently abled people with 35 inmates, one fire station **etc.** are situated within the radius of 200 meters from the dumpsite. Among them, a single house and a mechanical workshop were found very close, **i.e.,** within 20m distance from the dumpsite.

## 5. Vulnerability mapping of the Host community

| Sl No. | Particulars | Nos. |
|---|---|---|
| 1 | Number of senior citizens, aged above 60 | 50 |
| 2 | Number of single women | 17 |
| 3 | Physically challenged persons | 35 |
| 4 | Persons with chronic diseases | 15 |
| 5 | Persons having respiratory issues | 20 |
| 6 | Children below 5 years of age | 19 |

*Source of data: Secondary data from Ward level health officer*

## 6. Data Collection Tools

### 6.1 Social Screening

The social screening was conducted using the social and tribal screening checklist in accordance with the requirements of the ESMF. It has been observed that the only anticipated risk is associated with labour, with no other adverse social impacts on dwellings, land, labour, livelihood, or community resources of the host and other vulnerable communities. The assessment of the social screening indicates that the remediation of the dumpsite can have a positive impact on the living conditions of the host community.

Municipality is running an MCF, Vermi compost unit and windrow compost unit in the same compound. Total 46 HKS and 6 sanitation workers are working on shift basis in these units. So, it is essential to adopt proper measures to do the remediation work without interrupting the functioning of these units. No other specific social risks are identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process functioning in the site.

6.2 Transect walk

Transect walk is conducted to understand the social dynamics, demographic profile, livelihood patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community. The transect walk at North Paravoor dumpsite was carried out on 6-06-2023, which is crucial for developing effective dumpsite remediation strategies that align with their priorities

A transect walk was conducted in and around the dumpsite on 06/06/2023. The aim of the transect walk was to assess the site and gather information about its location, potential social risks, existing infrastructure, and the impact on surrounding communities. The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions and systems by observing, asking, listening, looking and producing a transect diagram. Information collected can be used to reveal land use practices, hazards and vulnerabilities to inform disaster mitigation and water management

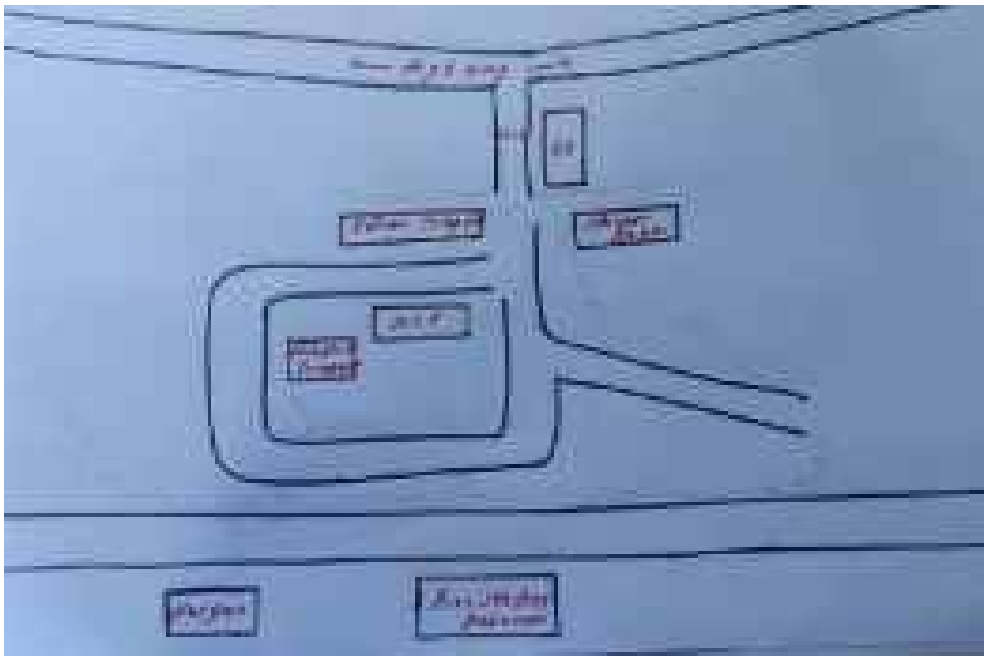

*Figure 6.1 Transect walk Map*

### 6.3 Focused Group Discussion

A Preliminary discussion was conducted on 30.05.2023 in the municipal hall with the families and representatives from the nearby institutions to identify their concerns about the remediation process. The dumpsite remediation process, benefits of the remediation were discussed during the meeting and addressed all the doubts and concerns of the host community during the stakeholder meeting.

### 6.4 Site Specific Observations from Transect walk and social screening

The major observations from the social screening and transect walk are given below:

- It is observed that, elderly aged above 60 years is running the windrow compost unit at the dumpsite. She is working on a full-time basis and this is the major source of income.
- It is observed that, there are 40 households, a church with a rehabilitation centre for differently abled people with 35 inmates, one fire station etc. are situated within the radius of 200 meters from the dumpsite. Among them, a single house and a mechanical workshop were found very close, i.e., within 20m distance from the dumpsite
- The Haritha Karma Sena (HKS) workers and sanitation workers, engaged in the waste management process in the MCF are not using protective gears.
- A rehabilitation centre with 35 differently abled people is functioning within the 200 meters radius from the dumpsite.
- There are no rag pickers staying within the 200-meter radius from the site.
- It is informed that, there was a fire hazard happened in the year 2019, and a major flood occurred in 2018.
- There is no requirement for government, forest, or private land acquisition for the dumpsite remediation project.
- The existing road to the dumpsite is only 3 meters wide, which is insufficient for accessing large transportation vehicles required for the remediation project.
- It is observed that, the host community is facing so many environmental and social issues due to the dumpsite.
- Proper firefighting mechanism is not installed in the dumpsite.

## 7. Stakeholder Analysis

Social safeguard aspects during dump site remediation are mainly focusing on meaningful stakeholder engagement, understanding stakeholder's risk perception and restoring them to a safe and environmentally sustainable state. The remediation process requires collaboration of the following stakeholders.

*Table 7.0.1 Stake Holder Details*

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 1 | ULB Council | Provide ground support |
| 2 | ULB Officials | Support and Monitoring of the process |
| 3 | DPMU | Monitoring and Evaluation |
| 4 | TSC/PMC | Technical support and consultation |
| 5 | Contractor | Execution of the Remediation process |
| 6 | Service providers/HKS | 46 HKS workers and 5 sanitation workers helps in the proper collection and waste segregation to prevent further dumping after remediation. |
| 7 | Public coming to the nearby workshop | Support and cooperation for the remediation process |
| 8 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 9 | Rag Pickers | Participation of informal sector to strengthen the collection process for preventing further dumping. |
| 10 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 11 | Owner and workers in the Workshop located within 20m of the site | Cooperating with the remediation process. |
| 12 | Public coming to the nearby workshop | Support and cooperation for the remediation process |

| | | |
|---|---|---|
| 13 | Staffs of the Fire Station located within the 20m of the site. | Provide emergency service at site if any emergency situations like fire or accidents at site. |
| 14 | Scrap dealers | Informal participation in NBD waste management to prevent further dumping after remediation |
| 15 | End recyclers | Process the inert and legacy waste safely after remediation |

## 8. Positive social impacts after remediation

Dumpsite remediation will create 1.25 acres of vacant land which can be effectively useful for other purposes of ULB especially for the waste management. Apart from the land, many dumps show significant contribution of recyclables to the revenue generated. And the removal of waste dump sites can create new opportunities for economic development in the area. The cleaned-up land can potentially be used for new construction, commercial development, or recreational activities. Other major positive social impacts are shown below.

### 8.1 Enhanced quality of life

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing in ward 6, the project can contribute to an improved sense of well-being. Also, it results to a clean and hygienic work environment for the workers engaged in MCF.

### 8.2 Livelihood and employment of vulnerable community

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

### 8.3 Economic opportunities.

After remediating the site, the Municipality is planning to enhance the capacity of the MCF to process more non-biodegradable waste and to set up a centralized waste management unit to process the biodegradable waste. These projects will create more job opportunities to the people who are looking for employment in waste management sector.

### 8.4 Access to service.

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the exiting site.

## 9. Expected social impacts during the remediation

- As a result of remediation process, health and safety issues may occurs to the SWM workers currently working inside dumpsite.
- GBV/SEA incidents might be occurred to the SWM workers and host community members as a result of labour influx as part of remediation.
- Chances of Spreading of Communicable diseases.
- There is a high chance of fire incidents, as there is no firefighting mechanisms installed in functioning MCF.

## 10. Feedback from Screening and Transect walk

- Effective FGD'S should be conducted among the host communities with the elected representatives, community leaders and ULB authorities for conveying the benefits of dumpsite remediation.
- Proper firefighting mechanisms to be established inside the dumpsite.
- A project-level grievance redressal mechanism will be established to address GBV related issues during the work execution.
- The existing road to the dumpsite is only 3 meters wide, which is insufficient for accessing large transportation vehicles required for the remediation project. However, there is an alternative road on the north side of the dumpsite, which is 7 meters wide. It is recommended to reopen this road before commencing bio mining operations to facilitate the transportation of construction materials.
- A detailed IEC plan needs to be prepared.
- Proper sign boards and emergency numbers should be exhibited.

## 11. Scoping of Social Impact Assessment and required Action plans

All the social risks were identified through the social screening and Transect walk conducted at site. Since there are families and institutions in the proximity of the dumpsite, below shown action plans have been formulated to be followed at site.

- **Labour Management Plan**:

Approximately 15 laborers would be engaged in a day during the bio mining process on a regular basis for a period of 6 months. The contractor must get all the mandatory registrations and licenses and to comply with all relevant labour laws. Labour management plan has been prepared and attached as Annexure.

- **Labour Influx Management Plan**

Since the site is near to the habitation, the influx of labour may affect the host community. So, an action plan has been prepared and the same is attached as Annexure.

- **Preventive GBV Action plan**

Preventive GBV plan shall be formulated and followed at site by the contractor as there are female workers engaged in work in the MCF and Windrow composting unit. An action plan has been prepared and the same is attached as Annexure.

- **Citizen Engagement Plan**

Being a thickly populated area, and considering the concerns of the host community, a detailed Community engagement plan has been prepared and the same is attached as Annexure.

As per the detailed assessment of potential social risk during the remediation process, the identification from social screening with screening checklist, transect walk and focus group discussion indicates that there will not be any impacts on the livelihood of the community and service providers including rag pickers and land acquisition is not required as sufficient land is available.

## 12. Conclusion.

The Social Screening and Transect Walk of the North Paravoor Dumpsite helped to analyse and identify the potential social impacts of the dumpsite remediation process on the host community. It also provided insight on the social dynamics, demographic profile, livelihood patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community. Removing the current legacy waste at the dump site via bio-mining will be extremely useful to the residents of the area. This can also eliminate the threat of summer fires and protect water supplies from contamination caused by excess leachate during the wet season. This will undoubtedly improve the quality of life for local communities while avoiding health problems caused by pollution. The proposed mitigation measures in this report will reduce the social risks identified through social screening and transect walk.

# ANNEXURE-1

## Citizen Engagement Plan

### 1. Stakeholder identification

As part of social safeguard initiatives for the Bioremediation of Vedimara dumpsite at North Paravoor, the social experts of TSC, DPMC and DPMU conducted interactive meetings with local community and functionaries of North Paravoor Municipality and PIU team. A detailed list of primary and secondary stakeholders is prepared on the basis of these exercises.

#### 1.1 Waste Generator

Since the dump site has been officially closed for the last 3 years, the waste generators in North Paravoor Municipality do not have any stake in the programme at present. But 40 families staying close to the Dump site and the employees of the nearby institutions such as Shelter home, Church and shops are the primary stakeholders.

#### 1.2 Service Providers

For the successful completion of the bioremediation project, service of many people, agencies and departments are to be ensured by proper advocacy and networking initiatives. Following is the list of service providers identified through stakeholder analyses and their expected role/responsibility in the project.

*Table1.1 Roles of Stakeholder*

| SL No | Stakeholder | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 1 | Municipal Council | Providing ground support and Monitoring |
| | Officials/staff members of the Municipality | Administrative supports and support for the monitoring of the process |
| 1 | Govt institutions like PCB, KSEB, KWA, and health department | To deliver necessary approvals and provide services for the remediation purpose |
| 3 | KSWMP | Monitoring and Evaluation |
| 4 | TSC/PMC | Technical support and supervision |
| 5 | Contractor | Execution of the Remediation process |
| 6 | Service providers/HKS of the Municipality | Proper collection, segregation, and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the future |
| 7 | Labors of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |

| | | |
|---|---|---|
| 8 | Waste Generator in the Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 9 | End recyclers | Process the inert and legacy waste safely after remediation |
| 10 | Media | Create an enabling environment for the successful completion of the project through positive reporting by the media. |
| 11 | Police | Ensure law and order in the area, if required |
| 12 | Fire and safety | Extend assistance in case of an emergency. |

## 2. Need of Plan

Citizen engagement as part of the proposed bioremediation of Vedimara dumpsite aims to facilitate two-way communication between the project and its stakeholders in order to make better informed decisions that are of value to the residents of the Municipality. Such an engagement will certainly pave the way for better implementation of the project, and it will ensure public participation in trouble shooting at all the stages of the implementation of the project.

## 3. Objective of Plan

The citizen engagement plan for the proposed dump site remediation is prepared with following objectives.

- To create a conducive environment for the smooth implementation of the proposed bioremediation of the dumpsite by promoting constructive dialogues between the project and its stakeholders.
- To ensure stakeholder participation in the planning, implementation, and monitoring of the project.
- To suggest appropriate activities with a monitoring plan and an expected budget for engaging the stakeholders with the motive of enhancing their ownership in the project through increased participation.

## 4. Stakeholder concerns

### 4.1 Waste Generators

The existing dump on the site is now the concern of the host community for the prevailing environmental and social problems facing them. The remediation work may create some discomfort to the 40 families residing near to the site and the persons associated with the nearby organizations/institutions. This can be managed through proper orientation and proper awareness generation.

### 4.2 Service Providers

Major concerns of the service providers which has to be addressed by the citizen's engagement plan can be summarized as follows.

- The policy makers and decision leaders of the Municipality are not aware about the urgency and importance of remediating the dumpsite. Hence there is an apathy observed among the councilors and officials to the project. Their improved involvement through proper sensitization is essential to the effective implementation.

- SWM related Service providers, HKS working in the MCF, RRF and windrow composting unit at the site need to be properly oriented about the project and health and safety measures to be adopted during the remediation period.
- The entire SWM related Service providers/HKS of the Municipality should be trained and motivated for proper timely collection, segregation, and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the future.

## 5. Public disclosure Activities proposed

### 5.1 Community Awareness

- Orientation meeting and focused group discussions with host community
- Organize exposure visit to any of the site where the remediation process completed successfully. Members from the primary stakeholders and ULB council may be participated in the exposure visit.
- Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency.

### 5.2 Awareness to Service Providers

- Sensitization on the bio-remediation activity is to be conducted for the Municipal Council and officials prior to the commencement of the actual bio-remediation process.
- Meeting with Contractor to understand their plan of operations/ labors involvement/timeline etc.
- Orientation to the Service providers/HKS members working in the MCF, RRF and Windrow unit.
- Sensitize the local and district level police officials on the proposed bioremediation in the dumpsite and anticipated issues and action required.
- Orientation meeting to the labors about the LMP and GBV action plan to be followed at the site.

## 6. Citizen Engagement Plan Matrix

| S. No | Engagement Challenge | Purpose on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Awareness on Project activities | | | |
| 2 | To facilitate timely support from the ULB and avoid delays in decision making. | To establish transparency and building confidence in the project commitments to ULB elected members and officials. | Sensitization on the bio-remediation activity is to be conducted for the Municipal Council and officials prior to the commencement of the actual bio-remediation process. | Contractor/PIU |
| 3 | To create awareness among 40 families of host community) and members of nearby organizations about the proposed bioremediation activities and safeguard measures to be adopted | To establish transparency and build confidence in the project commitments to the host community. | Sensitization meeting to host community | Contractor/PIU |
| 4 | To facilitate and establish problem solving mechanism at dumpsite site level | To facilitate host community participation in the Bioremediation activity and establish a mechanism to solve the issues raised at the site level at the earliest and avoid any delay and interruptions. | Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency. | Contractor/PIU |
| 5 | Understand the actual operational plans (Time of operations, Machineries involved, no of workers and labour details, action to be | To inform actual plan of operations to the host community and prevent any social and environmental issues and plan mitigation measures | Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc. | Contractor/PIU |

| | | | | |
|---|---|---|---|---|
| | taken for dust, odor and sound pollution, Vehicle movements etc. for mitigation measures to be planned. | | | |
| 6 | Confidence building measures in the host community to create community participation and generate positive attitudes for bio mining activities. | To avoid delays and completion of remediation activity as planned | Organize exposure visit for the host community and ULB council members | Contractor/PIU |
| 7 | To facilitate proper collection, segregation and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the future | To safeguard the environment, promote a healthy society, and implement measures for climate-resilient activities. | Orientation to the Service providers/HKS Municipality | Contractor/PIU |
| 8 | To secure support from the line department and prevent delays in decision-making. | To avoid delays and completion of remediation activity as planned | Issue based one to one meeting with Govt institutions like PCB, KSEB, KWA, Health Department | Contractor/PIU |
| 9 | To garner public support and ensure the smooth implementation of bioremediation activities | To raise awareness about the positive impact within the community and dispel any doubts regarding the remediation process. | Orientation to the Media persons on the proposed remediation in the dumpsite. | Contractor/PIU |
| 10 | To ensure peaceful and smooth bio remediation activity and prevent | To prevent unrest and social issues | Sensitize the local and district level police officials on the proposed bio remediation and | Contractor/PIU |

| | | | | |
|---|---|---|---|---|
| | any law and enforcement issue | | anticipated issues and action required | |
| 11 | Making aware of labors of the contractor about the Labour management Plan and GBV action plan to be followed at the site | To prevent violations in the action plans | Interactive session with Labors | Contractor/PIU |

7. Budget

| S. No | Activity | Specification | Quantity | Cost |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activity is to be conducted for the Municipal Council and officials prior to the commencement of the actual bio-remediation process | Half day Programme for the Councilors and Health Staff | 1 | [redacted] |
| 2 | Sensitization meeting to host community (40 families, Authority of shelter home running by the Church and shop keepers | Half day Program at site | 2 | [redacted] |
| 3 | Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency. | Committee formation | 1 | [redacted] |
| 4 | Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc. | One to one interaction | As required | [redacted] |
| 5 | Organize exposure to the members representing the host community families, employees of nearby institutions and council members | Exposure visits to Alappuzha Sajivothapuram site | 15 participants-1programme | [redacted] |
| 6 | Orientation to the Service providers/HKS of Municipality | Half day programme | 2 | [redacted] |
| 7 | Issue based one to one meeting with Govt institutions like PCB, KSEB, KWA, Health Department | One to one | As required | [redacted] |
| 8 | Orientation to the Media persons on the proposed remediation work | Half day programme | 1 | [redacted] |

| | | | | |
|---|---|---|---|---|
| 9 | Sensitize the local and district level police officials on the proposed bio remediation and anticipated issues and action required | One to one interaction | As required | [redacted] |
| 10 | Orientation to Labors deputed by the contractor about the LMP and GBV Action plans | Half day program | 1 | [redacted] |
| | **Total** [redacted] | | | |

## Annexure-2

# Preventive GBV Action Plan

## 1. Sub project information

Bio Remediation of existing dumpsite in ward 10 of North Paravoor Municipality

### 1.1 Details of labors

The project is under pre planning stage. ULB has to finalize contactor/Agency for Remediation. So, the exact number of Labors are not available. But approximately we can expect maximum of 12 labours

| | |
|---|---|
| Total number of labors | : 12(Approx.) |
| Category of labors (Age/sex/gender) | : Not available |
| Data of migrant labors, if any | : Not available |

## 2. GBV Issues likely to be identified at site

1. Issues against female workers at site
2. Lack of safe and Gender friendly toilets at work sites
3. Disparity in work and wages based on gender
4. Threat of GBV or Sexual Exploitation Abuse (SEA) incidents to female members of the host community

## 3. Activities under GBV Action plan

### 1. Formation of Internal Complaints Committee

The committee should be Presided by a senior woman and more than half of the total Committee members should be women. There should be an external member who has experience in dealing with issues related to women. Preferably a Social Worker /Advocate/NGO Representative.

**2. Placing of ICC informatory boards at Work site**

| Insert Logos of KSWMP,WB,AIIB | | | |
|---|---|---|---|
| **Project Name (KERALA SOLID WASTE MANAGEMENT PROJECT)** | | | |
| **Sub Project Name:** | | | |
| **Internal Complaints Committee** | | | |
| Sl.No | Name | Designation | Contact Number |
| | | | |
| | | | |
| **EMERGENCY CONTACT NUMBER** | | | |

**3. Gender Sensitization trainings for Labors**

The Project expect around 12 labours will be employed in a day and women participation in the labor force is limited, even the project is taking precaution to protect and prevent any GBV incidence at the site. Taking into consideration all these aspects, the project plan to conduct a half day sensitization program in the following subjects, viz. the type of GBV, the action to be taken by the victim, the laws and the support organizations which extend support to the victim of GVB and the role of ICC and their contact details etc.

**4. Sensitization for female host community members**

The citizen engagement plan has proposed an activity of host community meeting in which the importance and expected social risk of GBV will be discussed and the mitigation measures inbuilt in the project will be elaborated to the host community members especially to the women.

**5. Allocation of Gender friendly and safe toilet facilities for women**

Project has taken special care to arrange a separate toilet, wash and rest facility for female workers to protect their privacy and safety, and the same has to be arranged by the contractor.

**6. Keeping of wage register at site to restrict wage disparity based on gender**

The project actively opposes gender-based wage disparity at any site funded under the KSWMP-supported SWM project. To ensure gender parity in various aspects such as wages, division of labour, and facilities, an appropriate monitoring mechanism, such as a wage register, should be maintained for the scrutiny of the project implementers.

## 7. Details of GBV Service Providers identified

The government of Kerala has constituted a help desk under Kudumbashree to support or to prevent and extend support to the GBV victims, and their details are given below.

Kudumbashree Snehitha Gender Help Desk
Contact Number – 0484-2428745
Toll free number - 180042555678

**Preventive GBV Implementation plan**

| Sl No | Activity | Timeline | Primary Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Formation of Internal complaint committee | Pre-Construction Phase. | TSC/Contractor | DPMU |
| 2 | Placing of ICC informatory Board at worksite | Pre-Construction Phase. | Contractor | DPMU |
| 3 | Gender sensitization Training to labors | During Construction | Contractor/TSC | DPMU |
| 4 | Group Discussion with female host community members | Pre-Construction Phase. | TSC/ULB | DPMU |
| 5 | Ensuring Gender friendly and safe toilet facilities | Construction stage | Contractor | DPMU |
| 6 | Keeping Wage Register at site | Construction stage | Contractor | DPMU |

**Budget**

| Sl No | Particulars | Cost |
|---|---|---|
| 1 | Placing of ICC informatory board at site | [redacted] |
| 2 | Gender sensitization trainings to labor | [redacted] |
| 3 | FGD among Female host community members | [redacted] |
| | **Total Cost** | [redacted] |

**Monitoring plan**

| Activity | Monitoring Indicators | Means of Monitoring | Reporting Period | Responsibility |
|---|---|---|---|---|
| Formation of Internal complaint committee | Minutes of Meeting/Bye Law of Committee/Reports | Verification of Minutes of Meeting and Reports | 15 days after commencement of work | DPMU |
| Placing of ICC informatory boards at worksite | Photos of Boards placed | Physical verification | 15 days after the commencement of work | DPMU |
| Gender sensitization Training to labors | Attendance and Photographs | Verification of Documents | 5 days after the commencement of work | DPMU |
| FGD among female host community members | Attendance and Photographs | Verification of Documents | 5 days after the commencement of work | DPMU |
| Ensuring Gender friendly and safe toilet facilities | Gender friendly signage's, Condition of latches, Floor Condition, Status of Flush | Physical verification | Before Commencement of work | DPMU/TSC |
| Keeping Wage Register at site | Photographs | Verification of Register | 5 days after the commencement of work | DPMU/TSC |

## Annexure-3

# Labour Management Plan

## 1. INTRODUCTION

### 1.1 PROJECT TITLE:

Project for the remediation of dumpsite at Vedimara, owned by North Paravur Municipality

### 1.3 PROJECT AREA

The Vedimara Dumpsite of North Paravur Municipality is situated in ward 10 of the municipality, covering an area of 1.5 acres.

## 2. SCOPE AND STRUCTURE OF THE LABOUR MANAGEMENT PLAN

The scope of the LMP shall be as outlined in the World Bank's ESMF. The engagement will be planned as an integral part of the project's social assessment and project design and implementation. This document has 10 chapters. This chapter viz., chapter 1 served as introduction. Scope and structure of LMP is provided in chapter 2. An overview of labour use in the project is presented in chapter 3. Key potential labour risks are listed in chapter 4. Legislative framework governing labour employment in India/Kerala is discussed in chapter 5. Implementation Arrangements, policies and procedures follow in the subsequent chapter. Grievance redressal mechanism, contractor management are presented in the last chapters.

## 3. OVERVIEW OF LABOUR USE ON THE PROJECT

3.1 Details of Labors

The proposed remediation process requires following category and number labors

| Sl. No | Equipment | Category of labors | Required No.of labors |
|---|---|---|---|
| 1 | One trommel | Labors for waste segregated purpose | 5 |
| 2 | One excavator | Operator | 1 |
| 3 | One JCB | Operator | 1 |
| 4 | Two small tippers | drivers | 2 |

| | | | |
|---|---|---|---|
| | | Helpers | 2 |
| 5 | | Supervisor | 1 |
| **Total Labours** | | | 12 |

## 4. ASSESSMENT OF KEY POTENTIAL LABOUR RISKS

### 4.1 Project Activities:

The bioremediation of the dumpsite includes the following activities;

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement
- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

### 4.2 Key Labour Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.
- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.

- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female SWM workers are engaged.
- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form workers organizations, etc.
- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

## 5. BRIEF OVERVIEW OF LABOUR LEGISLATION: TERMS AND CONDITIONS

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all |

| | | |
|---|---|---|
| | | employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10. | Industrial Disputes Act 1947: | the Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

## 6. RESPONSIBILITY MAPPING

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring labourers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing labors, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the labors. The ULB will actively monitor the contractor's compliance with legal and welfare requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

## 5. CODE OF CONDUCT

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured.

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favors or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)
- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favors, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

## 8. SYSTEMATIZING THE CODE OF CONDUCT

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code

of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

## 9. TRANSPARENCY IN CONTRACT SPECIFIC TERMS AND CONDITIONS

All contracts must contain

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism.

**LABOUR MANAGEMENT PLAN MATRIX**

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on. | One notice board | As soon as the work is started. | Photographs of the notice board where the license is displayed. | Contractor |

| | | | | |
|---|---|---|---|---|
| To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board | Do | do | |
| To conduct pre- employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |

| | | | | |
|---|---|---|---|---|
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the construction period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |

| | | | | |
|---|---|---|---|---|
| Female members should be minimum 50%. ) | | | | |

## Summary

### Introduction

The Vadakara municipality is an Urban Local Body (ULB) of the Kozhikode district of Kerala, covering an area of 21.34 square kilometers (sqkm)and divided into 47 administrative wards. This municipality generates 35.60 tons per day (TPD) of solid waste. However, Vadakara ULB do not possess adequate solid waste treatment and disposal facilities as mandated by the Solid Waste Management (SWM) Rules,2016. Consequently, unsegregated waste was disposed of in an unscientific manner; essentially dumped at the ULBs trenching ground (where feceas / night soil used to be dumped from pit latrines) at Puthiyappa in ward 20. Over the years of past 50 years, Puthiyappa dumpsite saw various types of wastes dumped there. In order to promote a healthy and sustainable environment, it is imperative to undertake the remediation of the existing dumpsite.

### Subproject Description

The Biomining and Bioremediation at the Vadakara ULB dumpsite is proposed as part of the Kerala Solid Waste Management Project (KSWMP) with support from the World Bank and the Asian Infrastructure Investment Bank. The dumpsite situated in Ward 20, Puthiyappa, covers a total area of 1.52 acres and contains a legacy waste quantity of 29,140 tons. The waste at the site is approximately 50 years old, with dumping activities started in 1962 and stopped in 2018. Initially, the dumpsite served as a trenching ground for the disposal of sewage from pit latrines. The total volume of waste accumulated is approximately 38,367 cubic meters, and the dumpsite spans across an area of 1.25 acres.

i. **Status of Subproject Development at the time of EIA**

   Currently, the dumping has stopped at site and solid waste of the ULB is treated and disposed at multiple decentralized facilities across the city. A section of the dumpsite, comprising 712.09 cubic meters of waste, was capped in 2020. While the capping method remains unclear, the contractor will initiate discussions and assessments of the capped area, taking into account leachate and gas considerations. This will aid in formulating a strategy for biomining, with the implementation of all required fire and health and safety

precautions when disturbing the capped area. The entry to the dumpsite is facilitated by a 4-meter-wide approach road which needs an improvisation inorder to mobilize the heavy machineries, located in Meppayil–Vadakkara stretch. Inside the gated compound of the site, is a concrete tiled road for easy access within the site. Within the premises, there is a partially constructed non-operational MCF (Material Collection Facility) having an area of 180 square meters, having an steel roof and concrete floor and brick walls.

**ii.Technical_Aspects**

Following a comprehensive evaluation, the method or technique of Bio-mining with a goal of achieving 100% land reclamation and recovery is found to be the most suitable remediation approach, ensuring long-term sustainability and environmentally responsible treatment of legacy waste, leading to the complete remediation of the dumpsite. Based on the Feasibility and site conditions, Mobile trommel machinery would be the most suitable option for the small site at Puthiyappa, Vadakara. The optimal time frame for conducting the Biomining Process would be from December to April Months, a period characterized by lower rainfall levels as per climate data.

**Application of Regulatory and Guidance Framework**

In accordance with the SWM Rules of 2016, the selection of an appropriate method or technique for remediating a dumpsite should be determined through a feasibility study that consider technical, financial and environmental aspects complying with regulatory requirements (CPCB, KSPCB andNGT). The formulation of the subproject adhered to the State/National and World Bank ESMF / safeguards policies, both in its planning phase and will continue to do so during the implementation and monitoring stages. This commitment to compliance will be upheld by the ULB during the Project period.

**Baseline Environmental Scenario**

A detailed environmental baseline study was conducted for analyzing quality of air, groundwater, surface water, noise levels, and leachate characteristics. The preliminary Environmental Screening [Annexure -1] and the detailed assessment showed that this sub project falls under “E2” category. (Please note that suggestive environmental categorization of dumpsite biomining / bioremediation as per EMF for KSWMP is E1. However, considering

Copyright © 2023. KSWMP | All rights reserved

the very small extent of the dumpsite, absence of any sensitive environmental feature in or around the site, short biomining period, and the overall positive impacts of the proposed development post mitigation measures; this is categorized as E2. At this stage, locations for disposal of biomined wastes is unknown, the sunproject would be recategorized if the locations are near any sensitive areas. In case the biomining is clubbed with other multiple sites also, the overall categorization would be reconsidered)

An analysis has been conducted at the site to review and comprehend the physiography, climate, soil, cultural heritage, ecology, and biodiversity of the dumpsite. This assessment aims to identify potential impacts on the environment, human health, and biodiversity. Additionally, a traffic assessment has been performed to analyze traffic patterns and movements during the project's implementation phase.

**Terrestrial Ecology:**

The nearest Forest/Protected Area, known as Janakikkadu, is located approximately 22 kilometers away from the site. Various indigenous flora and fauna species commonly inhabit the vicinity of the site, which generally include *Funambulus tristriatus* (Jungle palm squirrel), *Eutropis carinata (*Brahminy Skink), *Pycnonotus cafer (*Red-vented Bulbul), *Acridotheres tristis (*common myna*), Ictinaetus malaiensis (*Black Eagle), *Ailanthus sp. (*Tree), *Areca catechu (Tree), Cyathula prostrate (Herb)* and *Aporosa cardiosperma (Shrub).* The species listed were not classified as Critically Endangered by International Union for Conservation of Nature (IUCN).

**Air Quality:**

Air monitoring was conducted continuously for a 24-hour duration and the results obtained were meticulously analyzed against the National Ambient Air Quality Standards (NAAQS) of 2009. It is noteworthy that all measured pollutants' concentrations were found to be well within the permissible limits. Furthermore, no presence of hazardous or toxic gases was detected during the monitoring process.

**Water Quality:**

The water quality monitoring was carried out at 3 locations for Ground water & 1 Location for Surface Water.

Copyright © 2023. KSWMP | All rights reserved

Groundwater samples were collected from three distinct locations, each within a radius of 200 meters from dumpsite. The analysis of these samples revealed that all parameters examined fall within acceptable limits, with the exception of pH levels.

Surface water assessment indicates that the Kuttiyadi River is located approximately 5 kilometers from the site. Additionally, there is a nearby drain that transports surface runoff, wastewater from the surrounding area, as well as leachate and drainage from the site. A surface water sample was collected from a specific location known as Akkamadathodu, which is at an aerial distance of 303 meters from the site. The Akkamadathode culminates at the Kuttiyadi River. The samples were collected downstream of the Akkamadothode. The natural drainage does not consistently carry water; it only flows when there is rainfall. Upon analysis, it was found that all examined parameters were within acceptable limits, with the exception of Biological Oxygen Demand (BoD).

**Noise Level:**

Sample for noise level monitoring were collected within the dumpsite to assess the current ambient noise levels. The results indicate that the noise levels observed are comfortably within the permissible limits. However, it shall be noted that there is no activity currently on site. And noise levels are expected to increase with biomining activity.

**Assessment of Risks/Impacts and Proposed Mitigation measures and Monitoring**

The anticipated impacts of the interventions proposed have been analyzed in detail and mitigation measures proposed. The Environmental Impact Assessment (EIA) and Social Impact Assessment (SIA) documents, which assess the potential environmental and social impacts of the proposed subproject, serve to identify potential risks, formulate mitigation measures and ensure compliance with environmental and social standards regulations. This dumpsite remediation project comprises an overview of the current environmental conditions within the project area. Furthermore, the report delineates the environmental baseline data, Disaster Management Plan, identification of sensitive receptors and a Fire Risk Assessment. Key environmental risks include leachate and storm water from the site impacting the nearby areas, odour (including gas), visual blight, flies & pests, storage and disposal of retrieved materials, fire, accidents & other disasters, and health and safety of

Copyright © 2023. KSWMP | All rights reserved

workers. Possible future dumping of wastes after biomining is also a concern. Mitigation and management measures for these in line with mitigation hierarchy are included in the EMP.

Proposed mitigation measures are designed to address environmental and social impacts effectively, with the goal of minimizing negative consequences while maximizing positive outcomes. Additionally, this report encompasses an Environmental Management Plan (EMP) and a Social Management Plan (SMP), providing detailed strategies for the management of the project's environmental and social facets.

In addition, a detailed Environment Monitoring Plan and Social Monitoring Plan will outline the monitoring procedures to assess the efficiency of mitigation measures and guarantee adherence to environmental and social standards. To ensure seamless and timely execution, the dumpsite remediation subproject report also includes an Environmental and Social Budget. This ensures a sustainable and responsible bio-mining process that prioritizes the protection of the environment and the well-being of nearby communities throughout the waste remediation process.

**Implementation Mechanism & Budget**

The Bio-mining project, with the objective of achieving 100% land recovery, will be carried out exclusively through an outsourcing model. The biomining process will be conducted separately at each ULB. If the land is found to be contaminated with hazardous wastes, the suproject shall be excluded. For solid waste/leachate contamination on site proper remedial measures will be followed before utilizing for future facilities. Retrieved materials and recyclables may be handed over to the authorized recyclers and the usage of these retrieved fractions is unknown today as it would be as per the Contractors proposal/plan. However, such reuse/recycling/disposal would be in line with National/State regulations which are stringent. . The land will be restored to its pre-waste dumping condition, necessitating the complete removal of all legacy waste until it reaches the original land surface. Following the completion of the bio-mining process, the machinery and vehicles belonging to the implementing agency must be vacated within 7 days. No waste material shall remain on site after contract period. The reclaimed land, free of any encumbrances, will then be transferred to the Urban Local Body (ULB).

Copyright © 2023. KSWMP | All rights reserved

The total budget proposed for Environmental Management and monitoring and social budget is [redacted]

**Consultation & Disclosure**

A transect walk was also carried out to assess the social characteristics in the vicinity of the dumpsite. To understand the social dynamics, demographic profile, livelihood patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community, a transect walk was carried out on 30.05.2023, (Attendees – 17 no.s)which was crucial for developing effective dumpsite remediation strategies that align with their priorities. The findings and recommendation of the transect walk is shown in the following table.

Copyright © 2023. KSWMP | All rights reserved

*Table 1 Findings and recommendation of the transect walk*

| S.No | Social risks | Findings and Recommendations |
|---|---|---|
| 1 | Presence of 300 families, institutions, shops, establishments, near (200m) the dumpsite. | a. Free movement of the residents needs to be ensured<br>b. Since the school has two entrances, inside and outside of the dumpsite road, the mobility of the students will not be disturbed. Regulation on either of this road may affect the free movement of the students during school opening and closing time. Necessary traffic arrangements must be made.<br>c. Working hours of shops and establishments may be restricted, that should not affect the livelihoods of the workers attached to these facilities |
| 2 | Sound pollution, health issues and foul smell most affects 16 families residing very close to the site (50m). | GRM cell under the ULB needs to be made operational. Stress management including counseling services to be ensured |
| 3 | Health risk of vulnerable groups residing near to the site which includes patients with breathing issues, pregnant women, PWDs, cancer patients, children below the age of two and elderly above the age of seventy-five. | Health issues may aggregate duringwork operations.<br>These factors should be considered strongly especially for all vulnerable groups |

# 1. INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake biomining of multiple Legacy Waste Dumpsites in various districts. As per the Feasibility Study and methodology statement for implementing the subproject, proposed dumpsites for biomining are grouped into two clusters: It is expected that one single contractor bids for one Cluster. Biomining and bioremediation of Puthiyappa dumpsite figures in Cluster 2. However, bidding modality is yet to be finalized- whether as a single site, or as a clusters.

## 1.2 The rationale for the Proposed Sub-Project

Puthiyappa dumpsite in Vadakara ULB at ward no.20 has a total waste quantity of 29,140 Tons, spreading over 1.25 acres. The site is located between Lat- 11°35'39.0"N and Long - 75°36'20.7"E and has an elevation of MSL +46 (m), with a gentle slope towards the south-eastern part. During monsoon season, due to the geography of the site, Leachate from waste flows downhill towards residential areas located at south Eastern side of the site. Vadakara ULB proposes biomining and bioremediation of the Puthiyappa legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite biomining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Objectives and scope of Environmental & Social Impact Assessment

***Environmental Categorization and Assessment:***

As per indicative categorization for dumpsite biomining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (1.52 acres) and waste spread (1.25 acres) and absence of

environmentally sensitive features around, this subproject is individually considered as E2, and EIA is prepared accordingly.

***Social Impact Assessment***

Under this category social impact assessment is also a key factor to be considered. Accordingly, detailed assessment of the environmental and social impacts was carried out.

### 1.4 Proposed sub project details

*Table 2 Proposed sub project details*

| Description | Details |
|---|---|
| Name of ULB | Vadakara |
| District | Kozhikode |
| Taluk | Vadakara |
| Total present population in the ULB | 41,572 |
| Name of the sub-project | Dumpsite Remediation at Puthiyappa |
| Location of the sub-project | Puthiyappa at ward no 20 |
| Total dumpsite area (in acres) | 1.52 |
| Total legacy waste accumulated area (in acres) | 1.25 |
| GPS Co-ordinate of the Site | Latitude: 11°35'39.0"N,<br>Longitude 75°36'20.7"E |
| Legacy waste quantity | 29,140 tons |

Copyright © 2023. KSWMP | All rights reserved

*Figure 1 Legacy Waste Dumpsite at Puthiyappa*

The technology proposed is Bio mining, and bioremediation in line with CPCB's Legacy Waste Biomining Guidelines, 2019. The various phases in the biomining process (as per Legacy Waste biomining Guidelines of CPCB) are shown below.

Copyright © 2023. KSWMP | All rights reserved

*Table 3 Phases of Bio mining*

| Phases of Bio-mining | |
|---|---|
| **Phase 1: Stabilization** | The legacy waste is formed into equal-sized windrows and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| **Phase 2: Sorting & Segregation** | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/circular rotatory sieves and manpower. |
| **Phase 3: Disposal & Utilization** | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |

### 1.5 Site management plan

The plan aims to minimize potential adverse impacts on sensitive receptors while maximizing the recovery of valuable resources and promoting site restoration.

Mobile machineries will be used for biomining of the small Vadakara dumpsite, and they do not require a separate area for erection. The waste will be excavated and directly fed into mobile screeners for processing. This approach minimizes the need for additional infrastructure and optimizes the efficiency for the biomining process. The proposed plan is as follows.

## 2. POLICY AND REGULATORY FRAMEWORK

### 2.1 National, State Legislations and Technical Guidelines related to environmental and social aspects of dumpsite remediation

*Table 5 Applicable rules and regulations for Vadakara dumpsite remediation*

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| 1 | The Motor Vehicle Act. 1988 | All vehicles used for installation and operation will need to comply with the provisions of this act and should have valid Pollution Under Control Certificate. |
| 2 | Authorization from PCB for storing Hazardous material like diesel for DG sets as per Hazardous and Other Wastes (Management & Trans boundary Movement) Rules, 2016 | Hazardous waste (used oil from DG Sets) is likely to be generated during the erection and operation stage. Hence, authorization under the purview of the rule shall be requiring. |
| 3 | Labour Act. | Occupational safety and health administration. |
| 4 | Solid Waste Management Rules, 2016 (MSW Rules) | To operate the mobile Bio mining plant, it is necessary to follow the existing MSW rules. |
| 5 | The Water (Prevention and Control of Pollution) Act, 1974 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 6 | The Air (Prevention and Control of Pollution) Act. 1981 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 7 | safety of the workers as per the ILO Convention No. 62 | Safety aspects |
| 8 | NOC from fire department | Safety aspects |
| 9 | Tree felling permission:<br>If felling of trees as defined in Kerala Preservation of Trees Act, 1986 | If any tree needs to be cut or replanted concerned permission is required from Forest |

Copyright © 2023. KSWMP | All rights reserved

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| | | Dept. Government of Kerala. The ULB will take the necessary permission. |
| 10 | NGT guidelines upto date | Relevant to the subproject to be considered for the successful implementation of the project. |
| 11 | Building and Other Construction Workers (Welfare Cess Act) 1996, | Discusses Health and Safety and environmental aspects associated with construction and allied works |
| **Other Applicable Rules** | | |
| 12 | Solid Waste Management Rules, 2016 (SWM Rules) | |
| 13 | Plastic waste Management Rules, 2016 | |
| 14 | Construction & Demolition, Waste Management Rules, 2016 | |
| 15 | Batteries (Management and Handling) Rules, 2001 | |
| 16 | E-Waste (Management) Rules, 2016 | |
| 17 | SBM-Urban Advisory on Landfill Reclamation, CPHEEO, June 2020. | |
| 18 | Kerala Municipality Act, 1994 & Rules | |

## 2.2 The World Bank Safeguards Policies

*Table 6 World Bank Safeguard Policies*

| S.No. | WB Policy | Safeguard policy applicable | Description |
|---|---|---|---|
| 1 | Environmental Assessment (OP/BP 4.01) | Yes | The project has potential impacts and pose risks to various environmental factors during the implementation phase. Consequently, this policy is triggered, necessitating assessment and management of E&S risks and impacts, and ensuring a structured approach to safeguard management for risk mitigation including (health & safety risks, risks and impacts due to linked activities) in alignment with regulatory requirements, and Environmental and Social Management Framework (ESMF). |
| 2 | Natural Habitats (OP/BP 4.04) | Yes | Though the project will not support any activities that involve conversion or degradation of natural habitats. However, impacts on any flora/fauna on site during the proposed activity is important |
| 3 | Pest Management (OP 4.09) | Yes | Considering the possible pest related issues as the project deals with wastes and improvements to dump sites, OP 4.09 Pest Management is triggered. As per this policy the banned pesticides/insecticides listed by the Nation / State and the World Health Organization (WHO) other national/state bodies should not be used in the project, and as much as possible Integrated Pest Management Options shall be followed |
| 4 | Physical Cultural Resources [PCR] (OP 4.11) | Yes | The proposed project will not support any activities that could potentially harm nearby cultural heritage, archaeological sites and physical resources valuable to the community |

## 3. BASELINE ENVIRONMENTAL SCENARIO

### 3.1 Project location of the site

Puthiyappa dumpsite in Vadakara ULB at ward no.20 is non-operational and dumping of waste stopped due to public protests during the year 2018. Up until July 2023, the disposal of waste from street sweeping was directed to a designated site. In accordance with the implementation of the Biomining Project, the disposal of street sweeping waste was subsequently discontinued and it is disposed in the Thumboormozhi units located in the Bus stand (Both New and Old) and Municpal office. The location detailed are described in the previous section of 1.1 and 1.4.

*Table 7 Sensitive receptor around the Dumpsite*

| S.No | Sensitive Receptors | Distance |
|---|---|---|
| 1 | Residential buildings | 300 households are located within 200 m radius of the dumpsite |
| 2 | Educational institutions such as Govt. Sanskrit HSS | 1.00 Km |
| 3 | Kuttiyadi river | 5.00 Km |
| 4 | Akkamadathodu Stream | 303 m |

### 3.2 Methodology for Environmental Baseline studies

Baseline Study in EIA process usually includes data collection and analysis of various aspects in the project area, such as: Physical Environment (e.g., topography, geology, soil, water, air quality, and climate) and Biological Environment (e.g., flora and fauna, Land/Soil, habitat, biodiversity, and ecological processes). The overall methodology of EIA comprises;

1) Scoping, Environmental Screening, Exclusion and Categorization
2) Environmental Baseline study like analysis of Air, Water, Soil and Noise/Vibration and impacts on biodiversity, workers and people around
3) Environmental Impact Assessment
4) Avoidance of adverse impacts, minimization, mitigation, and management measures
5) Environmental Management Plan (EMP)
6) Environmental Monitoring Plan (EmoP)
7) Budget for implementation of EMP and EmoP

The below table indicates the environmental attributes and frequency of monitoring

Copyright © 2023. KSWMP | All rights reserved

*Table 8 Environmental Attributes*

| S.No | Attributes | Parameters | Latitude & Longitude | No. of sampling locations | Frequency of monitoring / Data collection |
|---|---|---|---|---|---|
| 1 | Meteorology | Temperature humidity and rainfall | - | Study area | Data collected from IMD |
| 2 | Ambient air quality | $PM_{10}$, $PM_{2.5}$, $SO_2$, $NO_2$, VOCs | A1 - N- 11°35'39.182", E -75°36'28.543"<br><br>A2 - N- 11°35'37.504", E -75°36'26.874" | 2 | 24 hourly samples |

### 3.3 Existing Facilities on site and its Environmental Audit

There is a non-functional Material Collection Facility (MCF) for dry waste present on a part of the Puthiyappa dumpsite.

The MCF is not supported under KSWMP under this subproject. However, an environmental audit of the facility is important as this may be used as an associated facility to which some recyclables may be channelized to and is situated at the same site and might be impacted by the biomining activities.

*Table 9 Environmental Audit of MCF*

| S. No | Aspects | Remarks |
|---|---|---|
| 1 | Structural Characteristics | Area - 180 (in Sqm)<br>Buffer/setback around the MCF - 2 ft<br>Distance from waste pile of dumpsite- 35 m.<br>Roof: (GI Sheet Roof, Good condition)<br>Floor (Cement Floor, Good Condition)<br>Walls: (Concrete, Good Condition)<br>Doors & windows: Not available, need to furnish<br>Lack of ventilation, dust emission and odor can impact the MCF facility. |

### 3.4 Analysis of Environmental Baseline

*Table 10 Environmental Baseline*

<table>
<tr><th>S No</th><th>Environmental Aspect</th><th>Discussion on Baseline Scenario</th><th>Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject</th></tr>
<tr><td>1</td><td>Topography</td><td>The elevation of the Puthuyappa site is MSL +46(ft), gentle slope towards the southern and eastern section from the site. The land falls under midlands of Kerala. Soil is predominantly lateritic in nature. The legacy waste is spread over an area of 1.25 acres with an average height of 5 m, having a portion of the dumpsite which is 7.12 cu.m of waste being capped by 2020. In accordance with the directive from the National Green Tribunal (NGT), the biomining process is mandated to remediate all deposited waste within the premises, encompassing both current and pre-existing accumulations.</td><td>Leachate from the dumpsite drains out to South East side, to a channel (Meppayil).</td></tr>
<tr><td>2</td><td>Climate</td><td>Vadakara falls within the tropical to sub-tropical climatic region with heavy rains mostly during the six months from June to November; and occasional rains during other times of the year. Maximum temperature in the region varies almost between 32°C to 37°C and minimum temperature ranges from 21°C to 24°C.</td><td>During heavy rains, as the site is at an elevated terrain, draining out of stored waste and leachate may happen during biomining & bioremediation works.<br><br>The biomining project has been scheduled during the off-season for rainfall in anticipation of reduced precipitation.</td></tr>
<tr><td>3</td><td>Hydrology/Hydrogeology & Soil</td><td><table><tr><th>Pre-monsoon (m) *</th><th>Post-monsoon (m) *</th><th>Avg. Fluctuation (m)</th></tr><tr><td>16.03</td><td>10.93</td><td>5.1</td></tr></table>*Groundwater level<br>Kuttiyadi river is at a distance of 5.00 Km from the site. Akkanadathode stream is at an aerial distance of 303 m leading to kuttiyadi river.</td><td>Lateritic soil is porous and may lead to contamination of nearby wells. Hence, any waste below 10m depth need to be remediated after sample analysis and adequate measures are necessary to collect and manage leachate during all times</td></tr>

| S No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| | | 10 *Aporosa cardiosperma* Euphorbiaceae Flora [Shrub] | |
| 5 | Socio Economic Aspects | 300 households (residences) are located within 200 m radius of the dumpsite; Educational institutions such as Govt. Sanskrit HSS 1.00 Km.<br><br>Approximately 30 to 40 houses are situated in the southern direction which is within 100 m distance. Currently, there is no system in place for leachate drains or management because biodegradable waste was not dumped at site. However, during biomining activities, provisions for drains and leachate management will be established. In particular, this could prevent leachate runoff in the sloped area and its subsequent mixture with both ground and surface water.. | The dumpsite remediation process is anticipated to pose social risks, including pollution of food and beverages in nearby establishments and potential health issues for local residents, workers, laborers, and students. A Social Management Plan, based on social screening and transect walk findings, is essential to mitigate these risks. Furthermore, the proposed remediation will have a positive impact on nearby residents, as it will lead to the removal of legacy waste, improving both environmental and social conditions. |
| 6 | Land use, Development Pattern and Key Projects | Surrounding land use is mostly residential. Nearby cultural resources are temples situated at 280 m from the site. Neighbours complain about odour nuisance and leachate from dumping yard affecting the drains. No key development projects are there in the region.<br>Approximately 186 square meters of land is currently occupied by a partially constructed MCF (Material Recovery Facility), which is not in operation. This building lacks doors and windows.<br>It can be used for the labor resting room or storage of byproducts after renovation by contractor. | Odour, leachate and visual impacts on the surrounding landuses (residential, temples) and MCF |
| 7 | **Infrastructure and Services** | | |

| S No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| 7.1 | Traffic and Transportation | A detailed incremental load by vehicles during the operation phase is assessed and given under the traffic assessment report. Through assessment it is identified an additional 9.4 trucks/day will be the traffic load due to this activity. | The implementing agency shall ensure staggering of the traffic movements from site considering peak hours/school timings. Also, night time vehicular movements can be implemented. More accurate information shall be available once Contractor is being on boarded. EIA to be updated by the contractor based on his work plan. |
| 7.2 | Water Supply<br>a) Surface water<br>b) Ground Water | A) Surface water: Kuttiyadi river is 5km from the site. Surface water sample was collected from Akkamadathodu, which is at an aerial distance of 303 m, and the test results showed – all parameters are well within limits except BoD.<br>B) Ground Water collected from 3 different locations (Residences within 200m radius)– all parameters are well within limits except for pH. | Site Drainage & leachate Impacts due to biomining activity (esp during any seasonal rain) is important as far as the nearby soil & water environment are concerned. |
| 7.3 | Drainage, Sewerage and Sanitation | Region has an unplanned network of drains eventually leading to Kuttiaydi- River. The nearest drainage channel is Akkamadathodu which is 303 m distance from the site. Site drains into this channel which finally ends at Kuttiaydi river.<br>Vadakara is mainly served with septic tanks for individual premises (No toilets onsite, even for MCFs).<br>Leachate samples collected at site, showed BOD value exceeding the limit and all other parameters were within limits. | |
| 7.4 | Air Quality | Air samples were collected from 2 locations within the dumpsite and results found to be well within the permissible limits. | |

Copyright © 2023 [illegible] | All rights reserved

| S No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| 7.5 | Noise Level | Noise Level monitoring samples collected within the dumpsite in order to identify the present noise level and results found well within permissible limit | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity. |

### 3.5 Description of Environmental Parameters

The baseline environmental attributes viz., ground water, surface water, noise level, leachate, were analyzed for assessing the existing baseline conditions in and around the dumpsite. What follows is a brief description of baseline environmental attributes.

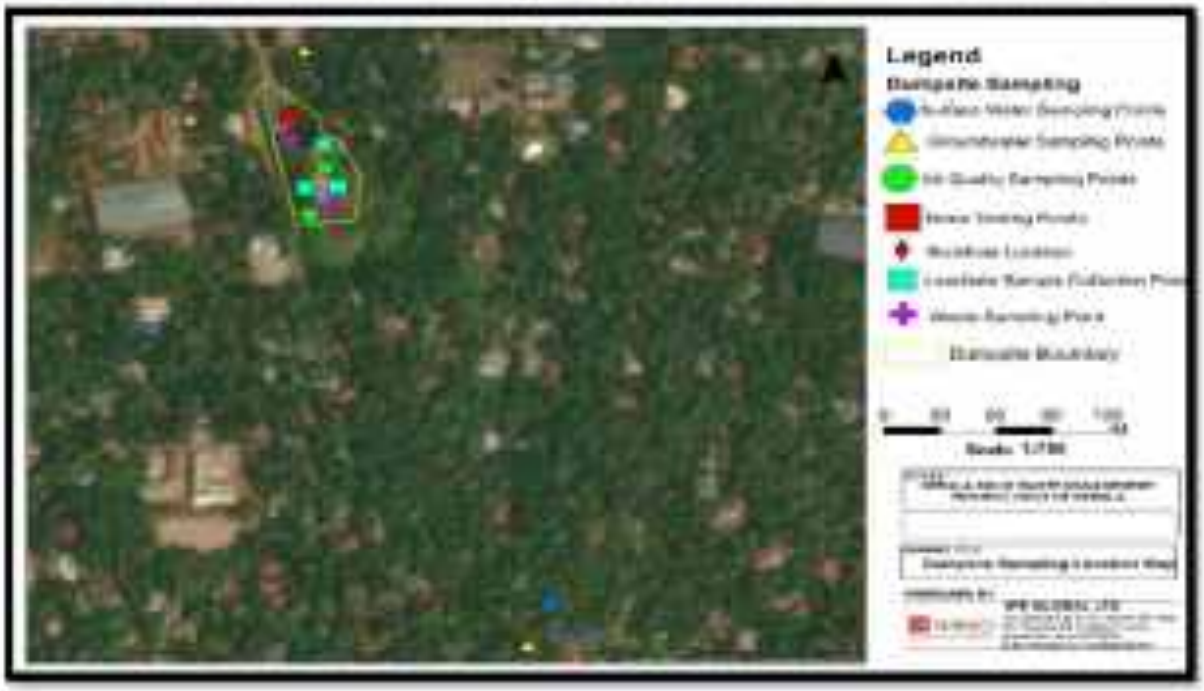

*Figure 3 Distance of the Sampling locations*

*Table 11 Distance & Direction of Sampling locations*

| S.No. | Description | Direction | From Boundary of the dumpsite (m) |
|---|---|---|---|
| 1 | Surface Water | South East | 222 |
| 2 | Ground water-1 | West | 40 |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| 3 | Ground water-2 | North East | 33 |
| 4 | Ground water-3 | South East | 247 |

**3.6 Identification of sampling location:**

*Table 12 Identification of sampling location*

| S.No | Description | Place identified | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Inside the dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind rose data, the air sampling sites were fixed at two locations near residential area. |
| 2 | Noise (1 Location) | Inside the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. The adjacent MCF is non-operational. |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite [stream] | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope on southeast direction which is having residential buildings possesses a potential risk of leachate runoff, which could result in the contamination of surface water on that particular side of the site. So, the location of surface water is taken on the south east direction. |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope (SE). The infiltration of leachate which could result in the contamination of ground water.<br>Based on the possible infiltration and slope direction the ground water samples were collected from the West, Northeast and |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Description | Place identified | Justification |
|---|---|---|---|
| | | | Southeast directions outside of the dumpsite from the open wells |

### 3.7 Sampling Methodology

*Table 13 Sampling Methodology*

| S.No | Description | Method |
|---|---|---|
| 1 | Air sampling | Calibrated High Volume Sampler, Calibrated rotameter & calibrated Dry gas maters and sampling locations selected based on wind rose and impacts on surrounding land uses. |
| 2 | Noise | Calibrated sound level meter and sampling locations selected based on highest noise level on site and impacts on surroundings |
| 3 | Ground water | Water samples were collected in polyethylene containers and sampling locations were selected based on leachate and run off flow and anticipated impacts on surroundings. |
| 4 | Surface water | Samples were collected in polyethylene bottles and sampling locations were selected based on leachate and run off flow and impacts on surrounding surface water bodies and drains (line sources of pollution) used by communities. |
| **NOTE: Sampling Photographs added as Annexure-C in the FR Report.** | | |

### 3.8 Site Connectivity

From the town centre, vadakkara meppayil road leads to the dumping yard. This is a internal road with black top. From access road, there is a small portion of around 10 m kucha road leading to the site. The same road leads to --- temple, and is used for processions of the temple during festivals.... Etc etc. The kutcha road is 3 m wide and 10 m long. It is not surfaced.

The width of site access road is approximately 5 m. The nearest major highway, NH 66, is only about 1.5 kilometers away. This highway provides access to other major cities in Kerala, such as Thiruvananthapuram and Kochi. The state highway, SH 17, is also about 2 kilometers away. This highway provides access to other parts of Kozhikode city. The local road, Mambaram Road, is about 0.5 kilometers away. This road provides access to the nearby residential areas.

Copyright © 2023. KSWMP | All rights reserved

Site Access Road to Main Road

Site Access Road to Meppayil Road

Site Entry

*Figure 4 Access Roads for the Site*

### 3.9 Traffic Assessment

Traffic assessment refers to the process of evaluating and analyzing the flow of vehicles, pedestrians, and other modes of transportation on roadways, intersections, or specific areas. This assessment helps in understanding current traffic conditions, identifying potential issues, and developing appropriate strategies to improve traffic flow, safety, and efficiency.

Copyright © 2023. KSWMP | All rights reserved

**Traffic load:**

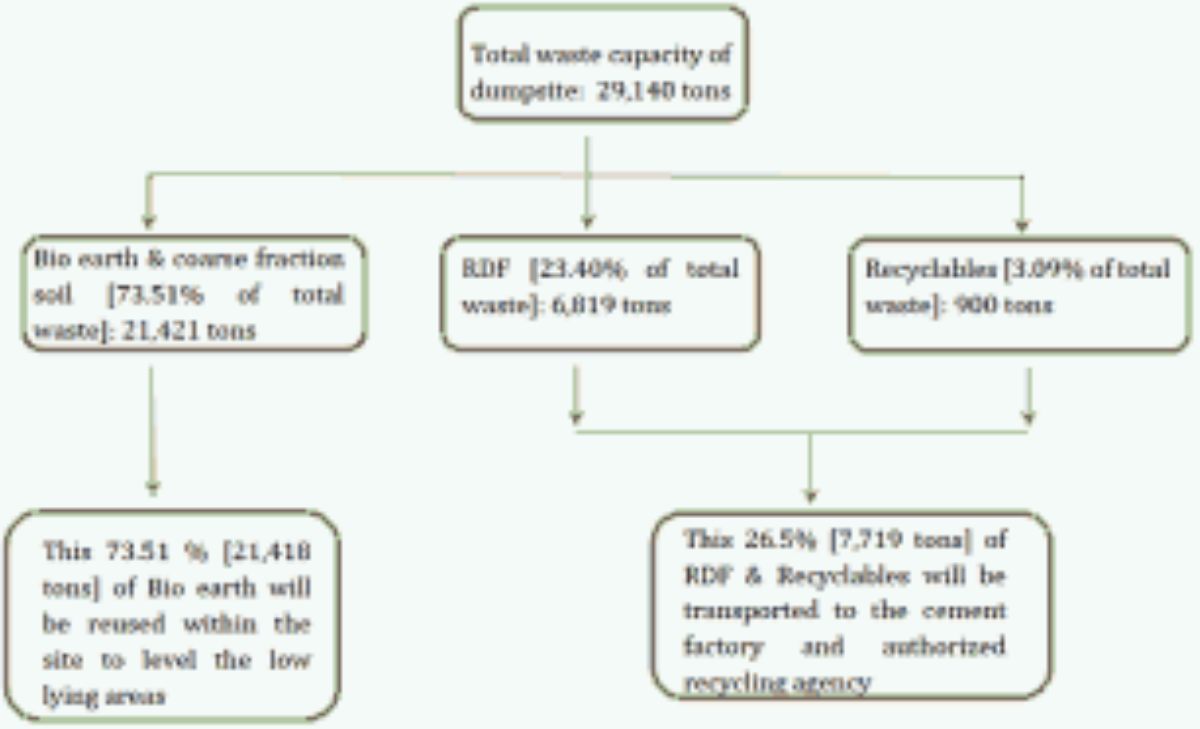

*Figure 5 Traffic load – Incremental due to Project*

The access road to the dumpsite is Vadakara- meppayil road which is 5m width. Considering 90 days of operation phase the trips are planned and the inward & outward of the vehicle to be made during off peak hours.

To promote safety and avoid traffic congestion, it is recommended to impose restrictions on the movement of vehicles used for the Biomining process. These restrictions should be enforced one hour prior to the commencement of school hours and one hour after the conclusion of school activities.

Copyright © 2023. KSWMP | All rights reserved

*Table 14 Truck Capacity*

| S.No | Materials | % of Materials | Weight of each materials(t) | Vehicle Type | Max Capacity of load carrying Truck (t) | No. of Trips |
|---|---|---|---|---|---|---|
| 1 | RDF | 20 | 5828 | 12 Wheeler Dumper | 18 | 324 |
| 2 | Glass | 3 | 874.2 | 12 Wheeler Dumper | 25 | 35 |

| 5 | Wood | 2.8 | 816 | 10 Wheeler Dumper | 5 | 163 |
| 30% of Total Weight | | | 8742 | Total No. of Trips | | 828 |

*Table 15 Total Trips planned*

| S.No. | Materials | Total Trip | Total Days for Disposal | Trip/Day | Remarks |
|---|---|---|---|---|---|
| 1 | RDF | 324 | 90 | 4 | Four Trips per day |
| 2 | GLASS | 35 | 90 | 0.4 | Three days once one trip |
| 3 | Rubber & Footwear | 102 | 90 | 1 | One trip per day |
| 4 | Metals | 204 | 90 | 2 | Two Trip Per day |
| 5 | Wood | 163 | 90 | 2 | Two Trip per day |

Copyright © 2023. KSWMP | All rights reserved

## 4. ANALYSIS OF ALTERNATIVES

### 4.1 Alternative 1: No project (without project scenario)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.

If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.

1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.
2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.
3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.
4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.
5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

### 4.2 Alternative 2: Mode of execution / Management Alternative

Regarding the execution strategy, the outcomes of a Transect walk have substantiated the impracticality of waste transfer between ULBs. As a result, the imperative is for the waste remediation procedure to take place on the premises, allowing only the byproducts to be considered for potential transfer.

The logistical aspects of arranging machinery and designating storage space for these byproducts will hinge upon the extent of land available. At the outset, the existing underutilized, partially constructed Material Collection Facility (MCF) may be considered to cater to the initial storage requirements after improvement, which will, in turn, be known whether the contractor will use this facility for storage. Budget provision is provided in the FR for such arrangements.

Copyright © 2023. KSWMP | All rights reserved

### 4.3 Technology Alternative

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

## 5. ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISK IMPACTS

Biomining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, biomining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition, cumulative impacts of simultaneous biomining of multiple such legacy waste sites on the environment is important. Especially with respect to

(i) Drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,

(ii) Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,

(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and

(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

Copyright © 2023. KSWMP | All rights reserved

### 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Vadakara dumpsite.

#### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Biomining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table 15 Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity. However, magnitude of cumulative impacts of various dumpsite remediation might be High.

*Table 16 Aspects for Determining the Magnitude of Impacts*

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite biomining activities will | A specific location within program component or site boundaries with no detectable |

Copyright © 2023. KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| | | | be on larger extent) | potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| **Likelihood of potential impacts occurring** | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

**NOTE: Anticipated Project Duration – 5 to 6 months**

Copyright © 2023. KSWMP | All rights reserved

### 5.1.2 Sensitivity of Receptor

The dumpsite is surrounded by residential buildings and some commercial establishment. During the time of site assessment, some sensitive receptors within 500m from the site were identified, such as schools, religious places and households. The project site lies near to residences, within a 200-meter radius, and it may cause potential impacts on air, noise, surface water, and ground water that will directly or indirectly affect over 200 families (1000 people) for a duration of 5 to 6 months. The sensitivity of these receptors is High. In addition, there is a drain which flows through the residential areas of Meppayil which drains the runoff and leachate from the site. The sensitivity of this receptor is also estimated as High.

### 5.1.3 Significance of the impact

- Significance if the impact is high as it would even result in community resistance to biomining and bioremediation.

Since the project operational duration is 5 to 6 months, then the magnitude of the negative impact can be considered as small and medium sensitivity. In other hand magnitude of the positive impact, after the biomining of the existing land can be used for the recreational park for the public use.

## 5.2. Cumulative Impacts in The Region / Cluster

The impacts that may arise due to clustering of different dumpsites. The following impacts could result from the clustering while implementation, requiring thorough assessment.

1. If a sensitive environmental component (River, mangrove, wetland, etc.) is served by the leachate/drainage from one or more nearby dumpsites, the impacts can be regional.
2. Presence of other projects outside KSWMP; existing or forthcoming landfills, transfer stations or those considered under Track 1 investments may together create a cumulative impact with this activity.
4. Impact of vehicular movement from various subprojects on biomining of dumpsites may have cumulative impacts on air, odour, traffic issues, and pollution in case of spills/accidents/emergencies due to this clustering approach.
5. Storage of materials if any at common sites, impacts during rains, floods/emergencies in multiple sites of same water/air shed.

**Source-Pathway-Receptor Analysis**

**A) Source**: The source of contamination is the legacy waste remaining and being deposited at the Puthiyappa closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is 50 years old, as dumping had started in year 1962 and ceased in 2018. Initially the dumpsite was acting as a trenching ground, depositing sewage (night soil) from pit latrines. The total waste volume is 38367 cu.m with the dumpsite spread over 0.51 ha and rises to a height of approximately 6.7 m from the base. Waste is seen 5m above ground level and 1.7m below ground level. In addition to the landfill gas and leachate, windblown dust and litter are also considered as sources of contamination.

**B) Pathways**: The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards South East direction acts as a pathway for the uncovered waste to flow into the unlined unnamed drainage canal along the boundary to south eastern side, which runs through the residential areas and terminates at Akkamadathodu canal at 303 m aerial distance from the dumpsite which ends at Kuttiyadi river.

Lateritic Soil acts as a pathway for transport of leachate to the groundwater and for uptake of contaminated surface run-off.

The leachate flows with groundwater and acts as the pathway. Surface water contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals, rivers and streams are further transported by surface waters and in this case the surface water acts as the pathway.

Copyright © 2023. KSWMP | All rights reserved

**Receptors:**

Receptors are air, surface water (drain passing through residential areas) and ground water. For drinking purpose, they mainly use municipal water supply (30 nearby Households within 50 m and 1 school within 250 m), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the nearby residences and institutions in Meppayil. As the dump is not contaminated by hazardous wastes, remediation would improve the pollution scenario provided the bioearth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from biomining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after biomining activity, activities in biomined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post biomining activity.

### 5.1 Impacts on Air Environment

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCF in this case), nearby communities of Ward 20.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.
- When the legacy site is opened, existing gases would get emitted. Further, any delay /unexpected stoppage of biomining activity, might further aggravate the process of gas formation depending on waste composition, leading to odour and fire risks. In the

Copyright © 2023. KSWMP | All rights reserved

case of Puthiyappa, since the analysis of wastes shows calorific value of 2000 for combustibles with around 17 percent plastics, 4 % paper and 2% cloth rags, it's well combustible; and the risk of fire is high during summers.

### *5.2. Impacts on Water Environment*

Ground water

- Pre and post -monsoon water levels are 16 and 10 mbgl. Borehole data indicates waste upto depth of 6.7m with hard lateritic strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. With the slope of the dumpsite, this tends to get accumulated at low-lying gradients and flows into unlined drain up to 303 m and terminates at Akkamadathodu. Slightly high BOD levels of the drain and ground water wells around are indicative of leachate and runoff pollution. Oozing & pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during biomining to prevent ground water contamination. There I a need to separate out site drainage and leachate.
- Leachate samples: BOD, COD, TDS, E.coli, and heavy metals exceeding limits may impact the ground water quality in nearby schools, residences, wells, and long term soil pollution.
- Borehole data: Dump below water table may impact water resources and wells nearby.
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

Surface water

- The dumpsite experienced flooding during 2018 floods. The site is at a higher elevation, and hence no submergence was experienced at the site during the floods.

Copyright © 2023. KSWMP | All rights reserved

The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas.

- There are no surface waterbodies near the site, except Akkamadathodu canal at 303 m distance.
- Predominant slope is in the South East Direction. At Southeast direction, (end direction) there are residential households and mixed vegetation. The drainage and leachate from the site flows to nearby open drainage channel which flows through residential areas, and ends at Akkamadathodu. It is important to contain and treat leachate from the proposed biomining activities on site. Treated leachate may be recirculated or used for other purposes.

### *5.3 Impacts on Land/Soil*

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as biomining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.
- Spillover of activities to nearby road and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste biomining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.
- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Puthiyappa, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Puthiyappa does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste

Copyright © 2023. KSWMP | All rights reserved

(including legacy asbestos), e-waste or biomedical waste is found while biomining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste), Feb 2019) and World Bank EHS Guidelines. A plan shall be prepared to auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

- Wherever fuel, combustibles and retrieved waste is stored, it shall be on impervious surface, at appropriate elevation, protection against rains, flooding (such as cut off drains, berms etc.), wind and fly / pest menace (screens, green cover etc), intruders (compound wall existing at Puthiyappa), watch and ward, lighting, remote monitoring measures etc). Risk of fire, dust and leachate contamination shall be well assessed by the contractor. Emergency Action Plan shall be prepared and mitigation measures shall be updated based on work plan/DPR, and implemented. Communities shall be made aware of works and advice to follow measures such as use of fly/dust covers/nets on wells etc.
- Of the waste samples analysed, 50 to 60 percent comprises of Bio earth; 30% being <4.75mm size; C/N ratio (15:01) indicating slight unpleasant odour (high Nitrogen; releasing ammonia) less than that suitable for good compost.

### *5.4 Impacts due to Noise and Vibration*

- Various machines and vehicles activities contribute to noise and vibration on and off site. This includes vehicles carrying recyclables, operation of JCB, and other machines, diesel generator sets, motors on site, etc. In addition, if a functional MCF/RRF is present, vehicles transporting dry waste from households to MCF, loading / unloading of collected waste materials, and workers activities on site would add to noise and vibration. Impacts include disturbance to fauna flora on site, health impacts on communities around due to exposure to large volume of sound.

Copyright © 2023. KSWMP | All rights reserved

### *5.5 Other impacts on Biodiversity - Fauna/Flora*

- There are no sensitive biodiversity areas within 10 km of the site. However, since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 50km from the site is Western Ghats, World Heritage biodiversity site, and 4 key biodiversity areas; including Aralam WLS, Brahmagiri Wildlife Sanctuary, Camel's Hump Mountains, and Kottiyoor Reserve Forest which hosts multiple species. Depending on the contractors plan for disposal of retrieved waste fractions, EIA shall be updated for biodiversity impacts.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora: Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke.
- Disturbance to other fauna and flora on site: SWM activities onsite including those related to MCF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species listed by IUCN.

### *5.6. Other impacts on Workers and Communities*

- Contaminants in soil and water: Direct or indirect contact with polluted soil or water by neighboring water users. Additionally, because of their locations, recovered lands are subsequently used as parks, or for SWM facilities or office spaces etc. This may pose risk of bioaccumulation of metals which can constitute a health risk. Also impacts on buildings due to gaseous emissions, risk of fire etc if used after clearing.
- Health Risks: One of the primary health risks of dumps is the spreading of diseases - diarrhea, hepatitis etc. The ways such infection can be spread are numerous but are often related to direct contact with the waste (e.g., clinical waste, fecal matter) by

Copyright © 2023. KSWMP | All rights reserved

scavengers and other unauthorized persons being on the site. The other main pathway is by vectors such as, foraging animals, rats, birds, flies and mosquitoes etc. Flies, mosquitoes, rodents, crows, pigeons, pest menace on site, for workers & communities & their assets (such as wells) due to exposure of putrefied wastes.

- Impacts if separate common site/s or a site among these dumpsites is chosen to store wastes from other dumps till it is disposed, or as transfer stations or for common processing of certain fractions: Such activities would result in Air, odor, dust, noise, water, vibration, flora, fauna, communities around the new site. There is also risk of contamination due to newly placed wastes, and pollution impacts and disturbances to communities due to works/activities on this site. Such sites and activities shall be avoided, and if quintessential for the project, be carefully chosen and approved only after thorough discussions with KSPCB, and all stakeholders. An assessment of their sensitivity and appropriateness shall be undertaken considering the environmental risks. They shall be audited and assessed for existing and future environmental impacts of such activities and mitigation shall be implemented. However, details on such sites shall be known only based on the final schema of implementation proposed by the contractor. Hence, the Contractor shall update EIA based on this before starting any activity on site.
- OHS impacts: Infectious wastes, fecal matter, clinical wastes and sharps; batteries, e-waste and possible bursting; Hazardous wastes like asbestos and other chemicals dumped; pesticides / insecticides, inoculum storage, handling and use on wastes/land leading to diarrhea, hepatitis, insect & reptile bites, interactions with foraging animals like rats, dogs, cattle, vector (mosquitoes, flies etc) transmitted diseases etc.
- This activity would result in large influx of workers from the region and beyond as this involves 19 dumpsites in two clusters. Worker facilities in the labour Camp if any, & site are important, as the density of population is high in Kerala. It is important that camp sites are not set up in the land to be remediated. Periodic health checkups (once a week) are very important as the work involves handling of waste. It is important to also provide periodic health checkup and co-ordination with local Primary Health

Copyright © 2023. KSWMP | All rights reserved

Center/Central Health Services for medical camps for residents, schools and others during the biomining period.

- Risk of Fire during biomining and due to retrieved material storage; possible Burning of retrieved materials; storage and use of firewood for various purposes, fuel for vehicles. The smoke from burning solid waste can result in respiratory complaints, dizziness, and headaches in the short-term, as well as potentially more serious diseases such as cancers and heart disease in the long term.
- Impacts of other site development works shall be well assessed, EIA/EMP updated, and mitigation measures included in Project costs and implemented by the contractor/ULB (whoever is responsible as per FR/Final Bid document)

### *5.7 Visual impacts, Noise, Odour, Vibrations*

- Odour & impacts on workers and communities during biomining, storage and Transport are key determinants of community agreement to the activity. Such odour would attract flies and vectors in large numbers, that may also contaminate the food, and water sources of nearby communities. It is important to minimize odor emission as guided by the CPCB Guidelines on Legacy Waste Biomining, 2019. Also provide periodic health checkup and co-ordination with local PHC/CHS for medical camps for residents, schools and others during the biomining period.
- Visual impacts of the waste being dug up, screened ad heaped/stored is not appealing. It is important to mask this appropriately.

### *5.8 Traffic impacts*

- Impacts due to new access road construction/upgradation. Access road to the site is unpaved and slushy during rains. It is important to minimize temporary pollution due to increased movement men, and materials from and to the site during biomining activity and beyond as it is proposed to store material on site including air and noise pollution, access restrictions to properties nearby, and vehicular conflicts
- Large vehicles moving in and out of the site carrying materials, tools, equipment & pedestrian/worker -vehicular conflicts; increased traffic on roads, large equipments & vehicles, noise, air pollution: vehicle emissions, DG sets

Copyright © 2023. KSWMP | All rights reserved

- Vehicles, equipment's not adhering to pollution standards

### *5.9 Other Impacts on existing or proposed activities on site/s*

- There may be approvals from various agencies for biomining activities and associated facilities; depending on utilities and uses on site & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of biomining on existing facilities on site such as MRF, MCF, composting yard etc. (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post biomining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped, or if this is dumped elsewhere or not processed, it will lead to health and environmental issues. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health & Safety impacts on workers, communities. Also, forward linkages are considered as associated facilities/linked activities. Impacts of transportation of these fractions (traffic increase, odor, leachate, dust), impacts during rains & emergencies, handling, storage at the identified locations, reuse etc. shall be mitigated.

### *5.10 Cumulative Impacts*

- Cumulative impacts on VECs to be considered for each Cluster & combined: Impact may be *known impacts* viz., impacts of floods, rains, emergencies; Air, Odor, Water (Ground & Surface), biodiversity, communities, storage of retrieved fractions at each site during bio mining activity. *Unknown cumulative impacts* to be updated by contractor viz., storage of materials at common sites, impacts during rains, floods/emergencies in multiple sites of same water/air shed; material transported from multiple sites through same roads, same time, to same destinations; disposal of materials across the region at various destinations.

Copyright © 2023. KSWMP | All rights reserved

## 6. ENVIRONMENTAL AND SOCIAL MANAGEMENT & MONITORING PLAN

### 6.1 Scope of Environmental Management & Monitoring Plan

An Environmental Management Plan (EMP) is a comprehensive strategy designed to manage and mitigate the impacts of activities on humans and the environment, particularly concerning air, water, soil, land, and biodiversity.

### 6.2 Environmental Management Plan

The detailed anticipated impacts and corresponding mitigation measures/management of the impacts are given below.

*Table 17 Impacts & mitigation measures on Planning and installation phase*

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| ***A*** | | **Planning and Pre-Construction Stage** | | |
| ***1*** | | ***Planning for biomining facility*** | | |
| 1 | Biomining & Bioremediation Plan & Capacities | ▪ Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / biomined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these biomined material in line wit the agreements with such facility owners and National, State regulations and WB EHS<br>▪ Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate Management Plan.<br>▪ The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers. | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Contractor to get all required licenses & permits before start of any activity on site | | |
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>• The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>• To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>• Grading shall be performed where necessary to provide a neat appearance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ULB |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality, odor, water contamination due to* | • Carry out site assessments as per Guidelines for Biomining of Legacy waste Dumpsites of CPCB<br>• Consider safe biomining & gas / leachate generation from existing capped portion of the site<br>• Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>• Provision of appropriate PPE's to the team undertaking the site assessments<br>• Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits | TSC, ULB, Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *leachate, health and safety impacts of the people working in the site assessment* | • Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>• Plan for machinery operated which will be operated by skilled operators at all times.<br>• Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>• Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | | |
| 4 | Absence / Delay in Permissions for Developing the biomining facility and associated works as per National regulations | • Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labor Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes | • Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>• Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>• PPEs to be used by workers<br>• Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *(Air Pollution) and Visual Blight due to excavation* | | on bidding mechanism/DPR | |
| 6 | Material sourcing, transport, and stacking of construction materials<br><br>*(Occupational Health and Safety issues and Air noise pollution)* | • Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>• Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>• Materials shall be sourced only from approved quarries<br>• Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>• The driver should be with required license and follow speed regulations<br>• Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>• Material transport and unloading activities should not result in noise disturbance to locals and should be during day time<br>• Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>• Provide vehicle wheel wash area on site<br>• Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves.<br>• Proper rest area on site shall be provided with water, first aid, toilets | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | • Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>• Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>• Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>• It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with land owners wherever the labour is accommodated<br>• Camp must not be provided in an area prone to Hazards<br>• Camp should be adequately at higher plinth levels to prevent water intrusion<br>• Rooms shall be of appropriate sizes with adequaate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>• Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>• The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>(Refer ECOP section 06 and section 11 of EMF for KSWMP) | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife | • Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in biomining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | habitations, etc. especially in case of providing support facilities<br><br>*(Impacts on Fauna / Flora)* | permissions from respective authorities such as Pollution Control Board, ULB etc.<br>• Identify appropriate government site to avoid land acquisition and resettlement impacts<br>• Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing. segregation of the same are to be arranged with due consideration to nearby residences (20 no's near South side of the site), slope (towards south east) other landuses | | |
| 9 | Contamination of groundwater due to leaching. Leachate parameters: BOD, COD, TDS, Ecoli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | • During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>• Depending on the contractors plan for biomining of the capped area on site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke – burning, trampling/machinery | • Movement routes of vehicles to be planned to avoid key fauna/flora on site such as *Ailanthus sp.*(Tree) & *Funambulus tristriatus* ( Jungle Palm Squirrel).<br>• Special precautions must be taken to avoid any harm to on-site biodiversity during operations. This includes the installation of bird netting and temporary fences based on site conditions and work schedules. Additionally, visual deterrents such as bird spiders and scarecrows should be employed as deemed appropriate.<br>• Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU/ULB |
| 11 | Nuisance hazards to neighboring areas | • Ensure proper design and adequate compound wall: high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements<br>• In case of waste mound and site edges are sliding or unsafe; provide engineered retention walls.<br>• Implementing a flexible work schedule to accommodate nearby temple festivals, aiming to minimize the impact on the community during the festive period. | Contractor | SPMU/DPMU/ULB |
| 12 | Treatment & Disposal of wastes and rejects | • Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & intert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Biocarth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any | | |

Copyright © 2023. KSWMP | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| **B** | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| | **Implementation of biomining of the dumpsite** | | | |
| 1 | Impact due to the vehicular movement<br><br>*(Air and noise environment & Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | • Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>• All vehicles and machinery should obtain Pollution Under Control Certificates<br>• HORN PROHIBITION signpost to be erected.<br>• Rumble strips/speed breaker to be provided on access roads.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>• Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>• Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>• Avoid heavy vehicle movement through Vadakara roads during peak hours 7 a.m to 10 a.m mention: school hrs / peak hrs; and during important period / festivals when people use the road to access temple<br>• Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | Contractor, ULB | SPMU/DPMU/ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>▪ Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities<br><br>*(water environment)* | ▪ Labour camps if *any* (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>▪ Vehicle washing or maintenance near water bodies are to be avoided.<br>▪ Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ULB |
| 4 | Leachate and Runoff from biomining activities<br><br>*(Soil contamination and groundwater contamination)* | ▪ Provide site cut off drain around the site to divert off stormwater from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>▪ Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>▪ Ensure stormwater drains will lead to drain outlets (along the south east boundary of the site) on roads adjoining the dump yard<br>▪ Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area preferably to the South East corner of the site<br>▪ Provide proper treatment of leachate and stormwater that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by biomining activities like excavation and waste segregation and stabilization<br>▪ The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality | Contractor | SPMU/DPMU/ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>▪ The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>▪ Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>▪ Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>▪ Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>▪ Store leachate preferably in above ground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally.<br>▪ An assessment of the strength and alignment of the retaining wall on the southern side will be conducted for mitigation. Additionally, a line of vegetation or plantation will be established along the southern perimeter inside the compound to prevent the outflow of leachate. | | |
| 5 | Soil decontamination from accumulated waste levels | ▪ Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bioculture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>▪ Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of | Contractor | SPMU/DPMU/ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *(Impact on leachate, odor)* | leachate in the soil by root-zone phytoremediation<br>▪ Soil and water testing shall be done and changes in contamination shall be noted. | | |
| 6 | Excavation of waste from the waste mound<br>*(Health and safety impacts)* | ▪ The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>▪ Machinery operated for excavation should be operated by skilled operators at all times.<br>▪ Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>▪ Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>▪ In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>▪ When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | Contractor | SPMU/DPMU/ULB |
| 7 | Transportation of wastes or retrieved or other material in | ▪ All vehicles shall carry only approved load of weight<br>▪ Regular cleaning of roads & drains and removal of spills if any.<br>▪ All waste transport vehicles shall be covered and movement shall be during non-peak hours. | Contractor | SPMU/DPMU/ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | • Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, biocultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | masks & goggles<br>▪ Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed with out slip, trip, fall especially on waste, leachate or trenches<br>▪ Proper training will be provided regarding the maintenance of health<br>▪ Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper handwash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>▪ First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>▪ Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>▪ Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>▪ Measures such as deferred timings and stretch break to be adopted<br>▪ Secure all installations from unauthorized intrusion and accident risks;<br>▪ Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every days start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipments, slips of men & material | | |

|---|---|---|---|---|
| | | (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>• EHS specialist with adequate experience & third party supervision are important for biomining activity<br>• Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>• Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>• Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas:<br>• Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers:<br>• Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br>• Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near thoseIn close proximity to this location, there is a transformer. Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection | | |

| 8 | Pest / Vermin Control (Odour. flies. rodent / other pest menaces) | • Regular cleaning and approved pest control measures to be adopted<br>• Biopesticides / biological control shall be followed.<br>• Banned pesticides/insecticides shall not be used.<br>• Workers shall be made aware of storage and use of pest control measures and PPEs to be used | Future Facility operator | ULB |
| 9 | Fire Safety | • The local fire brigade shall be informed of the activity. and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations. guidelines and international good practices | Future Facility Operator | ULB |
| 10 | Energy Efficiency & Water Use efficiency | • All activities to consider energy efficient & clean fuels: and use of energy efficient equipment & construction techniques<br>• Landscaping & green belts to use local / indigenous plants & trees<br>• Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

**Disposal phase of By-products from Bio-mining process**

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within a three-month period, penalties will be imposed on the contractor.

### 6.3 Emergency & Disaster Management Plan

**Hazards Associated with Dumpsite Activities**

The Disaster Management Act, 2005 mandates every Government Department to prepare, review and update Disaster Management Plan

#### 6.3.1 Identified Emergency Situations

*Table 18 Hazards associated with Dumpsite Biomining & Bioremediation*

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| **As per World Bank EHS Guidelines** | |
| **Waste Storage** | **Regular visual inspection of all waste storage collection and storage areas for evidence of accidental releases** |
| **Waste Segregation** | **Regular audit of segregation of biomined wastes** |
| **Monitoring records for hazardous waste collected, stored, or shipped should include** | **1. Material Identification:**<br>- Name and identification number of the hazardous material(s) present in the waste.<br><br>**2. Physical State:**<br>- Indicates whether the waste is in a solid, liquid, gaseous form, or a combination of these.<br><br>**3. Quantity:**<br>- Specify the amount of hazardous waste, and biomedical waste retrieved from site typically measured in kilograms or liters, or by the number of containers. All such waste shall be staked in appropriate places / containers for disposal; duly marked & records kept<br>-<br>**4. Waste Shipment Tracking:** |

Copyright © 2023. KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| | Documentation tracking details include:<br>- Quantity and type of hazardous waste.<br>- Dates of dispatch, transportation, and receipt.<br>- Records of the originator, receiver, and transporter involved in the waste shipment.<br><br>**5. Handling and Treatment:**<br>- Describes the method and date of various actions taken with the retrieved waste, such as storing, repacking, treating, or disposing it<br>- Cross-referenced with specific manifest document numbers relevant to the hazardous waste.<br><br>**6. Location within Facility:**<br>- Specifies the specific locations within the facility where retrieved waste – various types shall be stored or processed.<br>- Includes information about the quantity of waste at each location. |
| **Falls and Slips at the dumpsite**<br>**Slippery surfaces or uneven surfaces and poor access to work areas climbing on and off the facility, equipments/machinery or the waste segregation / other facilities set up.** | Tidy workplace by maintaining good housekeeping. Handholds wherever necessary and clear/ safe access to work areas with proper PPE to the persons working at the site. |
| **Fire Hazard**<br>**Fire risk may occur due to the following**<br>**Storage of flammable liquids / Gas like LPG, Diesel**<br>**Any combustible materials** | Combustible/flammable materials should be properly managed and stored/used. Fire extinguishers and Fire hydrant Network with reserve water (As per |

Copyright © 2023. KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| **Sparks<br>Open flames<br>Absence of Fire hydrant network may increase the risks in case of major fire accident** | NFPA Code) should be made available. Emergency Plan in case of fire. |
| **Absence of Personal Protective Equipment Lack of adequate footwear, Helmets, hearing/ eye protection, gloves & goggles may lead to injuries and death.** | Proper footwear, Helmets, hearing/ eye protection, gloves & goggles should be given to the workers at the dumpsite. Proper training should be given to the workers on the use of PPE. |
| **Electrical Hazard<br>Electric wires if any damaged<br>Poorly insulated<br>During temporary repairs<br>Circuits overloaded may lead to major accident** | Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit. |
| **Ladders<br>Risk may occur due to the following<br>Not secured against dislodgement<br>Defective ladders<br>Not sufficient length<br>Incorrectly placed** | Ladder risk can be mitigated by the following<br>Secured against movement or footed<br>Ladders in good condition<br>Regular inspection<br>Ladder should be extended one (1 m) meter above platform to avoid injuries |
| **Excavations<br>Risk may occur due to the following<br>Trench collapse<br>Gas emission** | Risk can be mitigated by the following<br>• Soil stability should be known before excavation<br>• No water accumulation<br>• V500 mask should be used in order to counter the gas emission.<br>• Emergency Plan |

Copyright © 2023. KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| **Defective or wrong Hand Tools**<br>Wrong/defective tool may end up with injuries to the workers using the tool | Right tool for the job should be used properly and it should be in good condition |
| **Accidents due to vehicular movement**<br><br>**Vehicle movement inside the site** | Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. |
| **Noise Hazard**<br>**Noise levels over 85 decibels would cause trouble to the people working at the site** | Noise Levels should be maintained below 85 decibels and with proper protection |
| **Falling Material**<br>**Fall during carrying/Lifting of waste and materials from overhead work areas.** | Risk can be mitigated by preventing the falls by barriers, training, strengthening the materials used for works and the following<br>Use of hard hats.<br>Person operating the jcb/machine must be provided with walkie talkie/hand signals to know about the clearances. Also the services of flag staff with flag & whistle to be arranged. |
| **Visitors Presence at site**<br>**Insufficient fencing may lead to attract pedestrians to enter the site.** | Fencing and barricades with proper signage boards indicating "trespassers not allowed" |

### 6.3.2. Proposed Organizational Structure for Disaster Management

The Organizational structure for the Disaster management contains the following team members.

**Emergency Response Team:**

A response team needs to be set in assistance with a senior executive (Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

Copyright © 2023. KSWMP | All rights reserved

Incident controller would be reporting to the Site Controller. Incident Controller organizes a team responsible for controlling the incidents with the personnel under his control.

Shift In-charge would be the reporting officer, who would bring the incidence to the notice of the Incidence Controller and Site Controller.

Emergency Coordinators would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.

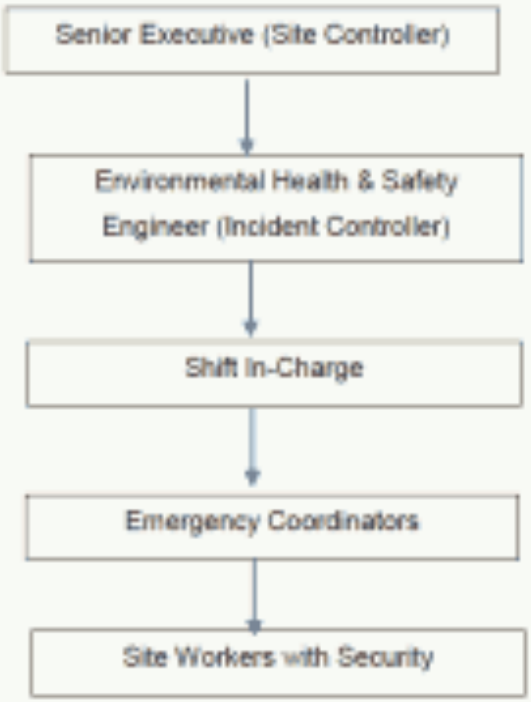

*Figure 7 Organizational structure for the Disaster Management Team*

### 6.3.3 Emergency Response Facilities

Emergency Control Center – with access for emergency shutdown procedures, duties and contact details of key personnel and government agencies, emergency equipment, etc.

- Assembly Point – with minimum facilities for safety and rescue
- Emergency Power Supply – connected with diesel generator, flame proof emergency lamps, etc.

Copyright © 2023. KSWMP | All rights reserved

- Fire Fighting Facilities – first aid fire-fighting equipment, fire alarms, etc.
- Location of Wind Stock – located at appropriate location to indicate the direction of wind for emergency escape
- Emergency Medical Facilities – Stretchers, gas masks, general first aid, emergency control room, breathing apparatus, other emergency medical equipment, ambulance The medical centre should display poster for treating burns and first aid. Some medicines and facilities to be kept in the medical centre are suggested.

**Health and Safety Measure for the workers**

All workmen employed in working conditions will be provided with adequate personal safety equipment as applicable to the work including (but not limited to):

- Safety shoes/boots
- Safety Helmets
- Hand gloves
- Ear muffs

**Monitoring Plan**

The considerations in an emergency planning include the following:

- Identification and assessment of hazards and risks
- Hazard consequences analysis
- Alarm and communication procedures
- Identification and equipping emergency control centre identify assembly, rescue points, medical facilities
- Emergency preparedness plan, procedure, steps to be taken before during and after emergency
- Formulation of plan and emergency sources
- Training rehearsal, evaluation and updating the plan
- Machinery should be examined regularly

Copyright © 2023. KSWMP | All rights reserved

- Medical examination:every employee shall be examined by doctors at least 3 months in a calendar. Health register should be maintained by the individual industry coming in the project site

**Emergency Action Plan for Fire**

In case of Fire the immediate plan of action will be “RACE” that stands:

R - Rescue: When you discover a fire, rescue people in immediate danger if you can do so without endangering yourself.

A - Alarm: Sound the alarm by pulling a fire pull station and call fire station, from a safe distance, notify security of precise location of fire.

C - Confine: if possible

E - Evacuate: Evacuate the place

Immediately inform the response team on site and local fire brigade. Response team moves to the point of fire and take all necessary steps to stop the fire. Fire brigade to join at the earliest. If the fire is not controllable and spreads, then the manager in charge should inform the district authorities and call for additional external help. Complete an Incident/Accident Report within 24 hours.

Firefighting system is proposed to prevent and control fire outbreaks. The firefighting system will consist of portable fire extinguishers, hose reel, wet riser, yard hydrant, automatic sprinkler system, and manual fire alarm system. In case of dumpsite biomining it is also important to shave fire lines in the biomining area & also in the storage area where material retrieved is stored.

**Emergency Action Plan for Electric Fire**

- Disconnect the affected areas electric supply
- If fire is small scale, then $NAHCO_3$ or Sand will be effective.
- Attempt to extinguish fire with the help of $CO_2$ based extinguisher

Copyright © 2023. KSWMP | All rights reserved

Seek support of Fire Brigade

Action Plan of on-site Emergency Plan

The action plan considered is given as follows:

- To constitute Disaster Management Committee under senior officer not below the rank of General Manager
- To identify potential hazards areas in the layout map
- To predict degree of burns and distance of the risk zone by using model
- To evacuate the area within risk zone
- To localize the emergency and if possible eliminate it
- To minimize the effects of accidents on people and property
- To take remedial measures in the quickest possible time to contain the incident and control it with minimum damage
- To mobilize the internal resource and utilize them in the most effective way
- To get help from the local community and government official to supplement internal manpower and resources
- To minimize the damage in other sections
- To keep the required emergency equipment in stock at right places and ensure that they are in working condition
- To keep the concerned personnel fully trained in the use of emergency equipment
- To give immediate warning to the surrounding localities in case of emergency situation arising
- To mobilize transport and medical treatment of the injured
- To educate the public in the surrounding village regarding hazards
- To arrange treatment of causalities
- To safe guard the people
- To identify the causalities and communicate to persons known to them
- To render necessary help to concerned
- To rehabilitate area affected

**Urban Floods:**

Copyright © 2023. KSWMP | All rights reserved

Floods are extreme events, usually triggered by extreme precipitation (river/inland floods) and/or storms (coastal floods). If these rainfalls exceed the retention capacity of the basins, drainage speed and volume, it causes floods.

**Different Types of Flooding:**

1) Localized flooding due to inadequate drainage;

2) Flooding due to overflows from Rivers/channels/drains, where the dumpsite is on or near flood plains or when flood plains are occupied by various settlements & other infrastructure without space for water to flow.

**Stakeholders in Disaster Management:**

The policy also systematizes a frame work of operation for the following set of stakeholders that play key roles in disaster management.

- Kerala State Disaster Management Authority
- State and Central Government Departments and Disaster response forces
- District Disaster Management Authorities
- Local authorities including Municipal Corporations/Municipalities, District/Block/Grama Panchayaths, Taluk/Village Officers etc.
- Voluntary and Civil Society Organizations
- Red Cross, multilateral aid agencies and U.N agencies
- Community – Village Disaster Management Committees / Task Forces
- Public sector Undertakings
- Private sector undertakings
- Army, Navy, Air Force, Coast guard, Airport Authority, National Disaster Response Force etc.

District disaster teams shall be informed of the proposed activity and its schedule.

### 6.4 Environmental Monitoring Plan

Monitoring at dumpsite will be carried out in four physical zones as follows:

i. On and within the dumpsite

ii. In the unsaturated subsurface zone beneath and around the dumpsite

Copyright © 2023. KSWMP | All rights reserved

iii. In the groundwater (saturated) zone beneath and around the dumpsite

iv. In the atmosphere/local air above and around the dumpsite

The Environmental Monitoring Program involves the following:

- Conducting survey and sampling program.
- Analysis of samples, data/information collected, and their interpretation.
- Preparation of reports for submitting to management and statutory authorities.
- Environmental monitoring is carried throughout the project operation to detect changes in the key environment quality parameters, which can be attributed to the project.

The results of the monitoring program will be used to evaluate the following.

- Extent and severity of the environmental impacts against the predicted impacts.
- Performance of the environmental protection measures or compliance with pertinent rules and regulations.

### 6.4.1 Air Environment

The potential sources of air pollution from the dumpsite include vehicular movement, emission of dust from biomining activities & wastes retrieved and stacked, and passive leakage of landfill gas from the disposal site. Other important contributor is odour emissions from the existing legacy site disturbed. Monitoring of the air environment will be carried out during the operational phase in and around the project site.

### 6.4.2 Noise Environment

The operations shall induce noise due to operations of transport trucks (men & material), JCB loaders and other types of machinery required at the dumpsite for moving wastes, screening, stacking, turning etc, and the biomining activity per se. Monitoring of ambient noise levels and also the exposure of the workers to that environment is essential.

### 6.4.3 Water Environment

Water quality to be monitored during the operational phase. The monitoring frequency needs to be increased if higher concentrations are expected. Both groundwater regime and

Copyright © 2023. KSWMP | All rights reserved

surface water domain is anticipated to be most-affected, through leachate contamination. Therefore, surface & ground water will be periodically monitored for the parameters particularly increase in BOD, heavy metals and the hazardous chemicals.

### 6.4.4 Land Environment

The soil in the dumpsite & neighboring areas will be analyzed for relevant parameters.

The details of Environmental Monitoring Programs are given below:

*Table 19 Environmental Monitoring Parameters*

| Environmental components | Locations | Frequency | Parameters |
|---|---|---|---|
| Ambient Air quality | Nearby habitations and downwind locations | Quarterly [1 sample] | $PM_{10}$, $PM_{2.5}$, $NO_x$, $CH_4$, CO, Ammonia |
| Noise | Outside the site – towards residential area | Monthly | Noise levels |
| Ground and Surface water | Ground water from the nearest well, drain upstream & downstream of where leachate is disposed, and Thodu upstream & downstream of were the drain joins | One Year | IS 10500:2012 drinking water parameter for ground water wells, class D, E for drain & Thodu (if these are not used as drinking water source) |
| Accidental release | Chemical, oil and fuel spills | Daily | Near chemical, oil storage areas Incident reports |
| Health safety Hazards | Medical records, documentation of injuries and accidents, Health and safety assessments | As and when accident/injury occurs | Incident reports |

Copyright © 2023. KSWMP | All rights reserved

| Environmental components | Locations | Frequency | Parameters |
|---|---|---|---|
| Leachate | 1 point per leachate pond | Weekly during biomining activity | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC),<br>• Dioxins |

In case, any deviation from FR, this would be updated and mitigation and monitoring measures would be revisited. Currently the location of disposal of biomined material, or type of transport of biomined material is unknown & hence, these impacts & mitigation, monitoring requirements will be updated & implemented by the Contractor. This aspect should be made a Bid condition.

### 6.5 Environmental & Social Safeguard Budget

The details of Environmental Budget for Implementation and Supervision of Environmental Management Plan (EMP) is given below:

Copyright © 2023. KSWMP | All rights reserved

*Table 20 Detailed Cost Breakup*

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| | **Environmental Safeguards** | | | | |
| 1 | Deodorizer equipment (power sprayer) | Only Once | | | |
| 2 | Green Net ( Approx., 250 m Length – Height – 3 m) and installation charges | Based on requirement | | | |
| 3 | Spillage Kit | Only Once | | | |
| 4 | Monitoring of Environmental parameters [Air, Ground water, Surface water, Noise, Soil and Leachate] Actual Noise abatement, odour management, dust management measures to be included in DPR cost | Quarterly, first six months by contractor and next two years by ULB | | | |
| 5 | Gas monitoring to check the gas accumulation at the dumpsite (including existing capped area at Puthiyappa dump) | Gas monitoring should be conducted at least twice a day for about 7 consecutive days | | | |

Copyright © 2023. KSWMP | All rights reserved

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| | **Environmental Safeguards** | | | | |
| 6 | Personal protective equipment | Entire Process | [redacted] | [redacted] | [redacted] |
| 7 | Training on capacity building | Entire Process | [redacted] | [redacted] | [redacted] |
| 8 | Leachate Management (Full costs included in DPR. This is only for incidental mitigation of odur, leaks, spillage, flies etc. ) | Only gap incidental costs. The rest are all included in DPR | [redacted] | [redacted] | [redacted] |
| 9 | Access Road Improvisation | Only Once | [redacted] | [redacted] | [redacted] |
| | **Social Safeguards** | | | | |
| 9 | Overall Budget for Social Safeguards | | [redacted] | [redacted] | [redacted] |
| **TOTAL** (actual costs for works involved for mitigation measures are to be included by the contractor in DPR costs based on his work method. This is only indicative cost for incidental mitigation & management measures. EHS in Labour camp also not included here; but shall be included by the contractor based on his work plan as this is combined with multiple other dumpsite biomining works) | | | | | [redacted] |

## 7. SOCIAL SAFEGUARD ASPECTS

### 7.1 Introduction

Dumpsite remediation refers to the process of mitigating the adverse effects of existing dumpsites and restoring them to a safe and environmentally sustainable state. It involves a series of systematic actions aimed at minimizing pollution, reducing health risks, and rehabilitating the affected areas. The bio mining process of Vadakara municipal dumpsite has been included in the World Bank supported KSWMP project. The dumpsite, which is located at Puthiyappa, ward 20 of the municipality has been operational since 1953, in a land extend of 152 cents owned by the ULB. However, it has not been used for any dumping purpose for the last five years. Currently, street sweeping trash is put in the dumpsite. Around 300 households reside within a 200-meter radius of this dumpsite that is prone to some sort of risks. The sixteen families living very near to the site is at most risk. A few institutions are also functioning near this dumpsite include a school, two colleges, one Anganwadi, a mini theater, staff quarters, library, and a veterinary hospital.

The site is located at 3 km from the National Highway 66. The access road to the site is of six-meter width. Mixed types of families of different socio-economic groups such as High-Income Groups (HIG), Middle-Income Groups (MIG), and Low-Income Group (LIG) reside within 200m radius making a cross section of the society. Most common livelihood sector is agriculture and farming, about 40 persons engaged with service sector jobs and eight persons employed with the government sector jobs. The information on socio-economic profile is being gathered adopting social tools like transect walk, Key Informants Interview (KII) etc.

### 7.2. Output of The Social Screening

Social screening of the dumpsite remediation, by a joint team of DPMU, DPMC, TSC and PIU, was carried out on 8.2.2023 following a screening checklist. Social screening was done to identify the potential social risks anticipated during dumpsite remediation. Vadakara dumpsite has a high density of population, presence of public utilities/facilities, educational institutions, library and a film society. The presence of chronic illness among the people who are staying very near remains as a risk factor.

**High density of population**

The dumpsite is in a densely populated area with about 300 households residing within a 200m radius. The municipality stopped dumping of biodegradable waste like slaughter waste, hotel waste, market waste etc since 2005. The land value of the nearby area is very low, which attracts low-income people prefer to find dwelling spaces near the site. As a result, the population density became very high. 16 families residing 50m radius from the

Copyright © 2023. KSWMP | All rights reserved

boundary of the dumpsite are very prone to risk. At present, there are no aesthetic or odor issues due to the dumpsite. In the process of transect walk and KIIs, it has been noted that the nearby households extend support for the dumpsite remediation activities.

**High proximity of educational institutions, public utilities and facilities.**

Educational institutions, library cum mini theater, warehouses, shops, veterinary hospitals, staff quarters etc are the public utilities near the dumpsite. A good number of people used to gather in the library regularly for reading and learning purposes. Dailies, journals and other periodicals are available in the library. It is also found as a venue for public gathering and recreation. Phalke Film Society (mini theater) organizes film shows regularly, organizing debates and discussions and also conducts annual film festivals. Municipal ward level programmes are being conducted at this space. Six shops and commercial establishments exist in the vicinity of 200m to the dumpsite which includes stationery and other small shops.

**Community Health and vulnerability**

The vulnerable groups such as persons with respiratory illness (30 nos), pregnant women (5), PWDs (4), terminal illness (4) children below the age of two (12) and elderly (18) may exhibit health issues during the remediation process. The biomining process may create vulnerabilities such as mobility, sound, water, and air pollution etc..

### 7.3 Transect Walk

To understand the social dynamics, demographic profile, livelihood patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community, a transect walk was carried out on 30.05.2023, which was crucial for developing effective dumpsite remediation strategies that align with their priorities. The findings and recommendation of the transect walk is shown in the below given table.

Copyright © 2023. KSWMP | All rights reserved

| S.No | Social risks | Findings and Recommendations |
|---|---|---|
| 1 | Presence of 300 families, institutions, shops, establishments, and other public utilities near (200m) the dumpsite. | • Free movement of the residents needs to be ensured<br>• Since the school has two entrances, inside and outside of the dumpsite road, the mobility of the students will not be disturbed. Regulation on either of this road may affect the free movement of the students during school opening and closing time. Necessary traffic arrangements must be made.<br>• Working hours of public utilities including shops and establishments may be restricted, that should not affect the livelihoods of the workers attached to these facilities |
| 2 | Sound pollution, health issues and foul smell most affects 16 families residing very close to the site (50m). | . SIA and SMP will consider the detailed impact and proper mitigation measures |
| 3 | Health risk of vulnerable groups residing near to the site(especially 16 families) which includes patients with breathing issues, pregnant women, PWDs, cancer patients, children below the age of two and elderly above the age of seventy-five. | Health issues may aggregate during work operations.<br>These factors should be considered strongly especially for all vulnerable groups |

**Findings of the consultation meeting.**

Copyright © 2023. KSWMP | All rights reserved

1. The local residents are much supportive for the entire proposed dumpsite remediation process
2. All concerns related to the health care of the vulnerable communities residing near to the dumpsite needs to be taken care properly.
3. Free movement of the residents needs to be considered while preparing the project. There should be adequate provision for necessary traffic regulations / rearrangements to manage the movements of vehicles as well as machineries.
4. The local residents wanted to get some sort of assurance from the authority that the present dumpsite should not be used for any kind of waste management activities.

1. 7.4 Scoping of Social Impact Assessment and Management Plans

Since the site is surrounded with a greater number of families and considering the major work to be implemented, the Vadakara dumpsite falls into a substantial social risk category. Proximity of public facilities and institutions, use of sophisticated technologies and machinery are also the reasons to consider the site to be a substantial risk category. All the social risks identified through social screening process need to be addressed. A detailed Social Impact Assessment will be carried out to understand the social impacts. The SIA will help to identify the possible positive and negative social impacts due to the biomining process. The SIA will consider the following risks in detail

**Community health and safety**: As per the screening, it was understood that vulnerable communities including persons with respiratory illness (30 nos), pregnant women (5), PWDs (4), terminal illness (4) children below the age of two (12) and elderly (18) may report illness due to sound and air pollutants. The risk possibilities due to the emission of gasses, dust etc is to be considered while preparing detailed SIA and SMP.

**Access to institutions and public utilities**: Access for 300 families to the public utilities such as a public library, film institute, 4 stationary shops and 2 petty shops, veterinary hospital, 1 school and 2 colleges, a supplyco warehouse may get affected during the biomining activities. Traffic restrictions in access roads may be imposed. A detailed SIA will cover all such issues in detail.

7. **Residents in the steep southern side**: A retention wall was constructed to protect the site from land erosion and leachate to the south side of the dumpsite which is a steep area. During rain, it may lead to water flow along with leachate towards the downstream.

Copyright © 2023. KSWMP | All rights reserved

4 families are staying within 50m of the compound wall. Considering the negative impact, the dumpsite remediation activities are scheduled to start by the end of November when monsoon season ends.

8. **Routine life:** Since the area is thickly populated, it may affect the routine daily life of the people. Restriction in public roads, disturbances in gathering spots, shops etc are the expected issues. Detailed impact assessment is needed to identify the ill effect on routine life and hence mitigation measures can be developed.

9. **Labor Management Plan:** Approximately 30 to 40 laborers would be engaged in a day for the biomining process on a regular basis for a period of 5 months. The contractor must get all the mandatory registrations and licenses and to comply with all relevant labor laws.

**OVERVIEW OF LABOUR LEGISLATION: TERMS AND CONDITIONS**

| S. No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |

Copyright © 2023. KSWMP | All rights reserved

| S. No | Applicable Acts | Details |
|---|---|---|
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |

Copyright © 2023. KSWMP | All rights reserved

| S. No | Applicable Acts | Details |
|---|---|---|
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10. | Industrial Disputes Act 1947: | the Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

The project expects a labor influx. The labor influx may have some negative effects on the host community. A detailed SIA is required to understand the labor related issues and derive suitable mitigation measures in terms of labour compliance and labor influx. According to the findings from SIA, the Labor management plan, labor influx management plan and GBV action plan will be prepared.

**Action plan for the preventive Gender Based Violence:** The bio-mining activities may require women laborers in the workforce. It is necessary to ensure better working conditions, a gender friendly working environment, and improved social security for the women workers. Provision for portable drinking water and toilet facilities needs to be separately arranged. The preventive gender-based violence action plan would be prepared after assessing the gender issues. Therefore, a comprehensive social impact assessment needs to be carried out.

Copyright © 2023. KSWMP | All rights reserved

### 7.4 Methodology for Social Impact Assessment

A predetermined methodology can be used to conduct the SIA. Baseline Study in SIA process usually includes data collection and analysis of various project aspects. The SIA methodology includes.

a) Social Screening

b) Stakeholder meeting

c) Household level survey

d) Baseline study /data collection

e) Focus Group Discussions(FGD)

f) Key Informants Interview

g) Data analysis (Quantitative and qualitative)

### 7.5 Costing For SIA

The scoping of SIA identifies the areas where impact assessment is required. After identifying social impacts, it would refer to suitable mitigation measures further. The mitigation measures include stakeholder consultations, activities to ensure community health and safety, mitigation to disruption of access to public utilities, GBV prevention activities, Labour management activities, influx management actions, strengthening of GRM. The cost for the implementation of mitigation measures can be derived from the programmes/ activities proposed under mitigation. Detailed cost estimation will be done during SMP and LMP, influx management and Preventive GBV action plan preparation. As a lump sum, [redacted] ([redacted]) would need to adopt mitigation measures. The total cost can be bifurcated into different heads based on SIA

Copyright © 2023. KSWMP | All rights reserved

## 8. INSTITUTIONAL ARRANGEMENTS

### 8.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organisation will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU

Copyright © 2023. KSWMP | All rights reserved

### 8.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for HKS (Health & Hygiene, source level waste segregation and source level treatment, Fire and Safety)
- Training program for ULB Councilors and Ward convener (Proposed SWM project plan of KSWMP)
- Training program for Political and trade union leaders (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for Residence Association leaders (Health, Hygiene different composting methods and source level waste segregation, littering of waste, Public Health, Fire and Safety)
- Training program for workers of Municipal Sanitary workers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for school / college students (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for ULB officials (Proposed SWM project plan of KSWMP, proposed policies, existing policies etc... to improve the existing pattern into zero waste concept of the municipality)
- Training program for School children, Parents and Teachers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Massive awareness campaign on 5R (Reuse, Recycle, Repurpose, Reduce and Refuse)

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and

Copyright © 2023. KSWMP | All rights reserved

disposal) and importance of their work and develop a sense of belonging towards the work.

### 8.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – https://kswmp.org/grievances / grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

## 9. PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

"Public Consultation" refers to the process by which the concerns of local affected persons and others who have plausible stake in the environmental impacts of the project or activity are ascertained with a view to taking into account all the material concerns in the project or activity design as appropriate.

Initially the public opposed the dumping of waste at Vadakara dumpsite and the same has been inactive from year 2018. Now this proposal is to remediate the existing site in order to protect the environment and human health of the nearby area. The summary of the document will be made available in the website, which will also be featured in a newspaper advertisement in Malayalam language for public disclosure.

### 9.1 Public Consultation

In connection with the dumpsite remediation, a consultation meeting was conducted on 30.5.2023 at Puthiyappa, the place where the dumpsite was located. Stakeholders from different social entities participated in consultation meeting followed by a transect walk. Local municipal ward councilor, ex councilor, political party leaders, trade union representatives, local residents, representative from Haritha Sahaya Stahapanam (Hariyali, a dedicated agency in charge of managing solid waste in Vadakara Municipality), officials from DPMU, ULB, PIU and TSC were participated.

In the meeting, ward councilor Smt. PP Leeba explained about the proposed dumpsite remediation activities with a positive note on how the remediation activities beneficial to the local community. The ward councilor extended all the support from the local people for the dumpsite remediation activities. Further, a detailed description on dumpsite remediation was given by Smt. Jannet TA, Social and Communication expert, DPMU. Participants expressed their concerns regarding the proposed project activities and its implementation modalities. The participants were happy that the believed that the life long bad image of 'trenching ground' would get removed since it was highly a stigmatized usage.

Shri. Valsan, Ex-councillor reiterated that that they were supporting the dumpsite remediation process believing that the activity would bring a positive impression and impact over the lives of local communities. He raised concerns regarding the use of reclaimed land and opined that land should be developed in such a way that must be beneficial to the local community. The participants, especially the local people were concerned about the further

Copyright © 2023. KSWMP | All rights reserved

usage of the land as they expressed their doubt related to the chance of further dumping of solid waste even after the dumpsite remediation. This was because the locals experienced ill treatment from the ULB for the past several years.

### 9.2 Outcome of the meeting

A transect walk was followed by the meeting with the participation of local residents. The local community, after the meeting and interactions, decided to extend all sort of support for the dumpsite remediation activity, provided there should be an assurance from the ward councilor that the land would not further be used for the same dumping purposes. The meeting also discussed various aspects of dumpsite remediation in detail including the possible social and environmental issues that may affect their routine life as well as the free movement during the time of operation

### 9.3 List of stakeholders attended

Stakeholders from various entities participated in the transect walk. The details of the participants are shown below

*Table 21 List of stakeholder attendeding the transect walk*

| S. No | Name | Designation |
|---|---|---|
| 1 | Leeba PP | Ward Councilor |
| 2 | Valsan | Ex councilor |
| 3 | Janatte TA | S&CE, DPMU |
| 4 | Sobha | HKS member |
| 5 | Kamala | HKS member |
| 6 | Nirmala | HKS member |
| 7 | Pradeep | Local residence |
| 8 | Latheef | Local Residence |
| 9 | Sanooj | Local residence |
| 10 | Manu | Interns |
| 11 | Neeraj | Interns |
| 12 | Livin Pramod | PIU – SWM Engineer |
| 13 | Manalil Mohanan | Director, Hariyali |

## 9.4 Information, Education and Communication (IEC) Plan

*Table 22 IEC Plan for Vadakara dumpsite*

| IEC Plan for Vadakara dumpsite remediation | | | | |
|---|---|---|---|---|
| **Programme** | **Methodology** | **Topic** | **Responsibility** | **Monitoring** |
| **Sensitization/ Awareness programme** | Meeting with all concerned Stakeholder's with prior notification to discuss about the process and remediation methods | Process of dumpsite remediation Developing as a Recreational park | Contractor | TSC/DPMU /DPMC |
| **Pamphlet** | Distribute to all households within the limits in connection with the dumpsite remediation programme. | Awareness through community participation Different locations in the neighboring area | Contractor | TSC/DPMU /DPMC |
| **Informative standees in all** | Visible places nearby the dumpsite | Protocol to the public who residing in nearby areas and also trespassers. | Contractor | TSC/DPMU /DPMC |
| **Announcement vehicle** | All across places near the dumpsite | Health and hygiene protocols during the dumpsite remediation process | Contractor | TSC/DPMU /DPMC |

Copyright © 2023. KSWMP | All rights reserved

| IEC Plan for Vadakara dumpsite remediation | | | | |
|---|---|---|---|---|
| **Programme** | **Methodology** | **Topic** | **Responsibility** | **Monitoring** |
| **Digital campaign (Social media)** | Areas surrounding waste dumping and all affected areas | Arrangement of a public audio system to address all people in the surrounding areas.<br><br>Short video presentations to communicate through different digital platforms like WhatsApp pertaining to the existing scenario and proposal of Recreational Park with self-explanation | Contractor | TSC/DPMU /DPMC |
| **Cautionary notification boards** | About vehicle movement and the transit of waste | precautionary measures should the general public take. | Contractor | TSC/DPMU /DPMC |

**Conclusion**

The dumpsite remediation activity at Vadakara involves moderate social and health risks. However, a set of risk mitigation activities are proposed in the social management plan to overcome the identified risks and its negative impacts on the people residing near to the site. Formation and regular meeting of GRM & stakeholders committee, capacity building, awareness generation, regulated working hours, controlled operation at school working hours, counseling for the aggrieved parties, gender sensitization, legal awareness, providing safety are the major mitigation measures. This proposal is made to reduce the social risk associated with dumpsite remediation and to minimize the negative social impacts.

# ANNEXURES

## Annexure 1 – Environmental Screening

**Environmental Screening**

**Sub Project Details**

| Name of Subproject: | Dumpsite Remediation |
|---|---|
| Sub project Components: | Dumpsite Remediation |
| Subproject Location (City / Town/ Village with ward numbers): | Vadakara ULB, Ward 20 Puthiyappa, Kozhikode District. |

**Stage 1: Exclusion List**

| Sl.No | Non-permissible Activities |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016 (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible) |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |
| The project does not fall under the above conditions as mentioned under exclusion list | |

Copyright © 2023. KSWMP | All rights reserved

**Stage 2: Environmental Screening Checklist**

| S.No | Components | Details |
|---|---|---|
| 1 | Project Components | Dumpsite Remediation |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities / associated facilities) | This proposed project involves biomining of existing dumpsite.<br>This remediation process involves<br>**Pre-processing of legacy waste**<br>1. Clearing and grubbing of site<br>2. Windrow formation for stabilising the excavated waste<br>3. Windrow turning, tilling and cone formation<br>**Machinery erection**<br>1. Site levelling for Plant erection on the site and commissioning of machineries.<br>2. Operation of plant for processing the waste.<br>3. Office set up and fire safety measures<br>The byproducts of the process are<br>1. Bio earth and coarse fraction soil – will be used within the site |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Components | Details |
|---|---|---|
| | | 2. RDF – will be send to nearby waste to energy plants like cement plant and power plant which further processing it will be used as fuel<br><br>3. Recyclables – will be send to the authorised recycling agency |
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination) Site Survey No./s (attach map) with ownership details, Geographical co-ordinates of the site location (including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | Latitude: 11°35'39.0"N, Longitude 75°36'20.7"E<br><br>Land ownership: Vadakara Municipality<br><br>Land use: Public<br><br>Disaster Zone: It falls under Zone III (Moderate) |
| 4 | Land Area proposed to be used: Location wise (in sq. km / sq. m) | It is remediation of land and hence no land required |
| 5 | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | Operational phase – 0.5 KL/day<br>Domestic use – 1.0 KL/day |
| 6 | Power Required and Source of Power | Demand load for the proposed equipment during the remediation process is available and additional power required will be made available by DG sets |

Copyright © 2023. KSWMP | All rights reserved

**Baseline Environmental Conditions**

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| 1<br><br>(i) | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers)<br><br>Critically Vulnerable Coastal Areas (CVCAs), Eco sensitive Areas (ESAs) | | No | The project site is not located near any Critically Vulnerable Coastal Areas (CVCAs), Eco sensitive Areas (ESAs) |
| (ii) | Cultural Heritage site, protected monuments – listed by ASI/State | | No | The project site is not located near any cultural Heritage or protected monuments as listed by ASI/state |
| (iii) | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species? If yes, which is the area? | | No | The project site is not located near Natural Forests / Protected Areas / Bio-Reserves |
| (iv) | Other Wetlands/ Mangrove/ Estuarine Region | | No | The project site is not located near any Wetlands/ Mangrove/ Estuarine Region |
| (v) | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | No | The project site is not located near any Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves |
| (vi) | Other Sensitive Environmental Components listed in EMF | | No | No other sensitive environmental components listed in |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| | | | | EMF exist nearby the project site |
| (vii) | Drinking water source, upstream and downstream uses of rivers, etc | | No | No river source is resorted for drinking water use<br>Downstreams the ground water source is available |
| (viii) | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | No | The sea is located 3 km (Aerial Distance) from the project site. There won't be any influence of tidal influence |
| (ix) | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | Yes | | a. **Nearest Habitation**- 30 Houses are located at an Aerial distance of 50 m<br>b. **Religious Place**- Mundayanparambu Temple is located at an aerial distance of 200 m<br>c. **School** – Govt Sanskrit school is located at an aerial distance of 250 m<br>d. **Tourist Places** – Nil |
| 2 | Is the site in Critical / Over Exploited Ground Water Block. Provide the level of the groundwater table | | No | Semi critical |
| 3 | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | | No | The site does not fall under major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| | | | | Earthquakes, Fire, Explosion.<br>There may be chance of fire due to<br>1. Fire breaking due to high temperature<br>2. Electrical short circuit due to poor maintenance.<br>3. Smoking in the premises near the waste storage.<br>4. Burning of the waste by unauthorized persons<br>5. Keeping highly flammable materials like, cooking gas, kerosene, match boxes, etc.<br>6. Not having provision for proper fire/smoke detecting system. |
| 4 | Describe the type of soil and vegetation on site | Yes | | Hard laterite soil with few trees present in the site |
| 5 | Is the site present in the flood plains as recorded in the last 100 years. Provide the HFL level of the site/region | | No | The sea is located 3 km (Aerial Distance) from the project site.<br>During 2018 peak flood the site experienced minimal problems or issues. |
| 6 | Existing pollution/contamination or degradation on site | Yes | | Dumpsite located in Vadakara ULB is the |

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| | | | | existing contamination and detailed under section 3.11 |
| 7 | Any other remark on baseline condition | Yes | | Based on the test result of environmental baseline for Vadakara dumpsite certain parameters exceeds the permissible limits and test report are given under section 3.11 |

**Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils**

| S.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Total extend of land to be covered/built | Yes | | 1.25 acres |
| 2 | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | Yes | | Due to open dumped area |
| 3 | Extend of Land to be remediated | Yes | | 1.25 acres |
| 4 | Extend of land expected to be under green belt | Yes | | Will be under the scope of contractor |
| | proposed project cause the following on Land / Soil: | | | |
| (i) | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | No | There will be no major impact other than the operational phase as this project is remediation project. During operational phase the anticipated impacts are identified |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| | | | | and mitigation measures are provided |
| (ii) | Substantial removal of Top Soil (mention area in sqm) | | No | Nil |
| (iii) | Any degradation of land / eco-systems expected due to the project? | | No | There will be no Land degradation instead it will be a remediation of land from further contamination |
| (iv) | Loss or impacts on Cultural/heritage areas/properties | | No | There will be no loss or impacts on Cultural/heritage areas /properties |
| (v) | Does the project activity involve cutting and filling/ blasting etc? | | No | The project does not involve cutting and filling/ blasting as the building is existing |
| (vi) | Will the project cause physical changes in the project area (e.g. changes to the topography) due to excavation, earthwork, or any other activity? | | No | The project will have change in a positive way by clearing the waste dumped into vacant land |
| (vii) | Will the project involve any quarrying/ mining etc? | | No | The project does not involve any quarrying/ mining |
| (viii) | Will the project / any of its component contaminate or pollute the Land? | | No | Presently there is contamination and due to the project activity the further contamination shall be eliminated and natural system shall be restored |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| (ix) | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | No | There will be no negative impact due to the proposed project |
| (x) | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | No | There will be no negative impact due to the proposed project |

| S.No | Impacts on Air and Noise Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | Yes | | It will be temporary and adequate mitigation measures will be taken to reduce the impact during the operational phase. |
| 2 | Will the project cause or increase pollution due to GHG emissions? | | No | Nil |
| 3 | Will the project cause or increase odour nuisance? | Yes | | The Biomining project will be create odour nuisance but it is temporary and once the process is completed there will be no odour nuisance. |
| 4 | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | Yes | | There may be chance for any release of toxic gases or potential fire outbreaks which will be mitigated through proper mitigation plan |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Impacts on Air and Noise Environment | Yes | No | Remarks |
|---|---|---|---|---|
| | | | | by adopting gas collection system. |
| 5 | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | Yes | | The Biomining project will create increase in noise level but it is temporary and once the process is completed there will be no noise. |

| S.No | Impacts on Water Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 2 | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 3 | Chances of Pollution of Water bodies / groundwater wells, nearby or downstreams | | No | This remediation project will transform the existing polluted area into a healthier and improved environment. Hence there will not be any chance of pollution of |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Impacts on Water Environment | Yes | No | Remarks |
|---|---|---|---|---|
| | | | | water bodies / groundwater wells, nearby or downstream |
| 4 | Will the activities proposed at the site(s) hinder natural drainage | | No | As the existing dumpsite will hinder the natural drainage pattern. The proposed activity once completed will improve the natural pathway without any obstacles. |
| 5 | Will the activities proposed at the site(s) decrease permeability /rainwater percolation | | No | The activities proposed at the site will not decrease permeability /rainwater percolation |

| S.No | Impacts on Bio diversity & Host Communities | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project necessitates cutting of Trees /Loss of Vegetation | | No | There will be no cutting of Trees. But there will be Loss of Vegetation due to this project |
| 2 | Will the project necessitate substantial removal of Top Soil (mention area in sqm) | | No | There will be no Substantial removal of Top Soil. |
| 3 | Any degradation of land / eco-systems expected due to the project? | | No | There will be no degradation of land / eco-systems expected due to the project activity.<br>Also, the proposed activity will protect the land from further contamination |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Impacts on Bio diversity & Host Communities | Yes | No | Remarks |
|---|---|---|---|---|
| 4 | Will the project result in Health & Safety Risks in the neighbourhood including the release of toxic gases, leachate, accident risks | Yes | | There may be chance of accidental risks due to leachate and toxic gases, which will mitigated by proper lined leachate drain and PPE kits |
| 5 | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | | No | There will be no major impact.<br>During operational phase there will be noise pollution due to movement of vehicles which will be curtailed by adopting mitigation measures. |
| 6 | Potential disruption to common property, accessibility, traffic disruptions, conflicts, or disruption to the local community within the subproject area? | | No | There will be no major impact.<br>During operational phase there will be slight increase in traffic due to movement of vehicles which will be mitigated by adopting movement of vehicles during off peak hours.. |

**Project Categorization and Need for Safeguards Instruments**

| Project category | ☐ F1 ☑ F2 ☐ F3 |
|---|---|
| Key Reasons | During screening, it has found that the proposed subproject is moderately causing impact to the base line environment, land/ soil / water /noise environment, biodiversity or to the community. Site is not close to any |

Copyright © 2023. KSWMP | All rights reserved

| | |
|---|---|
| | Environmental Sensitive Receptor. Moreover, Project results positive impacts on Environment. The Environmental Baseline analysis reveals that dumpsite not having any Heavy metal contamination. Hence it is categorized as E2. |
| **Safeguards Instruments Required?** | a) E1: Project-specific EIA (impact assessment considering the project details & location) by Independent Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>b) E2: Project-specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>c) E3: signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities |

| Status | Agency / Official | Name, Signature with Date and Seal |

## Annexure 2 – Social Screening Checklist

**Social Screening**

| PROJECT INFORMATION | |
|---|---|
| **Location of the sub-project** | Vadakara ULB Ward 28 Puthiyappa |
| **GPS coordinate of the Site** | Latitude: 11°35'39.0"N, Longitude 75°36'20.7"E |
| **Name of the sub-project** | Puthiyappa Solid waste Dumpsite Remediation - Bio mining |
| **Name of ULB** | Vadakara |
| **District** | Kozhikode |
| **Taluk** | Vadakara |
| **Total population in the ULB** | 80,356 |
| **Proposed dumpsite area (in acres)** | 1.52 acre |
| CHECKLIST FOR POTENTIAL SOCIAL RISKS | STATUS /REMARKS |
| Is there a risk that ULB do not have the capacity to meet their obligations in the project? | Lack of proper management of the dumpsite invited agitation from all areas causing negative impact. Since the site is a historical Dumpsite more than 75 years of dumping, Approx. 30,000 cum of legacy waste accumulated, ULB is struggling to implement any project even though which would solve the issues due to the resistance. Presently funds are available under KSWMP to provide the financial and Technical Support to The ULB for dumpsite remediation including bio mining. |
| Number of HH staying within 200 meters from dumpsite | 300 households are residing within 200 m to the dumpsite. This site has been in use since 1962. |
| Common Property Resources Affected: (Please give each type by number) | |
| Inventory of Kudumbasree / Harithakarma Sena's physical assets located at the dumpsites likely to be affected | 1. Newly constructed MRF building cannot be used until the completion of sub project- Bio mining |

Copyright © 2023. KSWMP | All rights reserved

| | |
|---|---|
| Are there any public utility/facilities (educational institutions, religious institutions, Airport, railway station, shops, market, public parks, etc.) within 200 meters to the dumpsite? | Yes. 1 school, 2 college,1 Anganwadi, 1 PCI/ supplyco godown, 6 shops.<br>1 library, 1Staff quarters, 1 Vetenary hospital and a Mini theatre. . |
| Is there a road access to the dumpsite? | Yes, A 8mt width road is already existing |
| Will the road require to be widened? | No |
| Does this road have public utilities/ facilities within 200 meters? | Yes, local public using this road for their daily transport. |
| Will people permanently or temporarily lose access to facilities, services, or natural resources? | No, people will not loss permanent or temporary access to facilities, services, or natural resources during the sub project activity |
| Is this site/location have any archaeological/historical importance | No, this site/location have no archaeological/historical importance |
| History of any hazards/fire accidents | Yes, three incidents of fire have been reported till the date |
| Rag pickers | |
| Are there any rag pickers staying within 200 meters from the dumpsite? | Yes, two families are staying within 200 meters from the dumpsite who are currently doing scrap dealer business. |
| Are these rag pickers have permanent/ temporary houses near the site? | Yes, they have permanent( rented) houses near the dumping site |
| Livelihood risk for the rag pickers | Dump site is currently not in use, It was closed 5 years ago. There is no livelihoods risk |
| Existing Dumpsite | |
| What is the current usage of the proposed dump site? | Site is being used for dumping street sweeping waste. |
| Is there any resistance observed at the site? | Yes, it had been witnessed continues protest from the public against waste dumping. Bio mining project has got appreciation from the public |
| Harm or losses due to failure of structural elements of the existing | No |

Copyright © 2023. KSWMP | All rights reserved

| | |
|---|---|
| facilities (e.g. collapse of buildings or infrastructure)? | |
| Influx of migrant workers to the site? | As of now there is no influx of migrant workers to the dump site. Since HKS is managing the waste there would not be having any migrant flow to the site even in the near future |
| LAND REQUIREMENT | |
| Government land | *1.52 acre of existing ULB land available* |
| Forest land | No |
| Private land | No |
| Are the actual plot size and ownership status known if the land parcel has to be acquired? | NA |
| Is there space on the currently designated plot or right-of-way for the transportation or mobilization of construction materials? | Yes |
| The total number of Community Property Resources affected/if yes description needed | About 30 open well water sources nearby would get polluted due to dumping of waste. |
| Economic displacement (e.g., the loss of assets or resources due to access restrictions resulting from land acquisition or other restrictions - even in the absence of physical relocation)? | NA |
| Is there a possibility of forced evictions? | No |
| What are the consequences of or changes to land tenure arrangements and/or community-based property rights/customary rights to land, territories, and/or resources? | NA |
| Land availability risk | Nil |
| DETAILS OF SCHEDULED TRIBES | |

Copyright © 2023. KSWMP | All rights reserved

| | |
|---|---|
| What is the total scheduled tribal population in ULB/ ULBs | NO |
| What is the population of ST staying near the dumpsite? (within 200 m) | NA |
| Are there any STs among the PAPs? | NA |
| Are there any STs losing land due to the project? | NA |
| Are there any STs losing their customary rights on land due to the project | NA |
| Forced eviction or total or partial physical or economic displacement of ST peoples, including restrictions on access to lands, territories, and resources? | NA |
| Are there any threats to the physical and cultural survival of ST people? | NA |
| Are there any agriculture or livelihood loss to the ST HH | NA |
| LIVELIHOOD ACTIVITIES AND COMMUNITIES TO BE AFFECTED | |
| Total no of HH affected due to proposed project activity. | 30 families who are staying within 50 m to the dumpsite are the most affected by the dumpsite. However, remediation activities only affect about 16 families who are very close to the dumpsite. |
| Total no of vulnerable HH affected due to proposed project activity | 08 vulnerable HH affected by the project as there were 6 differently abled, 2 single women, 6 widows 20 elderly people and 3 children (below the age of 05) are staying near to the site. |
| Total number of livelihood activities affected (Cattle shed, petty shop etc) | Nil |
| Livelihood activities of Artisans, small traders, and certain others to be affected | Nil |

Copyright © 2023. KSWMP | All rights reserved

| | |
|---|---|
| Discriminatory working conditions and/or lack of equal opportunity? | Nil |
| Occupational health and safety risks due to physical, chemical, biological, and psychosocial hazards (including violence and harassment) throughout the project life cycle? | Yes. Even though there is less occupational risks, health and safety risks are common due to the usage of heavy machineries including excavators, conveyors etc.<br>Smoke, dust and water pollution can cause health hazardous and social risks. |
| Total area of agriculture land to be affected (Title holders/non-title holders/squatters) | Nil |
| DWELLINGS (RESIDENTIAL) AFFECTED DUE TO SUB-PROJECT | |
| Total no of HH affected due to proposed project activity. | 30 HH are directly affected by the proposed project activity |
| Non titleholders (Encroacher) affected | Nil |
| Non titleholders (Squatter) affected | Nil |
| Are there any non-titled people who living/doing business on the proposed site | Nil |
| BPL Families/other vulnerable communities losing dwellings | Nil |

**PART – A**
**Summary of Risks/Impact identified**

| S. NO | IDENTIFIED RISKS | AFFECTED PERSONS/FAMILIES | REMARKS |
|---|---|---|---|
| 1 | Health hazards | 300 HH residing near to the dumpsite, college and anganwadi students | Regular medical check up to be conducted for the related health issues to the HHs |
| 2 | Environmental issues Air and water pollution | Residents near to the dumpsite, college and anganwadi students | Regular water sprinkling for dust and proper investigation of the water bodies as well as ground water. |

Copyright © 2023. KSWMP | All rights reserved

| S. NO | IDENTIFIED RISKS | AFFECTED PERSONS/FAMILIES | REMARKS |
|---|---|---|---|
| | | | Green belt and plantation can reduce these environmental issues. |
| 3 | Social issues including stigma and discrimination | Nearby households who were discriminated in participating in some common functions. | Social stigma is attached to the dumpsite as the nearby households were discriminated in participating in some common functions. |

**Date: 08-02-2023** **Place: Vadakara**

Findings/ Suggestions

1. The dumpsite area is a thickly populated with more than 200 residential units within 200 meters to the site.
2. The dumpsite is not currently in use for the purpose. However, a small portion of the site were used till July'23 for dumping street sweeping waste. In connection with the dumpsite Biomining project, the street sweeping waste dumping is stopped.
3. Health hazards' especially vector born diseases are very common due flies/ snakes and other vectors
4. There are health issues due to the bad quality of air and water. In monsoon season, water born diseases are very common to the people who are staying in the down streams.
5. People who are residing near to the dumpsite have been facing the issues of social stigma; and have been discriminated in different levels and occasions.
6. There is no livelihoods loss for rag pickers and scrap dealers

**Annexure 3 – Fire and Risk Assessment**

A fire and risk assessment is a systematic evaluation of potential fire hazards and associated risks within a particular environment or premises. The assessment aims to identify potential fire hazards, assess the level of risk they pose, and recommend measures to mitigate or manage those risks effectively. Fire and risk assessments are essential for ensuring the safety of the workers, protecting property, and complying with fire safety regulations.

The existing legacy waste dumpsite, occupying about 1.25 acres in ward 20 Puthiyappa, aims to fully reclaim the land for future development. Bio-mining, a technique chosen after careful evaluation will be used to recover the land and ensure sustainable and environmentally friendly treatment of the waste. The process will yield various by-products, which require immediate attention to prevent fire hazards.

The by-products are as follows:

1. The bio earth (19375.34 $m^3$) & C&D (8824.41 $m^3$) waste
2. Retrieved plastics, rags, paper & other combustibles that cannot be recycled, but may be used as Refused derived fuel (RDF) of 9169.71 $m^3$
3. Recyclables of 997.54 $m^3$

The retrieved plastics, rags etc that cannot be recycled and the recyclables if stored on site poses a potential fire risk and requires proper handling. To mitigate the risk, a storage and disposal process spanning 3 to 4 months shall be devised by the contractor in line with his work plan. During this period, the contractor shall implement various protective measures to prevent the possibility of a fire outbreak. These following measures are important for preventing fires, ensuring the safety of workers and nearby communities, and minimizing risks to the environment and property.

**Pre-Construction/Planning Stage:**

1. Fire Safety and Emergency Plan: Develop a comprehensive fire safety plan and emergency response plan to address potential fire incidents.
2. Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard.
3. Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.
4. Fire Equipment: Ensure that the site is equipped with fire extinguishers.

**Storage of Waste & RDF:**

**Fire Standards and Facilities:** Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.

Copyright © 2023. KSWMP | All rights reserved

Below equipment and their required quantities should be strategically positioned according to the site's specifications.

- Fire extinguisher (A, B, C powder): It will be used to immediately put off fire caused by wood, Paper and textiles, flammable liquids and flammable gases. Commonly can be placed anywhere inside the site
- Fire extinguisher (Foam spray): Mainly used to put off the fire caused by flammable liquids. It should be placed in diesel storage area, lubricant storage area and DG sets.
- Fire extinguisher ($Co_2$): Mainly used to put off the fire caused by Electrical short circuit. It should be placed near the control panel room/operation room.
- Fire bucket filled with sand: It should be placed near the diesel storage area

To ensure rapid response in case of a fire, it's essential to have a water tanker filled with water, equipped with a fire-fighting hose, readily accessible along with the portable motor. The presence of this equipped water tanker ensures timely and effective action during fire emergencies. All requirements in line with National / State regulations and as advised y the Local Brigade shall be arranged & followed

The following points to be considered for assessing the fire risk and procedure to mitigate it.

1. **Identification of Fire Hazards:** The first step involves identifying potential fire hazards in the premises. These hazards could include sources of ignition (e.g., electrical equipment), combustible materials (e.g., flammable liquids, paper, cardboard), and other factors that could contribute to the outbreak of a fire.
2. **Assessment of Risk:** Once the hazards are identified, the next step is to assess the level of risk associated with each hazard. This involves evaluating the likelihood of a fire occurring and the potential consequences if a fire were to break out.
3. **Escape Routes**: Since operational phase occurs in an open environment, the need for conventional escape routes in the event of a fire emergency may not be required.
4. **Fire Safety Measures:** The assessment reviews existing fire safety measures in place, such as fire alarms, fire fighting equipment, and fire suppression systems. Proper assembly point is required in case of fire break out
5. **Emergency Procedures:** The assessment evaluates the effectiveness of emergency procedures and evacuation plans in the event of a fire, ensuring that workers can safely evacuate the premises.
6. **Fire Training and Awareness:** The assessment considers the level of fire safety training provided to workers and the awareness of fire hazards and evacuation procedures.
7. **Record-Keeping:** Detailed records of the assessment process, findings, and recommended actions are maintained for future reference and regulatory compliance.

Copyright © 2023. KSWMP | All rights reserved

8. **Recommendations:** Based on the assessment, the fire risk assessor provides recommendations for improving fire safety, which may include installing additional fire safety equipment, conducting training programmes, or implementing any changes to reduce fire risks.
9. **Review and Updates:** Fire and risk assessments should be regularly reviewed and updated to account for any changes in the premises or regulations.

Fire and risk assessments play a crucial role in preventing fires and minimizing their impact if they occur. They are particularly important for dumpsites and other places with a higher risk of fire hazards to ensure the safety and well-being of workers.

NOTE : The major assessments had been referred based on the EMF Vol-II Part A – Indicative EMP

## Annexure 4 – Dumpsite screening checklist

Checklist for screening of dumpsites for potential landfill/ processing facility

| Name of the contact person from ULB/ Phone number and email Address | Vadakara |
|---|---|

| S.No. | Item | Norm | Information |
|---|---|---|---|
| 1 | Land ownership (including that required for approach road) (in line with revenue records) (supporting data to be provided as annex) | | Vadakkara, Municipality |
| 2 | Name of the location of site and Map of the site (include as an annex) | | Puthiyappa, Vadakkara |
| 3 | GPS coordinates of site | | Latitude: 11°35'39.0"N, Longitude 75°36'20.7"E |
| 4 | Is there a Pollution Control Board permit for dumping/SWM activity? | | Yes |
| 5 | Is there a notified no development zone or buffer or green belt around the dump? | | No |
| 6 | Possible area to be kept as buffer green belt around (within / outside the site for purchase) | | Not available |
| | Site Selection Criteria - give distances, wherever applicable | | |
| 7 | Groundwater (m below liner bottom) | 2m | No |
| 8 | Private water sources (well etc.)- distance from site boundary (to be | 100 m (river) | No |
| | | 200 m (Pond) | No |

Copyright © 2023. KSWMP | All rights reserved

| S.No. | Item | Norm | Information |
|---|---|---|---|
| | adjudged based on approx. distances during screening exercise) | 30 m (Local Canal) | 1 km from the dumpsite. |
| 9 | Env. Sensitive Areas/ Wetlands | Not Permitted | No |
| 10 | Site having Rare and Endangered Species | Not Permitted | No |
| 11 | Site should not be within Protected/ Reserve Forests | Not Permitted | Site is Not within the Protected/ Reserve Forests |
| 12 | Residential Development within prescribed buffer zone of 200 m | Not Permitted | Yes. Local Residents nearby Dumpsite within 150 m |
| 13 | Perennial Stream within site | Not Permitted | No |
| 14 | Airport | 20 Km | No |

| SNo | Item | Norm | Information |
|---|---|---|---|
| 15 | Distance to the nearest village in the predominant wind (m)direction | | Puthiyappa |
| 16 | Flood prone site | | No |
| 17 | Accessibility - Road access for heavy vehicles | | 4 m wide Approach road, Meppayil - Vadakkara |
| | i. Starting point of the access road | | Meppayil |
| | ii. length and width of the access road | | 4 m wide |
| | iii. Current condition of the access road (visual assessment) | | Tarring Road with good condition. |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Item | Norm | Information |
|---|---|---|---|
| 18 | Is the site that/stopping to nearby uses | | Flat |
| 19 | Soil base-soft soil/murram,soft rock etc | | Hard Laterite soil |
| 20 | Direction of Leachate flow out of the site, if any | | No. The biodegradable waste dumping stopped since 2018 |
| 21 | Othee uses within the dumpsite(recycling yard, compost pad etc) | | Proposed MRF building but not yet used |
| 22 | Boundary conditions-walls/fence/what land uses along boundary | | Compound wall |
| 23 | Year since the dump site is existing | | 1962 |
| 24 | Is the dumping Operation Ongoing | | Stopped the Biodegradable waste since 2018 |
| 25 | Any underground utilty/gas line etc near the site | | No |
| 26 | Existing power supply, water supply, electric poles going through/over/in the site etc. | | Yes. Nearby Transformer |
| 27 | Are there pools of leachate ,rat and fly infestations, domestic animals roaming freely, odours,dust, vermin and birds,waste being burnt at dumpsites or families of scavangers picking through the wastes | | No |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| **Geography and Climatic aspects** | | | |
| 28 | Average annual rain fall | | 3500 mm |
| 29 | Duration of rainfall | | May to August |
| 30 | Whether any incidents of flooding reported at site/other hazards | | |
| | No | | |
| | Very Rare | | Very Rare |
| | Some times | | |
| | Frequent | | |
| 31 | Any geological fault | | No |
| **Waste Characteristics** | | | |
| 32 | Characteristics of the dumps, such as the height and area, characteristics of solid waste based on visual inspection and degree of compaction (subjective), and any details of variability of wastes within the site. | | Since the biodegradable waste dumping stopped from 2018 due to public protest because of the leachate issues. Only the Non-Biodegradable waste only present in the dumpsites like Plastic wastes and street sweeping wastes |
| 33 | Type of waste (MSW/HW) (subjective assessment based on visual inspection) | | MSW |
| | i. 100% MSW | | |
| | ii. 75% MSW +25% (domestic and/ or biomedical/ HW/EW) | | Yes |
| | iii. 50% MSW +50% (domestic and/ or biomedical /HW/EW) | | |
| | iv. > 50% (domestic and/ or biomedical /HW/EW) | | |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| 34 | Expected waste contamination (visual check of ground water, littering, dust pollution, Smell/odour, Is the ground water being used for drinking purpose) | | Ground water not used for drinking. |
| 35 | How much quantum of fresh waste is dumped every day? | | Stopped the dumping of waste. |
| General Information | | | |
| 36 | Any reported Environmental and health impacts of existing dump (from ULB eg-media report or complaint) | | NO |
| 37 | Any ongoing litigation or disputes related to site usage | | NO |
| 38 | Potential for mining decomposed organic materials (compost from the existing dumps (By visual inspection) | | NO |
| 39 | Presence of rag pickers and approx., How many? Male/Female and age group | | Not available as on visit time. But as per SWM data file 168 rag pickers |
| 40 | Number of sensitive receptors close to dumpsite (approx.200 m which is buffer zone criteria) (mention distance to closest residence, social profile of the people, school, religious structure, wetland, forest, river, canal, Eco sensitive area, well, lake/pond) | | Nearby Small canal within 1 km named as Akkamadathodu Sanskrit School within 280 m. |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| 41 | Available open / clean space in the dump yard which can used to develop a treatment facility till such time the dump is cleaned, and land is recovered (percentage of land available for use) | | Yes |
| 42 | Space / covered shed (which may be renovated to house segregation & storage facility) | | 450 Sq.ft |
| 43 | Estimated time for dumpsite capping/ mining/ remediation. Does it fall within the project lifetime? | | 150 days |
| 44 | Possible Range of solutions: rehabilitate existing open dumps through landfill mining where the resource recovery might serve as a source of energy, recycle and reuse of metals, plastic and glass ware, use of compost as fertilizer for agriculture and as a cover material for future landfills, etc. | | RDF materials can be processed and used for cement kilns. |
| 45 | Is dumpsite remediation likely to benefit in regaining a suitable site for an engineered landfill cell or for setting up any other waste management facility? If yes, what could be set up? | | According to feedback from nearby residents, there is a demand for the establishment of a Recreational Park. |
| 46 | Likely area of the site which can be salvaged for future use More than 70%, 50-70%, 30-50%, Less than 30% | | 50 % . |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| **Upstream Linkages required** | | | |
| 47 | Stop the waste coming to the site or delineate a separate area for proper processing of waste. | | Dumping of waste stopped |
| 48 | Intention of anchor ULB (where the site is located) to allow the facility to be used as a regional facility, with other ULBs falling in the cluster, on a cost sharing basis. | | After thorough stakeholder consultation, the recommendation is to process the waste at a standalone site. |
| **Downstream Linkages required** | | | |
| 49 | Off-take of all the products coming out of the biomining - Plastic & RDF - cement factories, soil/bio-earth - farmers or gardens, inert - SLF/closure | | Forward linkage for the RDF yet to be finalized |
| 50 | Any wastewater treatment facility whether available within 10 km where leachate can be transported for treatment. | | No |

## Annexure 5 - Occupational Health and Safety

Occupational Health and Safety Risk Assessment for Dumpsite Remediation is as follows

**1. Introduction:**

The purpose of this Occupational Health and Safety (OHS) Risk Assessment is to identify, assess, and mitigate potential hazards and risks associated with the implementation of a Biomining project for dumpsite remediation. Biomining is a sustainable and environmentally friendly method used for the disposal of dumped waste and reclamation of land.

**2. Scope:**

This risk assessment focuses on the occupational health and safety aspects of the Biomining process for dumpsite remediation. It covers the potential hazards and risks that workers may encounter during site preparation, Biomining operations, and waste disposal activities. The assessment will also outline control measures to minimize or eliminate these risks.

**3. Hazard Identification:**

Biomining process identifies potential hazards, which include but are not limited to:

a. Chemical Hazards: Exposure to hazardous chemicals present in the dumpsite waste and chemicals used in the Biomining process.

b. Biological Hazards: Potential health risks associated with the presence of pathogens, disease-causing microorganisms, and vectors within the waste. These hazards can arise from the decomposition of organic matter, the presence of infectious materials, and the attraction of disease-carrying organisms such as rodents, insects, and other vermin.

c. Physical Hazards: Potential for slips, trips, and falls on uneven terrain or during equipment operation.

d. Mechanical Hazards: Risks associated with operating and maintaining heavy machinery.

e. Ergonomic Hazards: Strain and injuries related to improper handling of equipment or materials.

f. Environmental Hazards: Adverse effects on air and water quality during the Biomining process.

**4. Risk Assessment:** The risk assessment will categorize the identified hazards based on their severity and likelihood of occurrence. Each hazard will be evaluated using a risk matrix to determine the level of risk and priority for mitigation.

**5. Risk Mitigation Measures:**

Copyright © 2023. KSWMP | All rights reserved

To ensure the safety of personnel involved in the Biomining project, the following risk mitigation measures will be implemented:

a. Engineering Controls:

- Regular maintenance and inspection of machinery to prevent mechanical failures.

- Providing appropriate personal protective equipment (PPE) to workers.

b. Administrative Controls:

- Developing standard operating procedures (SOPs) for Biomining operations.

- Implementing a comprehensive training program for all personnel involved in the project.

- Scheduling regular breaks and rotation of tasks to minimize fatigue.

c. Environmental Monitoring:

- Regular monitoring of air and water quality to ensure compliance with safety standards.

- Establishing emergency response protocols in case of any unexpected environmental events.

d. Emergency Preparedness:

- Developing and practicing emergency response plans for potential accidents or incidents.

- Providing workers with first-aid training and easily accessible medical facilities.

e. Personal Protective Equipment (PPE):

- Mandating the use of appropriate PPE, such as respirators, gloves, safety goggles, and protective clothing.

**6. Worker Health Surveillance:**

Implementing a health surveillance program to regularly monitor the health of workers involved in the Biomining project. This may include medical examinations and assessments to detect any health issues related to exposure during the remediation process.

The work site to be equipped with first aid and the contractor must have tie-up with nearest primary health center/ medical facility for the welfare of the labors.

**7. Training and Education:**

Conducting comprehensive training and educational programs for workers and supervisors to raise awareness of potential hazards, proper handling of equipment, and the correct use of PPE.

Copyright © 2023. KSWMP | All rights reserved

## 8. Conclusion:

By proactively identifying potential hazards, assessing risks, and implementing appropriate control measures, this Occupational Health and Safety Risk Assessment aims to ensure the safe and successful execution of the dumpsite remediation Project through Biomining. Continuous monitoring and improvement will be essential throughout the project to maintain a safe work environment.

## EXECUTIVE SUMMARY

Vadakara Municipality is one of the rapidly developing urban local bodies in Kozhikode district. Even though the ULB has an excellent practice of waste management, the primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing the dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Consequently, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project for the remediation of legacy waste dumpsites in all the ULBs. As part of the project, in phase1 the existing dumpsite at Vadakara, ward 20, Puthiyappa was proposed for remediation.

The Vadakara municipality has an area of 21.34 sq.km with 47 wards. The municipality, with the financial and technical support of KSWMP, has taken up steps to remediate the existing legacy waste dumpsite located in around 1.25 acres of land inward 20, Puthiyappa and to recover land for future developmental activities. The Puthiyappa dumpsite was used for dumping municipal solid waste from the year 1962 to 2018. The dumping of solid waste (biodegradable waste) was stopped as a result of the protest from the local residents due to the serious health and environmental issues created by the odor and leachate from the dumpsite. The local residents are demanding to remediate the legacy dumpsite and to utilize the remediated land for social cause. Since the cessation of dumping activities in 2018, only sweeping waste from towns and streets were dumped at the facility daily and has now been discontinued since July'2023. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes.

To assess the quantity & composition of legacy waste & also evaluate the environmental baseline of the dumpsite, samples from representative locations were collected and analyzed for various parameters viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Groundwater and Surface Water. As part of the study, detailed site investigations were carried out for; – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical and Environmental Analysis by M/s Poluchem Laboratories. From the results of the investigations, it was found that the waste was seen upto a depth of 6.7 m (Above Ground 5 m & below Ground 1.7 m). The total estimated quantity of legacy waste is around 38367 $m^3$ Considering the density of the material to be 0.76 tons/cum the total quantity of waste disposed before conducting the survey is estimated as 29140 tons.

As per the SWM Rules 2016, selection of an applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out, and based on the results, remediation can be done by a) Capping without land recovery, b) Bio-mining – reclamation/recovery of land and c) capping with partial land recovery. The selection of technology shall also depend on the available resources viz., manpower, machineries, money, and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by- products.

Copyright © 2023. KSWMP | All rights reserved.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite.

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, mobile/compact screening machineries shall be optimum for processing the legacy waste of 38367 $m^3$ within the stipulated timeline of 31st March 2024.

Environmental & Social safeguards: The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project attracts moderate social risks based on the social mapping, transect walk and consultation with the people living around the proposed project site to assess the problems associated with the legacy waste dumpsite and the impact during the execution of the project.

By-products utilization/forward linkages/Usage

1. The approximate quantity of bio earth (19375.34 $m^3$) & C&D (8824.41 $m^3$) waste will be utilized for the development of the reclaimed legacy waste dumpsite as a Recreational Park/facility.
2. Refused derived fuel (RDF) of 9169.71 $m^3$ will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the process.
3. Recyclables of 997.54 $m^3$ will be sold to authorized recyclers.

The activities of bio-mining will be commenced from Oct 2023 and are expected to end by Mar 2024. An area of 1.25 acres will be reclaimed and will be developed into a recreational park based on the ULB decision for public use. Total cost of the project is [redacted] /-. The cost per $m^3$ for processing and disposal of the legacy waste is [redacted] /-.

## 1. INTRODUCTION

Vadakara Municipality, the first declared zero-waste municipality in the State, is one of the rapidly developing urban local bodies in Kozhikode district. Even though the ULB has an excellent practice of waste management, the primary environmental issue currently faced by the municipal authorities revolves around a longstanding existing legacy waste dumpsite. It has a long history of more than three decades of continuous dumping of both bio- and non-biodegradable wastes. Though the waste dumping activity has been stopped, the dumpsite remains as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Improper management of such sites pose significant environmental, social, and economic challenges for the communities and ecosystems in the vicinity.

In view of the environmental and social issues connected with dumpsites, the SWM Rules 2016, directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the remediation projects of legacy waste dumpsites in all the ULBs. As part of the project, in phase -1, the existing dumpsite of Vadakara, ward 20, Puthiyappa was proposed for remediation.

For arriving at a methodology for remediating the legacy waste in the dumpsites, as per the Project Implementation Manual, a feasibility study outlining the technical, economic, and socio-environmental factors has been carried out. As a result of the feasibility study that involved detailed field investigations & assessment, and market sounding, the method proposed for remediation of legacy waste dumpsite is biomining, which will ensure long-term sustainability and environmentally sound treatment, which is found technically feasible, economically viable, and socially acceptable. The details of various steps involved in the feasibility study are described in the following sections. `

## 2. GENERAL DESCRIPTION ABOUT PROJECT

Vadakara municipality has an area of 21.34 sq.km with 47 wards. Solid waste generated from 18,549 households and 5442 institutions including commercial establishments is 35.60 TPD. The municipality intends to strengthen and enhance the existing treatment facilities of the biodegradable & non-biodegradable waste system at household, institutional and community level for effective management of the solid waste generated, and also remediation of existing legacy waste dumpsite.

The Puthiyappa dumpsite was used for dumping of solid waste from the year 1962 to year 2018. The dumping of the solid waste (biodegradable waste) was stopped due to the protest from local residents for addressing the issues of odor and leachate from the dumpsite, and they are in demand for remediating the legacy dumpsite and to utilize the remediated land for social cause.

Since the cessation of dumping activities in 2018, only sweeping waste from towns and streets is dumped at the facility on a daily basis. The legacy waste is spread over an area of 1.25 acres with an average height of 5 m, having a portion of the dumpsite which is 712 cu.m of waste being capped by 2020. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. The municipality intends to remediate the existing legacy waste dumpsite for the recovery of land and develop the same into a recreational park for the public use after assessed the suitability of the soil as per applicable standards. The details of the legacy waste dumpsite are provided below:

*Table 1 Dumpsite Details*

| Name of ULB | Vadakara |
|---|---|
| District | Kozhikode |
| Taluk | Vadakara |
| Location | Ward 20, Puthiyappa Vadakara |
| GPS Co-ordinate of the Site | Lat: 11° 35' 37.5612" N, Long: 75° 36' 20.9376" E |
| Total dumpsite area (in acres) | 1.52 |
| Legacy waste spread (in acres) | 1.25 |

## 3. LOCATION, DEMOGRAPHY, ACCESS, LAND-USE, WATER TABLE AND CLIMATE OF THE ULB

### 3.1 LOCATION

Vadakara municipality lies at 11.60°N, 75.58°E, located in Vadakara Taluk of Kozhikode District with an area of 21.34 km$^2$, comprising 47 (Nos) administrative wards. The dumpsite located in the ward 20, puthiyappa which is around 2.4 km away from the Coastal Regulation Zone. It is situated about 49 km to the north of Kozhikode City and approximately 44 km to the south of Kannur City. Vadakara is surrounded by Mahe on the North, Payyoli on the South, Villiappally on the East, and Arabian Sea on the West. Location map of Vadakara is given below.

*Figure 2 Location of Vadakara*

### 3.2 POPULATION, DENSITY AND LITERACY RATE

As of the 2011 Census of India, Vadakara had a population of 75, 295, with a decadal growth rate of 4.91 % with males constituting 35,531 (47%) of the population and females 39,531 (53%). The present population is 79771, considering the decadal growth rate of 4.91%. The density is around 3227 persons/sq.km. The sex ratio is 1119 females for 1000 males against the state average of 1084.

The literacy rate of Vadakara city is 94.88 %, which is higher than the state average of 94.00 %. In Vadakara, the male literacy rate is around 97.12 % while female literacy rate is 92.91%.

Copyright © 2023. KSWMP | All rights reserved.

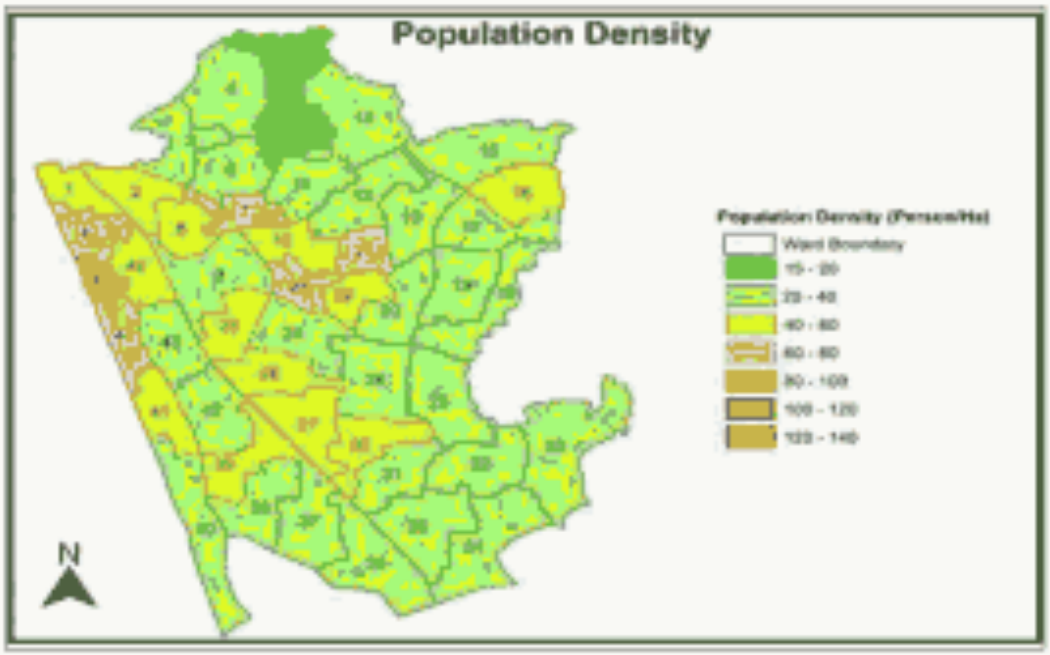

*Figure 3 Ward Wise Population Density (Person/ha)*

### 3.3 LAND USE

The Vadakara municipality has a total area of 21.34 Sq. km. The study area's land use has been assessed through satellite data interpretation and confirmed during on-site visits. The primary findings regarding the Vadakara Dumpsite from this analysis are as follows:

1. The predominant land use in the area is residential.
2. There is a nearby FCI Godown located approximately 20 meters away.
3. A veterinary hospital is situated at an approximate distance of 150 meters.

The land use indices of Vadakara municipality are shown in below figure.

Table 2 Land use indices

| Description | Area (in sq.km.) | Land Use % |
|---|---|---|
| Residential | 2.68 | 12.57 |
| Agricultural | 1.60 | 7.52 |
| Water bodies | 1.62 | 7.59 |
| Transportation | 1.02 | 4.76 |
| Commercial | 0.47 | 2.10 |
| Public and Semi Public | 0.15 | 0.78 |
| Tree Clad Area (Built up area with Thick Tree cover) | 13.02 | 61.01 |
| Private Vacant land | 0.78 | 3.67 |
| Total | 21.34 | 100 |

## 3.4 TRANSPORTATION CORRIDOR

*Table 3 Transportation corridor details*

| Mode | Details |
|---|---|
| Road | National Highway 66 passes through Vadakara town, connecting Vadakara to Kozhikode to the South (45 km) and to Kannur (44 km) and Mangalore (188 km) to the North. |
| Train | Vadakara Railway Station is one of India's model railway stations, and is connected to all major stations, and one of the top stations in North Kerala after Calicut and Kannur |
| Air | Kannur International Airport is the closest airport, approximately 48 km away. Calicut International Airport is approximately 60 km away. |

Copyright © 2023 KSWMP | All rights reserved.

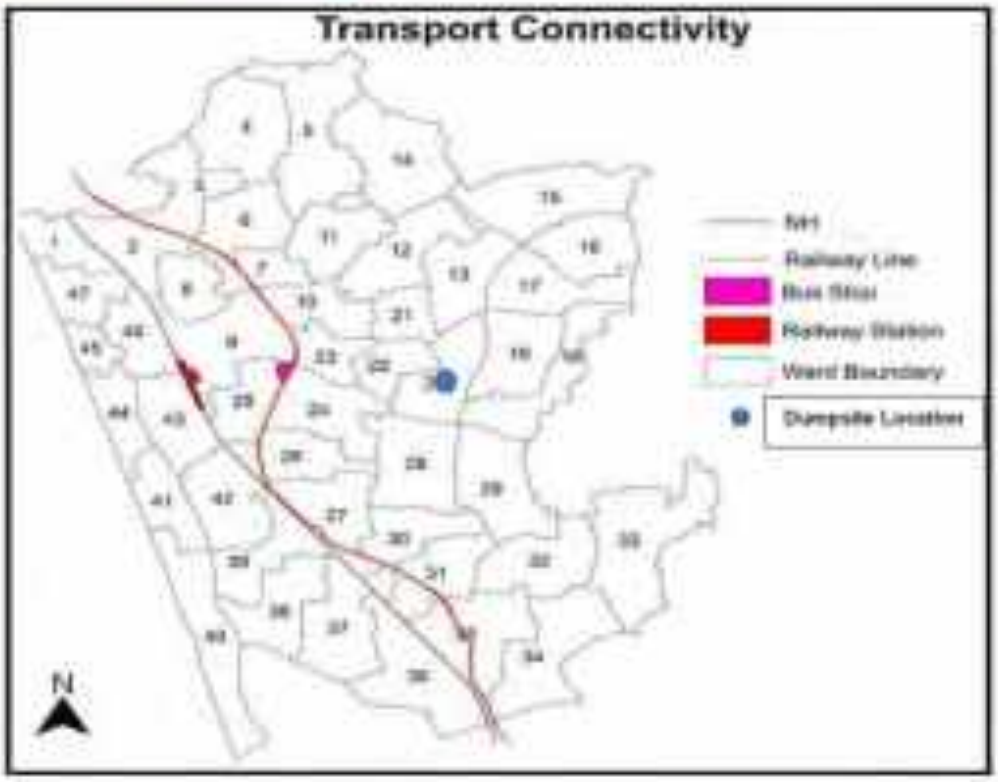

*Figure 6 Map for the Transportation Connectivity*

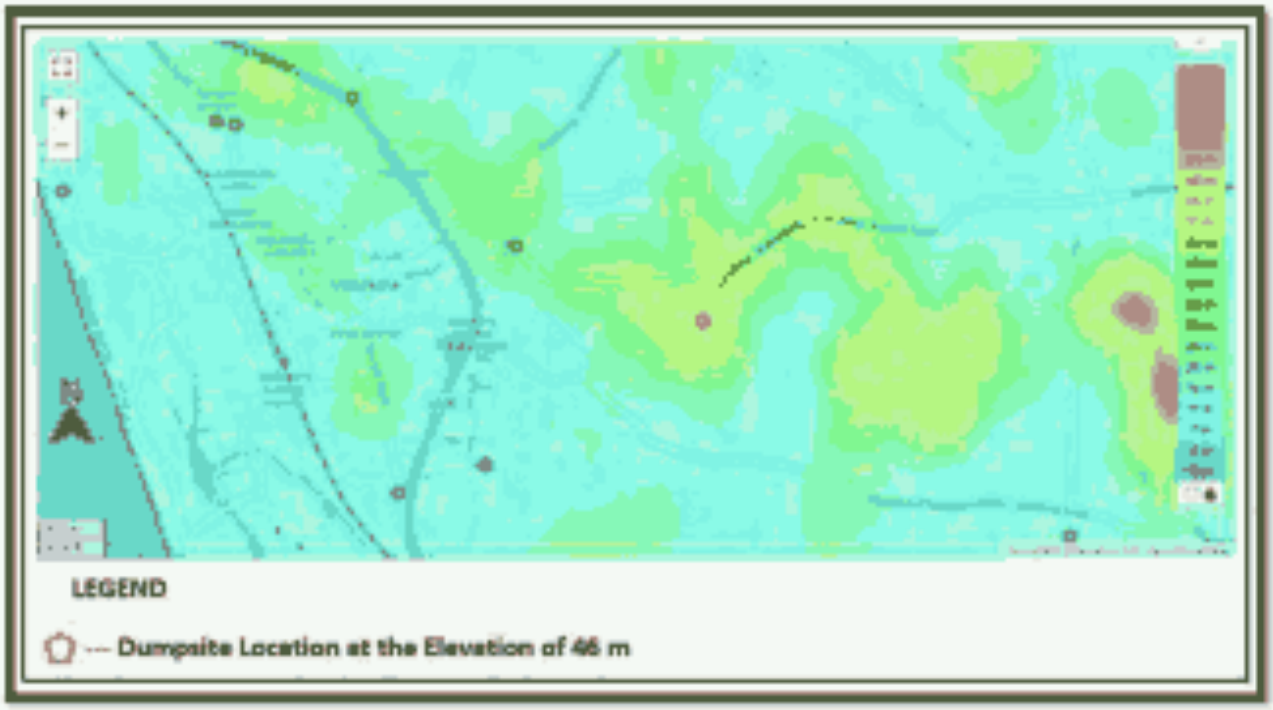
### 3.5 TOPOGRAPHY



Based on altitude, the terrain is classified into three: low land, midland and highland.

*Table 4 Topography*

| Altitude | Details |
|---|---|
| Low land | The Land lying between 0 to 7.5m from MSL is treated as low land. The lowland is the coastal land of Vadakara. |
| Midland | Land lying between 7.5m to 75m from MSL is treated as midland. Majority of the land area in Vadakara is midland. |
| Highland | There is no high land region in Vadakara |

The average elevation of the Vadakara is 46 m and falls under the midland category which can be seen from the figure below.

Copyright © 2023 KSWMP | All rights reserved

Source: en-in.topographic-map.com

*Figure 7 Topographic Map*

Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope on southeast direction possesses a potential risk of leachate runoff, which could result in the contamination of surface water on that side of the site.

## 3.6 CLIMATIC CONDITION

### 3.6.1 TEMPERATURE & RAINFALL

Vadakara falls in the tropical to sub- tropical climatic region. The maximum temperature varies between 32ºC and 37ºC and minimum temperature varies from 21ºC to 24ºC. The maximum monthly rainfall is 1031 mm and the annual rainfall is 3508 mm.

*Table 5 Temperature & Rainfall Data*

| Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Year |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Average high °C | 31.7 | 32.8 | 32.9 | 33.2 | 32.7 | 29.6 | 28.3 | 28.8 | 29.5 | 30.4 | 31.1 | 31.5 | 31.0 |
| Average low °C | 21.9 | 23.8 | 24.6 | 25.8 | 25.7 | 23.9 | 23.4 | 23.6 | 23.7 | 23.8 | 23.3 | 22.1 | 23.7 |
| Average precipitation mm | 2 | 4 | 15 | 78 | 292 | 905 | 1,031 | 520 | 282 | 248 | 100 | 23 | 3,508 |

Source: Climate-Data.org

Copyright © 2023. KSWMP | All rights reserved.

According to the Rainfall Data, the most favorable working period spans from December to March due to the lower precipitation levels.

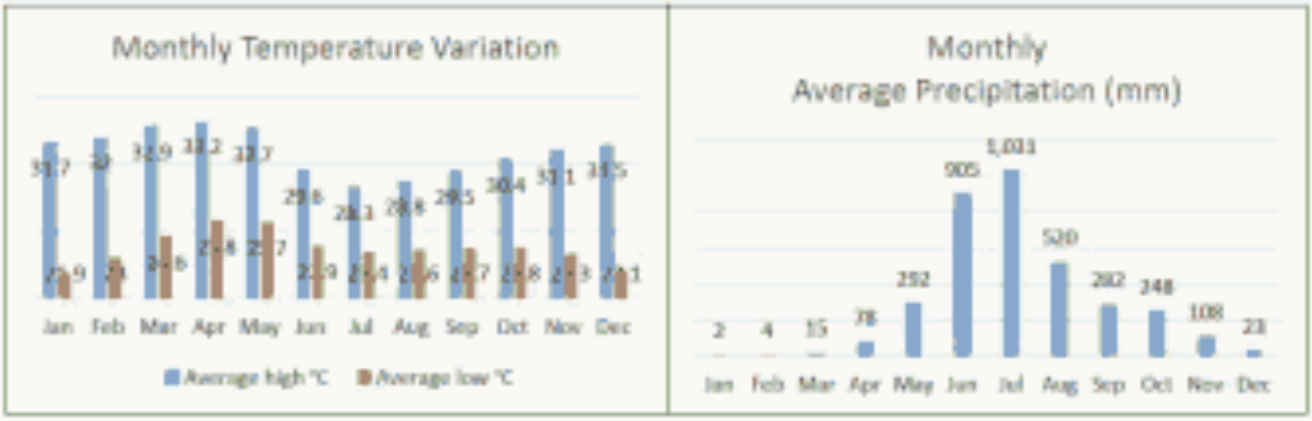


*Figure 8 Monthly Variation of Climate and Rainfall for Vadakara Town*

### 3.7 FLOOD ZONE

The details of the flood zone of Vadakara is provided in the table below. It may be noted that the site doesn't fall under flood zone and has a good elevation.

| DESCRIPTION | BASE YEAR | 1 in 10 YEAR (CC - RCP 8.5) | | 1 in 25 YEAR (CC - RCP 8.5) | | 1 in 50 YEAR (CC - RCP 8.5) | | 1 in 100 YEAR (CC - RCP 8.5) | |
|---|---|---|---|---|---|---|---|---|---|
| Vadakara | 2011 | Flood Inundation Area (Km2) | Max Flood Level (m) | Flood Inundation Area (Km2) | Max Flood Level (m) | Flood Inundation Area (Km2) | Max Flood Level (m) | Flood Inundation Area (Km2) | Max Flood Level (m) |
| | | 2.22 | 9.47 | 2.64 | 10.23 | 2.96 | 10.61 | 3.41 | 10.92 |

*Table 6 Flood zone details*

*Source: Kerala State Disaster Management Authority CC=Climate Change RCP=Representative Concentration Pathway*

### 3.8 EARTHQUAKE ZONE

The Bureau of Indian Standards (BIS) has grouped the country into four seismic zones viz. zones II, III, IV and V as detailed in the Map below. The Kerala state falls under Seismic Zone 3.

### 3.9 COASTAL REGULATION ZONE

As per the Coastal Regulation Zone (CRZ) notification 2011 and further amendment in CRZ notification 2019, the Vadakara legacy dumpsite does not fall under the CRZ zone. The dumpsite located in the ward 20, puthiyappa which is around 2.4 km away from the Coastal Regulation Zone

### 3.10 GROUND WATER LEVEL

The details of groundwater level during pre-monsoon and post-monsoon, and the average fluctuation is provided in the table below.

Copyright © 2023. KSWMP | All rights reserved.

*Table 7 Details of Ground Water level*

| Pre-monsoon (m) | Post-monsoon (m) | Avg. Fluctuation (m) |
|---|---|---|
| 16.03 | 10.93 | 5.1 |

*Source: Ground Water Information Booklet of Kozhikode District, Kerala State, CGWB*

# 4. DETAILED DESCRIPTION OF THE DUMPSITE

## 4.1 PHYSICAL FEATURE OF THE SITE

The total area of the dumpsite is approximately 1.52 acres, out of which 1.25 acres are covered by legacy waste, with an average height of 5.00 m. The legacy dumpsite is located at Lat: 11° 35' 39.228'' N, Long: 75° 36' 20.5668'' in Puthiyappa (ward-20), Vadakara.

The site has boundary walls of stone masonry on all sides with a single gate entry. Piped water supply with a storage tank of 5000 litres is available in the dumpsite. Electrical power infrastructure viz., power lines & electrical transformer of 100 KVA – 11 KV/440V is adjoining the boundary of the dumpsite. Within the boundary, an MCF of 180 $m^2$ area is located for storage and primary segregation of Non-Biodegradable waste. The dumpsite is connected with an access road of 5.00 m width and 250.00 m long from Meppayil Road.

## 4.2 INFORMATION ON SITE MANAGEMENT

The Puthiyappa dumpsite was used for dumping of solid waste from the year 1962 to year 2018. Due to public protest, dumping activities were stopped from 2018, at present only street sweeping waste (dry leaves) is disposed of in the existing dumpsite on a daily basis. Up until July 2023, the disposal of waste from street sweeping was directed to a designated site. In accordance with the implementation of the Biomining Project, the disposal of street sweeping waste was subsequently discontinued.

## 4.3 SITE HISTORY INCLUDING PUBLIC PROTEST

The dumping of the solid waste (biodegradable waste) was stopped due to the protest from local residents for addressing the issues created by odor and leachate from dumpsite and local residents are now demanding to remediate the legacy dumpsite and to utilize the remediated land for social cause.

## 4.4 DIRECTIONS FROM AUTHORITIES LIKE NGT, PCB, ETC.

### 4.4.1 NGT DIRECTIONS & ORDERS

The National Green Tribunal (NGT) has set norms and guidelines (O.A. No. 606/2018) to address legacy waste accumulated at long-operating dumpsites, to mitigate environmental and health hazards. The norms focus on closure and remediation of dumpsites, waste segregation and treatment using appropriate technologies, conducting Environmental Impact Assessments (EIAs), implementing land use planning and zoning regulations, monitoring and compliance measures, and promoting public participation and awareness regarding legacy waste management. These

Copyright © 2023. KSWMP | All rights reserved.

guidelines aim to stabilize dumpsites, prevent further pollution, and involve communities in decision-making and risk education.

### 4.4.2 LOCAL SELF GOVERNMENT DEPARTMENT - GUIDELINES

The remediation of dumpsites is further directed by Honorable NGT in its order OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. Remediation of Legacy Waste Dumpsites through Bioremediation - G.O.(Rt)No.2629/2022/LSGD Dated, Thiruvananthapuram, 29-10- 2022

### 4.4.3 KSPCB - GUIDELINES FOR DUMPSITE REMEDIATION

The Kerala State Pollution Control Board (KSPCB) has established guidelines (PCB/HO/SEE2/Model City/Kozhikode corporation/2019 dated 09/09/2021) for dumpsite remediation to address the environmental and health impacts of waste disposal. The recommended steps include conducting a site assessment, developing a remediation plan based on risk assessment, selecting appropriate remediation technologies, implementing remediation activities under supervision, verifying the success of remediation, and ensuring long-term management and monitoring of the site. By following these guidelines, the KSPCB aims to mitigate the adverse effects of waste disposal, protect the environment, and safeguard public health.

### 4.4.4 CPCB GUIDELINES

Hon'ble NGT warned that due to incremental growth of Municipal Solid Waste (MSW), these MSW dumps are converting into virtual mountains. Hon'ble NGT further directed that every city/town should adhere to clause 'J' of Schedule–I of SWM Rules, 2016. Finally, Hon'ble NGT directed CPCB to propose Standard Operating Procedure (SOP) for implementation of Bio-mining and Bioremediation of legacy solid waste.

### 4.4.5 SWACHH BHARAT MISSION (SBM) ADVISORY

The advisory on dumpsite bioremediation addresses the challenges of legacy waste and promotes sustainable waste management practices and emphasizes the importance of dumpsite bioremediation as a sustainable solution for managing legacy waste. By adopting these guidelines, municipalities can address the environmental and health risks associated with dumpsites and promote a cleaner and healthier living environment for communities.

### 4.4.6 CENTRAL PUBLIC HEALTH AND ENVIRONMENTAL ENGINEERING ORGANIZATION (CPHEEO) GUIDELINES

The guidelines aim to provide a comprehensive approach to remediate dumpsites in a safe and environmentally sustainable manner. Key points from the guidelines include conducting site assessments, segregating waste, and implementing engineering and biological measures to control contamination, treating leachate to prevent groundwater contamination, and conducting post-remediation monitoring. These guidelines are crucial to ensure effective and environmentally sound dumpsite remediation that protects public health and the environment.

Copyright © 2023. KSWMP | All rights reserved.

# 5 SCOPE OF WORK

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Vadakara includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (land recovery – Biomining, Capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the Environmental Management Framework – Vol II Part A.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Baseline assessment, impact & risk assessment, mitigations measures and Environmental Management & monitoring plan and its budget.
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport, Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 OBJECTIVES:

- To remediate the legacy waste dumpsite of approximately 29,140 Tons by 31st March 2024.
- To reclaim the legacy waste dump area and to develop recreational park facilities, thereby eliminating the chances of dump fires, leachate generation, and foul odor.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.
- To increase nearby real estate/social value and benefit the citizens.

Copyright © 2023. KSWMP | All rights reserved.

# 6 COMPOSITION, CHARACTERISTICS OF LEGACY WASTE AND ITS IMPACTS

## 6.1 DETAILED INVESTIGATION STRATEGY

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below;

- ✓ Bore hole upto a depth of 10 m and collection of 3 (nos) samples from the soil at interval of 1.5 m
- ✓ Waste analysis viz., leachate sample from 3 (nos) locations and physical analysis from 2 (nos) location, and chemical analysis from 1 (nos) location.
- ✓ Environmental baseline analysis surface water 1 (nos) location and ground water samples from 3 (nos) location (Well Water Samples -1 up gradient, 2 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location

## 6.2 DETAILED INVESTIGATIONS

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

*Table 8 Investigation details*

| S.No | Parameters | Sampling Nos. |
|---|---|---|
| 1 | Geotechnical Investigation | |
| A | Boreholes up to 10m depth (as per CPHEEO Manual) | 1 |
| B | Permeability test- (as per CPHEEO Manual) standard penetration test SPT and collection of undisturbed samples - Soil Investigation - Classification, gradation, Atterberg's limit, Bulk density, dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, strength, compressibility (vertically-3 samples per borehole) | 1 |
| 2 | Waste & Environmental Analysis | |
| A | Leachate Analysis (TCLP usepa 1311) (SCHEDULE II of SWM rules, 2016), Suspended solids, Dissolved solids (inorganic),pH, Ammonical nitrogen (as N), Total Kjeldahl nitrogen (as N), BOD, COD, Arsenic (as As), Mercury, Lead, Cadmium, Copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds | 3 |
| B | Physical Analysis of waste (As per CPHEEO manual) including Density, Bulk Density, Moisture Content, Size of waste Constituents, Calorific Value | 2 |
| C | Chemical Analysis of waste/soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), total Carbon, C/N ratio, calorific value, Bio-chemical - biodegradable factor | 1 |
| D | Ground Water (Well Water Samples -1 up gradient, 2 down gradient) - (shallow and deep wells): pH, Colour, EC, Turbidity, SS, TDS, TOC, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, | 3 |

Copyright © 2023 KSWMP | All rights reserved

| | | |
|---|---|---|
| | TKN, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total Coliforms (IS 10500 – 2012) | |
| E | Surface Water (pH, Colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, TKN, Total Alkalinity, Total hardness, Ecoli and Total Coliforms (IS 10500 – 2012) | 1 |
| F | Ambient Air Quality (Sulphur Dioxide (So2), Nitrogen Dioxide (No2), Particulate Matter 2.5, Particulate Matter 10, Ozone (O3), Lead (Pb), Carbon Monoxide (CO), Ammonia (NH3), Benzene (C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise Level (Eq)(Rules) for 24 hours | 1 |
| **Note: Detailed Technical Investigations conducted as per PIM** | | |

### 6.3 METHODOLOGY OF SAMPLING

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed sampling methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

*Table 9 Details of sampling location*

| S.No | Description | Sampling location | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Within the dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind-rose data the air sampling location fixed at two locations |
| | | Dumpsite entry point | |
| 2 | Noise (1 Location) | Within the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite (stream) | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope on southeast direction possesses a potential risk of leachate runoff, which could result in the contamination of surface water on that particular side of the site. So, the location of surface water is taken on the southeast direction |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope (SE). The infiltration of leachate which could result in the contamination of ground water |

Copyright © 2023 KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| | | | Based on the possible infiltration and slope direction, two ground water samples are collected in the east direction and one of the west direction. |
| 5 | Bore Hole (1 Location) | Within the dumpsite area | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 6 | Legacy Waste | Within the dumpsite area | Not Applicable |

*Table 10 Direction and Distance of the sampling location*

| S.No: | Description | Direction | From Dumpsite (m) | From Boundary (m) |
|---|---|---|---|---|
| 1 | Surface Water | Southeast | 303 | 222 |
| 2 | Ground water-1 | West | 110 | 40 |
| 3 | Ground water-2 | Northeast | 106 | 33 |
| 4 | Ground water-3 | Southeast | 325 | 247 |
| **Note: Air and Noise Monitoring are monitored inside the dumpsite** | | | | |

*Table 11 Quantity of sampling & location*

| S. No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 11°35'38.062" E -75°36'20.735"<br>Location -2: N- 11°35'37.392" E -75°36'20.681" |
| 2 | Surface Water | 1.5 Litres | Location -1:N- 11°35'29.729" E -75°36'24.791" |
| 3 | Ground Water | 1.5 litres | Location -1: N- 11°35'39.614"E -75°36'18.171"<br>Location -2: N- 11°35'41.468"E -75°36'22.459"<br>Locations -3:N- 11°35'29.581"E -75°36'24.331" |

### 6.4 ANALYSIS AND INTERPRETATION OF EXPLORATORY DATA

As part of the feasibility study, Technical Support Consultants (IPE Global Ltd) has entrusted the geotechnical investigation & Environmental baseline assessment to M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Pollurhem Laboratories (P) Ltd respectively.

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 16th May 2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 17th May 2023 and was completed on 23rd May 2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 06th June 2023 by M/s Pollurhem Laboratories (P) Ltd. The lab analysis reports were submitted by the investigation agencies to TSC. The lab analysis reports are provided in Annexures – A & B

#### 6.4.1 GEOTECHNICAL EXPLORATORY DETAILS

For assessing the depth of legacy waste and contamination of the soil below the legacy waste, bore hole samples were collected using rotary drill. The exploratory data of the bore hole revealed a maximum depth of 6.70m of waste followed by 3.80m of soil. Lateritic rock was encountered below the soil stratum. The Geotechnical investigation was carried out by M/s Matter Material

Testing & Research Laboratory (P) Ltd. The details of the exploratory data of the bore hole is provided below.

*Table 12 Exploratory Data of Bore Log*

| S. No | Borehole location | Total Depth of the Borehole (m) | Depth of Soil (m) | Depth of Legacy Waste (m) | Remarks |
|---|---|---|---|---|---|
| 1 | N- 11°35'38.862" E-75°36'20.735" | 10.5 | 3.8 | 6.7 | Lab Analysis Report provided in Annexure A |
| Note: Bore hole terminated at the depth of 3.8m below ground level due to Laterite rock | | | | | |

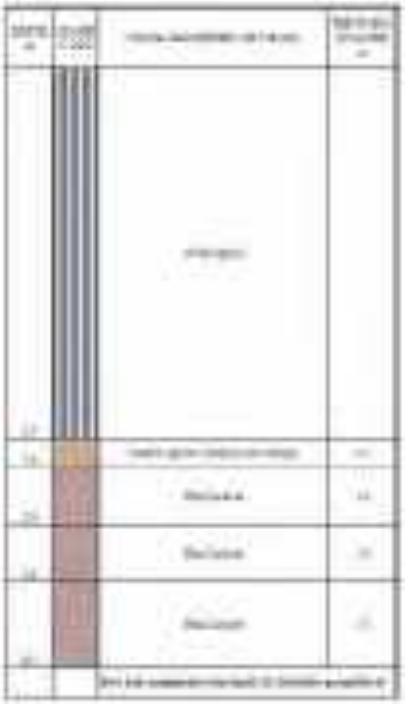

*Figure 10 Soil Profile & Geotechnical Investigation*

### 6.4.2 ESTIMATED TOTAL QUANTITY OF WASTE

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). The details of the estimated total quantity of waste is provided below:

*Table 13 Quantity of waste below ground level*

| Level | Area of the Waste ($m^2$) | Depth of the Waste (m) | Volume of the Waste ($m^3$) | Density of Waste ($T/m^3$) | Total Quantity of Waste (T) |
|---|---|---|---|---|---|
| Below Ground | 5060 | 1.7 | 8602.00 | 0.7595 | 6533.22 |

Copyright © 2023 KSWMP | All rights reserved.

*Table 14 Quantity of waste above ground level*

| Level | Volume of Legacy Waste (m3) | Density of Waste (t/m³) | Total Quantity of Waste (T) | Remark |
|---|---|---|---|---|
| Above Ground | 29765* | 0.7595 | 22,606.52 | *As per the Contour Survey Report by ULB |

*Table 15 Estimated total quantity of waste*

| Estimated total quantity of waste | |
|---|---|
| Total Quantity of Legacy Waste (m³) | 38367.00 |
| Total Quantity of Legacy Waste (T) | 29139.74 |
| Total Quantity of Legacy Waste (T) Approximately | 29,140.00 |

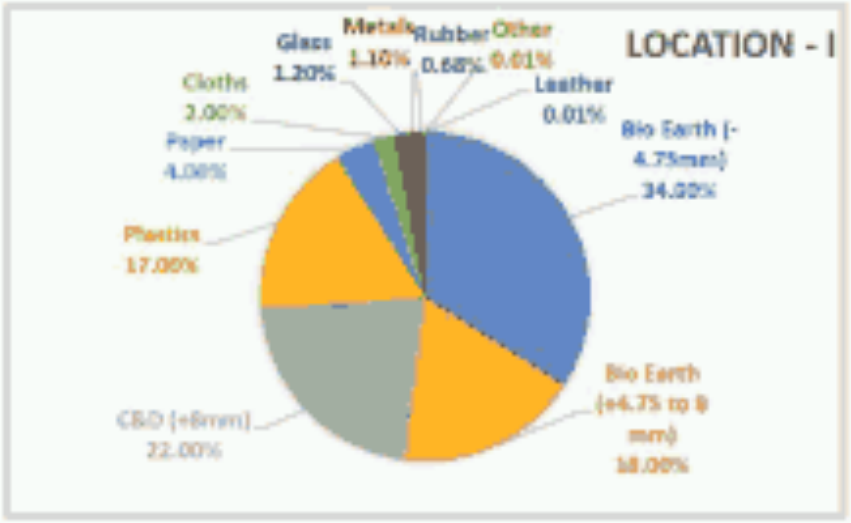
### 6.4.3 LEGACY WASTE CHARACTERIZATION

The characteristics of the legacy waste were assessed by collecting 2 samples of 25 kg from 2 (nos) locations within the dumpsite. The legacy waste samples were collected on 06th June 2023 by M/s Polluchem Laboratories (P) Ltd. The assessment of waste characteristics, was done based on the results of the analysis. The details of the characteristics viz., composition, physical & chemical characteristics, heavy metals, and estimated quantity of by-products are provided in the tables below:

| S. No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 11°35'38.862" E -75°36'20.735"<br>Location -2: N- 11°35'37.392" E -75°36'20.681" |



**Physical Composition:**

| Location | Inference |
|---|---|
| 1 | The analysis reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The PH of the sample is 5.4, which is in the acidic range, making the water not fit for any industrial purpose as it is more corrosive. |
| 2 | The analysis reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 6.30 which is in a slightly acidic range, and may have influence in the industrial processes as it is corrosive. |
| 3 | The analysis reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The PH of the sample analysis is 6.5 which is also in a slightly acidic range. |

**Note :** The sampling location and its respective distance from the dumpsite have been incorporated into Table 10.

| Location | Inference |
|---|---|
| 1 | The analysis reveals that all the parameters fall within the acceptable limit except BoD, which is slightly higher than the allowable limit, indicating that the leachate is containing organic matter. |
| 2 | Similar to the first location with a slightly higher content of BOD |
| 3 | Similar to the first location with a slightly higher content of BOD |

### 6.5 RISK ASSESSMENT

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and pathogens. Proper containment and management of leachate are essential to prevent water pollution.

The analysis of surface water reveals that all the parameters are within the acceptable limit, except it is slightly acidic and the dissolved oxygen content is less than prescribed limit, so also the BoD is greater than the allowable limit. Indicating that the water is contains organic load.

Copyright © 2023 KSWMP | All rights reserved.

*Table 26 Risk Assessment- surface water*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite – BoD higher than the acceptable limits |
| **Pathway** | Water / Run off |
| **Receptor** | Humans, Animals, Aquatic life and flora & fauna |
| **Risk** | High BoD indicates the water is highly polluted and it is harmful to ecosystems as fish and other aquatic life may suffocate in oxygen-depleted waters. Also, it will contain more pathogens and make the water unfit for human and animals. |

**Groundwater:** Pollutants from dumpsites can infiltrate into the underlying groundwater, if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources and ecosystems. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

The analysis of ground water samples at three different locations reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 5.40 @ G-1, 6.30 @ G-2 and 6.50 @ G-3 location which is in acidic range and harmful to health also make the water not fit for any industrial purpose as it is more corrosive.

*Table 27 Risk Assessment - Ground water*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite – pH is acidic in nature |
| **Pathway** | Water, Soil |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | **Possible risks to Human health**<br>• diarrhoea<br>• Nausea and Vomiting<br>• Abdominal Pain<br>• Weakness<br>• Shortness of Breath<br>**Possible risks to Animals**<br>Animals when intake waters with pH acidic in nature it affect the health of the animals.<br>**Possible risks to flora**<br>It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increases the availability of some elements to toxic levels, particularly aluminium and manganese. |

Copyright © 2023 KSWMP | All rights reserved.

**Air:** Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens etc.

*Table 28 Risk Assessment - air*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Within the limits |
| **Pathway** | Air |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | No anticipated Risks |

**Soil:** Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

*Table 29 Risk Assessment - soil*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Heavy metals etc. |
| **Pathway** | Soil |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | **Possible risks to Human health**<br>Soils if contain substances such as heavy metals, which may be toxic to humans, can pass those substances on to humans through crop uptake, leading to unsafe foods.<br>**Possible risks to Animals**<br>When farm animals consume the plants grown from contaminated soil it affects the health of animals in later stage.<br>**Possible risks to flora**<br>Soil pollution may alter plant metabolism and reduce crop yields and cause trees and plants that may absorb soil contaminants to pass them up the food chain. |

**Bioaccumulation in Biota:** Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. Contaminated soil or water can be taken up by plants, and these plants may then be consumed by animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the ecological balance and minimizing the exposure of organisms to contaminated environments.

# 7 EVALUATION OF REMEDIATION TECHNIQUES

Although the term "legacy waste" has not been defined in any official government document in India, it typically refers to aged municipal solid waste in landfills or dumpsites. There is no information on how old waste must be in order to qualify to be called legacy waste. These legacy dumpsites are creating various irreversible environmental/health/livelihood hazards. The major sources of pollution are:

- ✓ Puddles of leachate flowing through the adjacent area and reaching the water table long-term issues of greenhouse gas emissions
- ✓ Surface water and groundwater pollution due to erosion and seepage
- ✓ Dumpsite fires
- ✓ Due to the faster urban development and increased waste generation per capita and mismanagement of generated waste.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

**Remediation of legacy waste dumpsite**

Remediation is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

1. Uplift of the environment- reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.
2. Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
3. Land - Dumpsite land becomes available for public use or for setting up SWM facility on the reclaimed land.
4. Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled, or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels.

For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- ✓ A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- ✓ Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- ✓ History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- ✓ Baseline study of heavy metals in surface;

Copyright © 2023. KSWMP | All rights reserved.

- ✓ water, rainfall, soil type, surface hydrology, topography, wind direction etc. shall be studied before and after bioremediation.
- ✓ Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows

## 7.1 BIO-MINING – RECLAMATION/RECOVERY OF LAND

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

*Table 31 Phases of Bio-mining*

| Phases of Bio-mining | |
|---|---|
| Phase 1 Stabilization | The legacy waste is formed into equal-sized windrows, and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| Phase 2: Sorting & Segregation | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/circular rotatory sieves and manpower. |
| Phase 3 Disposal & Utilization | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |

| | |
|---|---|
| Salient Aspects | Land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>Compliance to SWM Rules and NGT orders.<br>Improvement in aesthetics and quality of life & health. |
| Applicability | The ownership is well defined.<br>Working space is available in the dumpsite.<br>Linkage for utilization by-products is available |

## 7.2 CAPPING WITHOUT LAND RECOVERY

Copyright © 2023. KSWMP | All rights reserved.

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| Salient Aspects | The capped area becomes a green space and can be developed into parks/recreational areas.<br>Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years.<br>Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep-rooted vegetation. Recurring expenditure will be incurred for regular maintenance.<br>On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio-mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | Capping could be a solution for legacy waste where bio-mining is not possible because of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for utilization/ disposal of segregated components<br>Lack of working space & resources |

## 7.3 CAPPING WITH PARTIAL LAND RECOVERY

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can linked to relevant buyers and the inert material will be capped to prevent further degradation of the environment.

| | |
|---|---|
| Salient Aspects | The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |
| Applicability | Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for disposal of inert<br>Recovery land for public use is not a priority |

## 7.4 SELECTION OF REMEDIATION OPTION

Copyright © 2023 KSWMP | All rights reserved.

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. It may be noted that the bio-earth and C&D material which will be recovered by remediation is proposed to be used for development of the reclaimed legacy waste dumpsite as recreational park/facility (for site development work/ profiling). The bio-earth and C&D material recovered will be subjected to bi-weekly sampling and conform to the parameters mentioned in Schedule II of SWM Rules 2016 before using the material. Considering the same, there won't be any leachate generation using this material. There won't be any capping done and hence the question of erosion etc. doesn't arise.

**Salient parameters for opting the Bio-mining – reclamation/recovery of land.**

1. Based on the assessment from the chemical analysis report from the M/s. Polluchem, all the heavy metals are within the permissible limits as prescribed by the regulatory authorities Soil is free of contamination viz., heavy metals, chemical and other toxic substances.
2. Land recovery, increase in value of land and available for public use/setting of SWM facility with immediate effect. An area of 1.25 acres will be reclaimed through bio-mining
3. Adequate downstream linkages for the management/disposal waste viz., Bio-earth and C&D waste will be utilized for development of the reclaimed legacy dumpsite as recreational park/facility, recyclables will be sold to the authorized recyclers & will be collected from the project site and RDF will be sent to Cement industries for co-processing viz., as supplement to the conventional fuel.
4. By products/aggregates generated from the process can be used as alternative construction material (after processing), fuel and recyclables.
5. The Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping.

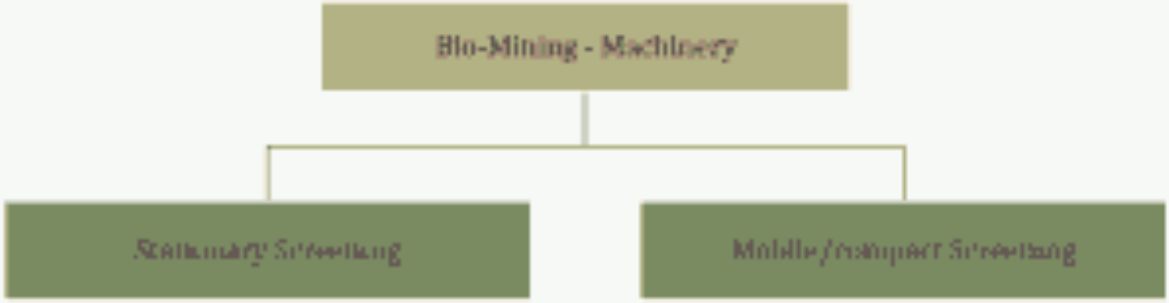
# 8 TECHNICAL DESCRIPTION OF THE SELECTED OPTION



## 8.1 METHODOLOGY

The legacy waste dumpsite reclamation through bio-mining with recovery of land involves Phase 1: stabilization, Phase 2: sorting & segregation and Phase 3: disposal & utilization

The type of machinery, capacity and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type machinery available for the bio mining are as follows:

1. Stationary screening machinery and
2. Mobile/compact machinery.

### 8.1.1 STATIONARY SCREENING MACHINERY

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- ✓ Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- ✓ Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- ✓ Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process.
- ✓ Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.

Copyright © 2023. KSWMP | All rights reserved.

- ✓ Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- ✓ Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

Source: DCC Infra., Gurugram Site

*Figure 11 Stationary Trommel Machine*

Salient Features of Stationary Screening Machinery:

- Land requirement high for setting of machinery and processing area.
- Erection, Installation and Commissioning is time consuming
- Cost Intensive – CAPEX & OPEX high
- Electrical Power Intensive and Consumption is high
- Breakdown of the Machinery is high, onsite technicians should be available.
- Manpower – skilled & unskilled Intensive
- Suitable for quantity more than 2,00,000 ton of legacy waste.
- Less suitability for reuse of the machinery/screenings for more than one site/location.

### 8.1.2 MOBILE/COMPACT SCREENING MACHINERY

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation.

**Structure:** The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor

Copyright © 2023. KSWMP | All rights reserved.

or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity.

**Screening Mechanism:** The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

**Separation System:** Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

**Treatment Process:** In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

**Transport:** Quick and easy folding of conveyor helps in quick setup time.

**Discharge height:** Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages.

*Source: Kleemann Mobile Screens (Piranna, Ahamadabad Site)*

***Figure 12 Compact Screening Machinery***

**Salient Features of Mobile/Compact Screening Machinery:**

Copyright © 2023. KSWMP | All rights reserved.

- Full Mobility: Plants are fully mobile like excavator. Plants can be moved across the most difficult of surfaces and terrain and can accommodate the most inaccessible locations.
- Quick Set up time: Track-Mobile plants can normally be set-up within 1 hour, as it normally does not require additional conveyors, feed hopper to link separate machines, thus increasing machine utilization.
- Versatility: Track-Mobile plants can be operated independently or in combination of two or three stage screening depending upon user requirements.
- No Civil works required: Plants do not require any civil works, can be erected & shifted quickly. Thus offer quicker return on investment.
- Manpower requirement is less.

## 8.2 SELECTION OF MACHINERIES

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, mobile / compact screening shall be the optimum screening machinery for the Vadakara Dumpsite. The 29140 tons legacy waste can be remediated within the stipulated time by NGT i.e. 31st March 2024

**Salient parameters for opting the Mobile/Compact screeners.**

1. Sorting/segregation of the stabilized legacy waste of 38367 m³/ 29140 Tons within the stipulated timeline of 31st March 2024.
2. The remediation process will be guided by National, State Regulations & EIA/EMP in line with KSWMP ESMF.
3. Salient Features of Mobile/Compact Screening Machinery – details are in the section 8.1.2

## 8.3 SYSTEM REQUIREMENTS

### 8.3.1 CAPACITY SIZING OF MOBILE COMPACT SCREENER

The capacity of the Mobile compact screener is assessed as **100 TPH** considering the physical site conditions including quantity & characteristics of legacy waste and stipulated timeline for 100 % land reclamation by **31st March 2024.** The details of plant capacity sizing are provided in the table below:

*Table 32 Capacity sizing of Mobile Compact Screener*

| Description | Quantity |
|---|---|
| Quantity of waste (Tons) | 29140 |

Copyright © 2023. KSWMP | All rights reserved.

| | |
|---|---|
| Mobilization and site preparation (days) | 60 |
| Weekends & Holidays | 20 |
| Rainy Days | 20 |
| Break downs (Days) | 15 |
| No of days (Nov 2023 - Mar 2024) | 150 |
| Effective processing days | 35 |
| Processing per day (Tons) | 756 |
| Capacity of the Plant - Considering working 8 hrs/day | 94 |
| Proposed Capacity of plant TPH | 100 |

### 8.3.2 MACHINERIES & VEHICLES

Detailed assessment of quantity (nos) of machinery, vehicles, auxiliary items required for effective processing of the legacy waste are provided in the Annexure – E. The summary of machineries and vehicles requirements are provided in the table below:

*Table 33 Machineries & Vehicles*

| S. No. | Description | Quantity(Nos) | Remarks |
|---|---|---|---|
| 1 | Mobile Trommel @ 100TPH | 1 | Detailed Specifications are provided at Annexure – E |
| 2 | Baling Machine @ 50TPH | 1 | |
| 3 | Ballistic Separator @ 30TPH | 1 | |
| 4 | Magnetic Separator | 1 | |
| 5 | Front End Loader @ Bucket Capacity 1Cum | 2 | |
| 6 | Chain Mounted Excavator @ Bucket Capacity 1.1 Cum | 2 | |
| 7 | Weighing bridge - 40 Ton | 1 | |
| 8 | Tipper @ 8Cum | 5 | |
| 9 | Tractor - Trolley shift of Materials | 1 | |
| 10 | Tractor -Trolley Water Tanker | 1 | |
| 12 | Mechanical Sprayer | 2 | |
| 13 | Office - Portable cabin (1 Nos) | 1 | |
| 14 | GPS (1 Nos) & Tracking System (1 Nos) | 1 | |
| 15 | CCTV System (Cameras 5 Nos) | 5 | |
| 16 | Fire Safety System - Fire Extinguisher ABC type 4 Kg/cm2 | 10 | |

Note: Considering the size of the site, it is required that the contractor liaisons with the Fire Department and deploys a fire tender at the site during the period of the contract works to manage any fire incident as part of Fire Safety Plan.

## 8.4 OPERATIONS AND MAINTENANCE

### 8.4.1 MANPOWER:

Detailed assessment manpower required for effective processing of the legacy waste are provided in the Annexure – L The summary of manpower required are provided in the table below:

*Table 34 Manpower details*

| S. No | Manpower | Nos |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental, Social and Health & Safety (ESHS) Officer | 1 |
| 3 | Security (3 X 8 Hrs) | 3 |
| 4 | Operations Supervisor & Accountant | 2 |
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 2 |
| 8 | Labors near Screening machinery | 4 |
| 9 | Labors at Baling facility | 2 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 11 |

### 8.4.2 ELECTRICAL POWER:

*Table 35 Electrical Power details*

| Machineries | Required Electrical Load (KW) | Working Hr. | Total Units (KW-Hr) |
|---|---|---|---|
| Baling Machine | 5 | 4 | 20 |
| Ballistic Separator | 15 | 6 | 90 |
| Magnetic Separator | 5 | 6 | 30 |
| Weigh bridge | 5 | 6 | 30 |
| Total | 30 | | 170 |

# 9 SCOPE OF DISPOSAL INCLUDING LOCATION OF DISPOSAL FOR RDF, BIO SOILS, C & D WASTE, AND OTHERS AS PER LOCAL DEMANDS

## 9.1 UTILIZATION OF BY PRODUCTS

The details of the utilization of aggregates/by-products screened out by processing of the stabilized legacy waste are provided in the table below

*Table 38 Utilization RDF, bio soils, C & D waste*

| S.No | Component | Quantity (Cu.m) | Utilization/Linkage/Usage |
|---|---|---|---|
| 1 | Bio earth and C&D Waste | 28200 | The bio earth and C&D and quantity 28200 cu.m waste will be utilized for development of the reclaimed legacy waste dumpsite as recreational park/facility after ensuring that it is free of contamination and meets the required standards. |
| 2 | RDF | 9169.71 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. Currently the indicative nearest location for the RDF disposal is at Dalmia Cements, Trichy which has the necessary infrastructure for co-processing of RDF. |
| 3 | Recyclables & others | 997.54 | Recyclables will be sold to CKCL/recyclers authorized by KSPCB/CPCB. |
| Note: The contractors engaged in biomining will be responsible for ensuring this disposal of Bio Earth, RDF, recyclables, and others. | | | |

### 10.1 REVENUE FROM THE PROJECT

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- Bio earth & C&D waste will be utilized within the remediated dumpsite as filler material for development of recreational park.
- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at no cost whereas transportation cost is required to be borne by the contractor sending the RDF to the cement factory/ WtE facility.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable.

### 10.2 FUNDING FOR PROJECT

The estimated cost of [redacted] - for the project Dumpsite Remediation which equals to [redacted] **per m³**. The sources and funding pattern is given below.

*Table 40 Funding for the project*

| Item | External (70%) | State Govt.(30%) | Total cost |
|---|---|---|---|
| | Rs. | Rs. | Rs. |
| Bioremediation | [redacted] | [redacted] | [redacted] |

Copyright © 2023 KSWMP | All rights reserved.

# 11 PROJECT IMPLEMENTATION PLAN

## 11.1 PROPOSED OPERATIONAL PLAN

The bioremediation of Vadakara dumpsite will be done with the land recovery and will be executed through an outsourcing model. The proposed operational plan is provided at the Annexure - I

## 11.2 TIMELINE

In compliance with the National Green Tribunal (NGT) orders, it is mandatory to remediate all dumpsites in Kerala by March 2024. To ensure timely completion and compliance with the deadline, timeline for the implementation of project is provided below.

| S No | Description | Time frame |
|---|---|---|
| 1 | Start date | 01/12/2023 |
| 2 | End date | 31/03/2024 |

## 11.3 CONTRACT MODEL

**Execution Method:**

- Item Rate Contract and disposal/Management of by-products/aggregates with land recovery and redevelopment of the site with inert/ soil earthfill. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

**Working Model:**

- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for setting up the plant to the Contractor.
- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- Contractor is responsible for disposal of RDF, recyclables, and aggregates

Copyright © 2023 KSWMP | All rights reserved

## 12 BENEFITS OF THE PROJECT

Remediation of legacy waste dumpsite in the Vadakara leads to the following anticipated benefits:

- **Reclamation of Land**: An area of 1.25 acres will be reclaimed and will be developed into a recreational park for public use. A contamination assessment is to be carried out before any public use project is taken up at the location.
- **Environmental Protection**: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity. The project shall arrest GHG emissions from the legacy dumpsite.
- **Health Improvement**: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- **Enhanced Water Quality**: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to the safe drinking water.
- **Aesthetic and Social Benefits**: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- **Operational & Life cycle Aspects**

  Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through bio-mining process.
- **Employment**

  During remediation & post- remediation period, requirement of un-skilled labor will be fulfilled by s local sourcing.

Copyright © 2023. KSWMP | All rights reserved.

# 13 CONCLUSION

- The activities of the bio-mining will be commenced from Dec 2023 to Mar 2024. An area of 1.25 acres will be reclaimed and will be developed into a recreational park for public use after contamination assessment.
- Through the process of bio mining the dumpsite, complete land reclamation and recovery, while prioritizing environmental safeguards. This means that the land will be reclaimed and put to use.
- Considering site conditions and quantum, screening of the 38367 $m^3$ of legacy waste, mobile / compact screening machinery will be preferred.
- Favorable site conditions for bio-mining:
    1. Optimum width of the road is available for movement of the vehicles.
    2. Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
    3. Piped water supply and a storage of water tank 5000 liters are available at the dumpsite.
    4. At the dumpsite plot, a vacant land parcel of approx. 0.20 acres is available for the installation of auxiliary infrastructures, supporting conditions movement of processing machinery and vehicles.
- The project activity requires to obtained "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- By-products utilization/forward linkages/Usage
    1. The bio earth & C&D quantity of 19375.34 $m^3$ & 8824.41 $m^3$ respectively is proposed to be utilized after testing for the contamination for development of the reclaimed land as recreational park/facility. The contractor shall level/profile the site in consultation with the PIU/TSC/DPMU.
    2. Refused derived fuel (RDF) of 9169.71 $m^3$ will be to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the processes. The indicative location of cement plant is Dalmia Cements, Trichy.
    3. Recyclables of 997.54 $m^3$ will be sold to CKCL /Private recyclers authorized by KSPCB/CPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, NGT orders, KSPCB norms, CPCB guidelines and KSWMP ESMF and other regulatory rules & norms.
- Environmental & Social safeguards:
    1. The project attracts E2 Environmental category based on the Environmental Screening and Exclusions mentioned in the Environmental and Social Framework Guidelines.
    2. Site specific Environmental Assessment and Environmental Management Plan has been developed.
    3. The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is [redacted] /- (INR [redacted]). The cost per $m^3$ for processing and disposal of the legacy waste is [redacted] /- per $m^3$.

# 1 INTRODUCTION

IPE Global Ltd. Which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Puthiyappu, Vadakara, Kozhikode district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 16th May 2023. During the site visit it was observed that the dumpsite is situated on the top a lateritic hill. The ground observed at the site was hard laterite and upon enquiry it was learned that two open wells which were located on a specific side of the hill were to closed because of leachate getting seeped in to the wells. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 17th May 2023 and was completed on 23rd May 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Soil samples and rock samples were collected and relevant laboratory tests were carried out on it. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

**Figure 1** : Location of the borehole drilled at the dumpsite

## 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil and rock samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

## 3 OBSERVATIONS FROM SITE

Matterlab has deputed a team from our geotechnical department during the third week of May 2023, in order to collect the information regarding the site prior to mobilising the equipment for drilling, along with an environmental engineer (Mr. Gopi) related to IPE Global.

The location of the dumpsite is situated on an elevated hill formation. The geological formation around the site as per our observations was hard laterite. It was also noted that the surrounding area of the dumpsite is habituated and open wells are situated all around the dumpsite. Upon enquiring the locals, it was revealed that 2 open wells in a specific direction to the dumpsite were effected and had to be closed due to the seepage of leachate.

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste in the landfill.

### 4.2 Drilling equipment

Mechanical rigs of rotary drilling machine were used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The boring diameter of 150mm was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling

mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as disturbed samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Extraction of Cores:**

The core samples were extracted from the core barrels in a manner to prevent disturbances to the core. All the pieces of cores were sequentially numbered from top to bottom. Arrows indicating the lower end of the piece are marked on each core. Rock classification in terms of

weathering and state of fractures and strength is carried out in the following manner. Tabulations given in below explain it briefly.

**Table 1: Rock Classification**

| Terms | Description | Grade |
|---|---|---|
| Fresh | No visible sign of rock material weathering; perhaps slight discoloration on Minor discontinuity surfaces. | I |
| Slightly Weathered | Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discoloured by weathering. | II |
| Moderately Weathered | Less than half of the rock material is decomposed or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as core stones. | III |
| Highly Weathered | More than half of the rock material is decomposed or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as core stones | IV |
| Disintegrated Rock | All rock material is decomposed and / or disintegrated to soil. The original mass structure is still largely intact. | V |
| Residual Soil | All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported. | VI |

-As per IS 4464-1985 (Reaffirmed 2004)

It should be understood that all grades of weathering may not be seen in a given rock mass and that in some cases a particular grade may be present to a very small extent. Distribution of the various weathering grades of rock material in the rock mass may be related to the porosity of the rock material and the presence of open discontinuities of all types in the rock mass.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log:

The commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 2** and the complete results of laboratory testing are presented in **Appendix II**.

(a) (b) (c) (d)

**Figure 3 :** Laboratory tests performed at MatterLab.

**Table 2: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |
|---|---|---|---|
| 1 | Rock | Point Load Test | ISRM suggested Method |
| 2 | | Water Absorption | IS: 1124 - 1974 |
| 3 | | Apparent Specific gravity | IS: 1124 - 1974 |
| 4 | | Dry density | ISRM suggested Method |
| 5 | | Mohrs' Hardness | Using Mohrs' scale |

## 6 SUMMARY

The geotechnical examination on the soil samples collected after boring through the waste at the dumpsite at Puthiyappu, Vadakara, Kozhikode was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was bored using a rotary drill. The maximum depth of investigation was 10.5m (6.7m in waste and 3.8m in the original ground).

The ground encountered after drilling through the waste was a Lateritic rock. Cutting had to be done to cut through the rock with a core recovery of 6% and an RQD of NIL. The rock samples collected during the site investigation were transported to the lab. The tests mentioned in the above table were performed on the samples in the laboratory following the respective codes to obtain the necessary parameters. The laboratory results on hard lateritic samples obtained from cutting are appended in **Appendix II**.

Annexure-I

# PROPOSED OPERATIONAL PLAN

## Proposed Operational Plan

The project of the Bio-mining with land recovery will be implemented through 100% outsourcing model. The detailed operations of land recovery is provided below:

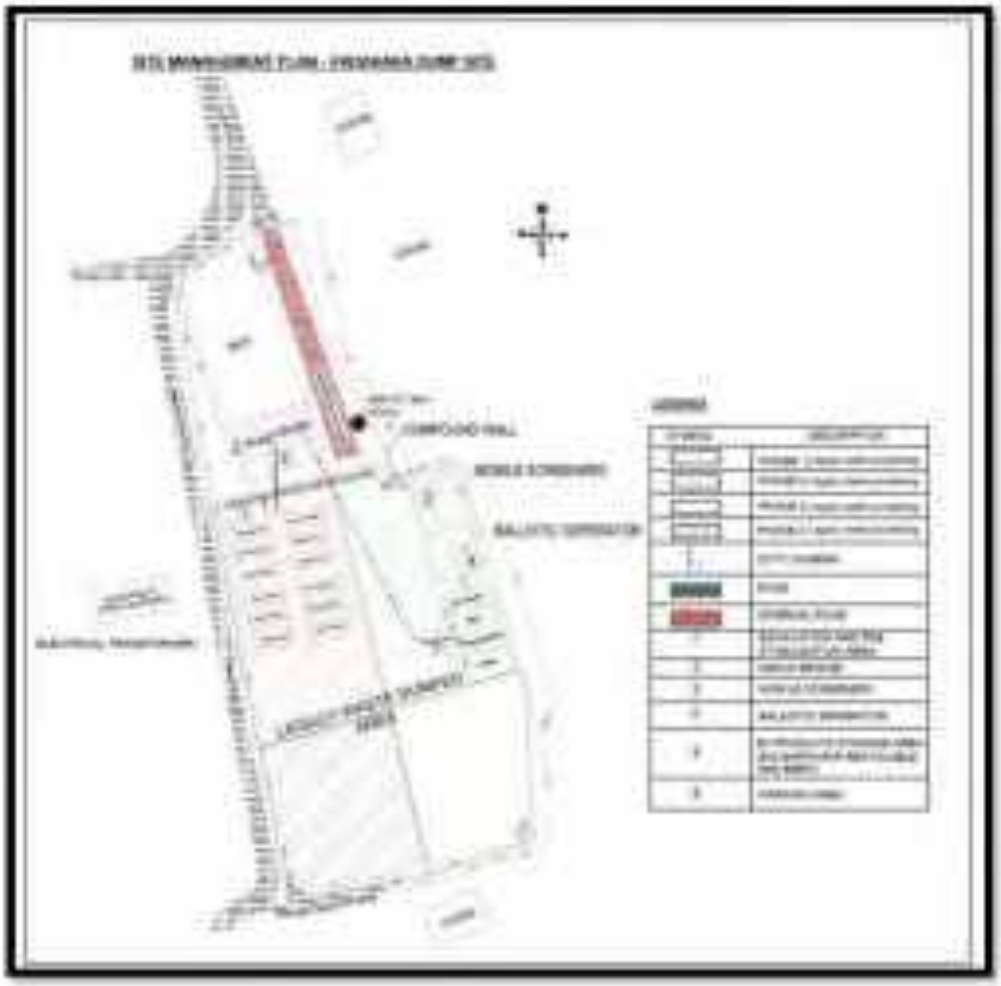
### 1. Project Kick-off

The existing legacy waste dumpsite should be visited jointly by representative of implementation agency, officials ULB and experts of PMU/PMC & TSC for the following

- ✓ For assessment of ***As –Is Situation*** of local settings viz., human settlement & environmental settings etc.,
- ✓ For validation of profile, quantity & physical characterization of legacy waste.
- ✓ Available services viz., electrical power, source of water and access road etc.,
- ✓ For ground truthing the sampling locations of baseline environmental parameter, locations where monitoring will conduct during operation phase and post reclamation phase
- ✓ For sensitizing/awareness of the upcoming the project activity to the stakeholders within the vicinity of the dumpsite.
- ✓ For understanding the sensitive of environmental & social aspects/social considerations viz., educational institutions, religious places and settlements settings.
- ✓ For ensuring that the implementation agency understands and to complies with all local and national regulations related to project activities.

### 2. Site Management Plan

The position of the machineries and other auxiliary machineries/equipment's in-line with the defined process of bio-mining with land recovery play imperative role in effective implementation of the project activities.



A detailed site management plan is prepared including the details of excavation & pre stabilization area in phases (1 to 4), machineries, weigh bridge, area allocation for by-products storage, vehicle parking area and position of CCTV cameras. The detailed site Management plan is provided below.

### 3. Site Preparation

The portion of the legacy waste dumpsite will be clear vegetation and levelling the area to create a stable & level platform for positioning of bio-mining machineries/equipment's and for processing of legacy waste.

### 4. Procurement of Machinery & Vehicles and Equipment's

An indicative list of Machineries &Vehicles and equipment's are proposed to for effective processing the quantity of existing legacy waste in-tune to the timeline of NGT orders. The indicative list of the Machinery & Vehicles and equipment's are provided in the Section 8.3.2

3. Mobilization of Manpower

For effective management of the project activities, an indicative list Manpower provided in the Section 8.4.1 shall be mobilize required.

4. Statutory Approvals

The implementation agency is responsible for obtaining all required permission/consent/approvals from the competent authorities. The ULB/DPMU/DPMC will only facilities implementation agency in obtaining the approvals etc. The indicative list of statutory approvals required for the project is provided below:

a. Site Authorization from KSPCB in conforming to SWM Rules 2016 and Consent to Establish/Operate KSPCB
b. Dept. of mining and geology
c. Necessary permission for storage of process materials and chemicals
d. NOC from Dept. of Fire and Rescue
e. Segregated Hazardous waste disposal arrangement (eg: KEIL Ambalamedu, Kochi)
f. NOC from Heritage/Archaeology if the site is in regulated zone of heritage/protected building
g. Any other statutory approvals/ permissions

## 7. Establishment of forward linkages

The By-products from the bio-mining process/operations viz., Bio earth/ C&D waste (Inert), RDF and Recyclables will be stored in the designated place (as indicated in the site management plan) within the dumpsite. The contractor is responsible for management/establishment of forward linkages. Utilization of Bio earth/C&D (inert) may be finalized in consultation with ULB. An indicative forward linkage is provided in the Section 9.1. The compost should conform to Schedule II of SWM Rules 2016, and RDF should conform to the Guidelines on Usage of RDF in various Industries issued by MoHUA. Bi-weekly sampling will be carried out to confirm the same.

**Bio-mining operations**

- Step-1 – Waste Stabilization

The initial step involves the use of a front-end loader to excavate the legacy waste, allowing for the leachate to dry out through exposure to solar radiation and for the removal of trapped methane from the heap. To ensure the decomposition of biodegradable waste such as discarded food, fruits, flowers, and garden waste, proper aeration is necessary to prevent the generation of leachate and odors. The top layer of the legacy waste, approximately 150 mm in depth, is repeatedly loosened using the front-end loader. Additionally, the waste is lightly mist-sprayed with bio-cultures to manage odors and disperse decomposing microbes throughout the waste. The loosened legacy waste forms windrows.

- Step-2 – Windrow Formation

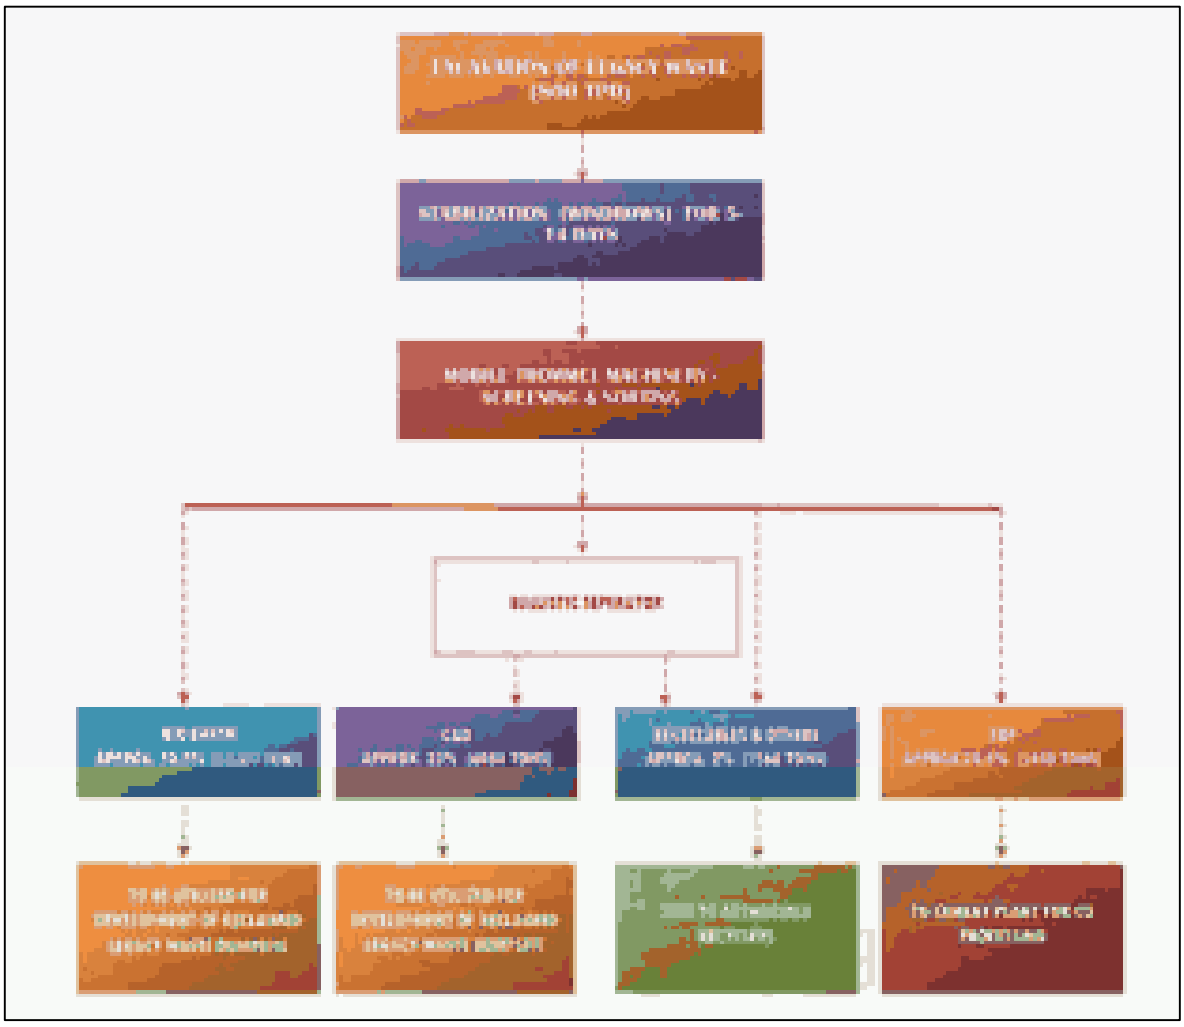
The second step involves creating windrows of the legacy waste using backhoe. Composting bio-cultures are added to accelerate decomposition and generate biological heat within the waste, aiding in drying it out and reducing its volume. These windrows are turned every 3 days to ensure proper biological treatment and moisture loss. After 1-2weeks, when the heaps have reached a suitable consistency for screening, the material is weighed and transferred to a Mobile Trommel, which consists of rotating cylinders with different-sized perforations.

- Step-3 – Sorting and Segregation by Mobile Trommel

The third step is to move stabilized waste to mobile trommel to get 3 different sizes of fractions

- ✓ Fraction 1 – (minus 30 mm) – Bio Soil/earth -Used for side development/ filling.
- ✓ Fraction 2 – (30-80) mm – Mixed fraction – Plastics with C&D (send to Ballistic Separator)
- ✓ Fraction 3 – (80 +) mm – Mixed fraction – (send to Ballistic Separator)

The Fraction-2 & Fraction-3 (30-80) mm & (80 +) mm is required to move for further separation process through ballistic separator.



- Step-4 – By - products – C&D materials

In the fourth step, the fraction-2 and fraction-3 are sorted into three types based on their shape and weight: heavy and rolling fraction (referred to as 3D) - C&D Material, light fraction (referred to as 2D) - RDF, and the sieved fraction (or under-screen fine fraction) - Plastic.

- Step-5 - Byproducts – RDF

In the fifth step, the RDF sorted by the ballistic separator (30TPH) is moved to the baling machine (50TPD) for packaging the RDF fractions. The baled RDF is then transported to Cement plants via a weigh bridge (30Ton), where a co-processing facility is available.

## 8. Monitoring & Supervising Mechanism

Supervision and monitoring during dumpsite remediation by TSC/PIU/DPMU

## 9. Record keeping and Reporting

i. The Implementation agency shall maintain a record of the daily processed legacy waste and also keep proper record of all the recovered and disposed of materials.

ii. The Implementation agency shall maintain authorized weigh bridge records at the point of receipt by end designated agency. A consolidated weigh bridge records certified by the Plant Manager/competent authority of the authorized Cement plant/ WtE or such units certifying the total RDF received from the Project is a valid proof of compliance.

iii. The Implementation agency shall maintain all the statutory records, as per SWM Rules, 2016, and also conditions stipulated in Site Authorization/Consent to Establish/Operate by KSPCB if any, KSWMP/WB requirements and other project relevance statutory requirements.

iv. The site shall be operated in CCTV surveillance with data storage of entire contract period. For CCTV surveillance High-Definition IP based cameras in adequate numbers. As per the requirement of the ULB/KSWMP link with mobile compatibility may be provided for online monitoring of the project activities.

v. The vehicles engaged for the project activities shall be equipped with Vehicles Tracking System (VTS) by equipping with GPS and online monitoring system.

vi. The agency is required to maintain loading and unloading weighbridge slips, e-way bill, LR copy, RDF receipt acknowledgement letter from the cement factory/ WtE facility for complete traceability of the recovered fractions.

## 10. Land recovery/project closure

Land shall be reclaimed to its original state prior to dumping of waste i.e. all the legacy waste must be removed till it reaches the surface of the original land. The Machinery & Vehicles of the implementation agency shall be vacated within 7 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB.

Annexure-J

# LSGD GUIDELINES FOR REMEDIATION OF LEGACY WASTE DUMPSITES THROUGH BIOREMEDIATION

# GOVERNMENT OF KERALA

## Abstract

Local Self Government Department - Guidelines for Remediation of Legacy Waste Dumpsites through Bio Remediation - orders issued.

## DEPARTMENT

G.O.(Rt)No.2629/2022/LSGD Dated,Thiruvananthapuram, 29-10-2022

Read 1 Letter No. 2683/C2/2022/SM dated 16.09.2022 from Executive Director Suchitwa Mission.

## ORDER

As per the letter read above, Executive Director, Suchitwa Mission had submitted draft guidelines for implementation of project for remediation of Legacy Waste Dumpsites through Bio Remediation.

2) Government have examined the matter in detail and are pleased to approve the guidelines enclosed herewith for implementation of project for reclamation of legacy waste dumpsites through bio remediation.

(By order of the Governor)
SHIBI ABRAHAM
DEPUTY SECRETARY

To:

Principal Director Local Self Government Department

Director Local Self Government(Urban) Department

Director, Local Self Government (Rural) Department

**ലെഗസി മാ**ലിന്യ **നിർമ്മാർ**ജന പദ്ധതികളു**ടെ നിർവ്വഹ**ണ ഉദ്യോഗ**സ്ഥ**ൻ

- ലെഗസി മാലിന്യ നിർമാർജന പദ്ധതികളുടെ നിർവ്വഹണ ഉദ്യോഗസ്ഥൻ തദ്ദേശ സ്വയംഭരണ സ്ഥാപനത്തിന്റെ എഞ്ചിനീയർ ആയിരിക്കും

നിർമ്മാർജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യ നിക്ഷേപങ്ങളുടെ അളവ തിട്ടപ്പെടുത്തൽ

- പൊതുവായി, നിർമ്മാർജ്ജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യത്തിന്റെ അളവ (ക്യൂബിക മീറ്ററിൽ) ടോട്ടൽ സ്റ്റേഷൻ സർവേയിലൂടെ കണ്ടെത്താവുന്നതാണ. എന്നാൽ ടോട്ടൽ സ്റ്റേഷൻ സർവേ സാധ്യമല്ലാത്ത സാഹചര്യത്തിൽ, ഒരു ലക്ഷം ക്യൂബിക മീറ്റർ വ്യാപ്തിയിൽ കൂടുതലുള്ള വലിയ ഡംപസൈറ്റുകളുടെ കാര്യത്തിൽ ഡ്രോൺ സർവ്വേ രീതി സ്വീകരിക്കാവുന്നതാണ.

- ആവശ്യമുള്ള പക്ഷം, പുറമെയുള്ള സർവേ ഏജൻസികളെ നിശ്ചിത നടപടിക്രമങ്ങൾ പാലിച്ച ഇതിനായി ഏർപ്പെടുത്താവുന്നതും, അതിനുള്ള ചെലവ ലഭ്യമായ ഫണ്ടിൽ നിന്ന തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം വഹിക്കേണ്ടതുമാണ.

- സൈറ്റിന്റെ കോണ്ടൂർ മാപ്പ തയ്യാറാക്കേണ്ടതും ആയത തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ പരിശോധിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

എസ്റ്റിമേറ്റ തയ്യാറാക്കലും പദ്ധതി രൂപീകരണവും

- സൈറ്റിന്റെ നിലവിലെ അവസ്ഥ, മാലിന്യത്തിന്റെ സ്വഭാവം/തരം, മാലിന്യ നിക്ഷേപത്തിന്റെ കാലയളവ, മറ്റ അടിസ്ഥാന വിശദാംശങ്ങൾ എന്നിവയെക്കുറിച്ചുള്ള വിശദമായ റിപ്പോർട്ട അനുബന്ധം- I ൽ നൽകിയിരിക്കുന്ന പ്രൊഫോർമയിൽ തയ്യാറാക്കേണ്ടതാണ

- അനുബന്ധം-II ൽ നൽകിയിരിക്കുന്ന സ്പെസിഫിക്കേഷനും ഡാറ്റയും അനുസരിച്ച ബയോമൈനിംഗ മുഖേന പ്രവൃത്തി നടപ്പിലാക്കുന്നതിന എസ്റ്റിമേറ്റ തയ്യാറാക്കേണ്ടതാണ.

- പ്രൊപ്പോസൽ തയ്യാറാക്കുന്നതിന്റെ ഭാഗമായി പ്രസ്തുത പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള എല്ലാത്തരം ചെലവുകളും പരിഗണിക്കേണ്ടതാണ.

- വാർഷിക പദ്ധതിയുടെ ഭാഗമായി പ്രോജക്ട ഏറ്റെടുക്കേണ്ടതും ലഭ്യമായ സ്രോതസ്സുകളിൽ നിന്നും ഫണ്ട വകയിരുത്തേണ്ടതുമാണ.

സാങ്കേതിക അനുമതി

നിലവിലുള്ള സാമ്പത്തിക അധികാരങ്ങൾ അനുസരിച്ച തദ്ദേശ സ്വയംഭരണ വകുപ്പ(ലോക്കൽ ഇൻഫ്രാസ്ട്രക്ച്ചർ & എഞ്ചിനീയറിംഗ വിങ) ലെ ബന്ധപ്പെട്ട എഞ്ചിനീയർ പ്രോജക്ടിന സാങ്കേതിക അനുമതി നൽകുകയും മാനദണ്ഡങ്ങൾ പാലിക്കുന്നതിനായി ചീഫ ടെക്നിക്കൽ എക്സാമിനർക്ക (ഫിനാൻസ വിംഗ) ആവശ്യമായ റിപ്പോർട്ടിംഗ ഉറപ്പാക്കുകയും ചെയ്യേണ്ടതാണ.

തദ്ദേശ സ്വയംഭരണ സ്ഥാപനങ്ങൾ ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ/ഭൂമികൾ വീണ്ടെക്കുന്നതിനുള്ള പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള നടപടി ക്രമങ്ങൾ

ടെൻഡറിംഗ

- ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ വീണ്ടെടുക്കുന്നതിനുള്ള പ്രവൃത്തിയുടെ വിശദമായ സ്കോപ്പ ഓഫ വർക്ക, നിബന്ധനകളും വ്യവസ്ഥകളും മുതലായവ വ്യക്തമായി പരാമർശിക്കുന്ന 'ടു കവർ ബിഡ്സ താല്പര്യപത്രം'(Request for Proposa - wo Cover Bd) തയ്യാറാക്കേണ്ടതും ആയത നടപടിക്രമങ്ങൾ പാലിച്ച പ്രസിദ്ധീകരിക്കുകയും ചെയ്യേണ്ടതാണ.

- കേന്ദ്ര പാർപ്പിട-നഗരകാര്യ മന്ത്രാലയവും (MoHUA) സെൻട്രൽ പബ്ലിക ഹെൽത്ത & എൻവയോൺമെന്റൽ എഞ്ചിനീയറിംഗ ഓർഗനൈസേഷനും (CPHEEO) ചേർന്ന പ്രസിദ്ധീകരിച്ച "സ്വച്ഛ ഭാരത മിഷൻ (അർബൻ)-അഡ്വൈസറി ഓൺ ലാൻഡ്ഫിൽ റിക്ലമേഷൻ" ൽ നൽകിയിരിക്കുന്ന മാർഗ്ഗനിർദ്ദേശങ്ങളെ

അടിസ്ഥാനമാക്കി RFP-യിലെ വ്യവസ്ഥകൾ/യോഗ്യതാ മാനദണ്ഡങ്ങൾ നിശ്ചയിക്കാവുന്നതാണ.

- കേന്ദ്ര മലിനീകരണ നിയന്ത്രണ ബോർഡ പുറപ്പെടുവിച്ച "ഗൈഡലൈൻസ ഫോർ ഡിസ്പോസൽ ഓഫ ലെഗസി വേസ്റ്റ (ഓൾഡ മുനിസിപ്പൽ സോളിഡ വേസ്റ്റ) " പ്രകാരം ലെഗസി മാലിന്യ നിക്ഷേപങ്ങൾ നിർമ്മാർജ്ജനം ചെയ്യേണ്ടതാണെന്ന നിബന്ധന പ്രവൃത്തിയുടെ 'സ്കോപ്പ ഓഫ വർക്കിൽ' ഉൾപ്പെടുത്തുന്നുണ്ടെന്ന ഉറപ്പ വരുത്തേണ്ടതാണ.

- ലഭ്യമാകുന്ന ടെക്നിക്കൽ ബിഡ്സുകൾ പരിശോധിച്ച വിലയിരുത്തേണ്ടതും സാങ്കേതിക യോഗ്യത നേടുന്ന ബിഡ്ഡർമാരെ ബിഡ/ടെൻഡർ അംഗീകാരത്തിന്റെ തുടർ ഘട്ടത്തിനായി ഷോർട്ടലിസ്റ്റ ചെയ്യേണ്ടതുമാണ. ടെക്നിക്കൽ ബിഡ്സുകളുടെ മൂല്യനിർണ്ണയം നടത്തുന്നതിനായി താഴെപ്പറയുന്ന അംഗങ്ങളെ ഉൾപ്പെടുത്തി തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതിക സമിതി രൂപീകരിക്കേണ്ടതാണ;

    - സെക്രട്ടറി
    - LSGD (LID & EW) എഞ്ചിനീയർ
    - ഹെൽത്ത വിഭാഗം ഉദ്യോഗസ്ഥൻ (നഗര തദ്ദേശ സ്ഥാപനങ്ങളുടെ കാര്യത്തിൽ)
    - ജില്ലാ ശുചിത്വ മിഷനിൽ നിന്നുള്ള സാങ്കേതിക വിദഗ്ധൻ
    - ജില്ലാ മലിനീകരണ നിയന്ത്രണ ബോർഡിന്റെ പ്രതിനിധി
    - അക്കാദമിക സ്ഥാപനങ്ങളിൽ നിന്നുള്ള മറ്റ വിദഗ്ധർ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതികമായി ഷോർട്ടലിസ്റ്റ ചെയ്ത ബിഡഡർമാരുടെ ഫിനാൻഷ്യൽ ബിഡ്സുകൾ തുറക്കേണ്ടതും നടപടിക്രമങ്ങളും മാനദണ്ഡങ്ങളും പാലിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

- തിരഞ്ഞെടുത്ത കരാറുകാരന/ഏജൻസിക്ക ലെറ്റർ ഓഫ അവാർഡ (L O A) നൽകുകയും കരാറിൽ ഏർപ്പെടേണ്ടതുമാണ.

നിർവ്വഹണം, മേൽനോട്ടം, ബില്ലുകൾ തയ്യാറാക്കൽ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയറും മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങളുടെ നിരീക്ഷണ ചുമതലയുള്ള ഉദ്യോഗസ്ഥനും അടങ്ങുന്ന ഒരു മേൽനോട്ട സമിതി (Superv s on Commttee) രൂപീകരിക്കേണ്ടതാണ

- R F P ഡോകുമെന്റിലും കരാറിലും ഉൾപ്പെടുത്തിയിട്ടുള്ള 'സ്കോപ്പ ഓഫ വർക്ക' കരാറുകാരൻ കൃത്യമായി പാലിക്കുന്നുണ്ടോ എന്ന നിരീക്ഷിക്കുന്നതിനായി തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം മേൽനോട്ട സമിതിയെ ചുമതലപ്പെടുത്തേണ്ടതാണ.

- പ്രസ്തുത പ്രവൃത്തി 'സ്കോപ്പ ഓഫ വർക്കിൽ' നിഷ്കർഷിക്കുന്ന പ്രകാരമാണോ നടപ്പിലാക്കുന്നതെന്ന മേൽനോട്ട സമിതി കൃത്യമായും പരിശോധിക്കുകയും നിരീക്ഷിക്കുകയും ചെയ്യേണ്ടതാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ കരാറുകാരന/ ഏജൻസിയ്ക്ക സൈറ്റ ഹാൻഡ ഓവർ ചെയ്ത നൽകേണ്ടതും പ്രവൃത്തി നടപ്പിലാക്കുന്നതിനുള്ള/ നിർവഹിക്കുന്നതിനുള്ള പിന്തുണ നൽകുകയും ചെയ്യേണ്ടതാണ.

- മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങൾ നിരീക്ഷിക്കുന്നതിന്റെ ചുമതലയുള്ള ഉദ്യോഗസ്ഥൻ പ്രസ്തുത പ്രവൃത്തിയിൽ ഉൾപ്പെടുന്ന മാലിന്യ പരിപാലനവുമായി ബന്ധപ്പെട്ട പ്രവർത്തനങ്ങളായ വിൻട്രോ ഫോർമേഷൻ, മാലിന്യം

തരംതിരിക്കൽ, മലിനീകരണ നിയന്ത്രണ മുൻകരുതലുകളും ആരോഗ്യപരമായ കാര്യങ്ങളും ഉറപ്പുവരുത്തൽ എന്നിവയ്ക്ക മേൽനോട്ടം വഹിക്കേണ്ടതും കരാറുകാരന/ഏജൻസിക്ക മേൽനോട്ട സമിതി മുഖേന ആവശ്യമായ നിർദ്ദേശങ്ങൾ നൽകേണ്ടതുമാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ എംബുക്കിൽ 'ഇനിഷ്യൽ', 'ഇന്റർമീഡിയറ്റ്', 'ഫൈനൽ' ലെവലുകൾ എന്നിവ എടുത്ത അളവുകൾ രേഖപ്പെടുത്തേണ്ടതും, തദ്ദേശ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- കരാറിൽ വിശദമാക്കിയിട്ടുള്ള ജോലിയുടെ വിവിധ ഘട്ടങ്ങൾ പൂർത്തിയാക്കിയ ശേഷം കരാറുകാരൻ/ഏജൻസി ക്ലെയിം ചെയ്യുന്ന പ്രവൃത്തിയുടെ വർക്ക ബില്ലുകൾ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ തയ്യാറാക്കേണ്ടതും തദ്ദേശ സ്വയംഭരണ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- <u>GUIDELINES FOR IMPLEMENTATION OF PROJECTS FOR RECLAMATION OF LEGACY WASTE DUMPSITES THROUGH BIO REMEDIATION (BIO MINING AND MANAGEMENT OF RECOVERABLES AND REJECTS)</u>

As per the provisions of Solid Waste Management Rules 2016, local bodies are mandated to remediate legacy waste dumpsites and reclaim the land based on the guidelines issued by CPCB. Remediation of legacy dumpsites involves various activities such as assessment of the nature and quantity of waste to be remediated, excavation works to open the dumps, screening and sorting to segregate the waste fractions, reuse and sale/marketing of recovered materials, scientific disposal of rejects as per the norms. The remediation of dumpsites is further directed by Honorable NGT in its order on OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. However, the progress of implementation of such projects has not been satisfactory so far. One of the main reasons is that there is a lack of clarity in the procedures to be followed for legacy waste remediation projects right from the approval of the project to the mode of execution (including sale and disposal of recovered materials) by LSGIs since the nature of such projects is not similar to the general public construction/civil works. Also, the nature, quality and quantity of material that can be recovered from an existing legacy dumpsite cannot be accurately predetermined without opening up such dumpsites and hence it is not practical to prepare a workable estimate for the same like other public works . In order to tackle these issues, Swachh Bharat Mission(Urban) and CPHEEO have issued an "Advisory on Landfill reclamation", and suitable provisions of this advisory can be adopted for the State of Kerala. In these circumstances, the Government has examined this matter in detail, and the following guidelines are issued for the implementation of projects for remediation of legacy dumpsites by Local Self Government Institutions.

**<u>Standards, guidelines and advisories to be followed</u>**

- "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" issued by Central Pollution Control Board
- "SBM-U Advisory on Landfill Reclamation" published by MoHUA and

CPHEEO

- Guidelines issued by Government of Kerala in this regard from time to time

**Models for implementing legacy waste dumpsite remediation by LSGI's**

- 100% outsourced model (As per "SBM -U Advisory on Landfill Reclamation" published byMoHUA and CPHEEO)

**Implementing officer for legacy waste dumpsite remediation projects**

The implementing officer for legacy waste remediation shall be the Engineer of the LSGI

**Quantification of legacy waste to be remediated**

- The volume of legacy waste (in m3) to be remediated shall be generally assessed through Total Station Survey. If a total station survey is not feasible, a drone survey may be adopted for large dumpsites having a volume of more than 1 (One) Lakh m3.
- If required, external survey agencies may be engaged following laid down procedures and the cost for the same shall be met by LSGI from available funds.
- Contour mapping of the site shall be prepared and approved by the Engineer of the LSG

**Project Cost Estimation and Formulation by LSGI**

- Detailed report regarding the site conditions, nature of dump, history of dumping and other basic details shall be prepared in the format given in **Annexure - I**
- The estimate for biomining shall be prepared as per the specification and data given in
  - **Annexure -II**
- The overall cost for the implementation of the project shall be considered as part of the proposal.
- Project shall be taken up as per annual projects and funds from available sources shall be ear marked

**Technical Sanction**

- Technical sanction for the project shall be issued by the concerned Engineer in LSGD (LID & EW) as per the existing financial powers and necessary reporting to the Chief Technical Examiner (Finance Wing) may be ensured for compliance as per norms

**Implementation steps for remediation of legacy waste dumpsites by LSGIs**

**Tendering**

- Request for Proposals (RFPs-Two cover bid) clearly mentioning the scope of work, terms and conditions for reclamation of legacy waste dump sites shall be prepared and published as per laid down procedures.
- Conditions/eligibility criteria in the RFP shall be fixed based on the guidelines given in"**SBM-U Advisory on Landfill Reclamation"** published by MoHUA and CPHEEO
- It shall be ensured to mention in the scope of work that remediation of legacy waste dumpsites shall be undertaken as per the **"Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)"** issued by Central Pollution Control Board.
- The technical proposals received should be evaluated and technically qualified bidders shortlisted for further stage of bid approval. A Technical committee shall be formed at LSGI level for evaluation of the technical bids with the following members;
    - Secretary
    - LSGD (LID & EW) Engineer
    - Health Official (in the case of Urban local bodies)
    - Technical expert from District Suchitwa Mission
    - Representative from District Pollution Control Board
    - Other experts from academic institutions if any
- Financial bids of the technically shortlisted firms should be opened at LSGI level and approved as per procedures and norms
- Letter of Award (LoA) is to be issued to the selected contractor agency and agreement executed

**Execution, Supervision and preparation of bills**

- LSGI shall constitute a supervision committee consisting of LSGI Engineer and the officer in charge of monitoring waste management activity
    - LSGI shall authorise the supervision committee to monitor that the contractor correctly follows the scope of work included in the RFP document and agreement
- The supervision committee shall inspect and monitor that the work is being carried out as per the scope defined.
- LSGI Engineer shall hand over the site and provide support for execution of work at the site by the contractor/agency
- The officer in charge of monitoring waste management shall oversee the waste management related activities such as formation of windrows, segregation of waste into various streams,ensuring pollution control measures and health matters involved in the project and shall give direction to the contractor/agency through the supervision committee.

- LSGI Engineer shall measure, record quantities by taking initial, intermediate and final levels in M-book and Check measurements shall be done by the officials of LSGD (LID & EW) as per the powers vested with in the Local Self Government Department.
- LSGI Engineer shall prepare the work bills claimed by the contractor/agency after completing stages of work detailed in the agreement and check measurement shall be made by the officials of LSGD (LID & EW) as per the powers vested within Local Self Government Department.
