## Summary

### Introduction

The Iritty municipality is in Kannur District of Kerala and has an area of 46.65 Sq.km with 33 wards. The Solid waste generated from Iritty ULB is 14.12 TPD. In Iritty ULB there is an existing dumpsite at Athithattu, Ward 12, and currently there is no dumping of waste. However, Iritty ULB did not possess a designated landfill site as mandated by the Solid Waste Management Rules of 2016. Consequently, unsegregated waste was disposed of in an unscientific manner. In order to promote a healthy and sustainable environment, it is imperative to undertake the remediation of the dumpsite.

### Subproject Description

The Bio-mining and Bioremediation at the Iritty ULB dumpsite was initiated as part of the Kerala Solid Waste Management Project (KSWMP) in collaboration with funding from the World Bank and the Asian Infrastructure Investment Bank. The dumpsite situated in Ward 12, Athithattu, covers a total area of 2.44 acres and contains a legacy waste quantity of 1,254 tons. The waste at the site is approximately 20 years old, with dumping activities started in 2000 and stopped in 2020. Initially, the dumpsite served as a trenching ground for the disposal of sewage from pit latrines. The total volume of waste accumulated is approximately 2,023 cubic meters, and the dumpsite spans across an area of 0.11 acres.

- Status of Subproject Development at the time of EIA

The entry to the dumpsite is facilitated by a 5-meter-wide approach road in good condition, located in Athithattu stretch. Within the premises, there is an operational MCF, and organic waste composter units (Windrow composting unit and Thumboormuzhi unit).

- Technical Aspects

Following a comprehensive evaluation, the method or technique of Bio-mining with a goal of achieving land reclamation and recovery is found to be the most suitable remediation approach, ensuring long-term sustainability and environmentally responsible treatment of legacy waste, leading to the complete remediation of the dumpsite. Based on the Feasibility and site conditions, Mobile trommel machinery would be the most suitable option for such a small site at Athithattu, Iritty. The optimal time frame for conducting the Bio-mining Process would be from December to April Months, a period characterized by lower rainfall levels as per climate data.

### Application of Regulatory and Guidance Framework

In accordance with the SWM Rules of 2016, the selection of an appropriate method or technique for remediating a dumpsite should be determined through a feasibility study that

Copyright © 2023. KSWMP| All rights reserved

consider technical, financial and Environmental aspects complying with regulatory requirements (KSPCB/NGT). The formulation of the subproject adhered to the State/National and World Bank safeguards policies, both in its planning phase and will continue to do so during the implementation and monitoring stages. This commitment to compliance will be upheld for a period.

**Baseline Environmental Scenario**

A detailed environmental baseline study was conducted for analyzing quality of air, groundwater, surface water, noise levels, and leachate characteristics. The preliminary Environmental Screening [Annexure -1] and the detailed assessment showed that this sub project falls under "E2" category. (Please note that suggestive environmental categorization of dumpsite bio-mining / bioremediation as per EMF for KSWMP is E1. However, considering the very small extent of the dumpsite, absence of any sensitive environmental feature in or around the site, short bio-mining period, and the overall positive impacts of the proposed development post mitigation measures; this is categorized as E2. At this stage, locations for disposal of bio-mined wastes are unknown, the subproject would be recategorized if the locations are near any sensitive areas. In case the bio-mining is clubbed with other multiple sites also, the overall categorization would be reconsidered)

An analysis has been conducted at the site to review and comprehend the physiography, climate, soil, cultural heritage, ecology, and biodiversity of the dumpsite. This assessment aims to identify potential impacts on the environment, human health, and biodiversity. Additionally, a traffic assessment has been performed to analyze traffic patterns and movements during the project's implementation phase.

**Terrestrial Ecology:**

The site is situated outside of a forested region. The nearest Forests/Protected Areas, known as Kottiyur reserve forest, Aralam wildlife sanctuary and also Brahmagiri wildlife sanctuary, are located. Various indigenous flora and fauna species commonly inhabit the vicinity of the site.

Fauna: Langur (*Semnopithecus entellus)*, Nilgiri Langur (*Trachypithecus johni)*, Lion-tailed Macaque (*Macaca Silenus)*, Bonnet Macaque (*Macaca radiata),* Tiger (*Panthera tigris)*, Leopard (*Panthera pardus)*, Wild Dog (*Cuon alpinus),* Jungle Cat (*Felis chaus),* Bear (*Melursus ursinus)*, Wild Boar (*Sus scrofa*) Asian Elephant (*Elephas maximus)*, Mouse Deer (*Moschiola meminna)* and Indian Muntjak (*Muntiacus muntjac),* Butterflies *(Lepidopter: Insecta),* Dragonflies and damselflies *(Odonata: Insecta),* Malabar gliding frog (*Rhacophorus malabaricus),* Malabar tree toad (*Pedostibes tuberculosus),* Glandular bush frog (*Raorchestes glandulosus),*

Flora: Tropical Evergreen Tree (*Dipterocarpus-Mesua- Palaquium),* Karanjili (*Dipterocarpus bourdillonii) etc.*

Copyright © 2023. KSWMP| All rights reserved

**Air Quality:**
Air monitoring was conducted continuously for a 24-hour duration at all sites, and the obtained results were meticulously analyzed against the National Ambient Air Quality Standards of 2009. It is noteworthy that all measured pollutants' concentrations were found to be well within the permissible limits. Furthermore, no presence of hazardous or toxic gases was detected during the monitoring process.

**Water Quality:**
The monitoring of water quality was carried out at 3 locations for Ground water & 1 Location for Surface Water.

Groundwater samples were collected from three distinct locations, each within a radius of 200 meters from residences. The analysis of these samples revealed that all parameters examined fall within acceptable limits, with the exception of pH levels.

Surface water assessment indicates that the Bavali River is located approximately 1.25 kilometers from the site. There is no connectivity for the leachate pathway to reach the river. Surface water sample had been taken nearby pond which is not connected with river.

**Noise Level:**
Sample for noise level monitoring were collected within the dumpsite to assess the current ambient noise levels. The results indicate that the noise levels observed are comfortably within the permissible limits. However, it shall be noted that there is no activity currently on site. And noise levels are expected to increase with bio-mining activity.

**Assessment of Risks/Impacts and Proposed Mitigation measures and Monitoring**

The anticipated impacts of the interventions proposed have been analyzed in detail and mitigation measures proposed. The Environmental Impact Assessment (EIA) and Social Impact Assessment (SIA) documents, which assess the potential environmental and social impacts of the proposed project, serve to identify potential risks, formulate mitigation measures and ensure compliance with environmental and social standards regulations. This dumpsite remediation project comprises an overview of the current environmental conditions within the project area. Furthermore, the report delineates the environmental baseline data, Disaster Management Plan, identification of sensitive receptors and a Fire Risk Assessment. Key environmental risks include leachate and storm water from the site impacting the nearby areas, odour (including gas), visual blight, flies & pests, storage and disposal of retrieved materials, fire, accidents & other disasters, and health and safety of workers. Possible future dumping of wastes after bio-mining is also a concern. Mitigation and management measures for these in line with mitigation hierarchy are included in the EMP.

Copyright © 2023. KSWMP| All rights reserved

Proposed mitigation measures are designed to address environmental and social impacts effectively, with the goal of minimizing negative consequences while maximizing positive outcomes. Additionally, this report encompasses an Environmental Management Plan (EMP) and a Social Management Plan (SMP), providing detailed strategies for the management of the project's environmental and social facets.

In addition, a detailed Environment Monitoring Plan and Social Monitoring Plan will outline the monitoring procedures to assess the efficiency of mitigation measures and guarantee adherence to environmental and social standards. To ensure seamless and timely execution, the dumpsite remediation subproject report also includes an Environmental and Social Budget. This ensures a sustainable and responsible bio-mining process that prioritizes the protection of the environment and the well-being of nearby communities throughout the waste remediation process.

**Implementation Mechanism & Budget**

The Bio-mining project, with the objective of achieving 100% land recovery, will be carried out exclusively through an outsourcing model. The bio-mining process will be conducted separately at each site. The bio-earth and coarse fraction segregated during the time of remediation are proposed to be used for filling low lying areas or can be used for agricultural land, after ensuring the desirable quality. If the land is found to be contaminated, proper remedial measures will be followed before utilizing for future facilities. The recyclables will be handed over to the authorized recyclers and the RDF is proposed to be handed over to the cement factories/boilers. The land will be restored to its pre-waste dumping condition, necessitating the complete removal of all legacy waste until it reaches the original land surface. Following the completion of the bio-mining process, the machinery and vehicles belonging to the implementing agency must be vacated within 7 days. The reclaimed land, free of any encumbrances, will then be transferred to the Urban Local Body (ULB).
The total budget proposed for Environmental monitoring and social budget is [redacted]/- which includes SMP budget.

**Consultation &Disclosure**

A transect walk was also carried out to assess the socio-environmental characteristics in the vicinity of the dumpsite. To understand the social dynamics, demographic profile, livelihood

patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community, a transect walk was carried out on 03-June-2023, (Attendees – 12 nos.) which was crucial for developing effective dumpsite remediation strategies that align with their priorities. The findings and recommendation of the transect walk is shown in the following table.

Copyright © 2023. KSWMP| All rights reserved

*Table 1 Findings and recommendation of the transect walk*

| S.No | Social risks | Findings and Recommendations |
|---|---|---|
| 1 | Presence of 2 families near (200 m) the dumpsite, | a. Free movement of the residents needs to be ensured |
| 2 | 5 women are working in the Thumboormuzhi model compost unit | Need to ensure the smooth functioning of compost unit and working conditions for women |

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# 1. INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio-mining of multiple Legacy Waste Dumpsites in various districts. As per the Feasibility Study and methodology statement for implementing the subproject, 12 dumpsites are grouped into a single cluster. It is expected that one single contractor bids for one Cluster. However, bidding modality is yet to be finalized- whether as a single site, or as a cluster.

## 1.2 The rationale of the Proposed Sub-Project

Athithattu dumpsite in Iritty ULB at ward no.12 has a total waste quantity of 1254 Tons, spreading over 0.11 acres. The site is located between Lat- 11°58'04.44"N and Long - 75°40'54.066"E and has an elevation of MSL +39 (m). During the monsoon season, the positioning of the dumpsite causes legacy waste to flow downhill affecting nearby residential areas. Iritty ULB proposes bio-mining and bioremediation of the Athithattu legacy waste dumpsite site under KSWMP supported by the World Bank and Feasibility Report has been prepared for this subproject. Considering the environmental and social impacts associated with legacy dumpsite bio-mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Objectives and scope of Environmental & Social Impact Assessment (ESIA)

As per indicative categorization for dumpsite bio-mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (2.44 acres) and waste spread (0.11 acres) and absence of environmentally sensitive features around, this sub-project is individually

Copyright © 2023. KSWMP| All rights reserved

considered as E2, and EIA is prepared accordingly. Required monitoring and analysis are carried out considering the possible impacts.

***Social Impact Assessment***:

Under this category social impact assessment is also a key factor to be considered. Accordingly, detailed assessment of the environmental and social impacts was carried out.

### 1.4 Proposed sub project details

*Table 2 Proposed Sub Project Details*

| Description | Details |
|---|---|
| Name of ULB | Iritty |
| District | Kannur |
| Taluk | Iritty |
| Total present population in the ULB | 54,151 |
| Name of the sub-project | Dumpsite Remediation at Athithattu |
| Location of the sub-project | Iritty ULB, Ward 12Athithattu |
| Total dumpsite area (in acres) | 2.44 |
| Total waste accumulated area (in acres) | 0.11 |
| GPS Co-ordinate of the Site | 11°58'04.44"N, 75°40'54.066"E |
| Legacy waste quantity | 2023 Cum |

KSWMP

Copyright © 2023. KSWMP | All rights reserved

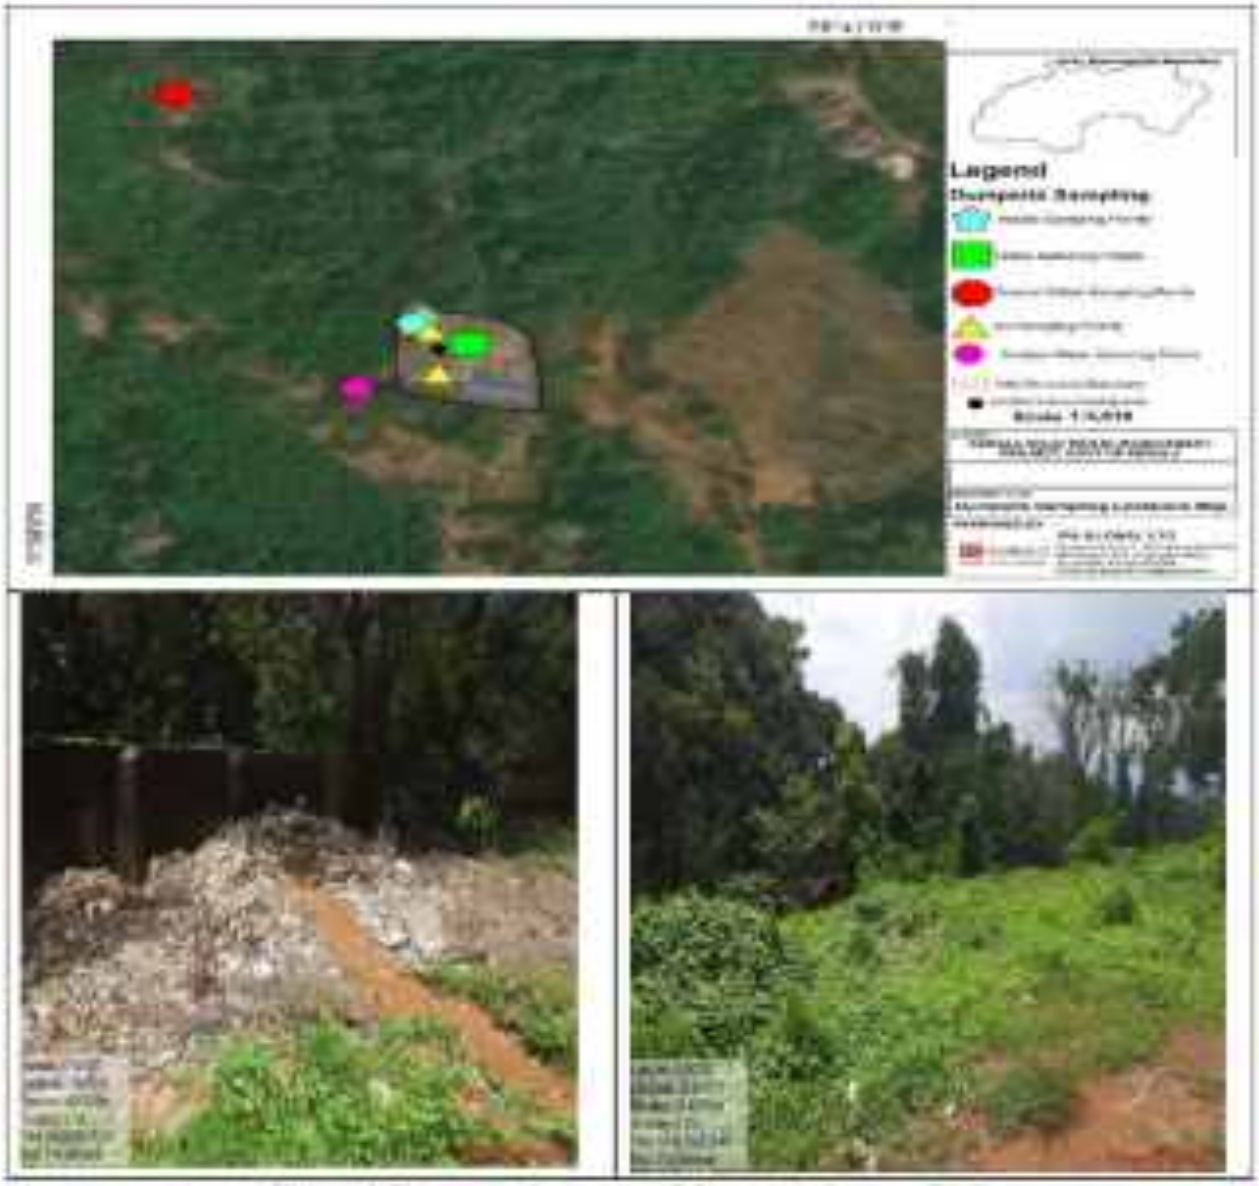

*Figure 1 Topo map & images of dumpsite (Source: TSC)*

The technology proposed is Bio mining and the valuable fractions other than the bio earth & coarse fraction obtained from this process will be sold to authorized recyclers. The various phases in the bio-mining process (as per Legacy Waste bio-mining Guidelines of CPCB) are shown below.

*Table 1 Phases of Bio-mining*

KSWMP

Copyright © 2023 | All rights reserved

| Phases of Bio-mining | |
|---|---|
| **Phase 1:** Stabilization | The legacy waste is formed into equal-sized windrows and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| **Phase 2:** Sorting & Segregation | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/circular rotatory sieves and manpower. |
| **Phase 3:** Disposal & Utilization | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |

### 1.5 Site management plan

The plan aims to minimize potential adverse impacts on sensitive receptors while maximizing the recovery of valuable resources and promoting site restoration.

Mobile machineries will be used for bio-mining of Iritty dumpsite, and they do not require a separate area for erection. The waste will be excavated and directly fed into mobile screeners for processing. This approach minimizes the need for additional infrastructure and optimizes the efficiency for the bio-mining process. The proposed plan is as follows

KSWMP

Copyright © 2023. KSWMP | All rights reserved

*Figure 2 Site Management Plan for Iritty*

## 2. POLICY AND REGULATORY FRAMEWORK

### 2.1 National, State Legislations and Technical Guidelines related to dumpsite remediation

*Table 5 Applicable rules and regulations for Iritty dumpsite remediation*

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| 1 | The Motor Vehicle Act. 1988 | All vehicles used for installation and operation will need to comply with the provisions of this act and should have valid Pollution Under Control Certificate. |
| 2 | Authorization from PCB for storing Hazardous material like diesel for DG sets as per Hazardous and Other Wastes (Management & Trans boundary Movement) Rules, 2016 | Hazardous waste (used oil from DG Sets) is likely to be generated during the erection and operation stage. Hence, authorization under the purview of the rule shall be requiring. |
| 3 | Labour Act. | Occupational safety and health administration. |
| 4 | Solid Waste Management Rules, 2016 (MSW Rules) | To operate the mobile Bio mining plant, it is necessary to follow the existing MSW rules. |
| 5 | World bank guidelines with reference to Project Implementation Manual and Environmental Social Management Framework | Processing waste and completing the Bio mining project requires strict adherence to the World Bank guidelines. |
| 6 | The Water (Prevention and Control of Pollution) Act, 1974 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 7 | The Air (Prevention and Control of Pollution) Act. 1981 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 8 | Contractor shall comply with the requirements for the safety of the workers as per the ILO Convention No. 62 | Safety aspects |
| 9 | NOC from fire department | Safety aspects |
| 10 | Tree felling permission:<br>If felling of trees as defined in Kerala Preservation of Trees Act, 1986 | If any tree needs to be cut or replanted concerned permission is required from Forest Dept. Government of Kerala. The ULB will take the necessary permission. |

KSWMP

Copyright © 2023. KSWMP | All rights reserved

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| 11 | NGT guidelines upto date | Relevant to the subproject to be considered for the successful implementation of the project. |
| Other applicable Rules & Regulations | | |
| 12 | Solid Waste Rules, 2016 (MSW Rules) | |
| 13 | Plastic waste Management Rules, 2016 | |
| 14 | Construction & Demolition, Waste Management Rules, 2016 | |
| 15 | Batteries (Management and Handling) Rules, 2001 | |
| 16 | E-Waste (Management) Rules, 2016 | |
| 17 | SBM guidelines 2.0 | |
| 18 | Kerala Municipality Act, 1994 & Rules | |
| 19 | Technical EIA Guidance Manual for Common Municipal Solid Waste -MoEF&CC | |
| 20 | Guidelines on the provision of the buffer zone around waste processing and disposal facilities, April 2017; amended in March 2019 -CPCB | |
| 21 | World bank guidelines with reference to Environmental Social Management Framework | |
| 22 | Contractor shall comply with the requirements for the safety of the workers as per the ILO Convention No. 62 | |

## 2.2 The World Bank Safeguards Policies

*Table 6 World Bank Safeguard Policies*

| S.No. | WB Policy | Safeguard policy applicable | Description |
|---|---|---|---|
| 1 | Environmental Assessment (OP/BP 4.01) | Yes | The project has potential impacts and pose risks to various environmental factors during the implementation phase. Consequently, this policy is implemented, necessitating a structured approach to safeguard management for risk mitigation in alignment with regulatory requirements, and Environmental and Social Management Framework (ESMF). |
| 2 | Natural Habitats (OP/BP 4.04) | Yes | Though the project will not support any activities that involve conversion or degradation of natural habitats; but in turn by improving SWM in ULBs; |

KSWMP

Copyright © 2023. KSWMP | All rights reserved

| S.No. | WB Policy | Safeguard policy applicable | Description |
|---|---|---|---|
| | | | ensure their long-term sustenance by preventing impacts due to waste, leachate, and landfill gas generation. |
| 3 | Pest Management (OP 4.09) | Yesz | Considering the possible pest related issues as the project deals with wastes and improvements to dump sites, OP 4.09 Pest Management is triggered. As per this policy the banned pesticides/insecticides listed by the Nation / State and the World Health Organization (WHO) should not be used in the project, and as much as possible Integrated Pest Management Options shall be followed |
| 4 | Physical Cultural Resources [PCR] (OP 4.11) | Yes | The proposed project will not support any activities that could potentially harm nearby cultural heritage, archaeological sites and physical resources valuable to the community |

## 3. BASELINE ENVIRONMENTAL SCENARIO

### 3.1 Project location of the site

The Iritty municipality has a dumpsite situated in Ward 12 at Athithattu, with GPS coordinates Lat-11°58'04.5"N, Long-75°40'53.9"E. The total quantity of legacy waste is 2023 Cum. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes.

*Table 7 Environmental Features around the Dumpsite*

| S.No | Sensitive Receptors | Distance |
|---|---|---|
| 1 | Residential buildings | 02 households are located within 200 m radius of the dumpsite |
| 2 | Educational institutions such as Global India Public School | 1.20 Km |
| 3 | Baveli river | 1.25 Km |
| 4 | Nearest Tourist place | |
| | Athithattu hill view | 800 m |
| | Kolly waterfall | 1.8 Km |
| | Poonthurutti kunnu (hiking area) | 2.1 Km |
| | | |

KSWMP

### 3.2 Methodology for Environmental Baseline studies

Baseline Study in ESIA process usually includes data collection and analysis on various aspects of the project area, such as: Physical Environment (e.g., topography, geology, soil, water, air quality, and climate). Biological Environment (e.g., flora and fauna, Land, habitat, biodiversity, and ecological processes). The overall methodology of ESIA

1) Scoping, Environmental Screening, Exclusion and Categorization
2) Environmental Baseline study like analysis of Air, Water, Soil and Noise/Vibration and impacts on biodiversity, workers and people around
3) Environmental Impact Assessment
4) Avoidance of adverse impacts, minimization, mitigation and management measures
5) Environmental Management Plan (EMP)
6) Environmental Monitoring Plan (EMoP)
7) Budget for implementation of EMP and EMoP

The below table indicates the environmental attributes and frequency of monitoring

*Table 8 Environmental Attributes*

| S. No | Attributes | Parameters | Latitude & Longitude | No. of sampling locations | Frequency of monitoring / Data collection |
|---|---|---|---|---|---|
| 1 | Meteorology | Temperature humidity and rainfall | - | Study area | Data collected from IMD |
| 2 | Ambient air quality | $PM_{10}$, $PM_{2.5}$, $SO_2$, $NO_2$, VOCs | A1 – 11°58'04.41" N, 75°40'54.066" E<br>A2 – 11°58'03.384" N, 75°40'53.94"E | 2 | 24 hourly samples |
| 3 | Noise levels | Noise levels in dB(A) Leq | N1 – 11°55'04.116" N, 75°40'54.509" E | 1 | Once |
| 4 | Surface water quality | Physical, chemical and biological parameters including pH, temperature, turbidity, | S1- 11°57'49.198" N, 75°41'11.609"E | 1 | Once |

### 3.3 Existing Facilities on site and its Environmental Audit

There is a functional MCF and organic composter units (Windrow Composting and Thumboormuzhi) for dry and wet waste present on a part of the Athithattu dumpsite, Iritty.

The MCF and composting units are not supported under KSWMP under this subproject. However, an environmental audit of the facility is important as this is an associated facility to which organic waste treatment mechanisms and some recyclables may be channelized to and is situated at the same site and might be impacted by the booming activities.

*Table 9 Environmental Audit of MCF and Organic waste treatment facilities*

And the sample collected from nerby pond.<br>B) Ground Water collected from 3 different locations (Residences within 200m radius)– all parameters are well within limits except for pH. | Site Drainage & leachate Impacts due to of bio-mining activity (esp during any seasonal rain) is important with respect to nearby soil & water environment |
| 7.3 | Drainage, Sewerage and Sanitation | Region has an unplanned network of drains eventually leading to Bavali River and there is no water connectivity from the site to river<br>Leachate samples collected at site, showed BOD value exceeding the limit and all other parameters were within limits | |
| 7.4 | Air Quality | Air Samples collected from 2 locations within the dumpsite and results found to be well within the permissible Limits. | |
| 7.5 | Noise Level | Noise Level monitoring samples collected within the dumpsite in order to identify the present noise level and results found well within permissible limit | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity. |

### 3.5 Description of Environmental Parameters

Under this baseline environmental attributes are arrived at after analysis of samples taken from the dumpsite and surroundings viz ground water, surface water, noise level and air. The map showing sampling locations and the analysis with observations are given below:

KSWMP

Copyright © 2023, KSWMP | All rights reserved

**Distance of the sampling locations**

*Table 11 Distance of Sampling locations*

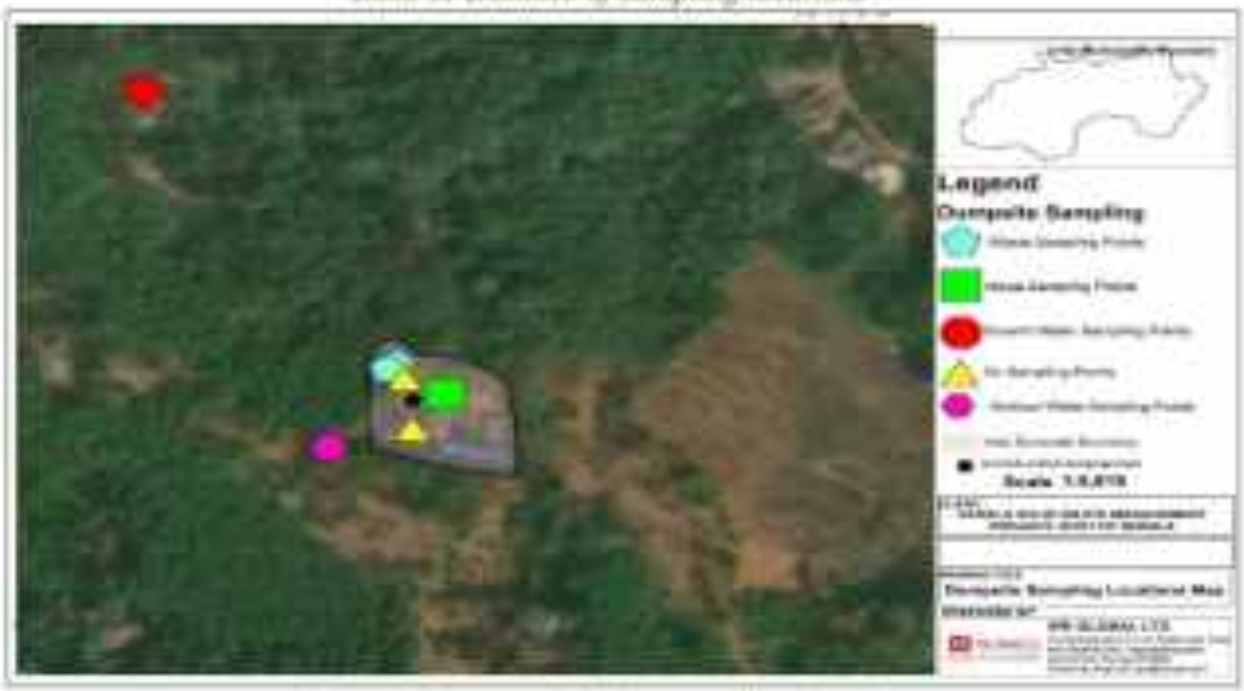

*Figure 3 Topo map showing sampling locations*

| S. No. | Description | Direction | From Centre of the Dumpsite | From Boundary of the Dumpsite (m) |
|---|---|---|---|---|
| 1 | Surface Water | Southwest | 714 m | 640 m |
| 2 | Ground water 1 | East | 75 m | 10 m |
| 3 | Ground water 2 | Northeast | 175 m | 118 m |
| 4 | Ground water 3 | Northwest | 2.87 Km | 2.82 Km |
| **Note:** Air and Noise Monitoring are monitored inside the Yard | | | | |

**3.6 Identification of sampling location:**

*Table 12 Identification of sampling location*

| S. No | Description | Place identified | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Inside dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind rose data, the air sampling sites were fixed at two locations inside the premises. |

KSWMP

Copyright © 2023 | All rights reserved

| | | | |
|---|---|---|---|
| 2 | Noise (1 Location) | Inside the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. The adjacent MCF and organic processing units. |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite [stream] | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope possesses a potential risk of leachate runoff, which could result in the contamination of surface water on that particular side of the site. So, the location of surface water is taken on the southeast direction. |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly. The infiltration of leachate which could result in the contamination of ground water.<br>Based on the possible infiltration and slope direction the ground water samples were collected within dumpsite. |

### 3.7 Sampling Methodology

*Table 13 Sampling methodology*

| S.No | Description | Method |
|---|---|---|
| 1 | Air sampling | Calibrated High Volume Sampler, Calibrated rotameter & calibrated Dry gas maters and sampling locations selected based on wind rose and impacts on surrounding land uses. |
| 2 | Noise | Calibrated sound level meter and sampling locations selected based on highest noise level on site and impacts on surroundings. |
| 3 | Ground water | Water collected in polyethylene and sampling locations selected based on leachate and run off flow and impacts on surroundings. |
| 4 | Surface water | Water collected in polyethylene bottles and sampling locations selected based on leachate and run off flow and impacts on surrounding surface water bodies and drains (line sources of pollution) used be communities |

### 3.8 Site Connectivity

The Athithattu dump site is located in Ward No. 12 of Iritty Municipality. The site is at a distance of 3 km from the Iritty – Peravoor Road.

### 3.9 Traffic Assessment

Traffic assessment refers to the process of evaluating and analyzing the flow of vehicles, pedestrians, and other modes of transportation on roadways, intersections, or specific areas. This assessment helps in understanding current traffic conditions, identifying potential issues, and developing appropriate strategies to improve traffic flow, safety, and efficiency.

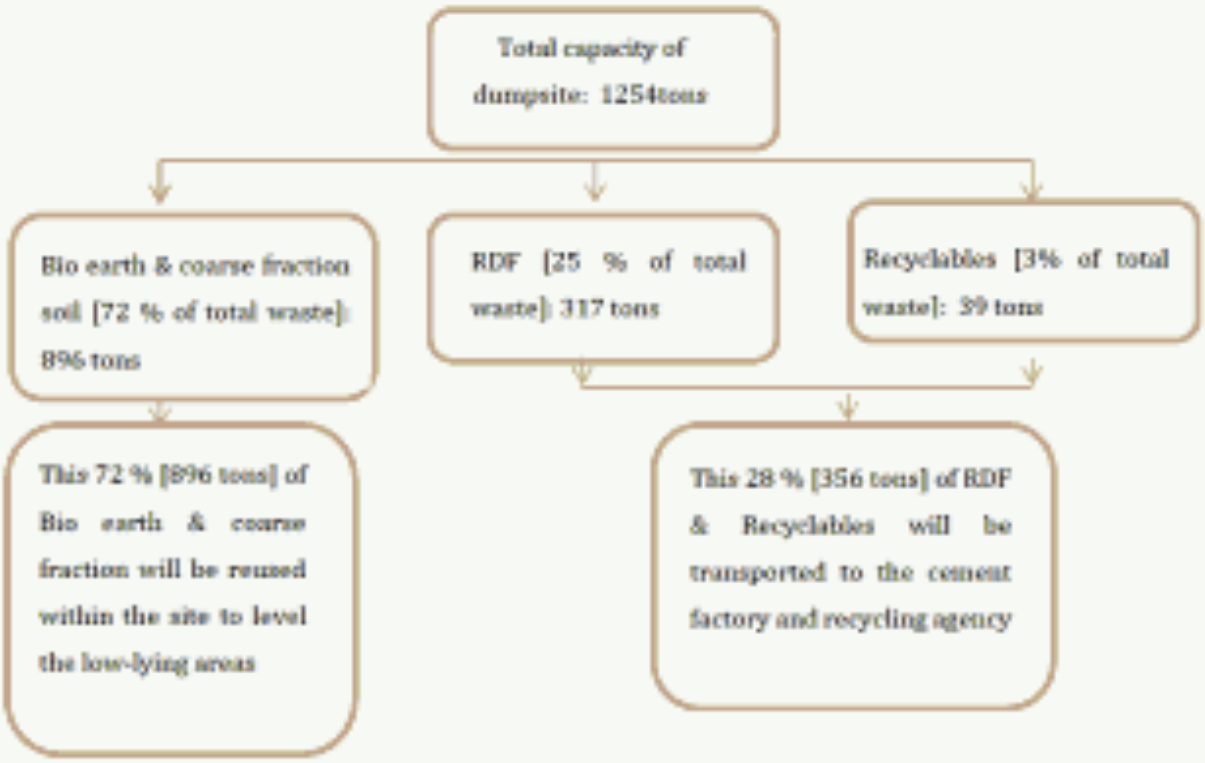

*Figure 4 Traffic Load*

## 4. ANALYSIS OF ALTERNATIVES

### 4.1 Alternative 1: No project (without project scenario)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.

If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows;

1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.

2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.

3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.

4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the local ecosystem, disrupting natural habitats and potentially causing long-term ecological imbalances.

5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

### 4.2 Alternative 2: Mode of execution / Management Alternative

Regarding the execution strategy, the outcomes of a Transect walk have substantiated the impracticality of waste transfer between Urban Local Bodies (ULBs). As a result, the imperative is for the waste remediation procedure to take place on the premises, allowing only the byproducts to be considered for potential transfer.

The logistical aspects of arranging machinery and designating storage space for these byproducts will hinge upon the extent of land available. At the outset, the existing underutilized, MCF and organic waste treatment facilities will be employed to cater to the initial storage requirements.

Copyright © 2023. KSWMP| All rights reserved

### 4.3 Technology Alternative

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as

1. Capping without land recovery,

2. Bio-mining – reclamation/recovery of 100% land

3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/byproducts are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

## 5. ASSESSMENT OF ENVIRONMNETAL AND SOCIAL RISK IMPACTS

Bio-mining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, bio-mining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition, cumulative impacts of simultaneous bio-mining of multiple such legacy waste sites on the environment is important. Especially with respect to

- Drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,
- Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,
- Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and
- Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

### 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Iritty dumpsite.

#### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Bio-mining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;

Copyright © 2023. KSWMP| All rights reserved

- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table 1 - Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity However, magnitude of cumulative impacts of various dumpsite remediations might be High.

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite bio-mining activities will be on larger extent) | A specific location within program component or site boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards** | Against | Complies with limits | Meets minimum | Not applicable |

KSWMP

Copyright © 2023 [redacted] | All rights reserved

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| and established professional criteria | national/approved standards and or international guidelines/obligations | given in national standards but not confirming to international lender guidelines in one or more parameters | national standard limits or international guidelines | |
| Likelihood of potential impacts occurring | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

**NOTE:** Anticipated Project Duration – 5 to 6 months

### 5.1.2 Sensitivity of Receptor

The dumpsite is surrounded by residential buildings and some commercial establishment, during the time of site assessment the experts observed, some sensitive receptors within 500m from the site. Namely some schools, religious places and households. The project's lies near residences, within a 200-meter radius, and its potential air, odour, fire, noise, vibration, ground water impact on over 2 families over a duration of 5 to 6 months. The sensitivity of these receptors is High.

### 5.1.3 Significance of the impact

- Significance if the impact is high as it would even result in community resistance to bio-mining and bioremediation.

Since the project operational time 5 to 6 months, then the magnitude of the negative impact can be considered as small and medium sensitivity. In other hand magnitude of the positive

KSWMP

Copyright © 2023. KSWMP | All rights reserved

impact, after the bio-mining of the existing land can be used for the recreational park for the public use.

### 5.2 Cumulative Impacts in the Region / Cluster

The impacts that may arise due to clustering of different dumpsites. The following impacts could result from the clustering while implementation, requiring thorough assessment.

1. If a sensitive environmental component (River, mangrove, wetland, etc.) is served by the leachate/drainage from one or more nearby dumpsites, the impacts can be regional.
2. Presence of other projects outside KSWMP; existing or forthcoming landfills, transfer stations or those considered under Track one investments may together create a cumulative impact with this activity.
4. Impact of vehicular movement from various subprojects on bio-mining of dumpsites may have cumulative impacts on air, odour, traffic issues, and pollution in case of spills/accidents/emergencies due to this clustering approach.
5. Storage of materials if any at common sites, impacts during rains, floods/emergencies in multiple sites of same water/airshed

However, such impacts will be known only based on final work plan, location and schedule for disposal of Legacy Waste once Contractor is on board. The need to update EIA/EMP based on this will be included in the Bid & Contract Documents.

### Source-Pathway-Receptor Analysis

**A) Source**: The source of contamination is the legacy waste remaining and being deposited at the Athithattu closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is 20 years old, as dumping had started in year 2000 and closed in 2020. Initially the dumpsite was acting as a trenching ground, depositing sewage from pit latrines. The total waste volume is 2,023 cum with the dumpsite spread over 0.11acre and rises to a height of approximately 4.5 m from the base. Waste is seen 4 m above ground level and 0.5 m below ground level. In addition to the landfill gas and leachate, material spill over the land in the compound and windblown dust and litter are also considered as sources of contamination.

**B) Pathways**: The following pathways for migration of contaminants have been identified: ***Wind***- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for

Copyright © 2023. KSWMP| All rights reserved

transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards low laying area acts as a pathway for the uncovered waste to flow into the unlined drainage canal along the boundary to low laying side, which runs through the residential areas.

***Lateritic Soil:*** The lateritic soil acts as a pathway for transport of leachate to the groundwater and for uptake of contaminated surface run-off.

***Leachate:*** The leachate flows with groundwater and acts as the pathway. Surface water Contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals, rivers and streams are further transported by surface waters and in this case the surface water acts as the pathway.

**Receptors:**

Receptors are air, surface water and ground water. For drinking purpose, they mainly use municipal water supply. (Nearby Households, industries and shops within 200 m), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the residences and people involved in industrial activity and shops. As the dump is not contaminated, remediation would improve the pollution scenario provided the bio-earth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF in the region. Depending on the locations of end use of fractions retrieved from bio-mining, the contractor shall assess the impacts on communities and workers on site & nearby and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after bio-mining activity, activities in bio mined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post bio-mining activity.

### 5.2.1 Impacts on Air Environment

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCFand Organic Waste Treatment units in this case), nearby communities of Ward 12.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.

Copyright © 2023. KSWMP| All rights reserved

- When the legacy site is opened, existing gases would get emitted. Further, any delay / unexpected stoppage of bio-mining activity, might further the process of gas formation depending on waste composition, odour and fire risks. In the case of Athithattu, since the analysis of wastes shows calorific value of 2000 for combustibles with around 21.3% plastics (include MLP/SUP also) and3.55% cloth rags, it's well combustible; and the risk of fire is high during summers and incidents

### 5.2.2 Impacts on Water Environment

**Groundwater**

- Post and pre-monsoon water levels are 6.49 and 5.57mbgl. Borehole data indicates waste upto depth of 4.5 m with hard lateritic strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. With the slope of the ground of the dumpsite, this tends to get accumulated at low-lying gradients. High BOD levels of the drain and ground water wells around are indicative leachate and runoff pollution. Oozing & Pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during bio-mining to prevent ground water contamination.
- Leachate samples: BOD, COD, TDS, E.coli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution.
- Borehole data: Dump below water table; impacts on water resources, wells nearby
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There is no parameters exceeding the permissible limits for heavy metals.

**Surface water**

- The dumpsite experienced flooding during 2018 floods. The site is at a higher elevation, and hence no submergence was experienced at the site during the floods. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas.
- There are no surface waterbodies near the site, except at 1.2 km distance from dumpsite.
- At East and West direction, (end direction) there are residential households and mixed vegetation are seen. The leachate from the site may flows through natural slope which ends in residential areas. It is important to contain and treat leachate from the proposed bio-mining activities on site. Treated leachate may be recirculated or used for other purposes.

Copyright © 2023. KSWMP| All rights reserved

### 5.2.3 Impacts on Land/Soil

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as bio-mining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.
- Spillover of activities to nearby road, and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste bio-mining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.
- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Athithattu, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Athithattu does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while bio-mining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste),Feb 2019 and World Bank EHS Guidelines. A plan shall be auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.
- Wherever fuel, combustibles and retrieved waste is stored, it shall be on impervious surface, at appropriate elevation, protection against rains, flooding (such as cut off drains, berms etc.), wind and fly / pest menace (screens, green cover etc), intruders (compound wall existing at Athithattu), watch and ward, lighting, remote monitoring measures etc). Risk of fire, dust and leachate contamination shall be well assessed by the contractor. Emergency Action Plan shall be prepared and mitigation measures shall be updated based on work plan/DPR, and implemented. Communities shall be made aware of works and advice to follow measures such as use of fly/dust covers/nets on wells etc.
- Of the waste samples analysed, 49% comprises of Bio earth; 32.5 % being <4.75mm size; C/N ratio (14.2:1) indicating slight unpleasant odour (high Nitrogen; releasing ammonia) less than that suitable for good compost.

Copyright © 2023. KSWMP| All rights reserved

### 5.2.4 Impacts due to Noise and Vibrations

Various machines vehicles and activities contribute to noise and vibration on and off site. This includes vehicles carrying recyclables, operation of JCB, and other machines, diesel generator sets, motors on site, etc. In addition, activities on the site and in relation to the existing MCFs such as vehicles transporting the dry waste from households to MCF, loading / unloading of collected waste materials, and workers activities on site would add to noise and vibration. Impacts include disturbance to fauna flora on site, health impacts on communities around due to exposure to large volume of sound.

### 5.2.5 Other impacts on Biodiversity - Fauna/Flora

- There are no sensitive biodiversity areas within 10 km of the site. However, since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Depending on the contractors plan for disposal of retrieved waste fractions, EIA shall be updated for biodiversity impacts.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke effects
- Disturbance to other fauna and flora on site: SWM activities onsite including those related to MCF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available Biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species listed by IUCN.

### 5.2.6 Other impacts on Workers and Communities

- Contaminants in soil and water: Direct or indirect contact with polluted soil or water by neighboring water users. Additionally, because of their locations, recovered lands are subsequently used as parks, or for SWM facilities or office spaces etc. This may pose risk of bioaccumulation of metals which can constitute a health risk. Also impacts on buildings due to gaseous emissions, risk of fire etc if used after clearing.
- Health Risks: One of the primary health risks of dumps is the spreading of diseases - diarrhea, hepatitis etc. The ways such infection can be spread are numerous but are often related to direct contact with the waste (e.g., clinical waste, fecal matter) by scavengers and other unauthorized persons being on the site. The other main pathway is by vectors such as, foraging animals, rats, birds, flies and mosquitoes etc.

Copyright © 2023. KSWMP| All rights reserved

- Flies, mosquitoes, rodents, crows, pigeons, pest menace on site, for workers & communities & their assets (such as wells) due to exposure of putrefied wastes

- Impacts if separate common site/s or a site among these dumpsites is chosen to store wastes from other dumps till it is disposed, or as transfer stations or for common processing of certain fractions: Such activities would result in Air, odor, dust, noise, water, vibration, flora, fauna, communities around the new site. There is also risk of contamination due to newly placed wastes, and pollution impacts and disturbances to communities due to works/activities on this site. Such sites and activities shall be avoided, and if quintessential for the project, be carefully chosen and approved only after thorough discussions with KSPCB, and all stakeholders. An assessment of their sensitivity and appropriateness shall be undertaken considering the environmental risks. They shall be audited and assessed for existing and future environmental impacts of such activities and mitigation shall be implemented. However, details on such sites shall be known only based on the final schema of implementation proposed by the contractor. Hence, the Contractor shall update EIA based on this before starting any activity on site.
- OHS impacts: Infectious wastes, fecal matter, clinical wastes and sharps; batteries, e-waste and possible bursting; Hazardous wastes like asbestos and other chemicals dumped; pesticides / insecticides, inoculum storage, handling and use on wastes/land leading to diarrhea, hepatitis, insect & reptile bites, interactions with foraging animals like rats, dogs, cattle, vector (mosquitoes, flies etc) transmitted diseases etc.
- This activity would result in large influx of workers from the region. Worker facilities in the labour Camp if any, & site are important, as the density of population is high in Kerala. It is important that camp sites are not set up in the land to be remediated. Periodic health checkups (once a week) are very important as the work involves handling of waste. It is important to also provide periodic health checkup and co-ordination with local Primary Health Center/Central Health Services for medical camps for residents, schools and others during the bio-mining period.
- Risk of Fire during bio-mining and due to retrieved material storage; possible Burning of retrieved materials; storage and use of firewood for various purposes, fuel for vehicles. The smoke from burning solid waste can result in respiratory complaints, dizziness, and headaches in the short-term, as well as potentially more serious diseases such as cancers and heart disease in the long term.
- Impacts of other site development works shall be well assessed, EIA/EMP updated, and mitigation measures included in Project costs and implemented by the contractor/ULB (whoever is responsible as per FR/Final Bid document)

Copyright © 2023. KSWMP| All rights reserved

### 5.2.7 Visual impacts, Noise, Odour, Vibrations

- Odour & impacts on workers and communities during bio-mining, storage and Transport are key determinants of community agreement to the activity. Such odour would attract flies and vectors in large numbers, who may also contaminate the food, and water sources of nearby communities. It is important to minimize odor emission as guided by the CPCB Guidelines on Legacy Waste Bio-mining, 2019. also provide periodic health checkup and co-ordination with local PHC/CHS for medical camps for residents, schools and others during the bio-mining period.
- Visual impacts of the waste being dug up, screened ad heaped/stored is not appealing. It is important to mask this appropriately.

### 5.2.8 Traffic Impacts

- Impacts due to new access road construction/upgradation. Access road to the site is unpaved and slushy during rains. It is important to minimize temporary pollution due to increased movement men, and materials from and to the site during bio-mining activity and beyond as it is proposed to store material on site including air and noise pollution, access restrictions to properties nearby, and vehicular conflicts
- Large vehicles moving in and out of the site carrying materials, tools, equipment & pedestrian/worker -vehicular conflicts; increased traffic on roads, large equipments & vehicles, noise, air pollution: vehicle emissions, DG sets
- Vehicles, equipment's not adhering to pollution standards

### 5.2.9 Other Impacts on existing or proposed activities on site/s

- There may be approvals from various agencies for bio-mining activities and associated facilities; depending on utilities and uses on site. & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of bio-mining on existing facilities on site such as MCF and composting yard etc (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post bio-mining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped & impacts if this is dumped elsewhere or not processed. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health &Safety impacts on workers, communities. Also forward linkages are considered as associated facilities/linked activities. Impacts of Transportation of

KSWMP

Copyright © 2023. KSWMP| All rights reserved

these fractions (traffic increase, odor, leachate, dust) impacts during rains & emergencies, and its handling, storage at the identified locations, reuse etc. shall be mitigated.

Copyright © 2023. KSWMP| All rights reserved

## 6. ENVIRONMENTAL AND SOCIAL MANAGEMENT & MONITORING PROGRAM

### 6.1 Scope of Environmental Management & Monitoring Plan

An Environmental Management Plan (EMP) is a comprehensive strategy designed to manage and mitigate the impacts of activities on humans and the environment, particularly concerning air, water, soil, land, and noise and vibration, and impacts on biodiversity and people.

### 6.2 Environmental Management Plan

The detailed anticipated impacts and corresponding mitigation measures/management of the impacts are given below

*Table 16 Impacts & mitigation measures on Planning and installation phase*

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| A | | **Planning and Pre-Construction Stage** | | |
| 1 | | ***Planning for bio-mining facility*** | | |
| 1 | Bio-mining& Bioremediation Plan & Capacities | • Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / biomined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these biomined material in line wit the agreements with such facility owners and National, State regulations and WB EHS<br>• Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate management Plan.<br>• The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>• Contractor to get all required licenses & permits before start of any activity on site | Contractor | DPMU/ULB |
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>• The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>• To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground. | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ ULB |

Copyright © 2023. KSUSSP All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Grading shall be performed where necessary to provide a neat appearance | | |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *Impact on air quality, odor, water contamination due to leachate, health and safety impacts of the people working in the site assesment* | • Carry out site assessments as per Guidelines for Bio-mining of Legacy waste Dumpsites of CPCB<br>• Consider safe bio-mining& gas / leachate generation from existing capped portion of the site<br>• Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>• Provision of appropriate PPE's to the team undertaking the site assessments<br>• Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>• Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>• Plan for machinery operated which will be operated by skilled operators at all times.<br>• Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>• Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | TSC, ULB, Contractor | DPMU/ULB |
| 4 | Absence / Delay in Permissions for Developing the bio-mining facility and associated works as per National regulations | • Required permissions for undertaking bio-mining at the existing dumpsite and assessments conducted for undertaking bio mining as per existing Laws, Regulations, including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labour Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes *(Air Pollution) and Visual Blight due to excavation* | • Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>• Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>• PPEs to be used by workers<br>• Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU/ ULB |

Copyright © 2024 [illegible] | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 6 | Material sourcing, transport, and stacking of construction materials *(Occupational Health and Safety issues and Air noise pollution)* | • Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>• Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of Labourers on site and Labour camp if any<br>• Materials shall be sourced only from approved quarries<br>• Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>• The driver should be with required license and follow speed regulations<br>• Materials shall be transported preferably through well-surfaced roads. If road it kachcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>• Material transport and unloading activities should not result in noise disturbance to locals and should be during day time<br>• Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>• Provide vehicle wheel wash area on site<br>• Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves.<br>• Proper rest area on site shall be provided with water, first aid, toilets | Contractor | SPMU/DPMU/ ULB |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | • Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>• Nearby health center shall be informed about the Labour camps appropriate medical checkup shall be arranged periodically<br>• Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>• It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with land owners wherever the labour is accommodated<br>• Camp must not be provided in an area prone to Hazards<br>• Camp should be adequately at higher plinth levels to prevent water intrusion<br>• Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG) | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |

Copyright © 2024 [illegible] | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>• The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>• (Refer ESCOP section D6 and section 11 of EMF for KSWMP) | | |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. especially in case of providing support facilities *(Impacts on Fauna / Flora)* | • Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in bio-mining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>• Identify appropriate government site to avoid land acquisition and resettlement impacts<br>• Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences other landuses | Contractor | SPMU/DPMU/ ULB |
| 9 | Contamination of groundwater due to leaching. Leachate parameters: BOD, COD, TDS, EcoIL Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | • During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>• Depending on the contractors plan for bio-mining of the capped area on site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ ULB |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke – burning, trampling/machinery | • Movement routes of vehicles to be planned to avoid key fauna/flora on site such as *Alstonia* sp.(Tree) &*Funambulus tristriatus* ( Jungle Palm Squirrel)<br>• Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU/ ULB |
| 11 | Nuisance hazards to neighboring areas | • Ensure proper design and adequate compound wall; high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements | Contractor | SPMU/DPMU/ ULB |

Copyright © 2024 [illegible] | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • In case of waste mound and site edges are sliding or unsafe; provide engineered retention walls | | |
| 12 | Treatment & Disposal of wastes and rejects | • Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & inert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Bioearth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>• Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| **B** | **Implementation or Bio-mining& Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| | **Implementation of bio-mining of the dumpsite** | | | |
| 1 | Impact due to the vehicular movement *(Air and noise environment&Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | • Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>• All vehicles and machinery should obtain Pollution Under Control Certificates<br>• HORN PROHIBITION signpost to be erected.<br>• Rumble strips/speed breaker to be provided on access roads.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>• Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>• Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>• Avoid heavy vehicle movement through Iritty roads during peak hours 7 a.m to 10 a.m mention: school hrs / peak hrs: and during important period / festivals when people use the road to access temple<br>• Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | Contractor, ULB | SPMU/DPMU/ ULB |

Copyright © 2024 [illegible] | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 2 | Impact due to the use of heavy vehicle and equipment *(Air and Noise environment)* | • Mixing equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>• Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>• Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>• Labour to be provided masks / PPEs.<br>• Construction / Bio-mining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighbering sensitive land uses<br>• Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>  ▪ Strictly adhering to designated working hours (day time); Sensitising construction truck drivers and equipment operators to switch off idle engines.<br>  ▪ Using modern, well-maintained and regularly serviced vehicles.<br>  ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>  ▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>• Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>• AsAthithattu dumpsite has sensitive receptors and settlement areas within 150m of it, noisy works shall be stopped from 22:00 to 06:00.<br>• Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>• Avoid noisy activities/machines near nearby household area of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>• Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | Contractor | SPMU/DPMU/ ULB |
| 3 | Impact during the construction activities *(water environment)* | • Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>• Vehicle washing or maintenance near water bodies are to be avoided.<br>• Contaminated water from construction / bio-miningactivities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | DPMU/ULB |

Copyright © 2024 KSUM | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 4 | Leachate and Runoff from bio-mining activities *(Soil contamination and groundwater contamination)* | ▪ Provide site cut off drain around the site to divert off stormwater from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>▪ Depending on the contractors plan for bio-mining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>▪ Ensure stormwater drains will lead to drain outlets (along the south east boundary of the site) on roads adjoining the dump yard<br>▪ Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area.<br>▪ Provide proper treatment of leachate and stormwater that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by bio-mining activities like excavation and waste segregation and stabilization<br>▪ The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>▪ The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>▪ Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>▪ Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>▪ Plan the works on site only during non-rainy seasons and to complete the works before rains<br>▪ Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | Contractor | SPMU/DPMU/ ULB |
| 5 | Soil decontamination from accumulated waste levels *(Impact on leachate, odor)* | ▪ Decontaminate the soil / stabilized layers remaining after storing out wastes using windrow and bio-culture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>▪ Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels | Contractor | DPMU/ULB |

Copyright © 2024 KSUWM | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>• Soil and water testing shall be done and changes in contamination shall be noted. | | |
| 6 | Excavation of waste from the waste mound *(Health and safety impacts)* | • The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>• Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>• Machinery operated for excavation should be operated by skilled operators at all times.<br>• Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>• Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>• In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>• When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection &treatment mechanism. | Contractor | SPMU/DPMU/ ULB |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles *(Air, Odour nuisances: spills and littering impacts on Air, Water, Land)* | • All vehicles shall carry only approved load of weight<br>• Regular cleaning of roads & drains and removal of spills if any.<br>• All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>• Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>• Adopt required measures as per CPCB guidelines, and site specific safety requirements. | Contractor | SPMU/DPMU/ ULB |
| 8 | Spreading and compaction of waste *(Safety)* | • Follow technical details in line with CPCB Guidelines<br>• The active working face should be minimized as much as practical an appropriate size is about 2 to 3 times the width of the compactor vehicle.<br>• Waste should be spread and compacted in layers not greater than 0.6m (2ft.) after compaction.<br>• Compaction of the waste should be on a slope of about 20-30% as guided via the permissible levels and worked from the bottom of the slope to the top | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 9 | Occupational health and safety impacts of the workers during the bio-mining & construction of support facilities:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, bicultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | • Avoid direct & double handling of wastes through avoidance measures (suitable planning & equipments), engineering controls & use PPEs<br>• Work area & Labour camps shall be provided with First Aid and other related activities.<br>• Emergency Preparedness plans shall be prepared and implemented for all manpower working centers and its field extension centers.<br>• An Environment Health & Safety policy shall be prepared and implemented<br>• Adequate manpower shall be provided &manager & staff shall listen and act upon the manpower related grievances.<br>• Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles<br>• Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed without slip, trip, fall especially on waste, leachate or trenches<br>• Proper training will be provided regarding the maintenance of health<br>• Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks& water supply), food, and water in a hygienic environment (with proper handwash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>• First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>• Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>• Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>• Measures such as deferred timings and stretch break to be adopted<br>• Secure all installations from unauthorized intrusion and accident risks.<br>• Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every days start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipments, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>• EHS specialist with adequate experience & third party supervision are important for bio- | Contractor, ULB | SPMU/DPMU/ ULB |

|---|---|---|---|---|
| | | mining activity<br>• Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>• Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>• Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas;<br>• Ensure moving equipment is outfitted with audible back -up alarms& flag men with whistles or speakers;<br>• Electrical wires should be properly insulated and earthed, no exposed wires and no overloading than it will reduce the accidents due to electrical short circuit.<br>• Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenanceto be marked well & safe kept before activity start near thoselin close proximity to this location, there is a transformer.Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>• All workers shall be registered as per prevalent Labour laws (including a workforce of subcontractors) and provided insurance cover& others as per existing acts/laws<br>• Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractors person/Insurance agent<br>• While using heavy machinery like JCB, cranes, etc. inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>• While using heavy machinery like JCB, cranes, etc. inform communities to prevent children and others from going near operating / movement areas including roads.<br>• Flagmen shall be arranged if work is near schools, hospitals, major roads, and trafficcontrol is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if | | |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Given that the access road is used by the public, it is imperative to implement the required safety precautions and environmental protection measures when transporting the waste. | | |
| 15 | Other activities | • No activity other than bio-mining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>• If existing MCF shall be used for storing bio-mining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after bio-mining works shall be after proper cleaning / washing & disposal of all rejects/inerts & tools to ensure good housekeeping & no H&S impacts<br>• If existing MCF shall be used by the ULB for storing dry wastes from Town, during bio-mining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 16 | Energy Efficiency & Water Use efficiency | • All activities to consider energy efficient & clean fuels; and use of energy efficient equipment &bio-mining / construction techniques<br>• Landscaping & green belts to use local / indigenous plants & trees<br>• Waste water and Leachate to be treated & recycled/reused | Contractor | ULB |
| C | **Future Site Usage (EMP shall be updated in line with EMF & used if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Bio-mining, but of the future facility operator & ULB** | | | |
| 1 | Future use of the biomined site: Green Park, MCF, MRF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | • ULB to ensure that the site will not be used for future dumping.<br>• Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around.<br>• ULB shall plan the future use of the site shall be in consultation with the communities.<br>• Phase 1 Environmental Assessment to be carried out, EA for existing facilities & EIA for proposed development in line with EMF in case this is proposed to be developed under KSWMP<br>• All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF/MRF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment, a nuisance to* | • The movement route shall be scheduled for each vehicle.<br>• Enforce speed limits applicable and make drivers aware of this<br>• Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule; preferably using GPS<br>• Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles<br>• Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards<br>• Proper lubrication shall be provided to minimize squeaking noise due to friction | Future Facility operator | ULB |

Copyright © 2024 [illegible] | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | Biodiversity, communities, Health impacts) | • Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br>• The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public<br>• Traffic will be managed at the site by providing adequate space for parking of vehicles<br>• Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design<br>• No waste or material shall be disposed in any place other than the designated area; including water bodies, coasts/forests, or sensitive areas. | | |
| 3 | Exhaust emissions (Air Impacts) | • No idling of vehicles on site.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed | Future Facility operator | ULB |
| 4 | Plying of vehicles through kutcha / unsurfaced roads and idling (Air pollution: SPM, CO, CO2) | • Vehicle movement shall be well planned – through topped roads. In case of necessity to move through Kutcha roads, ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Future Facility operator | ULB |
| 5 | Odor (Nuisance, Air) | • Daily soil covers to compacted wastes to manage odors.<br>• Waste with a strong odor to be covered immediately they are emptied from delivery vehicles;<br>• Control and manage leachate treatment plant to minimize odor.<br>• Adhere to air quality regulations with quarterly air quality monitoring Maintenance of the buffer zone and protective berms<br>• Provide buffers screens to curtail odor from reaching surrounding communities | Future Facility operator | ULB |
| 6 | Impact on the ambient noise quality during the operations (Noise, nuisance to sensitive receptors, Health impacts) | • Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines;<br>• Using modern, well maintained and regularly serviced vehicles;<br>• Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>• Provision of earmuffs and ear protection to workers and employees in high noise areas | Future Facility operator | ULB |

Copyright © 2024 [illegible] | All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 7 | Occupational health and safety impacts of the workers:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | • All OHS and CHS measures to be followed in line with applicable regulations, guidance<br>• Workers & communities shall be made aware of OHS, CHS risks and impacts & mitigation measures adopted<br>• Emergency management plan to be prepared & followed<br>• Workers shall be appropriately trained on OHS during construction & Operation of all future facilities | Future Facility operator | ULB |
| 8 | Pest / Vermin Control (Odour, flies, rodent / other pest menaces) | • Regular cleaning and approved pest control measures to be adopted<br>• Biopesticides / biological control shall be followed.<br>• Banned pesticides/insecticides shall not be used.<br>• Workers shall be made aware of storage and use of pestcontrol measures and PPEs to be used | Future Facility operator | ULB |
| 9 | Fire Safety | • The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations, guidelines and international good practices | Future Facility Operator | ULB |
| 10 | Energy Efficiency & Water Use efficiency | • All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & construction techniques<br>• Landscaping & green belts to use local / indigenous plants & trees<br>• Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

Copyright © 2024 [illegible] | All rights reserved

**Disposal phase of By-products from Bio-mining process**

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within a three-month period, penalties will be imposed on the contractor

## 6.3 Emergency & Disaster Management Plan

### Hazards Associated with Dumpsite Activities

The Disaster Management Act, 2005 mandates every Government Department to prepare, review and update Disaster Management Plan

### 6.3.1 Identified Emergency Situations

*Table 17 Hazards associated with Dumpsite Activity*

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| As per World Bank EHS Guidelines | |
| Waste Storage | **Regular visual inspection of all waste storage collection and storage areas for evidence of accidental releases** |
| Waste Segregation | **Regular audits of waste segregation and collection practices** |
| Monitoring records for hazardous waste collected, stored, or shipped should include | **1. Material Identification:**<br>- Name and identification number of the hazardous material(s) present in the waste.<br>**2. Physical State:**<br>- Indicates whether the waste is in a solid, liquid, gaseous form, or a combination of these.<br>**3. Quantity:**<br>- Specifies the amount of hazardous waste, typically measured in kilograms or liters, or by the number of containers.<br>**4. Waste Shipment Tracking:**<br>- Documentation tracking details include:<br>- Quantity and type of hazardous waste.<br>- Dates of dispatch, transportation, and receipt.<br>- Records of the originator, receiver, and transporter involved in the waste shipment. |

KSWMP

Copyright © 2023. KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| | **5. Handling and Treatment:**<br>- Describes the method and date of various actions taken with the hazardous waste, such as storing, repacking, treating, or disposing of it at the facility.<br>- Cross-referenced with specific manifest document numbers relevant to the hazardous waste.<br>**6. Location within Facility:**<br>- Specifies the specific locations within the facility where the hazardous waste is stored or processed.<br>-Includes information about the quantity of waste at each location. |
| Falls and Slips at the dumpsite, Slippery surfaces or uneven surfaces and poor access to work areas climbing on and off plant. | Tidy workplace by maintaining good housekeeping. Handholds wherever necessary and clear/ safe access to work areas with proper PPE to the persons working at the site. |
| Fire Hazard, Fire risk may occur due to the following, Storage of flammable liquids / Gas like LPG, Diesel, Any combustible materials, Sparks, Open flames, Absence of Fire hydrant network may lead to major fire accident | Combustible/flammable materials should be properly managed and stored/used. Fire extinguishers and Fire hydrant Network with reserve water (As per NFPA Code) should be made available. Emergency Plan in case of fire. |
| Absence of Personal Protective Equipment Lack of adequate footwear, Helmets, hearing/ eye protection, gloves & goggles may lead to injuries and death. | Proper footwear, Helmets, hearing/ eye protection, gloves & goggles should be given to the workers at the dumpsite. Proper training should be given to the workers on the use of PPE. |
| Electrical Hazard, Electric wires if any damaged, Poorly insulated, During temporary repairs, Circuits overloaded may lead to major accident | Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit. |

KSWMP

Copyright © 2023 KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| Ladders, Risk may occur due to the following Not secured against dislodgement, Defective ladders, Not sufficient length, Incorrectly placed | Ladder risk can be mitigated by the following<br>Secured against movement or footed<br>Ladders in good condition<br>Regular inspection<br>Ladder should be extended one (1 m) meter above platform to avoid injuries |
| Excavations<br>Risk may occur due to the following, Trench collapse, Gas emission | Risk can be mitigated by the following<br>Soil stability should be known before excavation<br>No water accumulation<br>V500 mask should be used at the in order to counter the gas emission.<br>Emergency Plan |
| Defective or wrong Hand Tools<br>Wrong/defective tool may end up with injuries to the workers using the tool | Right tool for the job should be used properly and it should be in good condition |
| Accidents due to vehicular movement<br><br>Vehicle movement inside the site | Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents |
| Noise Hazard<br>Noise levels over 85 decibels would cause trouble to the people working at the site | Noise Levels should be maintained below 85 decibels and with proper protection |
| Falling Material<br>Fall during carrying/Lifting of waste and materials from overhead work areas. | Risk can be mitigated by the following<br>Use of hard hats.<br>Person operating the Jcb/machine must be provided with walkie talkie/hand signals to know about the clearance |
| Visitors Presence at site<br>Insufficient fencing may lead to attract pedestrians to enter the site. | Fencing and barricades with proper signage boards indicating pedestrians not allowed |

KSWMP

### 6.3.2 Proposed Organizational Structure for Disaster Management

The Organizational structure for the Disaster management contains the following team members.

**Emergency Response Team:**

A response team needs to be set in assistance with a senior executive (Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

Incident controller would be reporting to the Site Controller. Incident Controller organizes a team responsible for controlling the incidents with the personnel under his control.

Shift In-charge would be the reporting officer, who would bring the incidence to the notice of the Incidence Controller and Site Controller.

Emergency Coordinators would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.

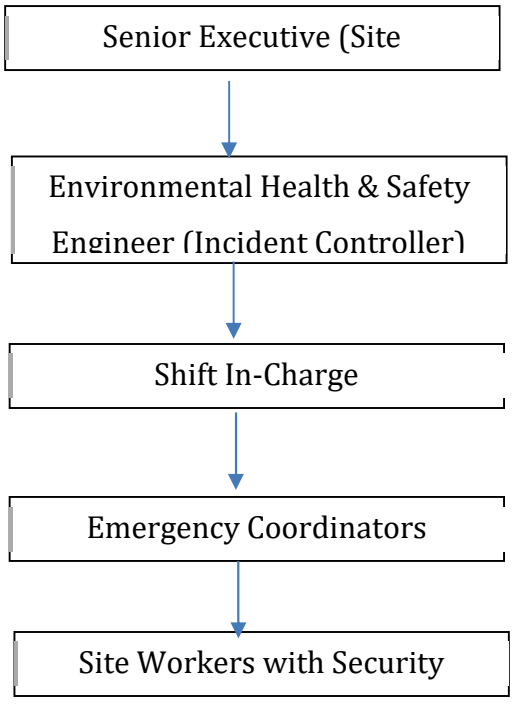

*Figure 6 Organizational Structure for the Disaster Management Team*

Copyright © 2023. KSWMP| All rights reserved

### 6.3.3 Emergency Response Facilities

Emergency Control Center – with access for emergency shutdown procedures, duties and contact details of key personnel and government agencies, emergency equipment, etc.

- Assembly Point – with minimum facilities for safety and rescue
- Emergency Power Supply – connected with diesel generator, flame proof emergency lamps, etc.
- Fire Fighting Facilities – first aid fire-fighting equipment, fire alarms, etc.
- Location of Wind Stock – located at appropriate location to indicate the direction of wind for emergency escape
- Emergency Medical Facilities – Stretchers, gas masks, general first aid, emergency control room, breathing apparatus, other emergency medical equipment, ambulance the medical Center should display poster for treating burns and first aid. Some medicines and facilities to be kept in the medical Center are suggested.

**Health and Safety Measure for the workers**

All workmen employed in working conditions will be provided with adequate personal safety equipment as applicable to the work lies:

- Safety shoes
- Safety Helmets
- Hand gloves
- Ear muffs

**Monitoring Plan**

The considerations in an emergency planning include the following:

- Identification and assessment of hazards and risks
- Hazard consequences analysis
- Alarm and communication procedures
- Identification and equipping emergency control centre identify assembly, rescue points, medical facilities
- Emergency preparedness plan, procedure, steps to be taken before during and after emergency
- Formulation of plan and emergency sources
- Training rehearsal, evaluation and updating the plan
- Machinery should be examined regularly
- Medical examination for every employee shall be examined by doctors at least 3 months in a calendar. Health register should be maintained by the individual industry coming in the project site

Copyright © 2023. KSWMP| All rights reserved

**Emergency Action Plan for Fire**

In case of Fire the immediate plan of action will be "RACE" that stands:

R - Rescue: When you discover a fire, rescue people in immediate danger if you can do so without endangering yourself.

A - Alarm: Sound the alarm by pulling a fire pull station and call fire station, from a safe distance, notify security of precise location of fire

C - Confine: if possible

E - Evacuate: Evacuate the place

Immediately informed the response team. Response team moves to the point of fire and take all necessary steps to stop the fire. If the fire is not controllable and spreads then the manager in charge should inform the district authorities and call for external help. Complete an Incident/Accident Report within 24 hours.

Firefighting system is proposed to prevent and control fire outbreaks for the project. The firefighting system will consist of portable fire extinguishers, hose reel, wet riser, yard hydrant, automatic sprinkler system, and manual fire alarm system.

**Emergency Action Plan for Electric Fire**

- Disconnect the affected areas electric supply
- If fire is small scale than $NAHCO_3$ or Sand will be effective.
- Attempt to extinguish fire with the help of $CO_2$ based extinguisher

Action Plan of on-site Emergency Plan

- The action plan considered is given as follows:
- To constitute Disaster Management Committee under senior officer not below the rank of General Manager
- To identify potential hazards areas in the layout map
- To predict degree of burns and distance of the risk zone by using model
- To evacuate the area within risk zone
- To localize the emergency and if possible, eliminate it
- To minimize the effects of accidents on people and property
- To take remedial measures in the quickest possible time to contain the incident and control it with minimum damage
- To mobilize the internal resource and utilize them in the most effective way

Copyright © 2023. KSWMP| All rights reserved

- To get help from the local community and government official to supplement internal manpower and resources
- To minimize the damage in other sections
- To keep the required emergency equipment in stock at right places and ensure that they are in working condition
- To keep the concerned personnel fully trained in the use of emergency equipment
- To give immediate warning to the surrounding localities in case of emergency situation arising
- To mobilize transport and medical treatment of the injured
- To educate the public in the surrounding village regarding hazards
- To arrange treatment of causalities
- To safeguard the people
- To identify the causalities and communicate to persons known to them
- To render necessary help to concerned
- To rehabilitate area affected

**Urban Floods:**

Floods are extreme events, usually triggered by extreme precipitation (river/inland floods) and/or storms (coastal floods). If these rainfalls exceed the retention capacity of the basins, drainage speed and volume, it causes floods.

**Different Types of Flooding:**

1) Localized flooding due to inadequate drainage

2) Flooding due to overflows from River, where settlements have taken place in the flood plains.

**Stakeholders in Disaster Management:**

The policy also systematizes a framework of operation for the following set of stakeholders that play key roles in disaster management.

- Kerala State Disaster Management Authority
- State and Central Government Departments
- District Disaster Management Authorities
- Local authorities including Municipal Corporations/Municipalities, District/Block/Grama Panchayaths, Taluk/Village Officers etc.
- Voluntary and Civil Society Organizations
- Red Cross, multilateral aid agencies and U.N agencies
- Community – Village Disaster Management Committees / Task Forces
- Public sector Undertakings
- Private sector undertakings

Copyright © 2023. KSWMP| All rights reserved

- Army, Navy, Air Force, Coast guard, Airport Authority, National Disaster Response Force etc.

### 6.4Proposed Environmental Monitoring Plan

Monitoring at a dumpsite site is carried out in four physical zones as follows:

i. On and within the dumpsite
ii. In the unsaturated subsurface zone beneath and around the dumpsite
iii. In the groundwater (saturated) zone beneath and around the dumpsite
iv. In the atmosphere/local air above and around the dumpsite

The Environmental Monitoring Program involves the following:

- Conducting survey and sampling program.
- Analysis of samples and data / information collected, and interpretation of data and information.
- Preparation of reports for submitting to management and statutory authorities.
- Environmental monitoring is carried throughout the project operation to detect changes in the key environment quality parameters, which can be attributed to the project.

The results of the monitoring program used to evaluate the following.

- Extent and severity of the environmental impacts against the predicted impacts
- Performance of the environmental protection measures or compliance with pertinent rules and regulations.

#### 6.4.1 Air Environment

The potential sources of air pollution from the dumpsite include vehicular movement and passive leakage of landfill gas from the disposal site. Monitoring of the air environment will be carried out during the operational phase in and around the project site.

#### 6.4.2 Noise Environment

The operations shall induce noise due to operations of transport trucks, JCB loaders and few other types of machinery required at the dumpsite. Monitoring of ambient noise levels and also the exposure of the workers to that environment is essential.

#### 6.4.3 Water Environment

Water quality to be monitored during the operational phase. The monitoring frequency needs to be increased if higher concentrations are expected. Both groundwater regime and surface water domain is anticipated to be most-affected, through leachate contamination. Therefore, surface water will be periodically monitored for the parameters particularly the heavy metals and the hazardous chemicals

Copyright © 2023. KSWMP| All rights reserved

### 6.4.4 Land Environment

The soil in the neighboring areas will be analyzed for the relevant parameters. The land environment also includes developing a green belt.

The details of Environmental Monitoring Programs are given below:

*Table 18 Environmental Monitoring Parameters*

| Environmental components | Locations | Frequency | Parameters |
|---|---|---|---|
| Ambient Air quality | Nearby habitations and downward locations | Quarterly [1 sample] | $PM_{10}$, $PM_{2.5}$, NOx, CH4, CO, Ammonia |
| Noise | Within the site | Monthly | Noise levels |
| Ground and Surface water | Ground water from the nearest well and streams or river | Quarterly | IS 10500:2012 drinking water parameter if required |
| Accidental release | Chemical, oil and fuel spills | Daily | Nil |
| Health safety Hazards | Medical records, documentation of injuries and accidents, Health and safety assessments | Monthly | Health and safety survey |
| Leachate | 1 point per leachate pond | Quarterly | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP |

KSWMP

| | | | |
|---|---|---|---|
| | | | • Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins |

In case of any deviation from FR, this would be updated, and mitigation monitoring measures would be revisited. Currently the location of disposal of bio mined material, or type of transport of bio mined material is unknown & hence, these impacts & mitigation, monitoring requirements will be updated & implemented by the Contractor. This aspect should be made a Bid condition.

### 6.5 Environmental & Social Safeguard Budget

The details of Environmental Budget for Implementation and Supervision of Environmental Management Plan (EMP) is given below:

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| | **Environmental Safeguards** | | | | |
| 1 | Deodorizer equipment (power sprayer) | Only Once | [redacted] | [redacted] | [redacted] |
| 2 | Green Net (Approx., 250 m Length – Height – 3 m) and installation charges | Based on requirement | [redacted] | [redacted] | [redacted] |
| 3 | Spillage Kit | Only Once | [redacted] | [redacted] | [redacted] |
| 4 | Monitoring of Environmental parameters [Air, Ground water, Surface water, Noise, Soil and Leachate] Actual Noise abatement, odour management, dust management measures to be included in DPR cost | Quarterly, first six months by contractor and next two years by ULB | [redacted] | [redacted] | [redacted] |
| 5 | Gas monitoring to check the gas accumulation at the dumpsite | Gas monitoring should be conducted at | [redacted] | [redacted] | [redacted] |

KSWMP

Copyright © 2023. KSWMP | All rights reserved

| | | | | | |
|---|---|---|---|---|---|
| | | least twice a day for about 7 consecutive days | | | |
| 6 | Personal protective equipment | Entire Process | [redacted] | [redacted] | [redacted] |
| 7 | Training on capacity building | Entire Process | [redacted] | [redacted] | [redacted] |
| 8 | Leachate Management (This is only for incidental mitigation of odur, leaks, spillage, flies etc.) | Entire Process | [redacted] | [redacted] | [redacted] |
| 9 | Site Access Road Improvisation | Onetime | [redacted] | | [redacted] |
| | **Social Safeguards** | | | | |
| 10 | Overall Budget for Social Safeguards | | [redacted] | [redacted] | [redacted] |
| **TOTAL (actual costs for works involved for mitigation measures are to be included by the contractor in DPR costs based on his work method. This is only indicative cost for incidental mitigation & management measures. EHS in Labour camp also not included here; but shall be included by the contractor based on his work plan as this is combined with multiple other dumpsite bio-mining works)** | | | | | [redacted] |

## 7. INSTITUTIONAL ARRANGEMNTS

### 7.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The support organisation will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU

### 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for ULB officials includes elected representatives, municipal officials.

Copyright © 2023. KSWMP| All rights reserved

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful.It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

### 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizens can lodge complaints either directly to ULBs, toll free number or through digital platforms (website/email – – https://kswmp.org/grievances /grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded and escalated to the further levels. A ULB level GRM system will be established for making speedy solutions.

A municipal level GRM committee is required to constitute during the subproject implementation. It will help to solve the issues locally. The Municipal Chairperson, Ward Councilor, Municipal Secretary, community representatives, contractor, social workers, subject expert etc., are the proposed members in the committee. The municipality can include more members if required.

Copyright © 2023. KSWMP| All rights reserved

# 8 PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

"Public Consultation" refers to the process by which the concerns of local affected persons and others who have plausible stake in the environmental impacts of the project or activity are ascertained with a view to taking into account all the material concerns in the project or activity design as appropriate.

Initially the public opposed the dumping of waste at Iritty dumpsite and the same has been inactive from year 2020. Now this proposal is to remediate the existing site in order to protect the environment and human health of the nearby area. The summary of the document will be made available in the website, which will also be featured in a newspaper advertisement in Malayalam language for public disclosure.

## 8.1 Public Consultation

In connection with the dumpsite remediation, a consultation meeting, with respect to transect walk, was conducted on 03.06.2023. Stakeholders from different social entities participated in a consultation meeting followed by a transect walk. Local residents, HKS, municipal workers, Kudumbashree members and officials from DPMU, ULB, PIU and TSC participated.

In the meeting, SWM Engineer explained about the proposed dump site remediation activities with a positive note on how the remediation activities are beneficial to the local community. The local residents extended whole support from the local people for the dumpsite remediation activities. Further, a detailed description on dumpsite remediation was given by the Social and Communication expert, DPMU. Participants expressed their concerns regarding the proposed project activities and its implementation modalities. The participants were happy that the lifelong bad image of 'trenching ground' would get removed since it was highly stigmatized usage.

## 8.2 Information, Education and Communication (IEC) Plan

*Table 19 IEC Plan for dumpsite remediation - Iritty*

| Programme | Methodology | Topic | Responsibility | Monitoring |
|---|---|---|---|---|
| **Sensitization/ Awareness programme** | Meetingwithallconcernedstakeholder'swithpriornotificationtodiscussaboutheprocessandremediationmet | Process of dumpsite remediation Developing as a Recreational Park | Contractor | TSC/DPMU /DPMC |

| | | | | |
|---|---|---|---|---|
| | hods | | | |
| **Informative standees in all** | Visible places near the dumpsite | Protocol to the public who reside in nearby areas and also trespassers. | Contractor | TSC/DPMU /DPMC |
| **Announcement vehicle** | All across places near the dumpsite | Health and hygiene protocols during the dumpsite remediation process | Contractor | TSC/DPMU /DPMC |
| **Digital campaign (Social media)** | Areas surrounding waste dumping and all affected areas | Arrangement of a public audio system to address all people in the surrounding areas.<br><br>Short video presentations to communicate through different digital platforms like WhatsApp pertaining to the existing scenario and proposal of Recreational Park with self-explanation | Contractor | TSC/DPMU /DPMC |
| **Cautionary notification boards** | About vehicle movement and the transit of waste | precautionary measures should the general public take. | Contractor | TSC/DPMU /DPMC |

**Conclusion**

The dumpsite remediation activity at Iritty municipality falls under moderate social risks. However, a set of risk mitigation activities are mentioned in the scoping of social management plan to overcome the identified risks and its negative impacts. Formation and regular meeting of GRM & stakeholder's committee, awareness generation counseling for the aggrieved parties, gender sensitization, legal awareness, providing safety are the major mitigation measures. This proposal is made to reduce the social risk associated with dumpsite remediation and to minimize the negative social impacts.

ANNEXURES

## Annexure 1 – Environmental Screening

Environmental Screening

Sub Project Details

| Name of Subproject: | Dumpsite Remediation |
|---|---|
| Sub project Components: | Dumpsite Remediation |
| Subproject Location (City / Town/ Village with ward numbers): | Iritty ULB, Ward 12 Athithattu, Kannur District. |

Stage 1: Exclusion List

| Sl.No | Non-permissible Activities |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016 (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible) |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |
| The project does not fall under the above conditions as mentioned under exclusion list | |

Stage 2: Environmental Screening Checklist

| Sl.No | Components | Details |
|---|---|---|
| 1 | Project Components | Dumpsite Remediation |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, | Bio-mining of dumpsite |

KSWMP

| | | | | |
|---|---|---|---|---|
| (ii) | Cultural Heritage site, protected monuments - listed by ASI/State | | No | The project site is not located near any cultural Heritage or protected monuments as listed by ASI/state |
| (iii) | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species? If yes, which is the area? | | No | The project site is not located near Natural Forests / Protected Areas / Bio-Reserves |
| (iv) | Other Wetlands/ Mangrove/ Estuarine Region | | No | The project site is not located near any Wetlands/ Mangrove/ Estuarine Region |
| (v) | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | No | The project site is not located near any Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves<br>There is a river baveli which is located at an Aerial distance of 1.25 Kmaway from the site |
| (vi) | Other Sensitive Environmental Components listed in EMF | | No | No other sensitive environmental components listed in EMF exist nearby the project site |
| (vii) | Drinking water source, upstream and downstream uses of rivers, etc | | No | No river source is resorted for drinking water use<br>Downstream the ground water source is available |

Copyright © 2023. KSWMP| All rights reserved

| | | | | |
|---|---|---|---|---|
| (viii) | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | No | The sea is located 32 km (Aerial Distance) from the project site. There won't be any influence of tidal influence |
| (ix) | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | Yes | | a. Nearest Habitation- 02 houses are located within aerial distance of 200 m<br>b. Religious Place- Temple is located at an Aerial distance of 600 m away from unit<br>c. School – Global India Public School is located at an aerial distance of 1.20 km<br>d. Hospital – Sky super speciality Hospital is located at an aerial distance of 1.60 km<br>e. Tourist Places – Kolly waterfalls is located at an aerial distance of 1.8 km<br>f. Airport – Kannur International Airport is located at an aerial distance of 15.5 km |

Copyright © 2023. KSWMP| All rights reserved

| | | | | |
|---|---|---|---|---|
| 2 | Is the site in Critical / Over Exploited Ground Water Block. Provide the level of the groundwater table | | No | The site falls under safe block |
| 3 | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | Yes | | The site does not fall under major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion.<br>There may be chance of fire due to<br>1. Fire breaking due to high temperature<br>2. Electrical short circuit due to poor maintenance.<br>3. Smoking in the premises near the waste storage.<br>4. Burning of the waste by unauthorized persons<br>5. Keeping highly flammable materials like, cooking gas, kerosene, match boxes, etc.<br>6. Not having provision for proper fire/smoke detecting system.<br>Mitigation Measures:<br>1. Proper maintenance and monitoring should be done in and around the site |

Copyright © 2023. KSWMP| All rights reserved

| | | | | |
|---|---|---|---|---|
| 4 | Describe the type of soil and vegetation on site | Yes | | Hard laterite soil with few trees present in the site |
| 5 | Is the site present in the flood plains as recorded in the last 100 years. Provide the HFL level of the site/region | | No | The sea is located 32 km (Aerial Distance) from the project site. |
| 6 | Existing pollution/contamination or degradation on site | Yes | | Dumpsite located in Iritty ULB is the existing contamination and detailed under section 3.11 |
| 7 | Any other remark on baseline condition | Yes | | Based on the test result of environmental baseline for Iritty dumpsite certain parameters exceeds the permissible limits and test report results are given under section 3.11 |

Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils

| Sl.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Total extend of land to be covered/built | Yes | | Total site area: 2.44 acres<br>Waste dumped area: 0.11 acre |
| 2 | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | Yes | | Due to open dumped area |
| 3 | Extend of Land to be remediated | Yes | | 0.11 acres |
| 4 | Extend of land expected to be under green belt | Yes | | Will be under the scope of contractor |
| | proposed project causes the following on Land / Soil: | | | |

KSWMP

Copyright © 2023. KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| (i) | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | No | There will be no major impact other than the operational phase as this project is remediation project. During operational phase the anticipated impacts are identified and mitigation measures are provided |
| (ii) | Substantial removal of Top Soil (mention area in sqm) | | No | Nil |
| (iii) | Any degradation of land / eco-systems expected due to the project? | | No | There will be no Land degradation instead it will be a remediation of land from further contamination |
| (iv) | Loss or impacts on Cultural/heritage areas/properties | | No | There will be no loss or impacts on Cultural/heritage areas /properties |
| (v) | Does the project activity involve cutting and filling/ blasting etc? | Yes | | The project is to remediate the existing dumpsite and the waste dumped below the ground will be excavated and disposed. The site will be levelled and filling done on the area of excavated waste below ground. |
| (vi) | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | Yes | | The project will have physical change in a positive way by clearing the waste dumped into vacant land |

Copyright © 2023. KSWMP| All rights reserved

| | | | | |
|---|---|---|---|---|
| (vii) | Will the project involve any quarrying/ mining etc? | | No | The project does not involve any quarrying/ mining |
| (viii) | Will the project / any of its component contaminate or pollute the Land? | | No | Presently there is contamination and due to the project activity the further contamination shall be eliminated and natural system shall be restored |
| (ix) | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | No | There will be no negative impact due to the proposed project |
| (x) | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | No | There will be no negative impact due to the proposed project |

| Sl.No | Impacts on Air and Noise Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | Yes | | It will be minimal and adequate mitigation measures will be taken to reduce the impact. |
| 2 | Will the project cause or increase pollution due to GHG emissions? | | No | Nil |
| 3 | Will the project cause or increase odour nuisance? | Yes | | The Bio-mining project will be create odour nuisance but it is temporary and once the process is completed there will be no odour nuisance. |

KSWMP

Copyright © 2023. KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| 4 | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | Yes | | There may be chance for any release of toxic gases or potential fire outbreaks which will be mitigated through proper mitigation plan. |
| 5 | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | Yes | | The Bio-mining project will create increase in noise level but it is temporary and once the process is completed there will be no noise. |

| Sl.No | Impacts on Water Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 2 | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 3 | Chances of Pollution of Water bodies / groundwater wells, nearby or downstream | | No | There will not be any chance of pollution of water bodies / groundwater wells, nearby or downstream |
| 4 | Will the activities proposed at the site(s) hinder natural drainage | | No | The activities proposed at the site will not hinder natural drainage and the proposed activity will improve |

KSWMP

Copyright © 2023. KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| | | | | the natural pathway without any obstacles. |
| 5 | Will the activities proposed at the site(s) decrease permeability /rainwater percolation | | No | The activities proposed at the site will not decrease permeability /rainwater percolation |

| Sl.No | Impacts on Bio diversity & Host Communities | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project necessitates cutting of Trees /Loss of Vegetation | | No | There will be no cutting of Trees /Loss of Vegetation due to this project |
| 2 | Will the project necessitate substantial removal of Top Soil (mention area in sqm) | | No | There will be no Substantial removal of Top Soil.<br>During the excavation of waste there is a slight chance of the top soil to get removed and the same will be mitigated with by-product (bio earth) of this activity |
| 3 | Any degradation of land / eco-systems expected due to the project? | | No | There will be no degradation of land / eco-systems expected due to the project activity.<br>Also, the proposed activity will protect the land from further contamination |
| 4 | Will the project result in Health & Safety Risks in the neighbourhood including the release of toxic gases, leachate, accident risks | Yes | | There may be chance of accidental risks due to leachate and toxic gases, which will mitigated by proper |

**Annexure 2 – Fire and Risk Assessment**

A fire and risk assessment is a systematic evaluation of potential fire hazards and associated risks within a particular environment or premises. The assessment aims to identify potential fire hazards, assess the level of risk they pose, and recommend measures to mitigate or manage those risks effectively. Fire and risk assessments are essential for ensuring the safety of the workers, protecting property, and complying with fire safety regulations.

The existing legacy waste dumpsite, occupying about 0.11 acres in ward 12 Athithattu, aims to fully reclaim the land for future development. Bio-mining, a technique chosen after careful evaluation will be used to recover the land and ensure sustainable and environmentally friendly treatment of the waste. The process will yield various by-products, which require immediate attention to prevent fire hazards.

The by-products and their intended use are as follows:

1. The bio earth 897 tons will be utilized for the development of the reclaimed legacy waste dumpsite as a green park/facility.
2. Refused derived fuel (RDF) of 318 tonswill be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the process.
3. Recyclables of 40 tons will be sold to authorized recyclers

The RDF by-product& recyclables, totaling around358 tons, poses a potential fire risk and requires proper handling. To mitigate the risk, a storage and disposal process spanning 3 to 4 months has been devised. During this period, the contractor will implement various protective measures to prevent the possibility of a fire outbreak.These following measures are important for preventing fires, ensuring the safety of workers and nearby communities, and minimizing risks to the environment and property.

Pre-Construction/Planning Stage:

1. Fire Safety and Emergency Plan: Develop a comprehensive fire safety plan and emergency response plan to address potential fire incidents.
2. Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard.
3. Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.
4. Fire Equipment: Ensure that the site is equipped with fire extinguishers.

Storage of Waste & RDF:

Copyright © 2023. KSWMP| All rights reserved

**Fire Standards and Facilities:** Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.

Below equipment and their required quantities should be strategically positioned according to the site's specifications.

- Fire extinguisher (A, B, C powder): It will be used to immediately put off fire caused by wood, Paper and textiles, flammable liquids and flammable gases. Commonly can be placed anywhere inside the site
- Fire extinguisher (Foam spray): Mainly used to put off the fire caused by flammable liquids. It should be placed in diesel storage area, lubricant storage area and DG sets.
- Fire extinguisher ($Co_2$): Mainly used to put off the fire caused by Electrical short circuit. It should be placed near the control panel room/operation room.
- Fire bucket filled with sand: It should be placed near the diesel storage area

To ensure rapid response in case of a fire, it's essential to have a water tanker filled with water, equipped with a fire-fighting hose, readily accessible along with the portable motor. The presence of this equipped water tanker ensures timely and effective action during fire emergencies.

The following points to be considered for assessing the fire risk and procedure to mitigate it.

1. Identification of Fire Hazards: The first step involves identifying potential fire hazards in the premises. These hazards could include sources of ignition (e.g., electrical equipment), combustible materials (e.g., flammable liquids, paper, cardboard), and other factors that could contribute to the outbreak of a fire.
2. Assessment of Risk: Once the hazards are identified, the next step is to assess the level of risk associated with each hazard. This involves evaluating the likelihood of a fire occurring and the potential consequences if a fire were to break out.
3. Escape Routes: Since operational phase occurs in an open environment, the need for conventional escape routes in the event of a fire emergency may not be required.
4. Fire Safety Measures: The assessment reviews existing fire safety measures in place, such as fire alarms, fire fighting equipment, and fire suppression systems. Proper assembly point is required in case of fire break out
5. Emergency Procedures: The assessment evaluates the effectiveness of emergency procedures and evacuation plans in the event of a fire, ensuring that workers can safely evacuate the premises.
6. Fire Training and Awareness: The assessment considers the level of fire safety training provided to workers and the awareness of fire hazards and evacuation procedures.

Copyright © 2023. KSWMP| All rights reserved

7. Record-Keeping: Detailed records of the assessment process, findings, and recommended actions are maintained for future reference and regulatory compliance.
8. Recommendations: Based on the assessment, the fire risk assessor provides recommendations for improving fire safety, which may include installing additional fire safety equipment, conducting training programmes, or implementing any changes to reduce fire risks.
9. Review and Updates: Fire and risk assessments should be regularly reviewed and updated to account for any changes in the premises or regulations.

Fire and risk assessments play a crucial role in preventing fires and minimizing their impact if they occur. They are particularly important for dumpsites and other places with a higher risk of fire hazards to ensure the safety and well-being of workers.

**Annexure 3- Checklist for screening of dumpsites for potential landfill/ processing facility**

| | |
|---|---|
| Name of the contact person from ULB-Phone number and email Address | Iritty |

| S.No. | Item | Norm | Information |
|---|---|---|---|
| 1 | Land ownership (including that required for approach road) (in line with revenue records) (supporting data to be provided as annex) | | Iritty Municipality |
| 2 | Name of the location of site and Map of the site (include as an annex) | | Athithattu, Iritty |
| 3 | GPS coordinates of site | | Latitude: 11°58'04.5"N, Longitude 75°40'53.9"E |
| 4 | Is there a Pollution Control Board permit for dumping/SWM activity? | | No |
| 5 | Is there a notified no development zone or buffer or green belt around the dump? | | No |
| 6 | Possible area to be kept as buffer green belt around (within / outside the site for purchase) | | Green belt is already available within the site |
| | Site Selection Criteria - give distances, wherever applicable | | |
| 7 | Groundwater (m below liner bottom) | 2m | No |
| 8 | Private water sources (well etc.)- distance from site boundary (to be adjudged based on approx. distances during screening exercise) | 100 m (river) | No |
| | | 200 m (Pond) | No |
| | | 30 m (Local Canal) | No |
| 9 | Env. Sensitive Areas/ Wetlands | Not Permitted | No |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| 10 | Site having Rare and Endangered Species | Not Permitted | No |
| 11 | Site should not be within Protected/ Reserve Forests | Not Permitted | Site is Not within the Protected/ Reserve Forests |
| 12 | Residential Development within prescribed buffer zone of 200 m | Not Permitted | Yes. Local Residents nearby Dumpsite within 200 m |
| 13 | Perennial Stream within site | Not Permitted | No |
| 14 | Airport | 20 Km | Yes |

| S.No | Item | Norm | Information |
|---|---|---|---|
| 15 | Distance to the nearest village in the predominant wind (m)direction | | Athithattu |
| 16 | Flood prone site | | No |
| 17 | Accessibility - Road access for heavy vehicles | | 3.5 m wide Approach road. The nearest major road is Iritty-nedumpoil and it is about 980 meters away from the site. This road provides access to the nearby residential areas. |
| | i. Starting point of the access road | | |
| | ii. length and width of the access road | | |
| | iii. Current condition of the access road (visual assessment) | | Tarring Road with good condition. |

| S.No. | Site Description | | |
|---|---|---|---|
| 18 | Is the site that/stopping to nearby uses | | Flat |
| 19 | Soil base-soft soil/murum,soft rock etc | | Hard Laterite soil |
| 20 | Direction of Leachate flow out of the site, if any | | No. The biodegradable waste |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| | | | dumping stopped since 2020 |
| 21 | Other uses within the dumpsite(recycling yard, compost pad etc) | | Windrow compost unit is existing. New MRF building constructed but not yet used |
| 22 | Boundary conditions-walls/fence/what land uses along boundary | | Compound wall |
| 23 | Year since the dump site is existing | | 2000 |
| 24 | Is the dumping Operation Ongoing | | Stopped the Biodegradable waste since 2020 |
| 25 | Any underground utilty/gas line etc near the site | | No |
| 26 | Existing power supply, water supply, electric poles going through/over/in the site etc. | | Three phase power available |
| 27 | Are there pools of leachate ,rat and fly infestations, domestic animals roaming freely, odours,dust, vermin and birds,waste being burnt at dumpsites or families of scavangers picking through the wastes | | No |

| Geography and Climatic aspects | | | |
|---|---|---|---|
| 28 | Average annual rain fall | | 4034 mm |
| 29 | Duration of rainfall | | May to October |
| 30 | Whether any incidents of flooding reported at site/other hazards | | |
| | i. No | | |
| | ii. Very Rare | | Very Rare |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| | iii. Some times | | |
| | iv. Frequent | | |
| 31 | Any geological fault | | No |
| Waste Characteristics | | | |
| 32 | Characteristics of the dumps, such as the height and area, characteristics of solid waste based on visual inspection and degree of compaction (subjective), and any details of variability of wastes within the site. | | Since the biodegradable waste dumping stopped from 2020. Only the Non Biodegradable waste only present in the dumpsites like Plastic wastes and street sweeping wastes |
| 33 | Type of waste (MSW/HW) (subjective assessment based on visual inspection) | | MSW |
| | i. 100% MSW | | |
| | ii. 75% MSW +25% (domestic and/ or biomedical/ HW/EW) | | Yes |
| | iii. 50% MSW +50% (domestic and/ or biomedical /HW/EW) | | |
| | iv. > 50% (domestic and/ or biomedical /HW/EW) | | |
| 34 | Expected waste contamination (visual check of ground water, littering, dust pollution, Smell/odour, ls the ground water being used for drinking purpose) | | Ground water not used for drinking. |
| 35 | How much quantum of fresh waste is dumped every day? | | Stopped the dumping of waste. |

**Annexure 4- Occupational Health and Safety**

Occupational Health and Safety Risk Assessment for Dumpsite Remediation is as follows

**1.Introduction**:

The purpose of this Occupational Health and Safety (OHS) Risk Assessment is to identify, assess, and mitigate potential hazards and risks associated with the implementation of a Bio-mining project for dumpsite remediation. Bio-mining is a sustainable and environmentally friendly method used for the disposal of dumped waste and reclamation of land.

**2. Scope:**

This risk assessment focuses on the occupational health and safety aspects of the Bio-mining process for dumpsite remediation. It covers the potential hazards and risks that workers may encounter during site preparation, Bio-mining operations, and waste disposal activities. The assessment will also outline control measures to minimize or eliminate these risks.

**3. Hazard Identification:**

Bio-mining process identifies potential hazards, which include but are not limited to:

a. Chemical Hazards: Exposure to hazardous chemicals present in the dumpsite waste and chemicals used in the Bio-mining process.

b. Biological Hazards: There is very rare chance of biological hazard in Iritty dumpsite as it is accumulated with majorly municipal solid waste.

c. Physical Hazards: Potential for slips, trips, and falls on uneven terrain or during equipment operation.

d. Mechanical Hazards: Risks associated with operating and maintaining heavy machinery.

e. Ergonomic Hazards: Strain and injuries related to improper handling of equipment or materials.

f. Environmental Hazards: Adverse effects on air and water quality during the Bio-mining process.

**4. Risk Assessment:** The risk assessment will categorize the identified hazards based on their severity and likelihood of occurrence. Each hazard will be evaluated using a risk matrix to determine the level of risk and priority for mitigation.

**5. Risk Mitigation Measures:**

Copyright © 2023. KSWMP| All rights reserved

To ensure the safety of personnel involved in the Bio-mining project, the following risk mitigation measures will be implemented:

a. Engineering Controls:

- Regular maintenance and inspection of machinery to prevent mechanical failures.

- Providing appropriate personal protective equipment (PPE) to workers.

b. Administrative Controls:

- Developing standard operating procedures (SOPs) for Bio-mining operations.

- Implementing a comprehensive training program for all personnel involved in the project.

- Scheduling regular breaks and rotation of tasks to minimize fatigue.

c. Environmental Monitoring:

- Regular monitoring of air and water quality to ensure compliance with safety standards.

- Establishing emergency response protocols in case of any unexpected environmental events.

d. Emergency Preparedness:

- Developing and practicing emergency response plans for potential accidents or incidents.

- Providing workers with first-aid training and easily accessible medical facilities.

e. Personal Protective Equipment (PPE):

- Mandating the use of appropriate PPE, such as respirators, gloves, safety goggles, and protective clothing.

**6. Worker Health Surveillance:**

Implementing a health surveillance program to regularly monitor the health of workers involved in the Bio-mining project. This program may include medical examinations and assessments to detect any health issues related to exposure during the remediation process.

**7. Training and Education:**

Conducting comprehensive training and educational programs for workers and supervisors to raise awareness of potential hazards, proper handling of equipment, and the correct use of PPE.

Copyright © 2023. KSWMP| All rights reserved

## 8. Conclusion:

By proactively identifying potential hazards, assessing risks, and implementing appropriate control measures, this Occupational Health and Safety Risk Assessment aims to ensure the safe and successful execution of the dumpsite remediation Project through Bio-mining. Continuous monitoring and improvement will be essential throughout the project to maintain a safe work environment.

## EXECUTIVE SUMMARY

Iritty is a Municipality and a Taluk of Kannur district in Kerala State. Even though he ULB has an excellent practice of waste management, the primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing waste dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. As a consequence, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate it in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project of remediation of legacy waste dumpsites in all the ULBs. As part of the project, in phase -1 the existing dumpsite of Athithattu, Iritty is proposed to be remediated.

The Iritty municipality has an area of 46.65 sq.km with 33 wards. The municipality intend to remediate the existing legacy waste dumpsite at Athithattu and recovery land 100% for development of recreational park for the public. The Athithattu dumpsite is used for dumping of solid waste from the year 2000 to year 2020. The dumping of the solid waste was stopped due to protest from the local residents for addressing the issues of the problems created by odour and leachate from dumpsite and local residents are in demand to remediate the legacy dumpsite and to utilize the remediated land for social cause.The total quantity of legacy waste is estimated to be approximately 1254.02 Tons. Since the cessation of dumping activities in 2020. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes.

To assess the quantity & composition of the legacy waste & also environmental baseline of the dumpsite, the samples from the strategic locations were collected to analyse viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Ground Water and Surface Water. Conducting Detailed Investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Chemical, Environmental Analysis by M/s Poluchem Laboratories. From the results of the investigations, it was found that the waste was found to depth of 4.5 m. The total estimated quantity of legacy waste is 1254.02 Tons.

As per the SWM Rules 2016, selection of the applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out and based on the results, remediation can be done by a) Capping without land recovery, b) Bio-mining – reclamation/recovery of land c) capping with partial land recovery. The selection of technology shall also depend on the available resources viz., manpower, machineries, money and physical site

Copyright © 2023. KSWMP| All rights reserved.

conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for 100% land recovery and forward linkages/utilization of processed aggregates/bi- products. Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land 100% is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and 100% land recovery/remediation legacy waste dumpsite.

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land 100%) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31$^{st}$ March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/bi- products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, mobile/compact screening is the machineries are which shall be the optimum screening machineries for processing the stabilized legacy waste of 2023.11 $m^3$ within the stipulated timeline of 31$^{st}$ March 2024 by NGT for remediation of legacy waste dumpsite.

Environmental & Social safeguards: The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project attracts moderate risk social category based on the social mapping & transect walk i.e., consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.

Bi-products utilization/forward linkages/Usage

1. The bio earth & C&D quantity 991.32 $m^3$ & 455.50 $m^3$ and waste will be utilized for development of the reclaimed legacy waste dumpsite as recreational park/facility.
2. Refused derived fuel (RDF) of 512.35 $m^3$ will be to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the processes
3. Recyclables of 64.23 $m^3$ will be sold to authorized recyclers and will be collected from the dumpsite.

The activities of the bio-mining will be commenced from the Dec 2023 to Mar 2024. An area of 0.11 Acre will be reclaimed and will be development into recreational park for public use.Total cost of the project is [redacted] **/-.** The cost per $m^3$ for processing and disposal of the legacy waste is [redacted] **/-.**

## 2. GENERAL DESCRIPTION ABOUT PROJECT

The Iritty municipality has an area of 46.65 sq.km with 33 wards. Solid waste generated from 11200 households and 1850 institutions including commercial establishments. The municipality intend to strengthen and enhance the existing treatment facilities of the bio degradable & non – degradable waste system at household, institutional and community level for effective management of the solid waste generated and also remediation of existing legacy waste dumpsite.

The Athithattu dumpsite was used for dumping of solid waste from the year 2000 to year 2020. The dumping of the solid waste was stopped due to protest from the local residents for addressing the issues of the problems created by odor and leachate from dumpsite and local residents are in demand to remediate the legacy dumpsite and to utilize the remediated land for social cause.

Since the cessation of dumping activities in 2020. The legacy waste is spread in an area of 0.11 Acre with average height of 4.5 m and a portion of the dumpsite is capped as part of the remediation. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. The municipality intend to remediate the existing legacy waste dumpsite at Athithattu and recovery land 100% for development of recreational park for the public. The details of the legacy waste dumpsite are provided below:

*Table 1 Dumpsite Details*

| Name of ULB | Iritty |
|---|---|
| District | Iritty |
| Taluk | Iritty |
| Location | Ward 12 - Athithattu, Iritty |
| GPS Co-ordinate of the Site | Latitude: 11°50'04.41"and Longitude: 75°40'54.066" |
| Total dumpsite area (in acres) | 2 Acre 40.44 Cent |
| Legacy waste spread (in acres) | 0.11 Acre |

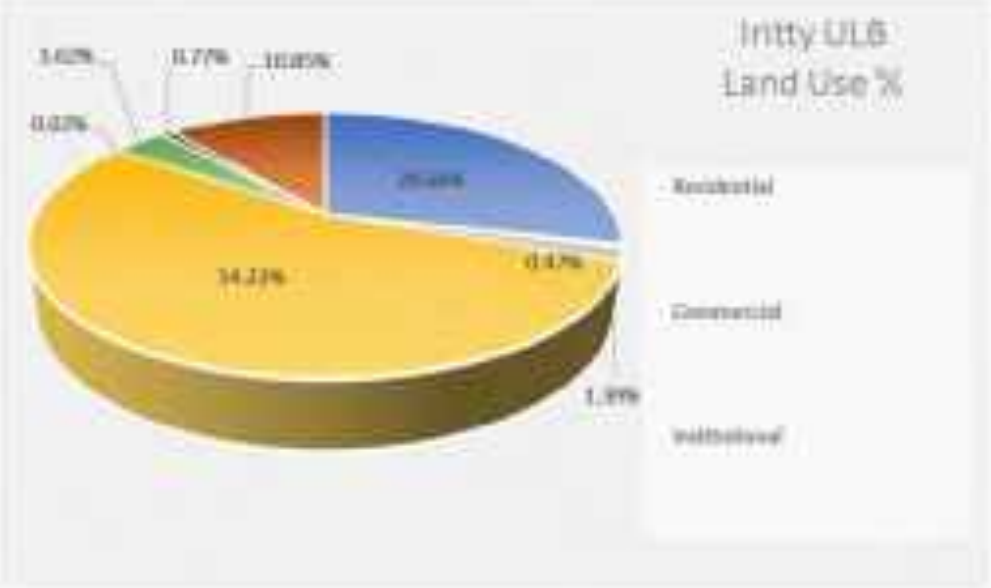
## 3. OCATION, DEMOGRAPHY, ACCESS, LAND-USE, WATER TABLE AND CLIMATE OF THE ULB

### 3.1 LOCATION

Iritty is a Municipality in the state of Kerala, India and is located at Latitude: 11° 58'04.41"and Longitude: 75°40'54.066" with an area 46.65 square Kilometer. Iritty is known as The Coorg Valley in God's Own Country Iritty is one of the fastest upcoming towns in Kerala with the distance of 20 km (12 mi) from Kannur International Airport and one among five taluks in Kannur district.



### 3.2 POPULATION, DENSITY AND LITERACY RATE

Iritty Municipality population is 43806, among them about 21,000 (48 %) are male and about 22,000 (52 %) are female. The Iritty Municipality was formed on 1st November, 2015, as per the survey present population is 43,806. The population density of Iritty municipality is 340 population per square kilometer

### 3.3 LAND USE

The Iritty municipality has a total area of 46.65 Sq. km. The land use indices of Iritty municipality are shown in below figure.

*Figure 2 Pie chart indicate the land use percentage wise*

Copyright © 2021 KSWMP | All rights reserved.

*Table 2 Land Use Details of Iritty*

| Description | Area in Sq.km | Land Use % |
|---|---|---|
| Residential | 13.37 | 28.66 |
| Commercial | 0.22 | 0.47 |
| Institutional | 0.65 | 1.39 |
| Agricultural | 25.29 | 54.22 |
| Recreational, open space | 0 | 0 |
| Transportation | 0.01 | 0.02 |
| Water bodies | 1.69 | 3.62 |
| Slums | 0 | 0 |
| Forest | 0 | 0 |
| Revenue Surplus land | 0 | 0 |
| Other Vacant land | 0 | 0 |
| Other (Hazardous Zone, Industrial, Quarry Laterite and Granite) | 0.36 | 0.77 |
| Others (Paddy Field (Cultivating), Paddy Field (Uncultivated), PWD- irrigation land, Roads) | 5.06 | 10.85 |

### 3.4 TRANSPORTATION CORRIDOR

*Table 3 Transportation corridor details*

| Mode | Details |
|---|---|
| Road | Iritty lies at an equal distance from the nearby cities of Kannur, Thalassery, Mahe, Taliparamba and Virajpet (Karnataka State). The proposed Kannur Mysore National Highway or SH 30 passes through Iritty connecting Thalassery, Mattanur Airport and Kodagu. This was initially called the TC Road by the British. This highway is used by interstate bus services plying to Madikeri, Mysore and Bangalore.SH 36 connects Iritty with Taliparamba that gives access to other towns like Irikkur and Sreekandapuram. Keezhur is the starting point of Iritty town. This place is well-connected by road from both Kannur and Thalassery. There are frequent buses from Iritty and to both these places and to several places across Kerala including Kottayam, Cochin (Ernakulam), Mangalore, Kasaragod, Panathur, Kanhangad, Cherupuzha, Wayanad and Kozhikode |

Copyright © 2025, KSWMP | All rights reserved.

| Mode | Details |
|---|---|
| Train | There is no railway line, with the nearest railway stations at Kannur and Thalaserry |
| Air | The nearest international airports are situated at Kannur (19.5 km away). |

### 3.5 TOPOGRAPHY

Iritty is surrounded by hills. A river flowing through Iritty is more commonly known as Iritty Puzha (Iritty River). There is a steel girder bridge, built in 1933, over the river. There is a dam in the place Pazhassi for irrigation purpose named 'Pazhassi Dam' which is almost 10 km from the town. Wayanad tourist destinations are near from this place. The nearby areas are depending on Iritty for most of their shopping. Payam, Aralam, Punnad, Vallithode, Kilyianthara, Kondambra, Kolikkadavu, Keezhur, Ulickal, Vattiyamthode, Mattara, Kalanki, Manikadave, Manippara Perumpally, Nuchiyad, Vayathoor, Edoor, Peratta, Karikottakari, Angadikadave, Puravayal, Kootupuzha, Charal, Alathupramba, Thermala, Urathoor, Vilakkode, Madathil etc. are the nearby small towns around.

### 3.6 CLIMATIC CONDITION

#### 3.6.1 TEMPERATURE & RAINFALL

The average monthly temperature and rainfall is shown in below. Iritty has a tropical monsoon climate with little to no rainfall from December to March and heavy to extremely heavy rainfall from April to November.

Iritty Municipality falls within the tropical to sub- tropical climatic region. The maximum temperature in the region varies almost between 28.60C to 33.90C and minimum temperature ranges from 21.40C to 25.70C. Iritty has a tropical monsoon climate with little to no rainfall from December to March and heavy to extremely heavy rainfall from April to November. Table 4 Temperature.

*Table 4 Temperature & Rainfall Data*

| Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Average high °F | 31.6 | 32.5 | 33.6 | 33.9 | 33.2 | 29.9 | 28.6 | 29 | 29.7 | 30.5 | 31 | 31.2 |
| Average low °F | 21.4 | 22.6 | 24.3 | 25.7 | 25.6 | 23.9 | 23.4 | 23.5 | 23.5 | 23.6 | 22.9 | 21.5 |
| Average precipitation in | 3 | 4 | 12 | 45 | 283 | 867 | 1,332 | 711 | 329 | 279 | 166 | 58 |

*Source: Climate-Data.org*

Copyright © 2023. KSWMP | All rights reserved.

According to the Rainfall Data, the most favorable working period spans from December to March due to the lower precipitation levels.

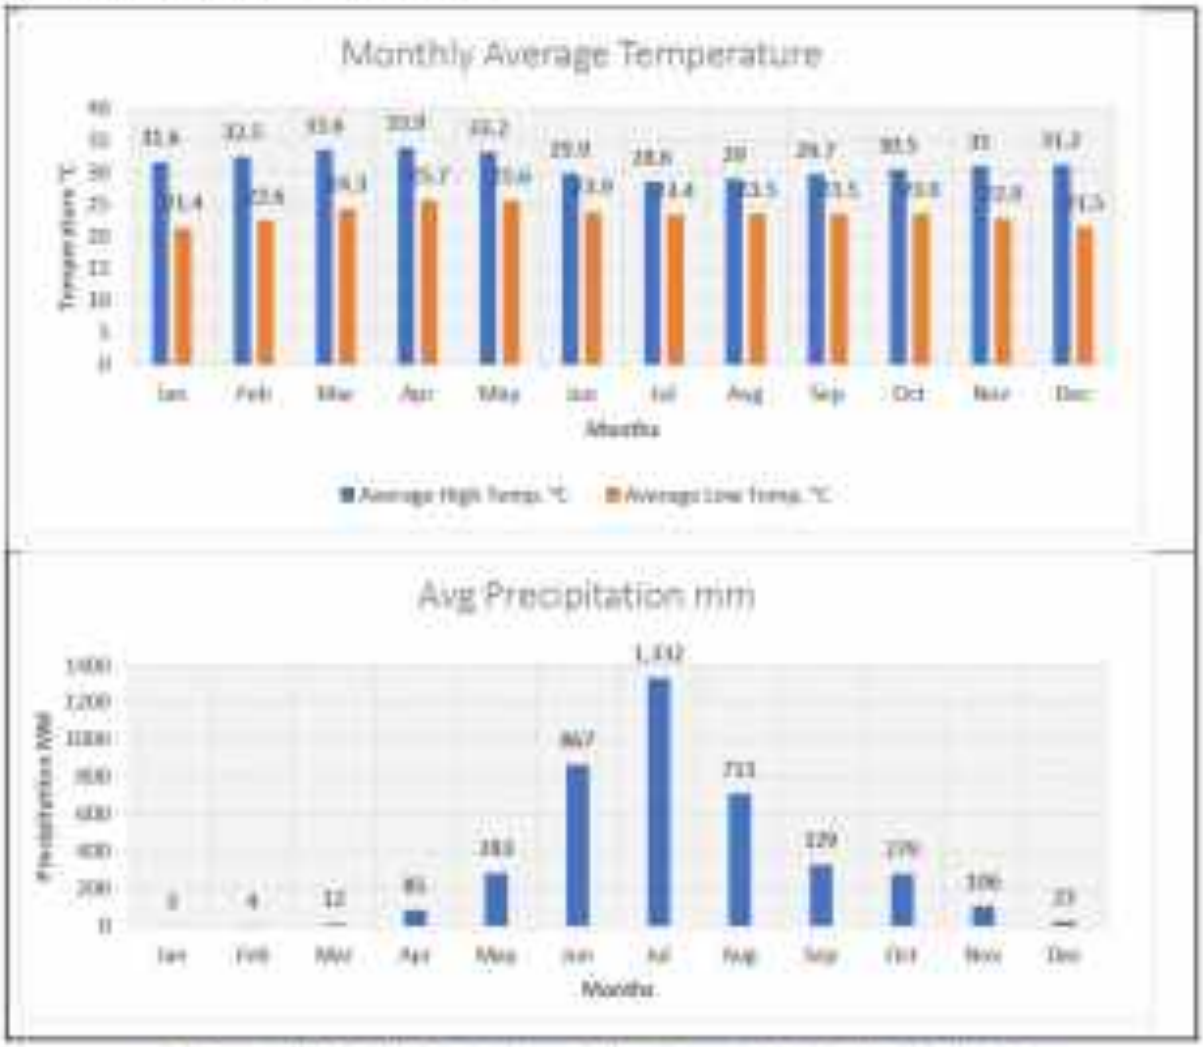


*Figure 3Monthly Variation of Climate and Rainfall for Iritty Town*

### 3.7 FLOOD ZONE

According to the 2022 Flood Probability Report published by the Kerala State Disaster Management Authority, the Iritty municipality has an average area of 10.45 square kilometers that is susceptible to flooding, with a peak elevation of 35.37m.

### 3.8 EARTHQUAKE ZONE

The Bureau of Indian Standards (BIS) has grouped the country into four seismic zones viz, zones II, III, IV and V as detailed in the Map below. The Kerala state falls under Seismic Zone 3.

### 3.9 COASTAL REGULATION ZONE

Copyright © 2023 KSWMP | All rights reserved.

As per the Coastal Regulation Zone (CRZ) notification 2011 and further amendment in CRZ notification 2019, the Iritty legacy dumpsite does not fall under the CRZ zone.

## 3.10 GROUND WATER LEVEL

The details of groundwater level during pre-monsoon and post-monsoon, and the average fluctuation is provided in the table below.

*Table 5 Details of Ground Water level*

| Pre-monsoon (m) | Post-monsoon (m) | Avg. Fluctuation (m) |
|---|---|---|
| 6.49 | 5.57 | 0.93 |

Copyright © 2023, KSWMP | All rights reserved.

## 4. DETAILED DESCRIPTION OF THE DUMPSITE

### 4.1 PHYSICAL FEATURE OF THE SITE

The total area of the dumpsite is approximately 2 Acre 40.44 Cent, out of which 0.11 Acre are covered by legacy waste, with an average height of 4.5 m from the adjacent road level. The legacy dumpsite is located Lat: 11° 58' 04.41" N, Long: 75° 40' 54.07" E at Aduthattu (ward-12), Iritty.

The dump site partially constructed of compound wall with buttress due to prevention of land slide and control the waste spillage in to the down side. Within the boundary of the site, MCF (area 67.74 m²), Thumboormuzhi (area 37.45 m²), Windrow compost unit (area 250 m²) and one open shed (area 72 m²) are available. The dumping activities were stopped from 2020 due to public protest.

*Figure 4 Iritty Dumpsite Photo*

### 4.2 INFORMATION ON SITE MANAGEMENT

The dumpsite of Iritty Municipality is located at Aduthattu (ward 12). The legacy waste has been dumped over last 20 years (from the year 2000 to year 2020).

Copyright © 2021 KSWMP | All rights reserved.

### 4.3 SITE HISTORY INCLUDING PUBLIC PROTEST

The dumping of the solid waste was stopped due to protest from the local residents for addressing the issues of the problems created by odor and leachate from dumpsite and local residents are in demand to remediate the legacy dumpsite and to utilize the remediated land for social cause.

### 4.4 DIRECTIONS FROM AUTHORITIES LIKE NGT, PCB, ETC.

#### 4.4.1 NGT DIRECTIONS & ORDERS

The National Green Tribunal (NGT) has set norms and guidelines (O.A. No. 606/2018) to address legacy waste accumulated at long-operating dumpsites, to mitigate environmental and health hazards. The norms focus on closure and remediation of dumpsites, waste segregation and treatment using appropriate technologies, conducting Environmental Impact Assessments (EIAs), implementing land use planning and zoning regulations, monitoring and compliance measures, and promoting public participation and awareness regarding legacy waste management. These guidelines aim to stabilize dumpsites, prevent further pollution, and involve communities in decision-making and risk education.

#### 4.4.2 LOCAL SELF GOVERNMENT DEPARTMENT - GUIDELINES

The remediation of dumpsites is further directed by Honorable NGT in its order OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. Remediation of Legacy Waste Dumpsites through Bioremediation - G.O.(Rt)No.2629/2022/LSGD Dated, Thiruvananthapuram, 29-10- 2022

#### 4.4.3 KSPCB - GUIDELINES FOR DUMPSITE REMEDIATION

The Kerala State Pollution Control Board (KSPCB) has established guidelines (PCB/HO/SEE2/Model City/Kozhikode corporation/2019 dated 09/09/2021) for dumpsite remediation to address the environmental and health impacts of waste disposal. The recommended steps include conducting a site assessment, developing a remediation plan based on risk assessment, selecting appropriate remediation technologies, implementing remediation activities under supervision, verifying the success of remediation, and ensuring long-term management and monitoring of the site. By following these guidelines, the KSPCB aims to mitigate the adverse effects of waste disposal, protect the environment, and safeguard public health.

#### 4.4.4 CPCB GUIDELINES

Copyright © 2023. KSWMP| All rights reserved.

Hon'ble NGT warned that due to incremental growth of Municipal Solid Waste (MSW), these MSW dumps are converting into virtual mountains. Hon'ble NGT further directed that every city/town should adhere to clause 'J' of Schedule–I (capping is not the first option for environmentally safe legacy waste management) of SWM Rules, 2016. Finally, Hon'ble NGT directed CPCB to propose Standard Operating Procedure (SOP) for implementation of Bio-mining and Bioremediation of legacy solid waste.

### 4.4.5 SWACHH BHARAT MISSION (SBM) ADVISORY

The advisory on dumpsite bioremediation addresses the challenges of legacy waste and promotes sustainable waste management practices and emphasizes the importance of dumpsite bioremediation as a sustainable solution for managing legacy waste. By adopting these guidelines, municipalities can address the environmental and health risks associated with dumpsites and promote a cleaner and healthier living environment for communities.

### 4.4.6 CENTRAL PUBLIC HEALTH AND ENVIRONMENTAL ENGINEERING ORGANIZATION (CPHEEO) GUIDELINES

The guidelines aim to provide a comprehensive approach to remediate dumpsites in a safe and environmentally sustainable manner. Key points from the guidelines include conducting site assessments, segregating waste, and implementing engineering and biological measures to control contamination, treating leachate to prevent groundwater contamination, and conducting post-remediation monitoring. These guidelines are crucial to ensure effective and environmentally sound dumpsite remediation that protects public health and the environment.

Copyright © 2023. KSWMP| All rights reserved.

# 5 SCOPE OF WORK

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Iritty includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (land recovery – Biomining, Capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the Environmental Management Framework – Vol II Part A.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Baseline assessment, impact & risk assessment, mitigations measures and Environmental Management & monitoring plan and its budget.
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport, Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 OBJECTIVES:

Copyright © 2023. KSWMP| All rights reserved.

- To remediate legacy waste dumps with approximately 1254.02 Tons by 31st March 2024.
- To reclaim the area i.e., 0.11 Acreand to extent the waste management activities and to eliminate dump fires, leachate generation, foul odour from dumpsite.
- To reduce Green House Gas Emissions, soil pollution and Ground water contamination.
- To increase nearby social/Real estate value and benefit the citizens.

.

# 6 COMPOSITION, CHARACTERISTICS OF LEGACY WASTE AND ITS IMPACTS

## 6.1 DETAILED INVESTIGATION STRATEGY

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below:

- ✓ Bore hole upto a depth of 9 m and collection of 3 (nos) samples from the soil at interval of 1.5 m.
- ✓ Waste analysis viz., leachate sample from 3 (nos) locations and physical analysis from 2 (nos) location, and chemical analysis from 1 (nos) location.
- ✓ Environmental baseline analysis surface water 1 (nos) location and ground water samples from 3 (nos) location (Well Water Samples -1 up gradient, 2 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location

## 6.2 DETAILED INVESTIGATIONS

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

*Table 6 Investigation details*

| S.No | Parameters | Sampling Nos. |
|---|---|---|
| 1 | Geotechnical Investigation | |
| A | Boreholes up to 10m depth (as per CPHEEO Manual) | 1 |
| B | Permeability test- (as per CPHEEO Manual) standard penetration test SPT and collection of undisturbed samples - Soil Investigation - Classification, gradation, Atterberg's limit, Bulk density, dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, strength, compressibility (vertically- 3 samples per borehole) | 1 |
| 2 | Waste & Environmental Analysis | |
| A | Leachate Analysis (TCLP usepa 1311) (SCHEDULE II of SWM rules, 2016), Suspended solids, Dissolved solids (inorganic),pH, Ammonical nitrogen (as N), Total Kjeldahl nitrogen (as N), BOD, COD, Arsenic (as As), Mercury, Lead, Cadmium, Copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds | 3 |
| B | Physical Analysis of waste (As per CPHEEO manual) including Density, Bulk Density, Moisture Content, Size of waste Constituents, Calorific Value | 2 |

Copyright © 2023. KSWMP | All rights reserved.

| S.No | Parameters | Sampling Nos. |
|---|---|---|
| C | Chemical Analysis of waste/soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), total Carbon, C/N ratio, calorific value, Bio-chemical - biodegradable factor | 1 |
| D | Ground Water (Well Water Samples - 1 up gradient, 2 down gradient) - (shallow and deep wells): pH, Colour, EC, Turbidity, SS, TDS, TOC, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, TKN, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total Coliforms (IS 10500 – 2012) | 3 |
| E | Surface Water (pH, Colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, TKN, Total Alkalinity, Total hardness, Ecoli and Total Coliforms (IS 10500 – 2012) | 1 |
| F | Ambient Air Quality (Sulphur Dioxide (So2), Nitrogen Dioxide (No2), Particulate Matter 2.5, Particulate Matter 10, Ozone (O3), Lead (Pb), Carbon Monoxide (CO), Ammonia (NH3), Benzene (C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise Level (Leq)(Rides) for 24 hours | 1 |
| **Note: Detailed Technical Investigations conducted as per PPR** | | |

### 6.3 METHODOLOGY OF SAMPLING

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed sampling methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

*Table 7 Details of sampling location*

| S.No | Description | Sampling location | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Within the dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind-rose data the air sampling location fixed at two locations |
| | | Dumpsite entry point | |
| 2 | Noise (1 Location) | Within the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite (stream) | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope on |

Copyright © 2023 KSWMP | All rights reserved.

| S.No | Description | Sampling location | Justification |
|---|---|---|---|
| | | | southeast direction possesses a potential risk of leachate runoff, which could result in the contamination of surface water on that particular side of the site. So, the location of surface water is taken on the southeast direction. |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope (SE). The infiltration of leachate which could result in the contamination of ground water.<br>Based on the possible infiltration and slope direction, two ground water samples are collected in the east direction and one of the west direction. |
| 5 | Bore Hole (1 Location) | Within the dumpsite area | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 6 | Legacy Waste | Within the dumpsite area | Not Applicable |

*Table 8 Direction and Distance of the sampling location*

| S.No. | Description | Direction | From Dumpsite (m) | From Boundary (m) |
|---|---|---|---|---|
| 1 | Surface Water | South | 640 | 714 |
| 2 | Ground water-1 | East | 10 | 75 |
| 3 | Ground water-2 | North East | 118 | 175 |
| 4 | Ground water-3 | North West | 2820 | 2875 |
| **Note: Air and Noise Monitoring are monitored inside the dumpsite** | | | | |

*Table 9 Quantity of sampling & location*

| S.No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 11 °58'04.542" E -75°40'53.061"<br>Location -2: N- 11 °58'04.452" E -75°40'53.753" |
| 2 | Surface Water | 1.5 Litres | Location -1:N- 11 °57'49.198" E -75°41'11.609" |

## 6.4 ANALYSIS AND INTERPRETATION OF EXPLORATORY DATA

As part of the feasibility study, Technical Support Consultants (IPE Global Ltd) has entrusted the geotechnical investigation & Environmental baseline assessment to M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Polluchem Laboratories (P) Ltd respectively.

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 05-June- 2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 27thJune 2023 and was completed on 28thJune 2023. Positioning of Air samplers & Noise monitoring equipment,

Copyright © 2023 KSWMP | All rights reserved.

sampling of surface/groundwater, leachate, and legacy waste were done on 09th June 2023 by M/s Polluchem Laboratories (P) Ltd. The lab analysis reports were submitted by the investigation agencies to TSC. The lab analysis reports are provided in Annexures – A & B

### 6.4.1 GEOTECHNICAL EXPLORATORY DETAILS

For assessing the depth of legacy waste and contamination of the soil below the legacy waste, bore hole samples were collected using rotary drill. The exploratory data of the bore hole revealed a maximum depth of 4.50m of waste followed by4.50m of soil. Lateritic rock was encountered below the soil stratum. The Geotechnical investigation was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. The details of the exploratory data of the bore hole is provided below.

*Table 10 Exploratory Data of Bore Log*

| S. No | Borehole location | Total Depth of the Borehole (m) | Depth of Soil (m) | Depth of Legacy Waste (m) | Remarks |
|---|---|---|---|---|---|
| 1 | N- 11°58'04.41"<br>E -75°40'54.066" | 9 | 4.5 | 4.5 | Lab Analysis Report provided at Annexure A |
| Note: Bore hole terminated at the depth of 4.50m below ground level due to Laterite rock. | | | | | |

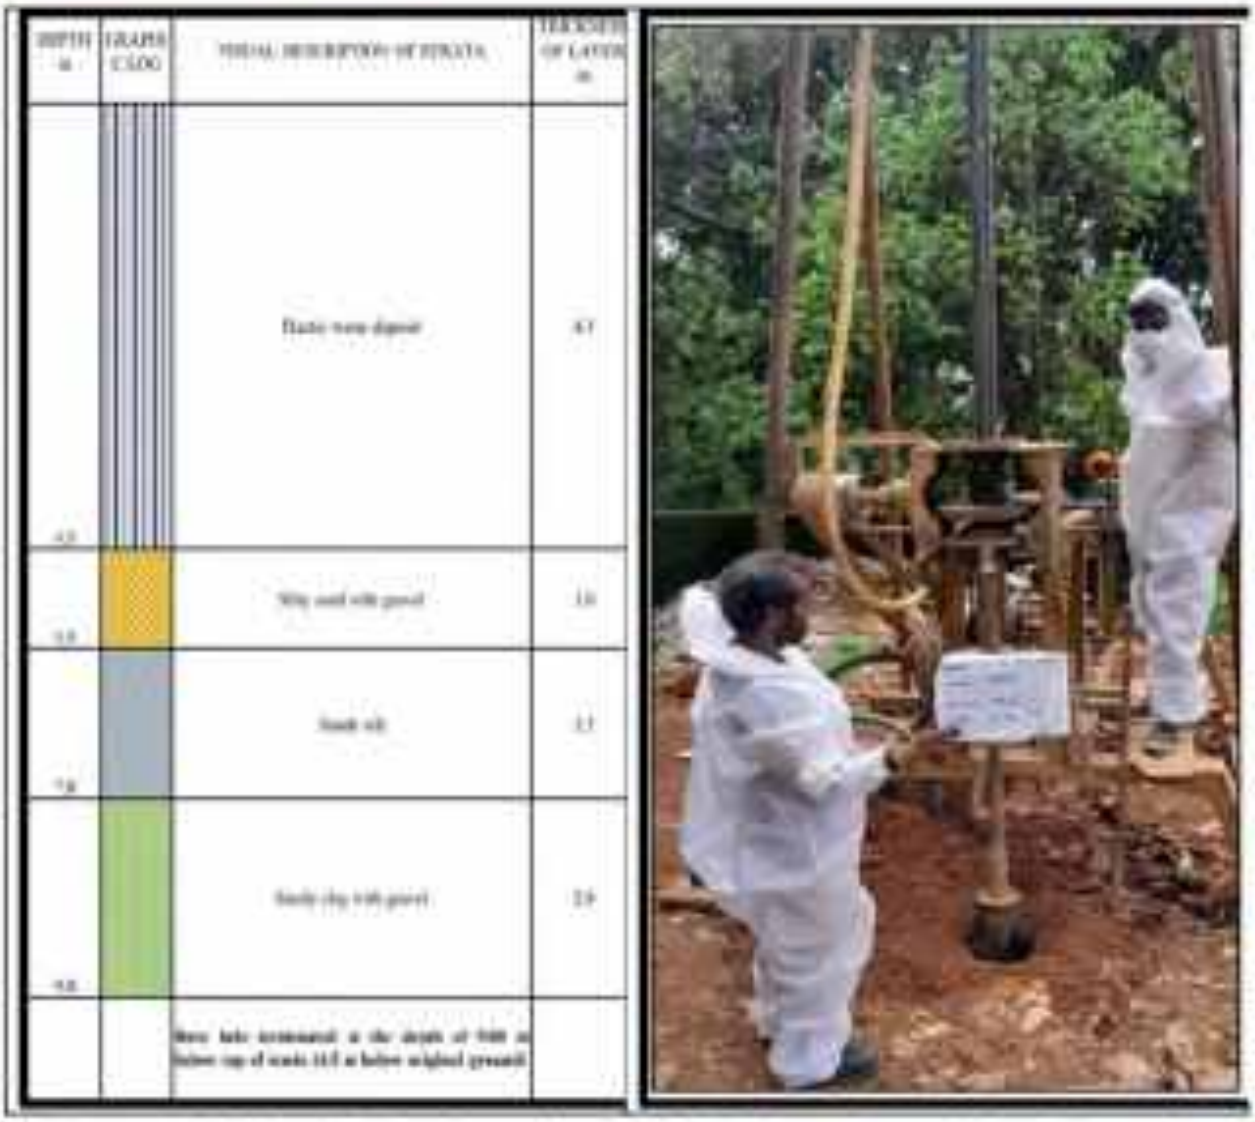

*Figure 6 Soil Profile Details and geotechnical Surveying at Iritty Dumpsite*

### 6.4.2 ESTIMATED TOTAL QUANTITY OF WASTE

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). The details of the estimated total quantity of waste is provided below:

*Table 11 Quantity of waste below and above ground level*

| Waste | Area of Dumpsite | Depth of Waste (m) | Density of Waste (t/m³) | Total Quantity of Waste (m³) | Total Quantity of Waste (T) |
|---|---|---|---|---|---|
| Above and Below | 449.58 | 4.5 | 619.85 | 2023.11 | 1254.024 |

### 6.4.3 LEGACY WASTE CHARACTERIZATION

The characteristics of the legacy waste were assessed by collecting e samples of 25 kg from 2 (nos) locations within the dumpsite. The legacy waste samples were collected on 09th June 2023 by M/s Polluchem Laboratories (P) Ltd. The assessment of waste characteristics. was done based on the results of the analysis. The details of the characteristics viz., composition, physical & chemical characteristics, heavy metals, and estimated quantity of by-products are provided in the tables below:

| S. No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1:N- 11 °58'04.41"E -75°40'54.066"<br>Location -2:N- 11 °58'03.384"E -75°40'53.94" |

**Physical Composition:**

*Table 13 Physical Composition for Location- 1, 2 & Average*

### 6.4.4 ENVIRONMENTAL BASELINE

The environmental baseline was assessed from the analytical results of air, surface &groundwater, noise and leachate from the location as mentioned in the section 6.3. The samples were collected on 09th June 2023 by M/s Polluchem Laboratories (P) Ltd. The Environmental baseline was

Copyright © 2023, KSWMP | All rights reserved.

analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the tables below:

**Surface Water Analysis:**

| Location | Inference |
|---|---|
| 1 | The analysis report on ambient air reveals that except $PM_{10}$ all other parameters are within the acceptable limits as per NAAQS. $PM_{10}$ is very slightly higher than the acceptable limit. |
| 2 | The analysis on ambient air reveals that all parameters are within the acceptable limits as per NAAQS. |
| NOTE: The contractor is required to implement all necessary protective measures during the construction process to ensure that air quality levels are maintained within permissible limits. | |

| Location | Inference |
|---|---|
| 1 | The analysis reveals that all the parameter within the acceptable limit except the BoD is greater than the allowable limit. Indicating that the leachate is containing biological contents. |

### 6.5 RISK ASSESSMENT

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and pathogens. Proper containment and management of leachate are essential to prevent water pollution.

In Iritty dumpsite, the analysis of surface water reveals that all the parameter are within the acceptable limit, except BoD value slightly surpasses the permissible limit and does not have any effect.

*Table 23 Risk Assessment- surface water*

| Risk Assessment | |
|---|---|
| **Source** | **Legacy Waste Dumpsite** |
| **Pollutant** | **Leachate from Dumpsite – BoD higher than the acceptable limits** |
| **Pathway** | **Water / Run off** |
| **Receptor** | **Humans, Animals, Aquatic life and flora & fauna** |
| **Risk** | **No effect on receptor** |

**Groundwater:** Pollutants from dumpsites can infiltrate into the underlying groundwater, particularly if the dumpsite is not adequately lined or if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources and ecosystems. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

In Iritty dumpsite, the analysis of ground water samples at three different locations reveals that except pH, color and turbidity all other parameters are within the limit as per IS 10500:2012. The

Copyright © 2023, KSWMP | All rights reserved.

pH of the sample analysis in all three location which is in slightly acidic range, which cause for corrosionsand make the water not fit for any industrial purpose. The color and turbidity is also very slightly higher for location 1 & 2 and two stations means either chances of having organic matter in the dissolved form or suspended particles or both respectively. But due to high range of turbidity founded at two locations in ground water, there may be chances of more suspended impurities found in ground water. Turbidity is a critical parameter in drinking water because bacteria, viruses and parasites (such as giardia and cryptosporidium) can attach themselves to the suspended particles.

*Table 24 Risk Assessment - Ground water*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite – pH is acidic in nature |
| **Pathway** | Water, Soil |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | **No major effect on receptor** |

**Air:** Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health.

In Iritty dumpsite, the analysis of Air samples at two different locations reveals that the $PM_{10}$ value is high in one location.

*Table 25 Risk Assessment - air*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Within the limits |
| **Pathway** | Air |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | **Negligible impact on the receptor is anticipated, and following the remediation of the site, the $PM_{10}$ associated value is expected to decrease.** |

**Soil:** Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

Copyright © 2023. KSWMP | All rights reserved.

*Table 26 Risk Assessment - soil*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Heavy metals etc. |
| **Pathway** | Soil |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | **Possible risks to Human health**<br>Soils if contain substances such as heavy metals, which may be toxic to humans, can pass those substances on to humans through crop uptake, leading to unsafe foods.<br>**Possible risks to Animals**<br>When farm animals consume the plants grown from contaminated soil it affects the health of animals in later stage.<br>**Possible risks to flora**<br>Soil pollution may alter plant metabolism and reduce crop yields and cause trees and plants that may absorb soil contaminants to pass them up the food chain. |

**Bioaccumulation in Biota**: Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. Contaminated soil or water can be taken up by plants, and these plants may then be consumed by animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife.

In Iritty dumpsite, the environmental baseline parameters are almost within the permissible limits and do not have any major effect on receptors.

*Table 27 Risk Assessment - Bioaccumulation in Biota*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Leachate and gas emission from Dumpsite |
| **Pathway** | Air, water and soil |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | Negligible impact on the receptor is anticipated, and following the remediation of the site, the associated value is expected to decrease. |

# 7 EVALUATION OF REMEDIATION TECHNIQUES

Although the term "legacy waste" has not been defined in any official government document in India, it typically refers to aged municipal solid waste in landfills or dumpsites. There is no information on how old waste must be in order to qualify tobe called legacy waste. These legacy dumpsites are creating various irreversible environmental/health/livelihood hazards. The major sources of pollution are:

- ✓ Puddles of leachate flowing through the adjacent area and reaching the water table long-term issues of greenhouse gas emissions
- ✓ Surface water and groundwater pollution due to erosion and seepage
- ✓ Dumpsite fires
- ✓ Due to the faster urban development and increased waste generation per capita and mismanagement of generated waste.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

**Remediation of legacy waste dumpsite**

Remediation is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

1. Uplift of the environment- reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.
2. Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
3. Land - Dumpsite land becomes available for public use or for setting up SWM facility on the reclaimed land.
4. Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled, or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels.

Copyright © 2023. KSWMP| All rights reserved.

For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- ✓ A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- ✓ Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- ✓ History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- ✓ Baseline study of heavy metals in surface;
- ✓ water, rainfall, soil type, surface hydrology, topography, wind directionetc. shall be studied before and after bioremediation.
- ✓ Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows

### 7.1 BIO-MINING – RECLAMATION/RECOVERY OF LAND

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

*Table 28 Phases of Bio-mining*

| Phases of Bio-mining | |
|---|---|
| Phase 1: Stabilization | The legacy waste is formed into equal-sized windrows, and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| Phase 2 Sorting & Segregation | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/circular rotatory sieves and manpower. |

Copyright © 2023, KSWMP | All rights reserved.

| | |
|---|---|
| **Phase 3: Disposal & Utilization** | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |

| | |
|---|---|
| **Salient Aspects** | land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>Compliance to SWM Rules and NGT orders.<br>Improvement in aesthetics and quality of life & health. |
| **Applicability** | The ownership is well defined.<br>Working space is available in the dumpsite.<br>Linkage for utilization by-products is available |

### 7.2 CAPPING WITHOUT LAND RECOVERY

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| **Salient Aspects** | The capped area becomes a green space and can be developed into parks/recreational areas.<br>Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years.<br>Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep-rooted vegetation. Recurring expenditure will be incurred for regular maintenance. |

Copyright © 2023 KSWMP | All rights reserved.

| | |
|---|---|
| | On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio-mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| **Applicability** | Capping could be a solution for legacy waste where bio-mining is not possible because of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for utilization/ disposal of segregated components<br>Lack of working space & resources |

### 7.3 CAPPING WITH PARTIAL LAND RECOVERY

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can linked to relevant buyers and the inert material will be capped to prevent further degradation of the environment.

| | |
|---|---|
| **Salient Aspects** | The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |
| **Applicability** | Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for disposal of inert<br>Recovery land for public use is not a priority |

Copyright © 2021 KSWMP | All rights reserved.

## 7.4 SELECTION OF REMEDIATION OPTION

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. It may be noted that the bio-earth and C&D material which will be recovered by remediation is proposed to be used for development of the reclaimed legacy waste dumpsite as recreational park/facility (for site development work/ profiling). The bio-earth and C&D material recovered will be subjected to bi-weekly sampling and conform to the parameters mentioned in Schedule II of SWM Rules 2016 before using the material. Considering the same, there won't be any leachate generation using this material. There won't be any capping done and hence the question of erosion etc. doesn't arise.

**Salient parameters for opting the Bio-mining – reclamation/recovery of land.**

1. Based on the assessment from the chemical analysis report from the M/s. Polluchem, all the heavy metals are within the permissible limits as prescribed by the regulatory authorities Soil is free of contamination viz., heavy metals, chemical and other toxic substances.
2. Land recovery, increase in value of land and available for public use/setting of SWM facility with immediate effect. An area of 1.25 acres will be reclaimed through bio-mining
3. Adequate downstream linkages for the management/disposal waste viz., Bio-earth and C&D waste will be utilized for development of the reclaimed legacy dumpsite as recreational park/facility, recyclables will be sold to the authorized recyclers & will be collected from the project site and RDF will be sent to Cement industries for co-processing viz., as supplement to the conventional fuel.
4. By products/aggregates generated from the process can be used as alternative construction material (after processing), fuel and recyclables.

Copyright © 2023. KSWMP| All rights reserved.

5. The Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping.

Copyright © 2023. KSWMP| All rights reserved.

# 8 TECHNICAL DESCRIPTION OF THE SELECTED OPTION

## 8.1 METHODOLOGY

The legacy waste dumpsite reclamation through bio-mining with recovery of land involves Phase 1: stabilization, Phase 2: sorting & segregation and Phase 3: disposal & utilization

The type of machinery, capacity and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type machinery available for the bio mining are as follows:

1. Stationary screening machinery and
2. Mobile/compact machinery.

### 8.1.1 STATIONARY SCREENING MACHINERY

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- ✓ Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- ✓ Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- ✓ Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered

Copyright © 2023, KSWMP | All rights reserved.

and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process.

- ✓ Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- ✓ Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- ✓ Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process

prepares the waste for further treatment or disposal.

Source: DCC Infra., Gurugram Site

Salient Features of Stationary Screening Machinery:

- Land requirement high for setting of machinery and processing area.
- Erection, Installation and Commissioning is time consuming
- Cost Intensive – CAPEX & OPEX high

***Figure 8Stationary Trommel Machine***

Copyright © 2023. KSWMP| All rights reserved.

- Electrical Power Intensive and Consumption is high
- Breakdown of the Machinery is high, onsite technicians should be available.
- Manpower – skilled & unskilled Intensive
- Suitable for quantity more than 2,00,000 ton of legacy waste.
- Less suitability for reuse of the machinery/screenings for more than one site/location.

### 8.1.2 MOBILE/COMPACT SCREENING MACHINERY

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation.

**Structure:** The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity.

**Screening Mechanism:**The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

**Separation System:** Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

**Treatment Process:**In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For

Copyright © 2023. KSWMP| All rights reserved.

example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

**Transport:** Quick and easy folding of conveyor helps in quick setup time.

**Discharge height:** Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages.

*Source: Kleemann Mobile Screens (Piranna, Ahamadabad Site)*

*Figure 9 Compact Screening Machinery*

**Salient Features of Mobile/Compact Screening Machinery:**

- Full Mobility: Plants are fully mobile like excavator. Plants can be moved across the most difficult of surfaces and terrain and can accommodate the most inaccessible locations.
- Quick Set up time: Track-Mobile plants can normally be set-up within 1 hour, as it normally does not require additional conveyors, feed hopper to link separate machines, thus increasing machine utilization.
- Versatility: Track-Mobile plants can be operated independently or in combination of two or three stage screening depending upon user requirements.
- No Civil works required: Plants do not require any civil works, can be erected & shifted quickly. Thus, offer quicker return on investment.
- Manpower requirement is less.

## 8.2 SELECTION OF MACHINERIES

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining –

Copyright © 2023. KSWMP| All rights reserved.

reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, mobile / compact screening shall be the optimum screening machinery for the Iritty Dumpsite. The 1254.02 tons legacy waste can be remediated within the stipulated time by NGT i.e. 31st March 2024

**Salient parameters for opting the Mobile/Compact screeners.**

1. Sorting/segregation of the stabilized legacy waste of 2023 m³/ 1254.02 Tons within the stipulated timeline of 31st March 2024.
2. The remediation process will be guided by National, State Regulations & EIA/EMP in line with KSWMP ESMF.
3. Salient Features of Mobile/Compact Screening Machinery – details are in the section 8.1.2

## 8.3 SYSTEM REQUIREMENTS

### 8.3.1 CAPACITY SIZING OF MOBILE COMPACT SCREENER

The capacity of the Mobile compact screener is assessed as **100 TPH** considering the physical site conditions including quantity & characteristics of legacy waste and stipulated timeline for 100 % land reclamation by **31st March 2024.** The calculation shown is only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards. The details of plant capacity sizing are provided in the table below:

*Table 29 Capacity sizing of Mobile Compact Screener*

| Description | Quantity |
|---|---|
| Quantity of waste (Tons) | 1254.02 |
| Mobilization and site preparation (days) | 45 |
| Weekends & Holidays | 12 |
| Rainy Days | 20 |
| Break downs (Days) | 15 |
| No of days (Dec 2023 - Mar 2024) | 120 |
| Effective processing days | 35 |

Copyright © 2023, KSWMP | All rights reserved.

| | |
|---|---|
| Processing per day (Tons) | 400 |
| Capacity of the Plant - Considering working 8 hrs/day | 94 |
| Proposed Capacity of plant TPH | 100 |

### 8.3.2 MACHINERIES & VEHICLES

Detailed assessment of quantity (nos.) of machinery, vehicles, auxiliary items required for effective processing of the legacy waste are provided in the Annexure – E. The summary of machineries and vehicles requirements are provided in the table below:

*Table 30 Machineries & Vehicles*

| S. No. | Description | Quantity(Nos) | Remarks |
|---|---|---|---|
| 1 | Mobile Trommel @ 100TPH | 1 | Detailed Specifications are provided at Annexure –F |
| 2 | Baling Machine @ 50TPD | 1 | |
| 3 | Ballistic Separator @ 30TPH | 1 | |
| 4 | Magnetic Separator | 1 | |
| 5 | Front End Loader @ Bucket Capacity 1Cum | 2 | |
| 6 | Chain Mounted Excavator @ Bucket Capacity 1.1 Cum | 2 | |
| 7 | Weighing bridge - 40 Ton | 1 | |
| 8 | Tipper @ 8Cums | 5 | |
| 9 | Tractor - Trolley shift of Materials | 1 | |
| 10 | Tractor -Trolley Water Tanker | 1 | |
| 12 | Mechanical Sprayer | 2 | |
| 13 | Office - Portable cabin (1 Nos) | 1 | |
| 14 | GPS (5 Nos) & Tracking System (1 Nos) | 5 | |
| 15 | CCTV System (Cameras 5 Nos) | 5 | |
| 16 | Fire Safety System - Fire Extinguisher ABC type 4 Kg/cm2 | 10 | |

***Note: Considering the size of the site, it is required that the contractor liaisons with the Fire Department and deploys a fire tender team at the site during the period of the contract works to manage any fire incident as part of Fire Safety Plan. Alternatively, general SOPs for fire safety detailed herewith are to be followed:***

- ***a) Fire Fighting System including fire hydrant, pressure pumps, 5000 Ltr (min) water storage, adequate hose reel and fire extinguishers to be provided at site.***
- ***b) Alternate source of power (DG)***
- ***c) Manual Fire Alarm System with evacuation plan***
- ***d) Regular check, maintenance of equipment's for firefighting (before initiating work and then at interval of 1 months thereof)***
- ***e) Training to all men. (Before initiating work and then at interval of 3 months thereof).***

Copyright © 2023. KSWMP | All rights reserved.

*f) Maintaining fire line while storage of material (RDF). RDF to not exceed 10% of total estimated waste at site at any given time.*

*g) Any other requirement in consultation with local Fire & Rescue Services office.*

## 8.4 OPERATIONS AND MAINTENANCE

### 8.4.1 MANPOWER:

Detailed assessment manpower required for effective processing of the legacy waste are provided in the Annexure – I. The summary of manpower required are provided in the table below:

*Table 31 Manpower details*

| S. No | Manpower | Nos |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental, Socialand Health & Safety (ESHS) Officer | 1 |
| 3 | Security (3 X 8 Hrs) | 3 |
| 4 | Operations Supervisor & Accountant | 2 |
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 2 |
| 8 | Labors near Screening machinery | 4 |
| 9 | Labors at Baling facility | 2 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 11 |

### 8.4.2 ELECTRICAL POWER:

*Table 32 Electrical Power details*

| Machineries | Required Electrical Load (KW) | Working Hr. | Total Units (KW-Hr) |
|---|---|---|---|
| Balling Machine | 5 | 4 | 20 |
| Ballistic Separator | 15 | 6 | 90 |
| Magnetic Separator | 5 | 6 | 30 |
| Weigh bridge | 5 | 6 | 30 |
| **Total** | **30** | | **170** |

Copyright © 2023, KSWMP | All rights reserved.

### 8.4.3 FUEL/DIESEL FOR VEHICLES:

*Table 33 Fuel/Diesel for Vehicles*

| Description | Liters per Day |
|---|---|
| Fuel - Diesel Mobile Trommel (12 liters/hour) | 96 |

### 8.4.4 WATER REQUIREMENTS:

*Table 34 Water Requirements*

| Description | Liters per Day |
|---|---|
| Water required for workers and other uses. | 5000 Liters Per Day |
| (Source – Municipality water Supply) | |

***Note;** The responsibility of availing necessary power and water connection shall be with the contractor as condition precedent before starting the work.*

Copyright © 2023. KSWMP | All rights reserved.

# 9 SCOPE OF DISPOSAL INCLUDING LOCATION OF DISPOSAL FOR RDF, BIO SOILS, C & D WASTE, AND OTHERS AS PER LOCAL DEMANDS

## 9.1 UTILIZATION OF BY PRODUCTS

The details of the utilization of aggregates/by-products screened out by processing of the stabilized legacy waste are provided in the table below.

*Table 35 Utilization RDF, bio soils, C & D waste*

| S.No | Component | Quantity (Cu.m) | Utilization/Linkage/Usage |
|---|---|---|---|
| 1 | Bio earth and C&D Waste | 896.62 | The bio earth and C&D and quantity 896.62 cu.m waste will be utilized for development of the reclaimed legacy waste dumpsite as recreational park/facility |
| 2 | RDF | 317.58 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel supplementing the conventional fuel. Currently the indicative nearest location for the RDF disposal is at Dalmia Cements, Trichy which has the necessary infrastructure for co-processing of RDF. |
| 3 | Recyclables & others | 39.81 | Recyclables will be sold to CKCL/recyclers authorized by KSPCB/CPCB. |
| Note: The contractors engaged in biomining will be responsible for ensuring this disposal of Bio Earth, RDF, recyclables, and others. | | | |

Copyright © 2023 KSWMP | All rights reserved.

## 10 ESTIMATED PROJECT COST

The details of the estimated cost for bio-mining - recovery of land by remediating legacy waste dumpsite is provided in the table below:

*Table 36 Details of Estimated Project Cost*

| Estimate for Dumpsite remediaion considering Forward Linkage | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| **Sr. No.** | **Activity** | **Details** | **Rate/ m3** | **Cost Index @ 1.35 * A** | **COP @ 1.15 * C** | **Round off (INR)** | **Quantity (m3)** | **Amount (Rs)** |
| | | | **A** | **B** | **D** | | | |
| 1 | Remediation/ Biomining | Rate adopted from Calculation from Suchitwa Mission (DSR 2018 including baling) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 2 | Transportation of RDF | The average distance to cement factories works out to be 400 km. The rate of transportation of of RDF can be considered as [redacted]. | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 3 | Disposal of recyclable | Considering that the recyclable will be sold at rate of [redacted] per m3 of recyclable, disposal cost can be around [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 4 | Disposal of Inert | Considering the disposal cost of [redacted] per m3 (market rate) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 5 | Disposal of Compost / Soil enricher | Considering the disposal cost of [redacted] per m3 (market rate) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |

## 10.1 REVENUE FROM THE PROJECT

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- Bio earth & C&D waste will be utilized within the remediated dumpsite as filler material for development of recreational park.
- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at no cost whereas transportation cost is required to be borne by the contractor sending the RDF to the cement factory/ WtE facility.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable.

## 10.2 FUNDING FOR PROJECT

The estimated cost of Rs. [redacted] /- for the project Dumpsite Remediation which works to Rs. [redacted] /- per $m^3$. The sources and funding pattern is given below:

*Table 37 Funding for the project*

| Item | External (70%) Rs. | State Govt.(30%) Rs. | Total cost Rs |
|---|---|---|---|
| Remediation of Legacy waste dumpsite | [redacted] | [redacted] | [redacted] |

# 11 PROJECT IMPLEMENTATION PLAN

## 11.1 PROPOSED OPERATIONAL PLAN

The bioremediation of Irrity dumpsite will be done with the land recovery and will be executed through an outsourcing model. The proposed operational plan is provided at the Annexure - I

## 11.2 TIMELINE

In compliance with the National Green Tribunal (NGT) orders, it is mandatory to remediate all dumpsites in Kerala by March 2024. To ensure timely completion and compliance with the deadline, timeline for the implementation of project is provided below.

| S No | Description | Indicative Time frame |
|---|---|---|
| 1 | Start date | 01/12/2023 |
| 2 | End date | 31/03/2024 |

## 11.3 CONTRACT MODEL

**Execution Method:**

- Item Rate Contract and disposal/Management of by-products/aggregates with land recovery and redevelopment of the site with inert/ soil enricher. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

**Working Model:**

- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for setting up the plant to the Contractor.
- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- Contractor is responsible for disposal of RDF, recyclables, and aggregates

Copyright © 2023 KSWMP | All rights reserved.

## 12 BENEFITS OF THE PROJECT

Remediation of legacy waste dumpsite in the Iritty leads to the following anticipated benefits:

- **Reclamation of Land**: An area of 0.11 acres will be reclaimed and will be developed into a recreational park for public use. A contamination assessment is to be carried out before any public use project is taken up at the location.
- **Environmental Protection**: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity. The project shall arrest GHG emissions from the legacy dumpsite.
- **Health Improvement**: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- **Enhanced Water Quality**: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to the safe drinking water.
- **Aesthetic and Social Benefits**: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- **Operational & Life cycle Aspects**

  Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through bio-mining process.
- **Employment**

  During remediation& post- remediation period, requirement of un-skilled labor will be fulfilled by s local sourcing.

Copyright © 2023. KSWMP| All rights reserved.

## 13 CONCLUSION

- The activities of the bio-mining will be commenced from Dec 2023 to Mar 2024. An area of 0.11 acres will be reclaimed and will be developed into a recreational park for public use but it is not finalized so it can be used as SWM processing facilities after contamination assessment.
- Through the process of bio mining the dumpsite, complete land reclamation and recovery, while prioritizing environmental safeguards. This means that the land will be reclaimed and put to use.
- Considering site conditions and quantum, screening of the 2023 $m^3$ of legacy waste, mobile / compact screening machinery will be preferred.
- Favorable site conditions for bio-mining:
    1. Optimum width of the road is available for movement of the vehicles.
    2. Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
    3. The borewell water source is available in the dumpsite.
    4. At the dumpsite plot, a vacant land parcel of approx. 0.20 acres is available for the installation of auxiliary infrastructures, supporting conditions movement of processing machinery and vehicles.
- The project activity requires to obtained "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- By-products utilization/forward linkages/Usage
    1. The bio earth & C&D quantity of 991.32 $m^3$&455.20 $m^3$respectively is proposed to be utilized after testing for the contamination for development of the reclaimed land as recreational park/facility. The contraction shall level the site in consultation with the PIU/TSC/DPMU.
    2. Refused derived fuel (RDF) of 512.35 $m^3$ will be to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the processes. The indicative location of cement plant is Dalmia Cements, Trichy.
    3. Recyclables of 64.23 $m^3$ will be sold to CKCL /Private recyclers authorized by KSPCB/CPCB

Copyright © 2023. KSWMP| All rights reserved.

- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, NGT orders, KSPCB norms, CPCB guidelines and KSWMP ESMF and other regulatory rules & norms.
- Environmental & Social safeguards:
    1. The project attracts E2 Environmental category based on the Environmental Screening and Exclusions mentioned in the Environmental and Social Framework Guidelines.
    2. Site specific Environmental Assessment and Environmental Management Plan has been developed.
    3. The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is Rs. [redacted] /- (INR [redacted]). The cost per $m^3$ for processing and disposal of the legacy waste is Rs [redacted] /- per $m^3$.

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Athithattu, Iritty, Kannur district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 05th June 2023. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 27th June 2023 and was completed on 28th June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

# 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along with Mr. Kamal Kishore Jha and Mr. Mahesh an environmental expert of IPE Global during the first week of

June 2023, in order to collect the information regarding the site prior to mobilising the equipment for drilling.

The dumpsite is situated well away from any human habitation. The site at this location is a sloping terrain.

**Figure 1** : Location of the borehole drilled at the dumpsite.

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste at the dumpsite.

### 4.2 Drilling equipment

Mechanical rigs of rotary drilling machine were used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag

bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log the commencement and completion date,

location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing are presented in **Appendix II**.

**Table 1: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |

## 6 SUMMARY

The geotechnical examination on the soil samples collected after boring through the waste at the dumpsite at Athirathattu, Iritty, Kannur was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was bored using a rotary drilling method. The maximum depth of investigation was 9.0 m (4.5 m in waste and 4.5 m in the ground). SPT and collection of undisturbed samples were carried out at regular intervals. Various laboratory tests were carried out on the SPT and undisturbed soil samples.

Based on the investigations carried out, it was observed that the original ground below the waste comprises of a silty sand with gravel layer until 5.5 m followed by a sandy silt layer having an average SPT N-value of 26 underlain by a sandy clay with gravel layer with an average N-value of refusal until the depth of termination at 9.0 m below the top of waste. The tests mentioned in the above table were performed on the samples in the laboratory following the respective codes to obtain the necessary parameters. The laboratory results on samples obtained from the site are appended in **Appendix II**.

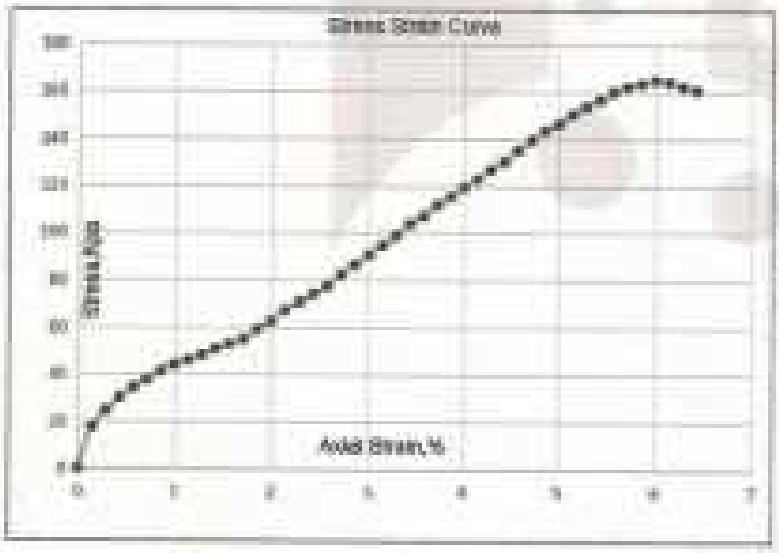
## UNCONFINED COMPRESSIVE STRENGTH(UCS) OF SOIL TEST REPORT

Report No: ML23/R-02363/12
Issue No: 1
Report Date: 09/07/2023



| | |
|---|---|
| Client: | Project Manger, SPE Global |
| Address: | 2nd Floor, 16/3878 - 3879, Kavanatt Building, Kanapparoor Village, Kakkanad, Ernakulam, Kerala-682030 |
| Contact: | - |
| Project No: | - |
| Project Name: | Geotechnical Investigation at Dumpsite in Athithattu, Ithly |
| Consultant: | - |
| Owner: | KSWMP |
| Contractor: | - |
| Project Location: | Athithattu, Ithly, Kannur District |
| Tel / Email: | - |

### Sample Details

| | | | |
|---|---|---|---|
| Received Date: | 06/07/2023 | Client Sample Ref.*): | Soil (UDS), BH 01, Depth 8.00m |
| Work Order ID: | ML23/W-02363 | Sample Submitted By: | Geotechnical Division |
| Sample ID: | ML23/W-02363/07 | Source: | BH 01, Depth 8.00m |
| Date Sampled: | 28/06/2023 | Sampled By: | Geotechnical Division |
| Sampling Method: | IS: 2132 - 1986 | Sample Size(kg): | 5 Approx |
| Sample Location: | Athithattu, Ithly, Kannur District | Date Tested : | 06/07/2023 - 07/07/2023 |
| Sample Cont. No: | - | Test Method Variation: | None |
| Test Location: | MatterLab, Kozhikode | Lab Sample Desc.: | Soil (UDS), BH 01, Depth 8.00m |
| Tested By: | GK/DK | Client Sample Desc.: | Soil (UDS), BH 01, Depth 8.00m |

### Test Results

Method: IS: 2720 (Part 10)-1991 (RA2013)

| | |
|---|---|
| Unconfined Compressive Strength(kPa) | 165 |
| Specimen Height (mm) | 140 |
| Specimen Dia(mm) | 70 |
| Specimen Density(g/cc) | 2.14 |
| Moisture Content(%) | 33 |
| Type of specimen | Undisturbed |
| Specimen Condition | - |

# VOLUMETRIC ANALYSIS

**Dumpsite volume:**

## IRITTY DUMPSITE QUANTITY

| Sl.no | Name: | Area (sq mtr) | Height above Ground level (m) | Average Height below Ground level (m) | Total Height (m) | Volume(Height x Area) (cum) |
|---|---|---|---|---|---|---|
| 1 | Plot 1 | 449.58 | - | 3.5 | 3.5 | 1573.53 |
| | | | | Grand Total | | 1573.53 |

Note:
*The volume herein above mentioned is not accurate. We haven't measured the height wherein we have calculated the total quantity according to the information given to us by the concerned authorities.*

NOTE: After the Geotechnical Analysis, It was found that the Waste depth is 4.5 m. So the Volume of the waste is revised. i.e 449.58 * 4.5 = **2023.11 cu.m**

# PROPOSED OPERATIONAL PLAN

## Proposed Operational Plan

The project of the Bio-mining with land recovery will be implemented through 100% outsourcing model. The detailed operations of land recovery is provided below:

### 1. Project Kick-off

The existing legacy waste dumpsite should be visited jointly by representative of implementation agency, officials ULB and experts of PMU/PMC & TSC for the following

- ✓ For assessment of ***As –Is Situation*** of local settings viz., human settlement & environmental settings etc.,
- ✓ For validation of profile, quantity & physical characterization of legacy waste.
- ✓ Available services viz., electrical power, source of water and access road etc.,
- ✓ For ground truthing the sampling locations of baseline environmental parameter, locations where monitoring will conduct during operation phase and post reclamation phase
- ✓ For sensitizing/awareness of the upcoming the project activity to the stakeholders within the vicinity of the dumpsite.
- ✓ For understanding the sensitive of environmental & social aspects/social considerations viz., educational institutions, religious places and settlements settings.
- ✓ For ensuring that the implementation agency understands and to complies with all local and national regulations related to project activities.

### 2. Site Management Plan

The position of the machineries and other auxiliary machineries/equipment's in-line with the defined process of bio-mining with land recovery play imperative role in effective implementation of the project activities.

A detailed site management plan is prepared including the details of excavation & pre stabilization area in phases (1 to 4), machineries, weigh bridge, area allocation for by-products storage, vehicle parking area and position of CCTV cameras. The detailed site Management plan is provided in below photo.

### 3. Site Preparation

The portion of the legacy waste dumpsite will be clear vegetation and levelling the area to create a stable & level platform for positioning of bio-mining machineries/equipment's and for processing of legacy waste.

4. **Procurement of Machinery & Vehicles and Equipment's**

An indicative list of Machineries &Vehicles and equipment's are proposed to for effective processing the quantity of existing legacy waste in-tune to the timeline of NGT orders. The indicative list of the Machinery & Vehicles and equipment's are provided in the Section 8.3.2

5. **Mobilization of Manpower**

For effective management of the project activities, an indicative list Manpower provided in the Section 8.4.1 shall be mobilize required.

6. **Statutory Approvals**

The implementation agency is responsible for obtaining all required permission/consent/approvals from the competent authorities. The ULB/DPMU/DPMC will only facilities implementation agency in obtaining the approvals etc. The indicative list of statutory approvals required for the project is provided below.

a. Site Authorization from KSPCB in conforming to SWM Rules 2016 and Consent to Establish/Operate KSPCB.
b. Dept. of mining and geology
c. Necessary permission for storage of process materials and chemicals
d. NOC from Dept. of Fire and Rescue
e. Segregated Hazardous waste disposal arrangement (eg: KEIL Ambalmedu, Kochi)
f. NOC from Heritage/Archeology if the site is in regulated zone of heritage/protected building
g. Any other statutory approvals/ permissions

7. **Establishment of forward linkages**

The By-products from the bio-mining process/operations viz., Bio earth/ C&D waste (Inert), RDF and Recyclables will be stored in the designated place (as indicated in the site management plan) within the dumpsite. The contractor is responsible for management/establishment of forward linkages. Utilization of Bio earth/C&D (inert) may be finalized in consultation with ULB. An indicative forward linkage is provided in the Section 9.1. The compost should conform to Schedule

II of SWM Rules 2016, and RDF should conform to the Guidelines on Usage of RDF in various Industries issued by MoHUA. Bi-weekly sampling will be carried out to confirm the same.

**Bio-mining operations**

- Step-1 – Waste Stabilization

The initial step involves the use of a front-end loader to excavate the legacy waste, allowing for the leachate to dry out through exposure to solar radiation and for the removal of trapped methane from the heap. To ensure the decomposition of biodegradable waste such as discarded food, fruits, flowers, and garden waste, proper aeration is necessary to prevent the generation of leachate and odors. The top layer of the legacy waste, approximately 150 mm in depth, is repeatedly loosened using the front-end loader. Additionally, the waste is lightly mist-sprayed with bio-cultures to manage odors and disperse decomposing microbes throughout the waste. The loosened legacy waste forms windrows.

- Step-2 – Windrow Formation

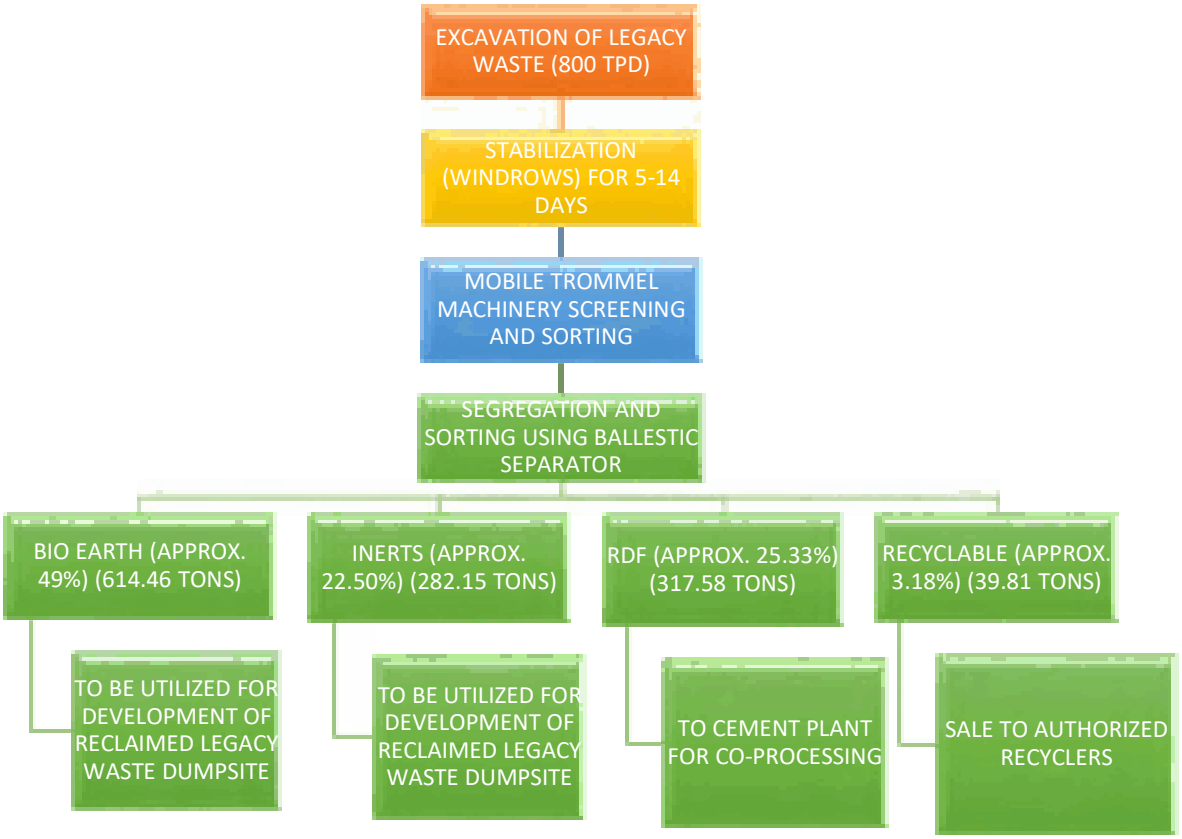
The second step involves creating windrows of the legacy waste using backhoe. Composting bio-cultures are added to accelerate decomposition and generate biological heat within the waste, aiding in drying it out and reducing its volume. These windrows are turned every 3 days to ensure proper biological treatment and moisture loss. After 1-2weeks, when the heaps have reached a suitable consistency for screening, the material is weighed and transferred to a Mobile Trommel, which consists of rotating cylinders with different-sized perforations.

- Step-3 – Sorting and Segregation by Mobile Trommel

The third step is to move stabilized waste to mobile trommel to get 3 different sizes of fractions

- ✓ Fraction 1 – (minus 30 mm) – Bio Soil/earth -Used for side development/ filling.
- ✓ Fraction 2 – (30-80) mm – Mixed fraction – Plastics with C&D (send to Ballistic Separator)
- ✓ Fraction 3 – (80 +) mm – Mixed fraction – (send to Ballistic Separator)

The Fraction-2 & Fraction-3 (30-80) mm & (80 +) mm is required to move for further separation process through ballistic separator.



- Step-4 – By - products – C&D materials

In the fourth step, the fraction-2 and fraction-3 are sorted into three types based on their shape and weight: heavy and rolling fraction (referred to as 3D) - C&D Material, light fraction (referred to as 2D) - RDF, and the sieved fraction (or under-screen fine fraction) - Plastic.

- Step-5 - Byproducts – RDF

In the fifth step, the RDF sorted by the ballistic separator (30TPH) is moved to the baling machine (50TPD) for packaging the RDF fractions. The baled RDF is then transported to Cement plants via a weigh bridge (30Ton), where a co-processing facility is available.

## 8. Monitoring & Supervising Mechanism

Supervision and monitoring during dumpsite remediation by TSC/PIU/DPMU

## 9. Record keeping and Reporting

i. The Implementation agency shall maintain a record of the daily processed legacy waste and also keep proper record of all the recovered and disposed of materials.

ii. The Implementation agency shall maintain authorized weigh bridge records at the point of receipt by end designated agency. A consolidated weigh bridge records certified by the

Plant Manager/competent authority of the authorized Cement plant/ WtE or such units certifying the total RDF received from the Project is a valid proof of compliance.

iii. The Implementation agency shall maintain all the statutory records, as per SWM Rules, 2016, and also conditions stipulated in Site Authorization/Consent to Establish/Operate by KSPCB if any, KSWMP/WB requirements and other project relevance statutory requirements.

iv. The site shall be operated in CCTV surveillance with data storage of entire contract period. For CCTV surveillance High-Definition IP based cameras in adequate numbers. As per the requirement of the ULB/KSWMP link with mobile compatibility may be provided for online monitoring of the project activities.

v. The vehicles engaged for the project activities shall be equipped with Vehicles Tracking System (VTS) by equipping with GPS and online monitoring system.

vi. The agency is required to maintain loading and unloading weighbridge slips, e-way bill, LR copy, RDF receipt acknowledgement letter from the cement factory/ WtE facility for complete traceability of the recovered fractions.

## 10. Land recovery/project closure

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the bidder to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

Annexure-J

# LSGD GUIDELINES FOR REMEDIATION OF LEGACY WASTE DUMPSITES THROUGH BIOREMEDIATION

# GOVERNMENT OF KERALA

## Abstract

Local Self Government Department - Guidelines for Remediation of Legacy Waste Dumpsites through Bio Remediation - orders issued.

## DEPARTMENT

G.O.(Rt)No.2629/2022/LSGD Dated,Thiruvananthapuram, 29-10-2022

Read 1 Letter No. 2683/C2/2022/SM dated 16.09.2022 from Executive Director Suchitwa Mission.

## ORDER

As per the letter read above, Executive Director, Suchitwa Mission had submitted draft guidelines for implementation of project for remediation of Legacy Waste Dumpsites through Bio Remediation.

2) Government have examined the matter in detail and are pleased to approve the guidelines enclosed herewith for implementation of project for reclamation of legacy waste dumpsites through bio remediation.

(By order of the Governor)
SHIBI ABRAHAM
DEPUTY SECRETARY

To:

Principal Director Local Self Government Department

Director Local Self Government(Urban) Department

Director, Local Self Government (Rural) Department

Executive Director, Suchitwa Mission

**ലെഗസി മാ**ലിന്യ **നിർമ്മാർ**ജന പദ്ധതികളു**ടെ നിർവ്വഹ**ണ ഉദ്യോഗ**സ്ഥ**ൻ

- ലെഗസി മാലിന്യ നിർമാർജന പദ്ധതികളുടെ നിർവ്വഹണ ഉദ്യോഗസ്ഥൻ തദ്ദേശ സ്വയംഭരണ സ്ഥാപനത്തിന്റെ എഞ്ചിനീയർ ആയിരിക്കും

നിർമ്മാർജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യ നിക്ഷേപങ്ങളുടെ അളവ തിട്ടപ്പെടുത്തൽ

- പൊതുവായി, നിർമ്മാർജ്ജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യത്തിന്റെ അളവ (ക്യൂബിക മീറ്ററിൽ) ടോട്ടൽ സ്റ്റേഷൻ സർവേയിലൂടെ കണ്ടെത്താവുന്നതാണ. എന്നാൽ ടോട്ടൽ സ്റ്റേഷൻ സർവേ സാധ്യമല്ലാത്ത സാഹചര്യത്തിൽ, ഒരു ലക്ഷം ക്യൂബിക മീറ്റർ വ്യാപ്തിയിൽ കൂടുതലുള്ള വലിയ ഡംപസൈറ്റുകളുടെ കാര്യത്തിൽ ഡ്രോൺ സർവ്വേ രീതി സ്വീകരിക്കാവുന്നതാണ.

- ആവശ്യമുള്ള പക്ഷം, പുറമെയുള്ള സർവേ ഏജൻസികളെ നിശ്ചിത നടപടിക്രമങ്ങൾ പാലിച്ച ഇതിനായി ഏർപ്പെടുത്താവുന്നതും, അതിനുള്ള ചെലവ ലഭ്യമായ ഫണ്ടിൽ നിന്ന തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം വഹിക്കേണ്ടതുമാണ.

- സൈറ്റിന്റെ കോണ്ടൂർ മാപ്പ തയ്യാറാക്കേണ്ടതും ആയത തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ പരിശോധിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

എസ്റ്റിമേറ്റ തയ്യാറാക്കലും പദ്ധതി രൂപീകരണവും

- സൈറ്റിന്റെ നിലവിലെ അവസ്ഥ, മാലിന്യത്തിന്റെ സ്വഭാവം/തരം, മാലിന്യ നിക്ഷേപത്തിന്റെ കാലയളവ, മറ്റ അടിസ്ഥാന വിശദാംശങ്ങൾ എന്നിവയെക്കുറിച്ചുള്ള വിശദമായ റിപ്പോർട്ട അനുബന്ധം- I ൽ നൽകിയിരിക്കുന്ന പ്രൊഫോർമയിൽ തയ്യാറാക്കേണ്ടതാണ

- അനുബന്ധം-II ൽ നൽകിയിരിക്കുന്ന സ്പെസിഫിക്കേഷനും ഡാറ്റയും അനുസരിച്ച ബയോമൈനിംഗ മുഖേന പ്രവൃത്തി നടപ്പിലാക്കുന്നതിന എസ്റ്റിമേറ്റ തയ്യാറാക്കേണ്ടതാണ.

- പ്രൊപ്പോസൽ തയ്യാറാക്കുന്നതിന്റെ ഭാഗമായി പ്രസ്തുത പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള എല്ലാത്തരം ചെലവുകളും പരിഗണിക്കേണ്ടതാണ.

- വാർഷിക പദ്ധതിയുടെ ഭാഗമായി പ്രോജക്ട ഏറ്റെടുക്കേണ്ടതും ലഭ്യമായ സ്രോതസ്സുകളിൽ നിന്നും ഫണ്ട വകയിരുത്തേണ്ടതുമാണ.

സാങ്കേതിക അനുമതി

നിലവിലുള്ള സാമ്പത്തിക അധികാരങ്ങൾ അനുസരിച്ച തദ്ദേശ സ്വയംഭരണ വകുപ്പ(ലോക്കൽ ഇൻഫ്രാസ്ട്രക്ച്ചർ & എഞ്ചിനീയറിംഗ വിങ) ലെ ബന്ധപ്പെട്ട എഞ്ചിനീയർ പ്രോജക്ടിന സാങ്കേതിക അനുമതി നൽകുകയും മാനദണ്ഡങ്ങൾ പാലിക്കുന്നതിനായി ചീഫ ടെക്നിക്കൽ എക്സാമിനർക്ക (ഫിനാൻസ വിംഗ) ആവശ്യമായ റിപ്പോർട്ടിംഗ ഉറപ്പാക്കുകയും ചെയ്യേണ്ടതാണ.

തദ്ദേശ സ്വയംഭരണ സ്ഥാപനങ്ങൾ ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ/ഭൂമികൾ വീണ്ടെക്കുന്നതിനുള്ള പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള നടപടി ക്രമങ്ങൾ

ടെൻഡറിംഗ

- ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ വീണ്ടെടുക്കുന്നതിനുള്ള പ്രവൃത്തിയുടെ വിശദമായ സ്കോപ്പ ഓഫ വർക്ക, നിബന്ധനകളും വ്യവസ്ഥകളും മുതലായവ വ്യക്തമായി പരാമർശിക്കുന്ന 'ടു കവർ ബിഡ്സ താല്പര്യപത്രം'(Request for Proposa - wo Cover Bd) തയ്യാറാക്കേണ്ടതും ആയത നടപടിക്രമങ്ങൾ പാലിച്ച പ്രസിദ്ധീകരിക്കുകയും ചെയ്യേണ്ടതാണ.

- കേന്ദ്ര പാർപ്പിട-നഗരകാര്യ മന്ത്രാലയവും (MoHUA) സെൻട്രൽ പബ്ലിക ഹെൽത്ത & എൻവയോൺമെന്റൽ എഞ്ചിനീയറിംഗ ഓർഗനൈസേഷനും (CPHEEO) ചേർന്ന പ്രസിദ്ധീകരിച്ച "സ്വച്ഛ ഭാരത മിഷൻ (അർബൻ)-അഡ്വൈസറി ഓൺ ലാൻഡ്ഫിൽ റിക്ലമേഷൻ" ൽ നൽകിയിരിക്കുന്ന മാർഗ്ഗനിർദ്ദേശങ്ങളെ

അടിസ്ഥാനമാക്കി RFP-യിലെ വ്യവസ്ഥകൾ/യോഗ്യതാ മാനദണ്ഡങ്ങൾ നിശ്ചയിക്കാവുന്നതാണ.

- കേന്ദ്ര മലിനീകരണ നിയന്ത്രണ ബോർഡ പുറപ്പെടുവിച്ച "ഗൈഡലൈൻസ ഫോർ ഡിസ്പോസൽ ഓഫ ലെഗസി വേസ്റ്റ (ഓൾഡ മുനിസിപ്പൽ സോളിഡ വേസ്റ്റ) " പ്രകാരം ലെഗസി മാലിന്യ നിക്ഷേപങ്ങൾ നിർമ്മാർജ്ജനം ചെയ്യേണ്ടതാണെന്ന നിബന്ധന പ്രവൃത്തിയുടെ 'സ്കോപ്പ ഓഫ വർക്കിൽ' ഉൾപ്പെടുത്തുന്നുണ്ടെന്ന ഉറപ്പ വരുത്തേണ്ടതാണ.

- ലഭ്യമാകുന്ന ടെക്നിക്കൽ ബിഡ്സുകൾ പരിശോധിച്ച വിലയിരുത്തേണ്ടതും സാങ്കേതിക യോഗ്യത നേടുന്ന ബിഡ്ഡർമാരെ ബിഡ/ടെൻഡർ അംഗീകാരത്തിന്റെ തുടർ ഘട്ടത്തിനായി ഷോർട്ടലിസ്റ്റ ചെയ്യേണ്ടതുമാണ. ടെക്നിക്കൽ ബിഡ്സുകളുടെ മൂല്യനിർണ്ണയം നടത്തുന്നതിനായി താഴെപ്പറയുന്ന അംഗങ്ങളെ ഉൾപ്പെടുത്തി തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതിക സമിതി രൂപീകരിക്കേണ്ടതാണ;

    - സെക്രട്ടറി
    - LSGD (LID & EW) എഞ്ചിനീയർ
    - ഹെൽത്ത വിഭാഗം ഉദ്യോഗസ്ഥൻ (നഗര തദ്ദേശ സ്ഥാപനങ്ങളുടെ കാര്യത്തിൽ)
    - ജില്ലാ ശുചിത്വ മിഷനിൽ നിന്നുള്ള സാങ്കേതിക വിദഗ്ധൻ
    - ജില്ലാ മലിനീകരണ നിയന്ത്രണ ബോർഡിന്റെ പ്രതിനിധി
    - അക്കാദമിക സ്ഥാപനങ്ങളിൽ നിന്നുള്ള മറ്റ വിദഗ്ധർ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതികമായി ഷോർട്ടലിസ്റ്റ ചെയ്ത ബിഡഡർമാരുടെ ഫിനാൻഷ്യൽ ബിഡ്സുകൾ തുറക്കേണ്ടതും നടപടിക്രമങ്ങളും മാനദണ്ഡങ്ങളും പാലിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

- തിരഞ്ഞെടുത്ത കരാറുകാരന/ഏജൻസിക്ക ലെറ്റർ ഓഫ അവാർഡ (L O A) നൽകുകയും കരാറിൽ ഏർപ്പെടേണ്ടതുമാണ.

നിർവ്വഹണം, മേൽനോട്ടം, ബില്ലുകൾ തയ്യാറാക്കൽ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയറും മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങളുടെ നിരീക്ഷണ ചുമതലയുള്ള ഉദ്യോഗസ്ഥനും അടങ്ങുന്ന ഒരു മേൽനോട്ട സമിതി (Superv s on Commttee) രൂപീകരിക്കേണ്ടതാണ

- R F P ഡോകുമെന്റിലും കരാറിലും ഉൾപ്പെടുത്തിയിട്ടുള്ള 'സ്കോപ്പ ഓഫ വർക്ക' കരാറുകാരൻ കൃത്യമായി പാലിക്കുന്നുണ്ടോ എന്ന നിരീക്ഷിക്കുന്നതിനായി തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം മേൽനോട്ട സമിതിയെ ചുമതലപ്പെടുത്തേണ്ടതാണ.

- പ്രസ്തുത പ്രവൃത്തി 'സ്കോപ്പ ഓഫ വർക്കിൽ' നിഷ്കർഷിക്കുന്ന പ്രകാരമാണോ നടപ്പിലാക്കുന്നതെന്ന മേൽനോട്ട സമിതി കൃത്യമായും പരിശോധിക്കുകയും നിരീക്ഷിക്കുകയും ചെയ്യേണ്ടതാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ കരാറുകാരന/ ഏജൻസിയ്ക്ക സൈറ്റ ഹാൻഡ ഓവർ ചെയ്ത നൽകേണ്ടതും പ്രവൃത്തി നടപ്പിലാക്കുന്നതിനുള്ള/ നിർവഹിക്കുന്നതിനുള്ള പിന്തുണ നൽകുകയും ചെയ്യേണ്ടതാണ.

- മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങൾ നിരീക്ഷിക്കുന്നതിന്റെ ചുമതലയുള്ള ഉദ്യോഗസ്ഥൻ പ്രസ്തുത പ്രവൃത്തിയിൽ ഉൾപ്പെടുന്ന മാലിന്യ പരിപാലനവുമായി ബന്ധപ്പെട്ട പ്രവർത്തനങ്ങളായ വിൻട്രോ ഫോർമേഷൻ, മാലിന്യം

തരംതിരിക്കൽ, മലിനീകരണ നിയന്ത്രണ മുൻകരുതലുകളും ആരോഗ്യപരമായ കാര്യങ്ങളും ഉറപ്പുവരുത്തൽ എന്നിവയ്ക്ക മേൽനോട്ടം വഹിക്കേണ്ടതും കരാറുകാരന/ഏജൻസിക്ക മേൽനോട്ട സമിതി മുഖേന ആവശ്യമായ നിർദ്ദേശങ്ങൾ നൽകേണ്ടതുമാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ എംബുക്കിൽ 'ഇനിഷ്യൽ', 'ഇന്റർമീഡിയറ്റ്', 'ഫൈനൽ' ലെവലുകൾ എന്നിവ എടുത്ത അളവുകൾ രേഖപ്പെടുത്തേണ്ടതും, തദ്ദേശ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- കരാറിൽ വിശദമാക്കിയിട്ടുള്ള ജോലിയുടെ വിവിധ ഘട്ടങ്ങൾ പൂർത്തിയാക്കിയ ശേഷം കരാറുകാരൻ/ഏജൻസി ക്ലെയിം ചെയ്യുന്ന പ്രവൃത്തിയുടെ വർക്ക ബില്ലുകൾ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ തയ്യാറാക്കേണ്ടതും തദ്ദേശ സ്വയംഭരണ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- <u>GUIDELINES FOR IMPLEMENTATION OF PROJECTS FOR RECLAMATION OF LEGACY WASTE DUMPSITES THROUGH BIO REMEDIATION (BIO MINING AND MANAGEMENT OF RECOVERABLES AND REJECTS)</u>

As per the provisions of Solid Waste Management Rules 2016, local bodies are mandated to remediate legacy waste dumpsites and reclaim the land based on the guidelines issued by CPCB. Remediation of legacy dumpsites involves various activities such as assessment of the nature and quantity of waste to be remediated, excavation works to open the dumps, screening and sorting to segregate the waste fractions, reuse and sale/marketing of recovered materials, scientific disposal of rejects as per the norms. The remediation of dumpsites is further directed by Honorable NGT in its order on OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. However, the progress of implementation of such projects has not been satisfactory so far. One of the main reasons is that there is a lack of clarity in the procedures to be followed for legacy waste remediation projects right from the approval of the project to the mode of execution (including sale and disposal of recovered materials) by LSGIs since the nature of such projects is not similar to the general public construction/civil works. Also, the nature, quality and quantity of material that can be recovered from an existing legacy dumpsite cannot be accurately predetermined without opening up such dumpsites and hence it is not practical to prepare a workable estimate for the same like other public works . In order to tackle these issues, Swachh Bharat Mission(Urban) and CPHEEO have issued an "Advisory on Landfill reclamation", and suitable provisions of this advisory can be adopted for the State of Kerala. In these circumstances, the Government has examined this matter in detail, and the following guidelines are issued for the implementation of projects for remediation of legacy dumpsites by Local Self Government Institutions.

**<u>Standards, guidelines and advisories to be followed</u>**

- "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" issued by Central Pollution Control Board
- "SBM-U Advisory on Landfill Reclamation" published by MoHUA and

CPHEEO

- Guidelines issued by Government of Kerala in this regard from time to time

**Models for implementing legacy waste dumpsite remediation by LSGI's**

- 100% outsourced model (As per "SBM -U Advisory on Landfill Reclamation" published byMoHUA and CPHEEO)

**Implementing officer for legacy waste dumpsite remediation projects**

The implementing officer for legacy waste remediation shall be the Engineer of the LSGI

**Quantification of legacy waste to be remediated**

- The volume of legacy waste (in m3) to be remediated shall be generally assessed through Total Station Survey. If a total station survey is not feasible, a drone survey may be adopted for large dumpsites having a volume of more than 1 (One) Lakh m3.
- If required, external survey agencies may be engaged following laid down procedures and the cost for the same shall be met by LSGI from available funds.
- Contour mapping of the site shall be prepared and approved by the Engineer of the LSG

**Project Cost Estimation and Formulation by LSGI**

- Detailed report regarding the site conditions, nature of dump, history of dumping and other basic details shall be prepared in the format given in **Annexure - I**
- The estimate for biomining shall be prepared as per the specification and data given in
  - **Annexure -II**
- The overall cost for the implementation of the project shall be considered as part of the proposal.
- Project shall be taken up as per annual projects and funds from available sources shall be ear marked

**Technical Sanction**

- Technical sanction for the project shall be issued by the concerned Engineer in LSGD (LID & EW) as per the existing financial powers and necessary reporting to the Chief Technical Examiner (Finance Wing) may be ensured for compliance as per norms

**Implementation steps for remediation of legacy waste dumpsites by LSGIs**

**Tendering**

- Request for Proposals (RFPs-Two cover bid) clearly mentioning the scope of work, terms and conditions for reclamation of legacy waste dump sites shall be prepared and published as per laid down procedures.
- Conditions/eligibility criteria in the RFP shall be fixed based on the guidelines given in"**SBM-U Advisory on Landfill Reclamation"** published by MoHUA and CPHEEO
- It shall be ensured to mention in the scope of work that remediation of legacy waste dumpsites shall be undertaken as per the **"Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)"** issued by Central Pollution Control Board.
- The technical proposals received should be evaluated and technically qualified bidders shortlisted for further stage of bid approval. A Technical committee shall be formed at LSGI level for evaluation of the technical bids with the following members;
    - Secretary
    - LSGD (LID & EW) Engineer
    - Health Official (in the case of Urban local bodies)
    - Technical expert from District Suchitwa Mission
    - Representative from District Pollution Control Board
    - Other experts from academic institutions if any
- Financial bids of the technically shortlisted firms should be opened at LSGI level and approved as per procedures and norms
- Letter of Award (LoA) is to be issued to the selected contractor agency and agreement executed

**Execution, Supervision and preparation of bills**

- LSGI shall constitute a supervision committee consisting of LSGI Engineer and the officer in charge of monitoring waste management activity
    - LSGI shall authorise the supervision committee to monitor that the contractor correctly follows the scope of work included in the RFP document and agreement
- The supervision committee shall inspect and monitor that the work is being carried out as per the scope defined.
- LSGI Engineer shall hand over the site and provide support for execution of work at the site by the contractor/agency
- The officer in charge of monitoring waste management shall oversee the waste management related activities such as formation of windrows, segregation of waste into various streams,ensuring pollution control measures and health matters involved in the project and shall give direction to the contractor/agency through the supervision committee.

- LSGI Engineer shall measure, record quantities by taking initial, intermediate and final levels in M-book and Check measurements shall be done by the officials of LSGD (LID & EW) as per the powers vested with in the Local Self Government Department.
- LSGI Engineer shall prepare the work bills claimed by the contractor/agency after completing stages of work detailed in the agreement and check measurement shall be made by the officials of LSGD (LID & EW) as per the powers vested within Local Self Government Department.

## 1. Introduction

Social safeguards aspects during dump site remediation mainly focusing on meaningful stakeholder engagement, understanding stakeholder's risk perception and restoring them to a safe and environmentally sustainable state. It involves a series of systematic social actions which include social inclusion, effective labor management, and prevention of gender violence during the process, successive rehabilitation of the affected people and reduction of health risk of the host community. The bio mining process of Iritty municipal dumpsite, at Kannur district, has been included in the World Bank supported KSWMP project.

### 1.1 Profile of the municipality

Iritty is located on the banks of Bavali river. Thalassery-Coorg-Mysore highway passes through this municipality. The municipality has a terrestrial character of the hilly region. Bavali river, is flowing through Iritty, commonly known as Iritty Puzha (Iritty River). The famous steel girder bridge, built in 1933, over the river. Pazhasi dam is built in the river which is around 10 km away from the municipality.

Socio-Economic profile of Iritty is presented below in the **Table** 1

**Table 1 Socio Economic Profile Data**

| **Socio Economic Profile Data** | |
|---|---|
| Name of District | Kannur |
| Total Population | 34198 |
| Total Male Population | 16396 |
| Total Female Population | 17802 |
| Total Scheduled Castes Population | 431 |
| Total Scheduled Castes Male Population | 200 |

| | |

## 1.2 Profile of Dumpsite

Athithattu dumpsite in Iritty municipality at ward no.12 has a total waste quantity of 1254 Tons, spreading over 0.11 acres. The site is located between Lat- 11°58'04.44"N and Long - 75°40'54.066"E and has an elevation of MSL +39 (m). During the monsoon season, the positioning of the dumpsite causes legacy waste to flow downhill. A side wall is protecting the downward flow of legacy waste. But the leachates flow down during the monsoon season. Iritty municipality proposes biomining and bioremediation in the Athithattu dumpsite site under the KSWMP supported project funded by the World Bank. A Feasibility Report (FR) has been prepared for this subproject. Considering the environmental and social impacts associated with biomining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP

## 1.3 Socio economic baseline of Host community

It is identified that there are 10 households situated within 200 meters from the dumpsite. In the premises of the dumpsite, a Thumboormuzhi model aerobic compost unit and windrow compost unit are functioning. These units are managed by 6 temporary women sanitation workers. The dumpsite is in an isolated hilly area. The dumpsite has sufficient road access and thus there will not be any disruption to the nearby households. No public facilities, properties or commercial establishments are existing near to the dumpsite. There are no scheduled tribes, rag pickers and other vulnerable communities living near the dumpsite.

### 1.4 Vulnerability mapping of host community

There are no scheduled tribes, rag pickers are living near the dumpsite. 6 women sanitation workers are also engaged in the segregating process here.

| Sl.No | Particulars | Number |
|---|---|---|
| 1 | Number of Senior citizens residing near dumpsite | 12 |
| 2 | Number of single women staying near the dumpsite | 0 |
| 3 | Number of persons with disabilities | 0 |
| 4 | Number of persons with severe disease | 0 |
| 5 | Number of persons with respiratory issues | 0 |
| 6 | Number of Kids | 4 |

*Table 2 Vulnerability Details of host community*

### 1.5 Stakeholder analysis

There are 10 households situated within 200 meters from the dumpsite. The episodes of public protest reported due to the indiscriminate dumping of BDW collected from streets. Street sweeping waste is managed by the 6 women workers, who are working in the dumpsite premises. Among these workers, four are attained the age of 60 years. They are managing the BDW management facilities, viz; Thumboormuzhi model aerobic compost unit and windrow compost unit. are managing the site. The livelihood of these women workers is the sale of compost and valuable NBDW collected along with street sweeping debris.

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| Service Providers | | |

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like PCB, KSEB, KWA etc | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | DPMU | Monitoring and Evaluation |
| 5 | TSC/PMC | Technical support and consultation |
| 6 | Contractor | Execution of the Remediation process |
| 7 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| Community | | |
| 8 | 6 Workers in the Bio waste processing unit | Support and cooperation for the remediation process |
| 9 | Members of 10 HHs in the 200 m radius of the dumpsite | Support and cooperation for the remediation process |
| 11 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 12 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 13 | Scrap dealers | Informal participation in NBD waste management to prevent further dumping after remediation |

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 14 | End recyclers | Process the inert and legacy waste safely after remediation |

*Table 3 Stakeholder analysis*

# 2. Output of Social Screening

## 2.1 Social Screening Checklist

The social screening has been conducted with a social screening checklist to identify the potential social risks anticipated during dumpsite remediation. Major findings during the screening process are shown below.

- The dumpsite is located in an isolated hilly area.
- A windrow compost unit and Thumboormuzhi model aerobic compost unit are functional. The units are managed by 6 women workers. A building for RRF constructed by the municipality, but is not functional.
- The dumpsite remains in close proximity to ten houses within 200 m distance.
- There will not be any adverse social impacts on dwellings, land, and community resources of host communities.
- There are no scheduled tribes, rag pickers living near the dumpsite.
- Since there is not much risk with respect to the social and economic conditions of the host communities, the dumpsite can be categorized into "Moderate Risk".

## 2.2 Transect walk

A transect walk conducted on 3rd June, 2023. Twelve persons actively participated in the transect walk. Local residents, HKS, municipal workers, Kudumbashree members and project officials were the participants. A consultation meeting was conducted and a social map was prepared with the support of participants followed by the transect walk through a predetermined route.

A Thumboormuzhi model aerobic compost unit is functional within the dumpsite compound. A windrow compost unit is also functional. It is also operated by the six women sanitation workers. This unit is operated by six temporary sanitation workers (daily wage) members. They are doing segregation of the street sweeping waste. BDW are given to a composting unit and NBDW are handed over to HKS for further processing. Income from the sale of compost and recyclables are the source of livelihood for this Kudumbashree unit.

No rag pickers earn livelihoods from the dumpsite. Vulnerable population is found near to the site even though it is a less populated area. The details of the vulnerable population are given in the above table. The project does not affect land of any individual living close to the area. The transect walk was useful to understand the social risk and social impacts to identify and prepare the mitigation plans and strategies.

### 2.3 Stakeholder Consultation meeting

A stakeholders' consultation meeting in connection with the Athithattu dumpsite was conducted on 10.11.2023 in the municipality. The municipal Chairperson chaired the meeting. Health Standing Committee Chairperson, Ward Councillor, Secretary, political leaders, Kudumbashree members living near to the dumpsite, ward convener, KSWMP project officials, etc participated in the meeting. The agenda of the meeting was the procedures of dumpsite remediation and realize the concerns of community.

The Municipal Chairperson emphasized the need for dumpsite remediation and available support from the government. The dumpsite is already closed. But the accumulated legacy waste, till the closure, is there and the menace of dumpsite can be removed only after the bio-mining process. Chairperson added, the dumpsite remediation is possible with the effective use of available funds and technical support. Municipal secretary requested the officials to expedite the process. The ward councilor extended the support of the people residing near the dumpsite. The Kudumbashree members and ward convener raised a concern of dumping of waste again in the remediated land. The project officials intimated in the meeting that the technical processes started and hopefully the subproject can tender before the end of 2023. They briefly explained about the process and positive impacts of dumpsite remediation.

The output of the meeting: The concerns of the community will be taken up before the commencement of work. The maintenance of BDW facilities and livelihood of workers during the bio-mining process will be taken care. The community extended their support to the remediation.

### 2.4 Key Informant Interview

As part of the assessment, key informants' interviews (KIIs) with the selected persons of the affected communities and gathered data on socio-economic conditions, health status, waste management practices, and opinion on the proposed remediation project to develop suitable and adequate mitigation plans. The KIIs was conducted on 10.11.2023. As part of the KII, the counselor and sanitation worker were interviewed at the dumpsite.

A ward councilor Smt. Idumathi NK and a woman sanitation worker, Vimala, were interviewed as part of KIIs. A predefined schedule was used to gather information from the informants. Open ended questions with sub questions were used to get maximum information and clarifications given. The interview was productive. The history and emergence of the dumpsite, people's protest, social and health issues and public views on the dumpsite were gathered as part of data collection. The major concerns and their expectations were delivered during the interview.

### 2.5 Focus Group Discussion (FGD)

A focus group discussion (FGD) was organized at the ULB to gather information from the selected people, including Municipal Chairperson, Councilor, Municipal Secretary, Kudumbashree members, Social and communication expert from DPMU, SWM Engineer and TSC members. The group opined for the use of inoculum or like solution to avoid the issue of flies, foul odor etc. Emergence of any issues during the bio mining process may attract disruption in the society. The Municipal officials explained the process and informed that it would take all the necessary precautions before the commencement of bio-mining with the support of DPMU, technical experts and contractor. All the members actively participated in the discussion. The participants supported the removal of the menace of dumpsite by bio-mining method.

### 2.6 Feedback from stakeholders

- 10 households are found with a diameter of 200 meters from the dumpsite.

- Six women sanitation workers are working here in the waste processing units located in this site.
- No rag pickers are associated with the dumpsite.
- There is no requirement for land acquisition for the dumpsite remediation project. The currently designated plot or right-of-way has enough space for the transportation of inert waste or mobilization of machineries and materials.
- The total scheduled tribal population in the municipality is 1064, but there are no scheduled tribes staying near the dumpsite, and no impact on their land, customary rights, or livelihoods of tribes is observed.

## 2.7 Findings of the Social screening

- The dumpsite area is not adjacent to any dwelling unit.
- The dumpsite is not currently in use for the purpose. However, a small portion of the site is currently being used for dumping street sweeping waste.
- There is no livelihood loss for rag pickers and scrap dealers.
- During the process of bio mining, there are chances of loss of livelihoods of six sanitation workers working in the BDW management facilities.

## 2.8 Expected site specific social impacts on host community

### 2.8.1 Enhanced quality of life

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing near the dumpsite, the project can contribute to an improved sense of well-being. Also, it results in a clean and hygienic work environment for the workers engaged in RRF.

### 2.8.2 Livelihood and employment of vulnerable community

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

### 2.8.3 Access to service

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the existing site.

### 2.8.4 Land availability

Land is available in the existing dumpsite, which is owned by the Iritty Municipality, so there is no need for land acquisition/transfer or purchase. The dumpsite is situated near the residential area. Living near a waste dump site can significantly impact the quality of life for residents. The removal of these sites can improve the aesthetics of the area, reduce odour and noise pollution, and increase property values for surrounding residents.

## 3. Scoping of Social Impact Assessment

All the social risks were identified through the social screening and Transect walk conducted at site. Since there are families and institutions in the close proximity of the dumpsite, below shown action plans have been formulated to be followed at site

### 3.1 Labour Management Plan

An average 30 laborers are expected to be engaged in the remediation process at a time. A detailed labour Management plan has been prepared and attached as Annexure.

### 3.2 Labour Influx Management Plan

Anticipate labour influx to the site is an average of 30 labourers. Since 10 households are residing in 200 m, there are chances of influx issues. A detailed labour Influx Management plan has been prepared and attached as Annexure.

### 3.3 Preventive GBV Action plan

Since an MCF, RRF and Bio waste processing units are functioning inside the dumpsite and close proximity to households there is a high chance of occurrence of GBV incidents. A detailed GBV action plan has been prepared and attached as Annexure.

### 3.4 Citizen Engagement Plan

Being a socially sensitive area with past protest history, public protest might have happened during the execution period of the project. A detailed citizen engagement plan has been prepared and attached as Annexure.

### 3.5 Livelihood Action Plan

Temporary loss of livelihood can be expected during the bioremediation process for those who are engaged in the management of street sweeping debris. Six women sanitation workers are engaged in the Thumboormuzhi model aerobic compost unit and windrow compost unit. The Thumboormuzhi model compost unit exists close to the entrance of the dumpsite. A detailed Livelihood Action Plan will be prepared.

# 4. Required Action Plans

## 4.1Labour Management Plan

### 4.1.1 Details of Labors

The proposed remediation process at Athithattu, requires following category and number labors

*Table 31 Manpower details*

| S. No | Manpower | Nos |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental, Socialand Health & Safety (ESHS) Officer | 1 |
| 3 | Security (3 X 8 Hrs) | 3 |
| 4 | Operations Supervisor & Accountant | 2 |
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 2 |
| 8 | Labors near Screening machinery | 4 |
| 9 | Labors at Baling facility | 2 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 11 |
| | Total | 30 |

*Table 4 Required No of labors*

#### Working Hours:

8 hours per shift

#### Type of Engagement

Contract. (Direct workers/contracted workers/daily wage workers/etc)

### 4.1.2 Assessment of key potential labour risks

**4.1 Project Activities:**

The bioremediation of the dumpsite at Athithattu includes the following activities;

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization

- Waste segregation and refinement
- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

### 4.1.3 Key Labor Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.
- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female

SWM workers are engaged.

- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form workers organizations, etc.
- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

#### 4.1.4 Brief overview of labour legislation: Terms and Conditions

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |

| Sl No | Applicable Acts | Details |
|---|---|---|
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employment. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of |

| Sl No | Applicable Acts | Details |
|---|---|---|
| | | Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10 | Industrial Disputes Act 1947: | The Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the |

| Sl No | Applicable Acts | Details |
|---|---|---|
| | | requirements for laying off or retrenching the employees or closing the establishment. |
| 11 | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

*Table 5 Brief overview of labour legislation*

### 4.1.5 Responsibility Mapping

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring laborers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing laborers, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the laborers. The ULB will actively monitor the contractor's compliance with legal and welfare requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

### 4.1.6 Code of Conduct

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured;

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favours or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)

- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favours, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

#### 4.1.7 Systematizing the code of conduct

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

#### 4.1.8 Transparency in contract specific terms and conditions

All contracts must contain;

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism

### 4.1.9 Labour Management plan matrix

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on. | One notice board | As soon as the work is started. | Photographs of the notice board where the license is displayed. | Contractor |
| To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board | Do | do | |
| To conduct pre- employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the constructio n period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commence ment of the work | Training records & Photographs | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| equal. Female members should be minimum 50%. ) | | | | |
| Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act<br>2. The Employee compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act<br>5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity Benefit Act | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| Conduct HIV/AIDS awareness programs | As per requirement | Once in six months | Reports, photographs etc | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of licence ids to be collected | PIU |
| All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only after procurement of third-party insurance to the vehicle | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

### 4.2Labour Influx Management Plan

An average of 30 labourers will be engaged in the dumpsite remediation process. The labour influx matrix is given in the below table

| Risk | Mitigation Measures | Implementation responsibility | Monitoring indicators | Monitoring responsibility |
|---|---|---|---|---|
| Social and Community wellbeing | Joint Meeting with the community by ULB officials and Elected members | Contractor/PIU | • Risk identification report<br>• Proposed action/mitigation plan<br>• Action taken report/progress report | TSC/DPMU |
| Economic and Livelihood Issues | Skilled /Unskilled jobs for the Community embers in the sub-project | Contractor/PIU | • Risk identification report<br>• Proposed action/mitigation plan<br>• Action taken report/progress report | TSC/DPMU |

| Risk | Mitigation Measures | Implementation responsibility | Monitoring Indicators | Monitoring responsibility |
|---|---|---|---|---|
| Accommodation /labour camp | • Ensure basic amenities are provided to the labourers ( Toiltes, Water, Kitchen facilities etc)<br>• Daily briefing to the labourers | Contractor | • Risk identification report<br>• Proposed action/mitigation plan<br>• List of facilities in labour camp<br>• Details of labours | TSC/DPMU |
| Communicable Diseases | • Access to Medical Check-up<br>• Awaresness to the laboures | Contractor | • SOP for prevention of communicable disease and health wellbeing on worksite and labour camp<br>• Report on medical check-up | TSC/DPMU |
| Crimes | • Intimation to the Local police about the camp | Contractor | • Work site complaint register | TSC/DPMU |

| Risk | Mitigation Measures | Implementation responsibility | Monitoring indicators | Monitoring responsibility |
|---|---|---|---|---|
| | | | • Number of cases reported, and action taken | |
| Child Labour | • Ensure Adhar card of all labourers at the site | Contractor & TSC | • Number of child labour issues reported<br>• Data of labours | ULB/DPMU |
| Gender-based violence, including sexual harassment child abuse and exploitation | Gender sensitisation briefing to the labourers | Contractor/TSC | • Number of cases reported<br>• Action taken report<br>• Number of cases resolved<br>• Time taken for resolving complaints | ULB/DPMU |
| Labour licences | Mandatory provisions to be followed | Contractor/PIU | • Number of labours having licence | DPMU |

*Table 7 Labour Influx Management Plan*

### 4.3Preventive GBV Action Plan

#### 4.3.1 GBV Action Plan – matrix

The purpose of the Gender-Based Violence Action Plan in the Kerala Solid Waste Management Project (KSWMP) is to prevent and address gender-based violence (GBV) in all aspects of the project. This includes during the planning, implementation, and monitoring of project activities. The GBV AP is an integral part of the KSWMP's Environmental and Social Management Framework (ESMF). The GBV action plan outlines a number of measures that will be taken to prevent and address gender based violence.

| Action | Tasks | Timeline | Implementing Responsibility | Monitoring Indicators | Monitoring responsibility |
|---|---|---|---|---|---|
| Formation of internal complaints committee | • ULB level ICC will be constituted | Before implementation | ULB | • Minutes and Reports | TSC |
| Map GBV issues | Ensure justice, safety and protection, reasonable wages, care and support, adequate Work space, | During implementation | Contractor/ULB | Issue tracking system in place Feedback report(monthly) | TSC |

| Action | Tasks | Timeline | Implementing Responsibility | Monitoring Indicators | Monitoring responsibility |
|---|---|---|---|---|---|
| | Avoid Gender discrimination Physical, Sexual , Psycological and socio Economic violence. stress, emotion, conflict, abuse, threatens | | | | |
| Map GBV service providers and quality assessment of services | • NGOs<br>• Police Station KELSA<br>• Women protection officer<br>• List of Nongovernm | Before implementation | TSC | • Directory of service providers<br>• List of key partners<br>• Mapping of roles and responsibilities | TSC |

| Action | Tasks | Timeline | Implementing Responsibility | Monitoring Indicators | Monitoring responsibility |
|---|---|---|---|---|---|
| | ent and private agencies providing GBV support<br>• Map local informal grassroot level organizations<br>• Review the quality of services in terms of prevention, protection, rescue, rehabilitation, restoration, reintegration, research, and documentation | | | • Monthly report on quality Assessment | |

| Action | Tasks | Timeline | Implementing Responsibility | Monitoring Indicators | Monitoring responsibility |
|---|---|---|---|---|---|
| Facilitate GBV awareness and sensitization programs | • Organize sensitization activities<br>• Display sign boards around the project site | During implementation | Contractor/ICC | • Detailed activity plan<br>• Progress reports<br>• Completion report | TSC |
| Create a GBV response and support mechanism | SOP for the actions to be followed in terms of any incidents related to GBV will be formed along with ICC. The SOP will detail the identification of support mechanisms | During implementation | ULB/ICC | • SOP for prevention, protection, and rehabilitation | TSC |

| Action | Tasks | Timeline | Implementing Responsibility | Monitoring Indicators | Monitoring responsibility |
|---|---|---|---|---|---|
| | and terms of conditions for compliance with existing rules and regulations and operational strategy. | | | | |
| Reporting, monitoring and review | • Create GBV data fields<br>• Quarterly reports<br>• Conduct review | During implementation | Contractor/ TSC | • Progress reports (Monthly, quarterly)<br>• CB report<br>• Monthly complaint status and action taken report<br>• Establishment of Feedback system | TSC |

## 4.4 Site Specific Citizen Engagement Plan

### 4.4.1 Stakeholder identification

As part of social safeguard initiatives for the Bioremediation of dumpsite at Athithattu, Iritty municipality. The social experts of DPMU, DPMC and TSC conducted brainstorming exercises with local community, municipal officials, and PIU. A detailed list of primary and secondary stakeholders is prepared on the basis of these exercises.

### 4.4.2 Waste Generators

The dumpsite is located in Athithattu ward No 12. The dumpsite is located inside the existing common solid waste management facility of the municipality. A Thumboormuzhi model aerobic compost unit and windrow compost units are working in the premises of the dumpsite. Currently the shops and streets are the waste generators directly related with the facilities inside. Street sweeping debris from the town is being brought to the site followed by segregation. BDW put in the aerobic compost units and NBDWs are handed over to HKS.

### 4.4.3 Service Providers

For the successful completion of the bioremediation sub project, service of many people, agencies and departments are to be ensured by proper advocacy and networking initiatives. Following is the list of service providers identified through stakeholder analyses and their expected role/responsibility in the project

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| Service Providers | | |
| 1 | ULB Council | Providing ground support to the remediation process |

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 2 | Govt institutions like PCB,KSEB,KWA etc. | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | Contractor | Execution of the Remediation process |
| 5 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| Community | | |
| 6 | 6 Workers in the TMC unit and windrow compost | Support and cooperation for the remediation process |
| 7 | Members of 10 HHs in the 200 m radius of the dumpsite | Support and cooperation for the remediation process |
| 8 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 9 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |

*Table 9 Service Providers*

### 4.4.4 Need of the plan

Citizen engagement as part of the proposed bioremediation of the dumpsite in Iritty municipality aims to facilitate two-way communication between the project and its stakeholders in order to make better informed decisions. Such an engagement will certainly pave the way for better implementation of the project, and it will ensure public participation in trouble shooting at all the stages of the implementation of the project.

### 4.4.5 Objective of the plan

The citizen engagement plan for the proposed dump site remediation is prepared with following objectives;

- To create a conducive environment for the smooth implementation of the proposed bioremediation of the dumpsite by promoting constructive dialogues between the project and its stakeholders.
- To ensure stakeholder participation in the planning, implementation, and monitoring of the sub-project.
- To suggest appropriate activities with a monitoring plan and an expected budget for engaging the stakeholders with the motive of enhancing their ownership in the project through increased participation.

### 4.4.6 Stakeholder concern

**Waste Generators**

The management of wastes generated from street sweeping and the market are processed in the premises of the dumpsite. The waste collection may get delayed/stopped due the remediation process.

**Service Providers**

Major concerns of the service providers which has to be addressed by the citizen's engagement plan can be summarized as follows;

- Livelihood of temporary women sanitation workers currently working in the dumpsite may get affected.

- SWM related Service providers/HKS of the municipality should be trained and motivated for proper timely collection, segregation and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the future.

#### 4.4.7 Activities proposed

Community/citizen Awareness

- Focus group discussions to host community
- Organize exposure visit for the identified members from host community and council members
- Formation of GRM committee to take up any issue raised at site level and help to resolve an emergency.
- Sensitization programs to nearby vendors

Awareness to Service providers

- Sensitization on the bio-remediation activity is to be conducted for the Iritty Municipal Council and officials prior to the commencement of the actual bio-remediation process.
- Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc.
- Orientation to the Service providers/HKS of Iritty Municipality
- Sensitization meetings to the local and district level police officials on the proposed bio remediation of dumpsite and anticipated issues and action required
- Sensitization programs to Fire Force, and PCB regarding dumpsite remediation.
- Orientation regarding the dumpsite remediation process and its benefits to local community

### 4.4.8 Citizen engagement plan

**Citizen Engagement Plan matrix**

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Lack of Awareness on Project activities | Non co-operation of Community/stakeholders | Awareness campaigns /IEC material/ sensitization programs to the stakeholders | ULB/Contractor |
| 2 | Delay in decision making and timely support from the ULB | To establish transparency and building confidence in the project commitments to ULB elected members and officials | Sensitization on the bio-remediation activity for the elected representatives and officials prior to the commencement. | ULB/Contractor |
| 3 | Lack of proper GRM system | Delay in the execution of remediation work | Constitution of GRM Committee to take-up social issues raised at site level | ULB/Contractor |
| 4 | Lack of conducive environment for bioremediation activity | Delay in the execution of remediation work | Sensitisation meetings to various departments | ULB/Contractor |

*Table 10 Citizen Engagement Plan matrix*

#### 4.4.8.1 Monitoring Plan

| S. No | Activity | Means of Communications | Monitoring Indicator | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activities for the Municipal Council and officials | Presentation and group discussion | No of councilors and officials attended | DPMU/DPMC/ TSC |
| 2 | Sensitization meeting to host community | Presentation and group discussion | No of persons attended. | DPMU |
| 3 | Formation of GRM committee | Office order/ proceedings on the formation of GRM committee | Office order/ proceedings | DPMU |
| 4 | Orientation to the Service providers/HKS | Presentation and group discussion | No of service providers/HKS attended | ULB/DPMU |
| 5 | One to one meeting district administration, line departments, PCB, KSEB, KWA, Fire & Safety and Police | Presentation | No of one to one meeting conducted / no of officials attended | ULB/DPMU |
| 6 | IEC display board | IEC boards | No of IEC developed and displayed | ULB/DPMU |

*Table 11 Citizen Engagement-Monitoring Plan*

#### 4.4.8.2. Budget

| S. No | Activity | Specification | Quantity / events | Cost |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activities for the Municipal Council and officials prior to the commencement of the work | Half day Programme for Councilors and municipal officials | 1 | [redacted] |
| 2 | Sensitization meeting to host community | Half day Programme by incorporating all host community members | 2 | [redacted] |
| 3 | Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency. | Committee formation | 1 | [redacted] |
| 4 | Meeting with Contractor to get an understanding of their plan of operations/No labors involvement/timeline etc. | One to one interaction | As required | [redacted] |
| 5 | Orientation to the Service providers/HKS | Half day programme | 2 | [redacted] |
| 6 | Issue based one to one meeting district administration, line departments, PCB, KSEB, KWA, Fire & Safety and Police | One to one | As required | [redacted] |
| 7 | IEC display board for information dissemination | IEC display in the site | 1 | [redacted] |
| | | | Total | [redacted] |

# EXECUTIVE SUMMARY

**INTRODUCTION:** Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. The selected dumpsite is Kalamassery which is located near Ward no 6 of Kalamassery municipality, Ernakulum District.

**RATIONALE FOR THE PROPOSED SUB-PROJECT:** Kalamassery ULB proposes bio mining and bioremediation of the Kalamassery legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

**PROPOSED SUB-PROJECT DETAILS:** Kalamassery dumpsite is located at a distance of 1 km from the centre of Kalamassery town in western side and encompasses a total area of approximately 1.95 acres of land. The coordinates of the dumpsite are 10.065159° N & 76.327607° E. Currently, the quantity of waste dumped at this site is about 55,927.88 Cu.m. The legacy waste is presented about 8.5 m below and 2.5 m above the ground level as per the geotechnical investigation studies conducted. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts.

**APPLICABLE NATIONAL, STATE LEGISLATIONS AND TECHNICAL GUIDELINES:** To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed and followed.

**THE WORLD BANK SAFEGUARDS POLICIES, AND KSWMP ESMF**: The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are ensured.

**SUB-PROJECT SCREENING AND ITS CATEGORIZATION:** As per indicative categorization for dumpsite bio mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite and waste spread of 1.95 acres, this subproject is individually considered as E2 and EIA is prepared accordingly.

**ENVIRONMENTAL BASELINE:** Physiographically, Kalamassery falls under Flat Terrain zone. As per Wind rose diagram, the most predominant wind directions are blowing from West and WSW direction throughout the year. As per the geotechnical investigation, the subgrade soil was encountered at 8.5 m below the waste depth of the dumpsite and the predominant soil is gravelly clay. The dumpsite is surrounded by predominantly of Commercial and Industrial land use. The cultural heritage zone near dumpsites is Edapally at a distance of 4.5 Km in South direction. Hence, no significant physical impact to the heritages sites is envisaged during remediation. As per the district disaster management plan-2015 and flood vulnerability map the dumpsite is under flood prone zone.

**DESCRIPTION OF ENVIRONMENTAL PARAMETERS:** The analysed air pollution data indicates that the levels are within acceptable limits of NAAQs. The ambient Noise Levels are well within the National Ambient Noise standards for Commercial Area. The ground water quality results indicate that the dumpsite has not caused any major increase of the parameters and the quality parameters are within the IS10500:2011. Similarly, the surface water sample shows that it is not largely influenced by the dumpsite as the quality is within the limits of IS 2296, except for BOD which shows a marginal increase in value of about 6.3 mg/l and coliforms. The leachate monitoring data indicates, very low

concentrations of tested parameters. The heavy metals are also found to be below deducted limit, hence the soil is unlikely to be contaminated by heavy metals from the waste.

**ANALYSIS OF ALTERNATIVES:** After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

**ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS:** Environment: During operational phase (bio-remediation), the main potential nuisances caused by a dump site are fugitive dust, odour, foul gases, smoke from the site (in case of fire), and leachate generation. Birds, vermin, and rodents, littering, noises both from machineries operating at the site and waste collection vehicles. Social: No specific social risk is identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process. It can be overcome by using adequate protective measures properly.

**ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN:** The management plan proposed are for pre-remediation as well as during remediation stage and post remediation. The mitigation measures are recommended for impacts from air, noise, water, leachate, health and safety aspects. The proposed monitoring plan includes leachate, surface and ground water monitoring for a period of once in three months. The cost of [redacted] is required for implementation and supervision of EMP.

**SOCIAL MANAGEMENT AND MONITORING PLAN:** The social management plan proposed are for pre-remediation as well as during remediation stage. The mitigative measures proposed addressing concern of local community about remediation work, labour management issues, health and safety risks of labours, gender discrimination.

**EMERGENCY PREPAREDNESS PLAN:** The identified emergency situations which may arise from remediation activities are fire risk in summer, occupational health and safety related risks. The Kalamassery police station at 2 km, Public Health Centre at 1.5km, Kochi medical hospital at 5 km, Eloor Fire station at Pathalam within 3 km are the nearest emergency services. Periodic Compliance monitoring system will be done by the contractor during remediation.

**PUBLIC CONSULTATION AND INFORMATION DISCLOSURE: A** Transect walk was carried out on 06.06.2023 covering the surrounding area of the dump site. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact. Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the process at the site. Site control measures should be enforced to prevent unauthorized personnel into the work site.

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# CHAPTER 1. INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-Lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. There are 19 dumpsites identified for remediation under the Kerala Solid Waste Management Project. Several others have been taken up for remediation directly by the ULBs. Currently, 7 dumpsites considered within the three districts (Ernakulum, Alappuzha and Idukki), falling under Package B are selected by Kerala Solid Waste Management Project (KSWMP) for remediation under the project. One of the selected dumpsites is Kalamassery which is located at Ward no 6 of Kalamassery municipality, Ernakulum District.

## 1.2 The rationale for the Proposed Sub-Project

Kalamassery dumpsite in Kalamassery ULB at Ward no. 06 has a total waste quantity of 55,927.88 Cu.m, spreading over 1.95 acres of land. The site is located between Latitude 10.065159° N and Longitude 76.327607° E and has an elevation of MSL +9 (m), with a gentle slope towards the north-eastern part. During monsoon season, due to the slope of the site, Leachate from waste flows downhill towards nearby nallah located at northern side of the dumpsite. Kalamassery ULB proposes bio mining and bioremediation of the Kalamassery legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Proposed Sub-Project Details

Kalamassery dumpsite is located at a distance of 1 km from the centre of Kalamassery town in western side and encompasses a total area of approximately 1.95 acres of land. The coordinates of the dumpsite are 10.065159° N & 76.327607° E. It is located in ward no. 6 of the municipality. Kalamassery municipality holds the ownership of the dumpsite. The dumpsite is surrounded by highway from north-western directions. In South-eastern direction, railway line passing through it. North-eastern side of the dumpsite is vacant land. A small nallah flows North-eastern side of the dump site within the distance of 30 m.

Currently, the quantity of waste dumped at this site is about 55,927.88 Cu.m. The legacy waste presented is about 8.5 m below and 2.5 m above the ground level as per the geotechnical investigation studies conducted. Hence bioremediation of dumpsite is essential to mitigate from the environment impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues.

### 1.4 Objectives and Scope of the ESIA

As per indicative categorization for dumpsite bio mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite and waste spread (1.95 acres) and absence of environmentally sensitive features around, this subproject is individually considered as E2 and EIA is prepared accordingly.

The EIA & SIA process involves the identification of the potential environmental and social issues in the project and during design interventions. The EIA & SIA further carries out impact prediction and evaluation of residual environmental and social issues of a Project. It then goes on to outline the proposed mitigation measures for residual impacts and enhancement measures for positive impacts which the Project will implement.

### 1.5 Structure of the Report

The Consolidated ESIA report has been structured into the following Chapters:

- Introduction and Project Description.
- Policy, Legal and Administrative Framework presents a review of the existing Institutions and legislation relevant to the project at the National and the State levels;
- Environmental Assessment Methodology discusses sequence of tasks carried Out in preparing EIA;
- Existing Environmental Scenario presents a consolidated picture of the existing Environmental setting of the project;
- Assessment of Potential Impacts identifies and quantifies the potential impacts on each of the environmental components due to the proposed project development;
- Analysis of Alternatives discusses the criteria for analysis of alternatives of technology for remediation.
- Mitigation Measures presents an elaborate listing of the nature of impacts on each of the environmental components and the avoidance and mitigation measures suggested.
- Public Consultation details the stages and types of public consultations carried out during the project preparation stage and people's perceptions of the project benefits and the Potential impacts;

# CHAPTER 2. POLICY AND REGULATORY FRAMEWORK

## 2.1 Applicable National, State Legislations and Technical Guidelines

**National Environmental Rules and Regulations: -**

To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed. A summary of environmental legislation/regulations relevant to project is furnished in the following **Table-2.1**.

**TABLE: 2.1 SUMMARY OF ENVIRONMENTAL LEGISLATION/REGULATIONS**

| SR. NO. | ACT / RULES | PURPOSE | APPLICABLE (YES / NO) | REASON FOR APPLICABILITY | AUTHORITY |
|---|---|---|---|---|---|
| 1 | Environment Protection Act, 1986 | To protect and improve the overall environment. This is an umbrella Act. | Yes | As all environmental notifications, rules and schedules are issued under this act. | MoEF&CC, CPCB, SPCB |
| 2 | Solid Waste Management Rules, 2016 | To manage collection, transportation, Segregation, Treatment, and disposal of solid wastes (other than Hazardous water, Plastic Waste, Bio Medical waste) | Yes | Dumpsite remediation/bio mining | MoEF&CC, CPCB, SPCB |
| 3 | Air (Prevention and Control of Pollution) Act, 1981 | To control air pollution by controlling emission of air pollutants as per the prescribed standards. | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 21 of Air (Prevention and control of Pollution) Act 1981. | State Pollution Control Board, Kerala |
| 4 | Water Prevention and Control of Pollution) Act, 1974 | To control water pollution by controlling discharge of pollutants as per the prescribed standards | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 25 of this Act. | State Pollution Control Board, Kerala |
| 5 | The Noise Pollution (Regulation and Control) Rules, 2000 & amendments | The standards for noise for day and night have been promulgated by the MoEF&CC for various activities. | Yes | This act will be applicable for all construction equipment deployed at worksite and in operation. | State Pollution Control Board, Kerala |

| | | | | | |
|---|---|---|---|---|---|
| 6 | Public Liability and Insurance Act, 1991 | Protection from accidents. | Yes | This act will be applicable for providing immediate relief to the persons affected by accident occurring during work | State Pollution Control Board, Kerala |
| 7 | Central Motor Vehicle Act 1988 | To check vehicular air and noise pollution. | Yes | This rule will be applicable to vehicles deployed for construction activities and construction Machinery. | Motor Vehicle Department |
| 8 | The Plastic Waste Management Rules, 2016 | For the storage and disposal of plastic wastes through authorized vendors. | Yes | This act will be applicable for the storage and disposal of all the plastic wastes. | State Pollution Control Board, Kerala |
| **Other Applicable Rules** | | | | | |
| 9 | Construction & Demolition, Waste Management Rules, 2016 | | | | |
| 10 | Batteries (Management and Handling) Rules, 2001 | | | | |
| 11 | E-Waste (Management) Rules, 2016 | | | | |
| 12 | Kerala Municipality Act, 1994 & Rules | | | | |
| 13 | Hazardous & Other Wastes (Management And Transboundary Movement) Rules, 2016 | | | | |
| 14 | Bio-medical Waste (Management & Handling) Rules, 1998 | | | | |

## Applicable Social and Other Legislation

**Other Legislations applicable to Construction activities under the project**

- Workmen's Compensation Act 1923 (the Act provides for compensation in case of injury by accident arising out of and during the course of employment);
- Payment of Gratuity Act, 1972 (gratuity is payable to an employee under the Act on satisfaction of certain conditions on separation if an employee has completed 5 years);
- Employees PF and Miscellaneous Provision Act 1952 (the Act provides for monthly contributions by the employer plus workers);
- Maternity Benefit Act, 1951 (the Act provides for leave and some other benefits to women employees in case of confinement or miscarriage, etc.);
- The Sexual Harassment of Women at Workplace (Prevention, Prohibition and Redressal) Act, 2013 is introduced to prevent and provide redressal of complaints of sexual harassment.
- The Protection of Women from Domestic Violence Act, 2005 defines domestic violence, describes the powers and duties of protection officers, service providers and lists the procedures for obtain reliefs.
- Contract Labor (Regulation and Abolition) Act, 1970 (the Act provides for certain welfare measures to be provided by the contractor to contract labour);
- Minimum Wages Act, 1948 (the employer is supposed to pay not less than the Minimum Wages fixed by the Government as per provisions of the Act);
- Payment of Wages Act, 1936 (it lays down as to by what date the wages are to be paid, when it will be paid and what deductions can be made from the wages of the workers);

- Equal Remuneration Act, 1979 (the Act provides for payment of equal wages for work of equal nature to Male and Female workers and not for making discrimination against Female employees);
- Payment of Bonus Act, 1965 (the Act provides for payments of annual bonus subject to a minimum of 83.3% of wages and maximum of 20% of wages);
- Industrial Disputes Act, 1947 (the Act lays down the machinery and procedure for resolution of industrial disputes, in what situations a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing down the establishment);
- Industrial Employment (Standing Orders) Act; 1946 (the Act provides for laying down rules governing the conditions of employment);
- Trade Unions Act, 1926 (the Act lays down the procedure for registration of trade unions of workers and employers. The trade unions registered under the Act have been given certain immunities from civil and criminal liabilities);
- Child Labour (Prohibition and Regulation) Act, 1986 (the Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of child labour is prohibited in Building and Construction Industry);
- Inter-State Migrant Workmen's (Regulation of Employment and Conditions of Service) Act, 1979 (the inter-state migrant workers, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home to the establishment and back, etc.);
- The Building and Other Construction Workers Act (BOCW), 1996 is a social welfare legislation that aims to benefit workers engaged in building and Other Constructions Works.

### 2.2 The World Bank Safeguards Policies, and KSWMP ESMF

The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dumpsite remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are summarized below.

**Environmental Codes of Practices (ECoP):** The ECoP's guidelines for environmental management of bio-mining and bio-remediation activities which are seen to be of limited extent of impacts/risk, temporary and reversible, and readily managed with good practices during the implementation. The following key points should be considered.

**Key Points of ECoP to be considered:**

- The bio-mining activities and preparatory activities shall follow the "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" published by CPCB in February 2019.

- Bio-mining methods include Tractor Tiller, Trench method, Cone Method, windrow, Thin Layer Method, etc. More appropriate may be the Cone method for legacy waste and window for relatively fresh waste.

- Leachate channelization and treatment facility shall be set up before starting the bio-mining works. Works shall take place only during the non-monsoon period; and there shall be

suitable precautions to prevent any rainwater disturbing the operations (like seasonal unexpected rains, storm water, runoffs from other sources).

- Ballistic separator and trommel may be used for screening. Screened fractions into which waste is segregated include RDF, inert, Compost, and C&D wastes.

**Applicable World Bank Operational policies**

OP 4.01 Environmental Assessment Help to ensure the environmental and social soundness and sustainability of investment projects. Support integration of environmental and social aspects of projects in the decision-making process.

OP 4.04 Natural Habitats Promote environmentally sustainable development by supporting the protection, conservation, maintenance, and rehabilitation of natural habitats and their functions.

OP 4.09 Pest Management includes training to prevent risk to human beings or animals from Bio-culture, enzymes, insecticides and such formulations used for remediation.

OP 4.11 Physical Cultural Resources (PCR) includes resources of archaeological, paleontological, historical, architectural, religious (including graveyards and burial sites), aesthetic, or other cultural significance. Assist in preserving PCR and in avoiding their destruction or damage.

WB General EHS Guidelines Recommendations of these guidelines would be incorporated in ESMP and Bidding document for this sub-project.

The Environmental Management Framework (EMF) has been prepared to assist in the screening, assessment, and management of environmental risks of all solid waste management projects at an early stage during the planning and integration, mitigation hierarchy during the subproject design, implementation, and operation. The framework helps provide specific guidance on the policies and procedures to be followed for environmental assessment along with the roles and responsibilities of the implementing agencies.

# CHAPTER 3. ENVIRONMENTAL AND SOCIAL BASELINE

## 3.1 Project Location of the Site

Kalamassery dumpsite is located at a distance of 1.0 km from the centre of Kalamassery town in western side and encompasses a total area of approximately 1.95 acres of land. The coordinates of the dumpsite are 10.065159° N & 76.327607° E. The dumpsite is surrounded by NH-544 highway in NW direction, a railway line passing through in SE direction and vacant land in the NE side of the dumpsite. A small nallah flows in NE direction of the dump site at a distance of 30 m. The google map image showing the location of Kalamassery dumpsite is shown below in **Figure: 3.1**.

**FIGURE: 3.1 GOOGLE IMAGE SHOWING THE LOCATION OF THE EXISTING DUMPSITE AT KALAMASSERY**

## 3.2. Methodology for Environmental Baseline Studies

The baseline appraisal should consider all aspects of the environment that may be altered by the proposed project. These can be categorized as physical, biological or socioeconomic attributes. The baseline should be based upon the findings of the screening and scoping studies. Surface water and sediments, groundwater, air quality, noise, soils and land use Biodiversity Socio-economic (social), cultural heritage, traffic and transport Physical Biological Socio-economic. The scope of the baseline study, including attributes that will be appraised, and the geographical extent of the analysis, will typically have been agreed with the relevant decision makers as an outcome of the scoping phase. It is important to re-emphasize that the scope (and detail) of the baseline study should be commensurate with the size and scale of the project and hence the potential changes that the project may have upon the environment and society. The baseline study will typically be developed in three stages:

**Desktop study:** Office-based exercise during which readily available existing information (i.e. that can be used to describe the existing environment) is collected and reviewed to ensure its appropriateness for use within the EIA & SIA;
**Field study:** The stage within which additional data is captured in the field, with the intent of addressing any gaps that have been identified in the existing knowledge base; and
**Reporting stage**: Collation of the captured information into the baseline report.

The below table indicates the environmental attributes and location of monitoring.

**TABLE : 3.1 ENVIRONMENTAL ATTRIBUTES**

| S.NO | DESCRIPTION | PARAMETERS TESTED | SAMPLING LOCATION | JUSTIFICATION |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs. | Upwind direction in West South West (WSW) boundary of the dumpsite. Sampling at Distance 50 m from the boundary of dumpsite. | The AAQ locations were chosen based on the Wind rose data obtained for Kalamassery. The most predominant wind direction are from West and WSW. |
| | | | Downwind direction in North East boundary of the dumpsite. | |
| 2 | Noise (1 Location) | Ambient Noise level (E(P)) for 24 hours | Entrance of the dumpsite. Distance 20 m from the boundary of dumpsite. | Most vulnerable point in the site in regards of Noise quality is due to entry and exit of the waste loading and unloading vehicle and nearby highway NH-544 highway in NW direction. |
| 3 | Surface water (2 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, E.coli and Total coliforms (IS 10500-2012). | One Surface water sampling location at 245 m distance in North West direction ie, upstream of the river muttar. | Surface water sample points are selected based on the water flow from upstream to downstream. |
| | | | Second surface water sampling location at 30 m distance in North direction ie, downstream of the muttar river called nallah. | |
| 4 | Ground water (1 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, E.coli and Total coliform (IS 10500-2012). | Groundwater sampling location at 100 m distance in East direction. | |

| TABLE : 3.1 ENVIRONMENTAL ATTRIBUTES | | | | |
|---|---|---|---|---|
| **S.NO** | **DESCRIPTION** | **PARAMETERS TESTED** | **SAMPLING LOCATION** | **JUSTIFICATION** |
| 5 | Bore Hole(1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, Strength compressibility (vertically-3 samples per borehole). | Centre of the dumpsite. | Volume of legacy wastes were found to be higher in the center part of the dumpsite during investigation. So the bore hole test was performed in the center. |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cynide, Chloride, Fluoride, Phenolic compounds. | North East boundary direction within the dumpsite - one point | |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | Within the dumpsite at 2 locations, one at East direction and at one at West direction. | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. So the two locations were considered for sampling. |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Poatassium (N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | 1 | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. |

### 3.3 Environmental Audit of the existing Dumpsite

Inside the dumping yard, there are two MCFs, RRF and washrooms for the workers assigned for the collection and segregation process. The MCF are functional for dry waste management in the Kalamassery dumpsite, but not supported under KSWMP project. However, an environmental audit of the facility is important since is situated at the same site and might be impacted during the bio-mining activities.

| TABLE: 3.2 ENVIRONMENTAL AUDIT OF EXISTING FACILITIES | | |
|---|---|---|
| **S. NO** | **ASPECTS** | **REMARKS** |
| 1 | Structural Characteristics | Area – MCF 1-13.5*8.5 = 114.75 (in Sq. m)<br>MCF 2-15*7.5 = 112.5 (in Sq. m)<br>RRF - 13.5*5.3 = 71.55 (in Sq. m) |

| | | |
|---|---|---|
| | | Buffer/setback around the MCF – 5 FT<br>Distance from waste pile of dumpsite- 10 m.<br>Roof: (GI Sheet Roof, Damaged)<br>Floor (Cement Floor, Damaged)<br>Walls: No<br>Doors & windows: No |
| 2 | Functional Characteristics (MCF & BSF Units) | Activities in the MCF/RRF: Functional MCF. Bailing machine functioning now.<br>Materials and condition of stacking: Not organized<br>Activities spilling out onto the dumpsite: Yes<br>Access to the MCF (Common access for MCF/RRF & Dumpsite. Both are in the same premises.)<br>No: of workers – 22 in MCF |
| 3 | Facilities (MCF & BSF Units) | Parking area - Near yard in crematorium<br>Loading/unloading Area -Yes<br>Storage room & area: No<br>Worker snack/rest areas: No<br>Worker / other washrooms & sewerage: Yes<br>Water supply for Cleaning, Washroom: Yes<br>Greenbelt: NIL |

### 3.4 Physiography and Climate

**Physiography**

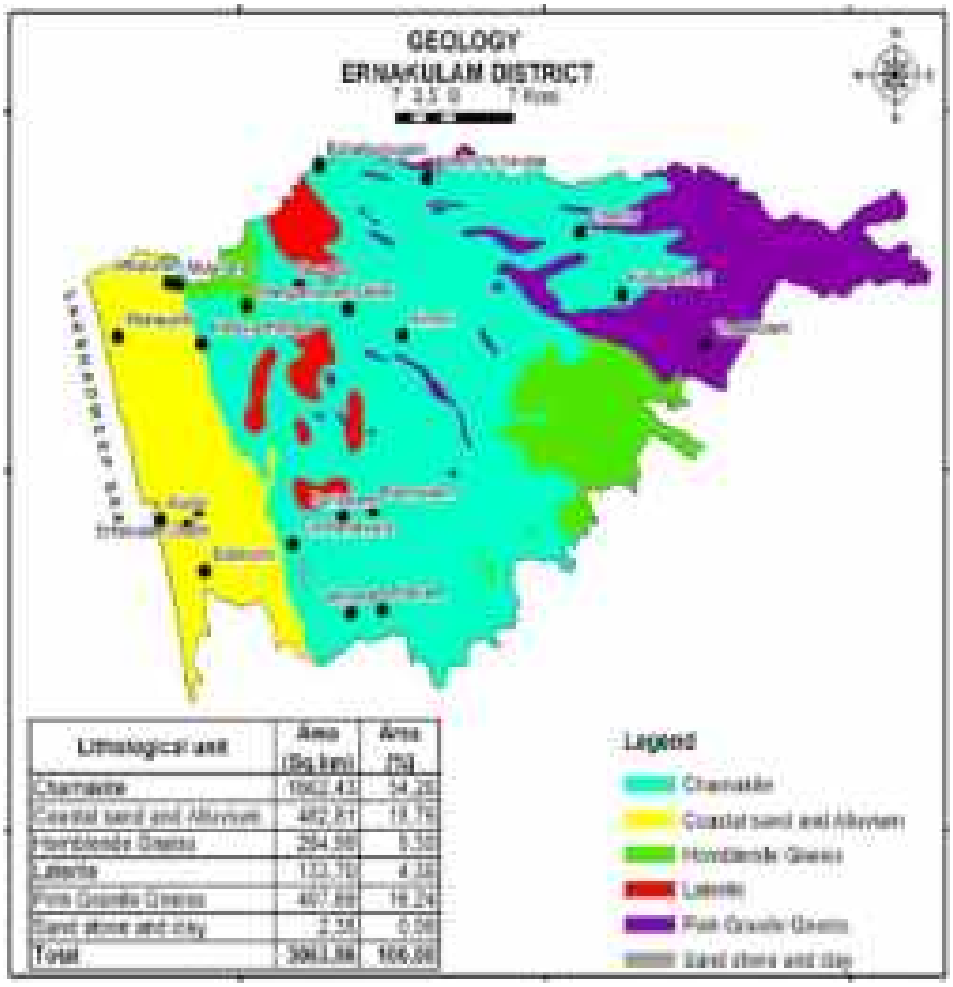
Physiographically, Kalamassery falls under Flat Terrain zone.

**Climate**

Kalamassery has a tropical climate. Rainfall is significant in most months of the year, and the short dry season has little effect. As per Climate-Data.org, the average annual temperature is 27.6 °C in Kalamassery. Precipitation here averages 3,570 mm. The month of January has 22 mm of rainfall. Most of the precipitation here falls in June-July with an average of 568 mm. The warmest month of the year is March with an average temperature of 29.4 °C. As per wind rose diagram, the most predominant wind directions are blowing from WSW and West direction, hence it was being considered for AAQ monitoring location. The wind rose diagram for Kalamassery (Ernakulum) is shown in **Figure: 3.2**.

**Source:** meteoblue

**FIGURE: 3.2 WINDROSE DIAGRAM FOR ERNAKULAM**



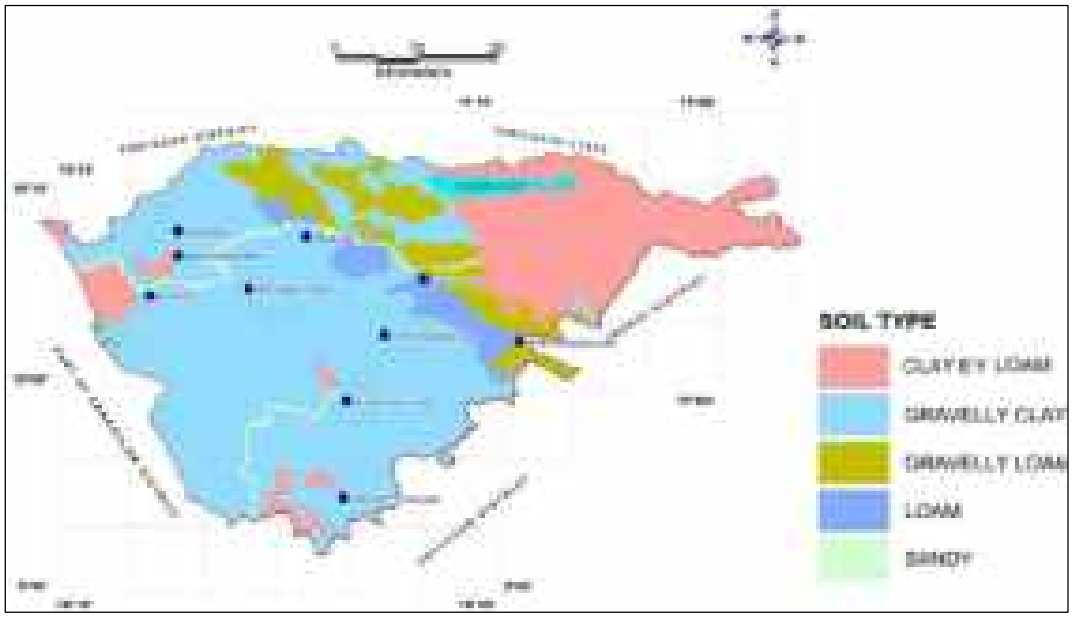
### 3.5 Hydrology, Hydrogeology, and Soil

**Hydrogeology**

The occurrence and movement of ground water is mainly controlled by factors like physiography, geological setting, etc. The aquifer type is phreatic aquifer and ground water table level ranging from 5 to 10 m during most of the year.

**Geology**

The geology of Kalamassery is predominantly of Charnockite group. The geology map of Ernakulum District is shown in **Figure: 3.3**.

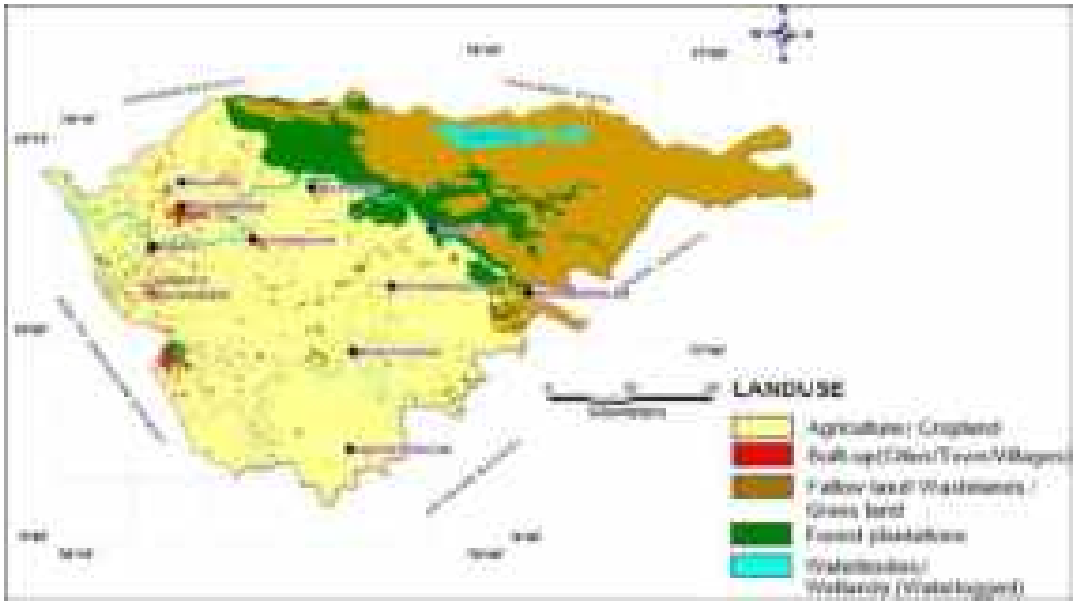


**Source:** CGWA, Ernakulum

**FIGURE: 3.3 GEOLOGICAL MAP OF ERNAKULAM DISTRICT**

**Soils**

As per the geotechnical investigation, the soil was encountered at 8.5m below the waste depth of the dumpsite and the predominant soil is gravelly clay. The detailed geotechnical investigation report is enclosure in the FR. The map showing soil type of Ernakulum is shown in **Figure: 3.4**.



**Source:** CGWB, Ernakulum

**FIGURE: 3.4 MAP SHOWING SOIL TYPE OF ERNAKULAM DISTRICT**

### 3.6 Land Use & Land Cover

The highest percentage of land use falls under residential/agricultural mix of (47.96%), which include mainly dry agriculture lands where in residential developments are co- existent, forest land (23.17%), agriculture (9.22%), residential (5.67%), water bodies (5.7%), plantation (5.52%), marshy land (1.87%) and the remaining areas are under other built up land use. The land use & land cover map of Ernakulum District is shown in **Figure: 3.5**.

**Source:** CGWB, Ernakulum

**FIGURE: 3.5 LANDUSE & LANDCOVER MAP OF ERNAKULAM DISTRICT**

### 3.7 Cultural Heritage

The cultural heritage zone near Kalamassery municipality is Thrikkakkara Vamana Moorthy Temple- 4.5 Km away, South direction from the dumpsite. Hence, no significant physical impact to the heritages site is envisaged during remediation.

### 3.8 Ecology and Biodiversity

The wild faunal species present are, mainly dogs, rodents and flies are seen near the dumpsite. Also, crow, egrets, and other birds are seen feeding on the wastes. The flora mostly covers shrubs, tubers, and trees.

### 3.9 Site Connectivity

The nearest National Highway is (NH-544)- 4 lane (Two Way) in NW direction which is adjacent to the dumpsite. The dump site has well connected road access facility for transportation.

### 3.10 Natural Disasters

As per the district disaster management plan-2015 and flood vulnerability map, the dumpsite is not under flood prone zone.

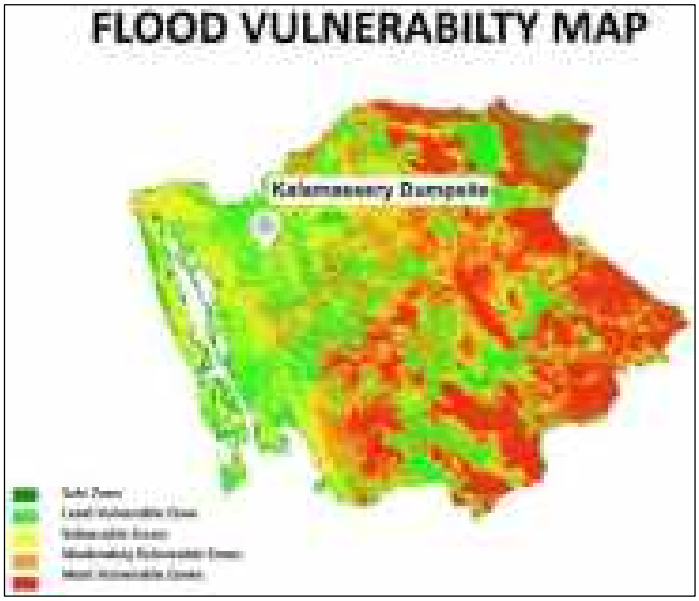


**FIGURE: 3.6 MAP SHOWING FLOOD VULNERABLITY MAP OF ERNAKULAM DISTRICT**

### 3.11 Description of Environmental Parameters

**TABLE- 3.3 DESCRIPTION OF ENVIRONMENTAL BASELINE PARAMETERS**

| S NO | ENVIRONMENTAL ASPECT | DISCUSSION ON BASELINE SCENARIO | REMARKS ON DEMAND SUPPLY GAPS (AVAILABILITY, QUALITY) & ASPECTS TO BE ADDRESSED IN THE SUBPROJECT |
|---|---|---|---|
| 1 | Water Source<br>a) Surface water<br>b) Ground Water | A) Surface water: One Surface water sampling location at 245 m distance in North West direction ie, upstream of the river | Site Drainage & leachate Impacts due to bio mining activity (especially during any seasonal rain) is important as far as |

| TABLE- 3.3 DESCRIPTION OF ENVIRONMENTAL BASELINE PARAMETERS | | | |
|---|---|---|---|
| **S NO** | **ENVIRONMENTAL ASPECT** | **DISCUSSION ON BASELINE SCENARIO** | **REMARKS ON DEMAND SUPPLY GAPS (AVAILABILITY, QUALITY) & ASPECTS TO BE ADDRESSED IN THE SUBPROJECT** |
| | | muttar and Second surface water sampling location at 30 m distance in North direction ie, downstream of the muttar river called nallah– all parameters are well within limits except BOD.<br>B) Groundwater sampling location at 100 m distance in East direction- all parameters are well within limits. | the nearby soil & water environment are concerned. |
| 2 | Leachate | The data indicates very low concentrations of tested parameters. The heavy metals are also found to be below detected limit, hence the soil is unlikely to be contaminated by heavy metals from the waste. | |
| 3 | Air Quality | Air samples were collected from 2 locations at 50 m from the boundary of dumpsite and North East boundary of the dumpsite and results found to be well within the permissible limit. | The vehicular movement of machinery and recovered material during dump site remediation will be the additional source of Air Pollution. |
| 4 | Noise Level | Noise Level monitoring samples collected at Entrance of the dumpsite. Distance 20 m from the boundary of dumpsite. Noise levels are well within the National Ambient Noise standards for Commercial area. | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity. |

# CHAPTER 4. ANALYSIS OF ALTERNATIVES

## 4.1 Alternative 1: No Project Alternative (without Dumpsite Remediation)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.
If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.
1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.
2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.
3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.
4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.
5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

## 4.2 Alternative 2: Mode of Execution / Management Alternative

Muvattupuzha Municipality intends to complete the remediation project as earlier. However, considering the time required for mobilization, installation, sieving and handling recoverable etc., a time frame of about six months will be considered. The broad timeline chart for the execution of this project is given below Table – 4.1.

**TABLE – 4.1 TIMELINE CHART FOR EXECUTION**

| S. No. | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
|---|---|---|---|---|---|---|---|
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries , Hiring & Installation of Machineries, Electrical Works | ■ | ■ | ■ | ■ | ■ | ■ |
| 3 | Excavation of Legacy Waste | | ■ | ■ | ■ | ■ | ■ |
| 4 | Site Development for Windrows & Leachate Collection | | ■ | ■ | ■ | ■ | ■ |
| 5 | Windrow Formation & Spraying of Bio culture | | ■ | ■ | ■ | ■ | ■ |
| 6 | Sieving Operations | | ■ | ■ | ■ | ■ | ■ |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | ■ | ■ | ■ | ■ | ■ |
| 8 | Project Closure Activities:<br>• Levelling of Reclaimed Land using Bio-soil<br>• Handover the available infrastructure at site to the ULB<br>• Closure Report Submission to ULB, | | ■ | ■ | ■ | ■ | ■ |
| 9 | Buffer Period (Rainy Season) | ■ | ■ | ■ | ■ | ■ | ■ |

### 4.3 Alternative 3: Technology Alternatives

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as,

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

# CHAPTER 5. ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS

Bio mining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, bio-mining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition to the below mentioned,

(i) Drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,
(ii) Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,
(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and
(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

## 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 200 m aerial distance of Kalamassery dumpsite.

### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Bio-mining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity. However, magnitude of cumulative impacts of various dumpsite remediation might be High.

| TABLE: 5.1 ASPECTS FOR DETERMINING THE MAGNITUDE OF IMPACTS | | | | |
|---|---|---|---|---|
| **Aspects** | **Large** | **Medium** | **Small** | **Negligible** |
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite bio mining activities will be on larger extent) | A specific location within program component or site boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| Likelihood of potential impacts occurring | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

NOTE: Anticipated Project Duration - 5 to 6 months

### 5.1.2 Sensitivity of Receptor

The dumpsite is surrounded by Within Apollo junction and SCMS Cochin School of Business and there are no many habitats within 200 metres. Hence sensitivity of receptors will not affect much due to the bio-remediation process of the dump site and can be categorized as low Vulnerable receptor capacity to absorb proposed changes or/and good opportunities for mitigation. In addition, there is a nallah which flows at a distance of 30 m from the dumpsite in

North direction, there is chance of runoff and leachate towards the nallah during rainy season. Hence, the sensitivity of this receptor is estimated as high.

### 5.1.3 Significance of the impact

The significance of the Sub-project impact is tabulated below: -

| TABLE: 5.2 SIGNIFICANCE OF THE PROJECT | | | |
|---|---|---|---|
| **PROJECT DETAILS** | **SENSITIVITY** | **VULNERABILITY OF RESOURCE** | **IMPORTANCE OF RESOURCE** |
| No project Impacts | High | Medium | Medium |
| Project with Bio Remediation (Bio-mining) | Low | Low | Low |

Overall, Bio mining will have a low to medium impact, with more of a positive Impact on the Environment and Human health in the longer term.

**Source-Pathway-Receptor Analysis**

A) **Source:** The source of contamination is the legacy waste remaining and being deposited at the Kalamassery closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. The total waste volume 55,927.88 cu. m with the dumpsite spreading over 1.95 acres and the legacy waste presented is about 8.5 m below and 2.5 m above the existing ground level. In addition to the landfill gas and leachate, windblown dust and litter are also considered as sources of contamination.

B) **Pathways:** The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards North Eastern direction acts as a pathway for the uncovered waste to flow into the canal along the boundary to Northern side, which runs alongside the dumpsite at distance of 30 m.

   The leachate flows with groundwater and acts as the pathway. Surface water contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals and rivers are further transported by surface waters and in this case the surface water acts as the pathway.

C) **Receptors:** Receptors are air, surface water (drain passing through residential areas) and ground water. No households within 200 m from the dumpsite. As the dump is not contaminated by hazardous wastes, remediation would improve the pollution scenario provided the bio-earth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from bio-mining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may

result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after bio-mining activity, activities in bio-mined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post bio mining activity.

**5.2 Impacts on Air Environment**

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCF & RRF in this case), nearby communities of Ward 06.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.
- When the legacy site is opened, existing gases would get emitted. Further, any delay /unexpected stoppage of bio mining activity, might further aggravate the process of gas formation depending on waste composition, leading to odour and fire risks.

***5.3. Impacts on Water Environment***

**Ground water:**

- The ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. Oozing & pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during bio mining to prevent ground water contamination
- Leachate samples: BOD and COD values may impact the ground water quality in nearby residences, wells, and long term soil pollution.
- Borehole data: Dump below water table may impact water resources and wells nearby.
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

**Surface water:**

- The dumpsite experienced flooding during 2018 floods and the site is not vulnerable to flooding. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas. A nallah is at a distance of 30 m from the dumpsite.
- Predominant slope is from North Western towards North East Direction. During rainy season leachate from the site flows to nallah which flows through nearby nallah. It is important to contain and treat leachate from the proposed bio mining activities on site. Treated leachate may be recirculated or used for other purposes.

**5.4 Impact due to Odour**

Dumpsite of organic, or partly organic waste, always results in anaerobic degradation of the waste and consequently, the production of landfill gas, consisting mainly of methane, $H_2S$, Ammonia, and carbon dioxide. If not properly managed the gas can cause odor problems in the neighborhood and since landfill gas is a highly potent greenhouse gas it will also contribute to the increased level of greenhouse gases (GHG) in the atmosphere. Dumpsite gas may also increase the risk of fires or explosions at the landfill site and surroundings.

**5.5 Impact on Noise**

A potential nuisance is a noise from transport of vehicle and machinery operating during remediation phase of the Dumpsite and transports of waste to the Dumpsite. The topography is favorable to attenuate noise to the surroundings. Apollo junction and SCMS Cochin School of Business and there are no many habitats within 200 metres. Hence, the impact will be lower during remediation to the residents.

**5.6 Impacts on Soil**

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as bio mining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.

- Spillover of activities to nearby road and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste bio mining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.

- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Kalamassery, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Kalamassery does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while bio mining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste), Feb 2019 and World Bank EHS Guidelines. A plan shall be prepared to auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

**5.7 Other impacts on Biodiversity - Fauna/Flora**

- There are no sensitive biodiversity areas within 10 km of the site. However, since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 42 Km, east direction from the site, there is a Kothamangalam Forest Range.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora: Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke.
- Disturbance to other fauna and flora on site: onsite activities including those related to MCF and RRF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Only naturally occurring plants and animals were noticed, no threatened or endangered. There is no key species identified which are listed by IUCN.

**5.8 Other Impacts on existing or proposed activities on site/s**

- There may be approvals from various agencies for bio mining activities and associated facilities; depending on utilities and uses on site & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of bio mining on existing facilities on site such as RRF, MCF, etc. (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc.).
- Post bio mining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped, or if this is dumped elsewhere or not processed, it will lead to health and environmental issues. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health & Safety impacts on workers, communities. Also, forward linkages are considered as associated facilities/linked activities. Impacts of transportation of these fractions (traffic increase, odor, leachate, dust), impacts during rains & emergencies, handling, storage at the identified locations, reuse etc, shall be mitigated.

# CHAPTER 6. ENVIRONMENTAL AND SOCIAL MANAGEMENT AND MONITORING PLAN

## 6.1 Proposed Environmental and Social Management Plan

The proposed Environmental and Social Management plan is presented in the below table.

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| ***A*** | | **Planning and Pre-Construction Stage** | | |
| ***1*** | | ***Planning for bio mining facility*** | | |
| 1 | Bio mining & Bioremediation Plan & Capacities | ▪ Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / bio mined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these bio mined material in line with the agreements with such facility owners and National, State regulations and WB EHS<br>▪ Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate Management Plan.<br>▪ The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>▪ Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU /ULB |
| 2 | Site Access Closure | ▪ The total cessation of dumping in the site will be implemented before any works.<br>▪ All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>▪ The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>▪ To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>▪ Grading shall be performed where necessary to provide a neat appearance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU /ULB |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality,* | ▪ Carry out site assessments as per Guidelines for Bio mining of Legacy Waste Dumpsites of CPCB<br>▪ Consider safe bio mining & gas / leachate generation from existing capped portion of the site<br>▪ Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means | TSC, ULB, Contractor | SPMU/DPMU /ULB |

| | | | | |
|---|---|---|---|---|
| | *odor, water contamination due to leachate, health and safety impacts of the people working in the site assessment* | ▪ Provision of appropriate PPE's to the team undertaking the site assessments<br>▪ Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>▪ Plan for machinery operated which will be operated by skilled operators at all times.<br>▪ Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>▪ Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | | |
| 4 | Absence / Delay in Permissions for Developing the bio mining facility and associated works as per National regulations | ▪ Required permissions for undertaking bio mining at the existing dumpsite and assessments conducted for undertaking bio mining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labor Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU /ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes *(Air Pollution) and Visual Blight due to excavation* | ▪ Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>▪ Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>▪ PPEs to be used by workers<br>▪ Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU /ULB |
| 6 | Material sourcing, transport, and stacking of construction materials *(Occupational Health and Safety issues and Air noise pollution)* | ▪ Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>▪ Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>▪ Materials shall be sourced only from approved quarries<br>▪ Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>▪ The driver should be with required license and follow speed regulations<br>▪ Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>▪ Material transport and unloading activities should not result in noise disturbance to locals and should be during daytime | Contractor | SPMU/DPMU /ULB |

| | | | | |
|---|---|---|---|---|
| | | ▪ Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>▪ Provide vehicle wheel wash area on site<br>▪ Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves.<br>▪ Proper rest area on site shall be provided with water, first aid, toilets | | |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | ▪ Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>▪ Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>▪ Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>▪ It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with landowners wherever the labour is accommodated<br>▪ Camp must not be provided in an area prone to Hazards<br>▪ Camp should be adequately at higher plinth levels to prevent water intrusion<br>▪ Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>▪ Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>▪ The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>(Refer ECOP section 06 and section 11 of EMF for KSWMP) | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. especially in case of providing support facilities *(Impacts on Fauna / Flora)* | ▪ Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in bio mining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>▪ Identify appropriate government site to avoid land acquisition and resettlement impacts<br>▪ Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences, slope and other land uses | Contractor | SPMU/DPMU /ULB |
| 9 | Contamination of groundwater due to leaching. Leachate | ▪ During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, | Contractor | SPMU/DPMU /ULB |

| | | | | |
|---|---|---|---|---|
| | parameters; BOD, COD, TDS, E.coli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>▪ Depending on the contractors plan for bio mining of the site, adopt plans to manage leachate | | |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke burning, trampling/machinery | ▪ Movement routes of vehicles to be planned to avoid key fauna/flora on site<br>▪ Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU /ULB |
| 11 | Nuisance hazards to neighboring areas | ▪ Ensure proper design and adequate compound wall; high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements<br>▪ In case of waste mound and site edges are sliding or unsafe; provide engineered retention walls. | Contractor | SPMU/DPMU /ULB |
| 12 | Treatment & Disposal of wastes and rejects | ▪ Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & inert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Bio earth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>▪ Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| ***B*** | **Implementation or Bio mining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| **Implementation of bio mining of the dumpsite** | | | | |

| | | | | |
|---|---|---|---|---|
| 1 | Impact due to the vehicular movement<br>*(Air and noise environment & Vehiclular - Vehicular & Vehicular - Pedestrian Conflicts)* | ▪ Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>▪ All vehicles and machinery should obtain Pollution Under Control Certificates<br>▪ HORN PROHIBITION signpost to be erected.<br>▪ Rumble strips/speed breaker to be provided on access roads.<br>▪ Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>▪ Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>▪ Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>▪ Avoid heavy vehicle movement through adjacent NH road during peak hours 7 a.m. to 10 a.m. mention: school hrs. / peak hrs.; and during important period / festivals when people use the road to access temple<br>▪ Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | Contractor, ULB | SPMU/DPMU /ULB |
| 2 | Impact due to the use of heavy vehicle and equipment<br>*(Air and Noise environment)* | ▪ Mixing equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>▪ Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>▪ Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>▪ Labor to be provided masks / PPEs.<br>▪ Construction / Bio mining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighboring sensitive land uses<br>▪ Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>  ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>  ▪ Using modern, well-maintained and regularly serviced vehicles.<br>  ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>  ▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>▪ Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>▪ As Kalamassery dumpsite has sensitive receptors and settlement areas within 150m of it (no households at 200 m distance, noisy works shall be stopped from 22:00 to 06:00. | Contractor | SPMU/DPMU /ULB |

| | | | | |
|---|---|---|---|---|
| | | ▪ Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>▪ Avoid noisy activities/machines near South side of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>▪ Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities *(water environment)* | ▪ Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>▪ Vehicle washing or maintenance near water bodies are to be avoided.<br>▪ Contaminated water from construction / bio mining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU /ULB |
| 4 | Leachate and Runoff from bio mining activities *(Soil contamination and groundwater contamination)* | ▪ Provide site cut off drain around the site to divert off storm water from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>▪ Depending on the contractors plan for bio mining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>▪ Ensure storm water drains will lead to drain outlets<br>▪ Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area<br>▪ Provide proper treatment of leachate and storm water that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by bio mining activities like excavation and waste segregation and stabilization<br>▪ The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>▪ The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>▪ Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>▪ Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>▪ Plan the works on-site only during non-rainy seasons and to complete the works before rains | Contractor | SPMU/DPMU /ULB |

| | | | | |
|---|---|---|---|---|
| | | ▪ Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | | |
| 5 | Soil decontamination from accumulated waste levels *(Impact on leachate, odor)* | ▪ Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bio culture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>▪ Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>▪ Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU /ULB |
| 6 | Excavation of waste from the waste mound *(Health and safety impacts)* | ▪ The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>▪ Machinery operated for excavation should be operated by skilled operators at all times.<br>▪ Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>▪ Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>▪ In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>▪ When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | Contractor | SPMU/DPMU /ULB |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles *(Air, Odour nuisances; spills and littering impacts on Air, Water, Land)* | ▪ All vehicles shall carry only approved load of weight<br>▪ Regular cleaning of roads & drains and removal of spills if any.<br>▪ All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>▪ Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>▪ Adopt required measures as per CPCB guidelines, and site specific safety requirements. | Contractor | SPMU/DPMU /ULB |
| 8 | Occupational health and safety impacts of the workers during the bio | ▪ Avoid direct & double handling of wastes through avoidance measures(suitable planning & equipment's), engineering controls & use PPEs<br>▪ Work area & Labour camps shall be provided with First Aid and other related activities.<br>▪ Emergency Preparedness plans shall be prepared and implemented for all manpower working | Contractor, ULB | SPMU/DPMU /ULB |

| | | | | |
|---|---|---|---|---|
| | mining & construction of support facilities:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, bio cultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | centers and its field extension centers.<br>▪ An Environment Health & Safety policy shall be prepared and implemented<br>▪ Adequate manpower shall be provided & manager & staff shall listen and act upon the manpower related grievances.<br>▪ Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles<br>▪ Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed with out slip, trip, fall especially on waste, leachate or trenches<br>▪ Proper training will be provided regarding the maintenance of health<br>▪ Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper hand wash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>▪ First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>▪ Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>▪ Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>▪ Measures such as deferred timings and stretch break to be adopted<br>▪ Secure all installations from unauthorized intrusion and accident risks;<br>▪ Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every days start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipment's, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>▪ EHS specialist with adequate experience & third party supervision are important for bio mining activity<br>▪ Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>▪ Provide visitor orientation if visitors to the site need to gain access to areas where hazardous | | |

| | | | | |
|---|---|---|---|---|
| | | conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>▪ Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas;<br>▪ Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>▪ Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br>▪ Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near those In close proximity to this location, there is a transformer. Disallow worker exposure to noise level greater than 85 dB (A) for more than 8 hours a day without hearing protection<br>▪ All workers shall be registered as per prevalent labor laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>▪ Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractor's person/insurance agent<br>▪ While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>▪ While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>▪ Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>▪ A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>▪ No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor<br>▪ All works related to working at heights will be undertaken only during the daytime when sufficient sunlight is available; | | |

| | | | | |
|---|---|---|---|---|
| | | ▪ Use of temporary fall protection measures and outer edges of any elevated work surfaces, such as handrails and toe boards to prevent materials from being dislodged will be done;<br>▪ All excavation activities to be conducted in supervision of the site contractor;<br>▪ Proper signage and lights to be provided in all work or activity areas & work permit system to be ensured.<br>▪ All records on emergencies, accidents, workers & their duty schedule, important site events, waste storage & disposal etc shall be maintained on site. All accidents including Indicative, Serious and Severe accidents to be recorded. All severe & serious accidents to be reported to the Bank & procedures followed for root cause analysis & Corrective Action Plans prepared and implemented, as per Banks Incident Reporting Tool | | |
| 9 | Risk of fire due to conditions leading to spontaneous combustion *(Air environment, disturbance to communities and workers, health impacts, safety issues)* | ▪ Follow CPCB Directions (May 26, 2022) Directions under Section 5 of EP Act (1986) – for Implementation of SWM Rules 2016 –Fire Incidents at MSW Dumpsites (https://cpcb.nic.in/openpdffile.php?id=UHVibGljYXRpb25GaWxlLzQyNDRfMTY1NDE2Mzk3N19tZWRpYXBob3RvNzYxMi5wZGY= ), LSGD Kerala Government GO on Fire Safety of MRF, MCFs (for the MRF on site if used for storage of wastes)and other Regulations, guidelines applicable<br>▪ Divide the site & plan for work in each area/quadrant as per work plan & prepare fire safety plan & emergency response plan in line with EIA Annexure 3; and National/State regulations & WB EHS<br>▪ Examine the site everyday by experienced Fire Safety / OHS personnel for any smokes<br>▪ Avoid conditions that can lead to spontaneous combustion such as:<br>o Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard<br>o Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.<br>▪ Design the facility for access by firefighting equipment, including clear aisles among waste heaps or work areas and access to adequate water supply.<br>▪ Ensure workers are briefed of fire hazard & its management<br>▪ No unauthorized entry shall be permitted to the site; including of workers during holidays, nighttime, or hours other than normal work hours under the supervision of site engineer / supervisor. Fencing and barricades with proper signage boards indicating “trespassers not allowed”<br>▪ The following activities should be implemented to prevent fires from occurring at the facility<br>o adequate fire-fighting equipment should be made available on-site and stored in an accessible manner,<br>o all operating staff should be trained and able to manage fire outbreaks at any part of the facility.<br>o clear signage should be established to inform workers and the public that flammable | Contractor, ULB | SPMU/DPMU |

| | | | | |
|---|---|---|---|---|
| | | liquids are not permitted on the site. This should be reinforced by advice to customers at the gatehouse and inspection of loads at the organic reception area.<br>o Approved quantities of combustible contaminants that have been separated (such as tires and plastic bottles) should be stockpiled in small piles or windrows.<br>o all fuels or flammable solvents for operational use should be stored in an appropriately ventilated and secure store (at appropriate height). This store should be located away from the bio mining, storage, and processing areas.<br>o all flammable liquids should be stored within a bund that can hold 110% of the volume of the flammable liquids stored there so that any release of raw or burning fuel cannot cause a fire in the combustible organics present on the site or have an impact on contaminating storm water.<br>▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented throughout the bio mining activity in line with National State regulations, guidelines and international good practices<br>▪ Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.<br>▪ Contain all local smokes/small fires inside the dump asap. Fire brigade help shall be sought on all smokes/fires outside the dump<br>▪ Ash from fires to be contained at the earliest within the site using bunds or screens, rather than allowing to disturb nearby receptors. Early clearing and disposal of such ash at TSDF to be ensured.<br>▪ Provide contact details of Fire Department & ambulance other essential emergency services on site & ensure training to the workers by such service providers | | |
| 10 | Construction of new facilities in retrieved land | ▪ The excavated site shall be protected from any dumping during or after the bio mining activity and shall be reserved for SWM activities in line with SWM Rules 2016<br>▪ Any new facility under KSWMP to be constructed on the retrieved land, shall follow EMF procedures & National State regulations | ULB | SPMU/DPMU |
| 11 | Pest / Vermin Control & Visual impacts<br>(Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted; preferably in coordination with Health section of ULB & local Health Center<br>▪ Communities around shall be made aware of possible pest menace & ULB shall support those in need with required pest management measures and offered health checkups<br>▪ Bio pesticides / biological control shall be followed. However, bio pesticides, or bio cultures used shall be tested to ensure the presence of no banned chemicals or hazardous materials<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used<br>▪ Visual blight to be curtailed by screens, proper lighting, housekeeping, leachate management | Contractor, ULB | DPMU, SPMU |

| | | | | |
|---|---|---|---|---|
| 12 | Odour nuisance | ▪ Waste with a strong odor to be covered immediately they are emptied from vehicles.<br>▪ Control and manage leachate treatment to minimize odor.<br>▪ Provide buffers screens to curtail odor from reaching surrounding communities especially to North side of site.<br>▪ Using natural deodorizers such as lemongrass, eucalyptus etc. and planting fragrant flowering plants around the site to mask odor. | Contractor, ULB | DPMU, SPMU |
| 13 | Storage, Collection, Transport, Treatment & Disposal of wastes and rejects | ▪ Storage, Collection, Treatment, treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste<br>▪ Storage, Collection, Transport, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc); & adequate protection shall be made to prevent such impacts even during rains / disasters<br>▪ Waste handling shall be in line with existing regulations & guidelines & avoid health & safety impacts<br>▪ No material is allowed to remain on site after the contract period<br>▪ Adequate fire safety arrangements & awareness & training to workers shall be ensured on site & at disposal / treatment areas for wastes in discussion with Local Fire Brigade to prevent any fire on legacy waste site or retrieved & stored wastes or that is transported<br>▪ Vehicles movement shall be tracked by ULB to ensure disposal of material/rejects/interts in designated or agreed area & are in line with schedule; using GPS.<br>▪ Given that the access road is used by the public, it is imperative to implement the required safety precautions and environmental protection measures when transporting the waste. | Contractor, ULB | DPMU, SPMU |
| 14 | Other activities | ▪ No activity other than bio mining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>▪ If existing MCF shall be used for storing bio mining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after bio mining works shall be after proper cleaning / washing & disposal of all rejects/inerts & tools to ensure good housekeeping & no H&S impacts<br>▪ If existing MCF shall be used by the ULB for storing dry wastes from Town, during bio mining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 15 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & bio mining / construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water and Leachate to be treated & recycled/reused | Contractor | ULB |
| **C** | **Future Site Usage (EMP shall be updated in line with EMF & used if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Bio mining, but of the future facility operator & ULB** | | | |

| | | | | |
|---|---|---|---|---|
| 1 | Future use of the bio mined site: Green Park, MCF, MRF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | ▪ ULB to ensure that the site will not be used for future dumping.<br>▪ Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around.<br>▪ ULB shall plan the future use of the site shall be in consultation with the communities.<br>▪ Phase 1 Environmental Assessment to be caried out, EA for existing facilities & EIA for proposed development in line with EMF in case this is proposed to be developed under KSWMP<br>▪ All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF/MRF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment, a nuisance to biodiversity, communities, Health impacts)* | ▪ The movement route shall be scheduled for each vehicle.<br>▪ Enforce speed limits applicable and make drivers aware of this<br>▪ Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule; preferably using GPS<br>▪ Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles<br>▪ Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards<br>▪ Proper lubrication shall be provided to minimize squeaking noise due to friction<br>▪ Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br>▪ The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public<br>▪ Traffic will be managed at the site by providing adequate space for parking of vehicles<br>▪ Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design<br>▪ No waste or material shall be disposed in any place other than the designated area; including water bodies, coasts/forests, or sensitive areas. | Future Facility operator | ULB |
| 3 | Exhaust emissions<br>*(Air impacts)* | ▪ No idling of vehicles on site.<br>▪ Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed | Future Facility operator | ULB |
| 4 | Plying of vehicles through kutcha / unsurfaced roads and idling<br>*(Air pollution: SPM, CO, CO2)* | ▪ Vehicle movement shall be well planned – through topped roads. In case of necessity to move through Kutcha roads, ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Future Facility operator | ULB |
| 5 | Impact on the ambient noise quality during the operations | ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines;<br>▪ Using modern, well-maintained and regularly serviced vehicles; | Future Facility operator | ULB |

| | | | | |
|---|---|---|---|---|
| | *(Noise, nuisance to sensitive receptors, health impacts)* | ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>▪ Provision of earmuffs and ear protection to workers and employees in high noise areas | | |
| 6 | Occupational health and safety impacts of the workers:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | ▪ All OHS and CHS measures to be followed in line with applicable regulations, guidance<br>▪ Workers & communities shall be made aware of OHS, CHS risks and impacts & mitigation measures adopted<br>▪ Emergency management plan to be prepared & followed<br>▪ Workers shall be appropriately trained or OHS during construction & Operation of all future facilities | Future Facility operator | ULB |
| 7 | Pest / Vermin Control (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted<br>▪ Bio pesticides / biological control shall be followed.<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used | Future Facility operator | ULB |
| 8 | Fire Safety | ▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations, guidelines and international good practices | Future Facility Operator | ULB |
| 9 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

### 6.1.1 Disposal phase of By-products from Bio-mining process

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within a three-month period, penalties will be imposed on the contractor.

## 6.2 Disaster Management and Emergency Preparedness

A disaster is a catastrophic situation in which suddenly, people are plunged into helplessness and suffering and, as a result, need protection, clothing, shelter, medical and social care, and other necessities of life. In the case of Dumpsite remediation, Disaster Management Plan is aimed to ensure the safety of life, protection of the Environment, protection of installation, restoration of the remediation process, and salvage operations in this order of priorities.

For effective implementation of the Disaster Management Plan, it should be widely circulated and personnel training is to be provided through rehearsals/drills. The disaster management Plan consists of Onsite Emergency Plan and an offsite Site Emergency plan, which is outlined here for Emergency Preparedness. Nearby Kalamassery police station at 2 km, Public Health Centre at 1.5km, Kochi medical hospital at 5 km, Eloor Fire station at Pathalam within 3 km are the nearest emergency services.

### 6.2.1 Approach to Disaster Management Plan (DMP)

The objective and approach of the Disaster Management Plan is to make use of the combined resources of the plant and the outside services to achieve the following:

- Effect the rescue and medical treatment of casualties;
- Safeguard other people;
- Minimize damage to property and the environment;
- Initially contain and ultimately bring the incident under control;
- Identify any dead;
- Provide for the needs of relatives;
- Provide authoritative information to the news media;
- Secure the safe rehabilitation of the affected area;
- Preserve relevant records and equipment for the subsequent inquiry into the cause and circumstances of the emergency.

In effect, it is to optimize operational efficiency to rescue rehabilitation and render medical help and to restore normalcy. Disaster Management Plan should include Emergency Preparedness Plan, Emergency Response Team, Emergency Communication, Emergency Responsibilities, Emergency Facilities, and Emergency Actions.

#### 6.2.1.1 Identified Emergency Situations

Major disasters which can affect the remediation process are as follows:

- Floods due to heavy rainfall
- Fire risk in summer
- Occupational and health risks during the remediation process
- Safety-related accidents during the remediation process

#### 6.2.1.2 Proposed Organizational Structure for Disaster Management Plan

**Response team:** Setup an Emergency Organization. Emergency Organization includes the senior executive (head of EO as a Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

- All Incident control would be reported to the Site Controller. Each Incident Controller organizes a team responsible for controlling the incident with the personnel under his control.
- **Shift In-charge** would be the reporting officer, who would bring the incident to the notice of the Incidence Controller and Site Controller.
- **Emergency Coordinators** would be appointed who would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential and support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.
- In each shift, the electrical supervisor, in charge, and other maintenance staff would be drafted for emergency operations. In the event of power or communication system failure, some of the staff members in the office/facility would be drafted and their services would be utilized as messengers for quick passing of communications.

### 6.3 Proposed Monitoring Plan

The proposed monitoring plan is presented in table below,

**TABLE -6.3 PROPOSED MONITORING PLAN AND FREQUENCY**

| Monitoring media/parameters | Items and parameters | Frequency | Location |
|---|---|---|---|
| **Ambient Air Quality** | PM10, PM2.5, NOx, CH4, CO, Ammonia | Quarterly (1 sample) | 2 point |
| **Noise** | $L_{eq}$ Day and Night | Monthly | 2 point |
| **Health safety Hazards** | Medical records, documentation of injuries and accidents, Health and safety assessments | As and when accident/injury occurs | Incident reports |
| **Leachate** | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins<br>• Heavy Metals (As per the schedule II of SWM Rules, 2016) | Quarterly | 2 point |
| **Groundwater quality** | Parameters will be defined and sampling, preservation, and analysis of water will be carried out following those stipulated in the subsections below and Standards Methods for Testing Water and wastewater, 21st edition, published by American Public Health Association (2005). | Quarterly | 8 points |
| **Surface water quality** | | Quarterly | 6 points. 2 upstream and 4 downstream |

### 6.4 Estimated Budget for Implementation and Supervision of EMP

The estimated cost of [redacted] is required for budget provision for implementation and supervision of EMP. The remediation will be only during shorter time duration and hence the recurring cost won't be incurred. The estimated cost particulars for EMP is mentioned below.

**TABLE -6.4 ESTIMATED BUDGET FOR EMP**

| Particulars | Capital Cost (In Lakhs) |
|---|---|
| Dust Mitigation Measures Including site barricading, water sprinkling and Wheel Washing, leachate management | [redacted] |
| Mobile Toilet, Pest Control, Disinfectant | [redacted] |
| Medical cum First Aid facility | [redacted] |
| PPE for workers & welfare, Fire Fighting Equipment | [redacted] |
| Monitoring / testing (air, noise, water, soil, leachate) | [redacted] |
| **Total** | [redacted] |

# CHAPTER 7 INSTITUTIONAL ARRANGEMENTS

## 7.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organization will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU.

## 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for HKS (Health & Hygiene, source level waste segregation and source level treatment, Fire and Safety)
- Training program for ULB Councilors and Ward convener (Proposed SWM project plan of KSWMP)
- Training program for Political and trade union leaders (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for Residence Association leaders (Health, Hygiene different composting methods and source level waste segregation, littering of waste, Public Health, Fire and Safety)
- Training program for workers of Municipal Sanitary workers (Health, Hygiene and source level waste segregation, Fire and Safety)

- Training program for school / college students (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for ULB officials (Proposed SWM project plan of KSWMP, proposed policies, existing policies etc... to improve the existing pattern into zero waste concept of the municipality)
- Training program for School children, Parents and Teachers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Massive awareness campaign on 5R (Reuse, Recycle, Repurpose, Reduce and Refuse)

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

## 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

# CHAPTER 8. PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

## 8.1 Approach to Public Consultation

**KSWMP** has developed a detailed strategy and installed various inclusive mechanisms in the different stages of the remediation process considering the project affected persons, families, and commercial establishments.

As the initial step, a **Transect walk** was carried out on **06.06.2023** covering the surrounding area of the dump site. The aim of the transect walk was to assess the site and gather information about its location, potential social risks, existing infrastructure and the impact on surrounding communities. The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions and systems by observing, asking, listening, looking and producing a transect diagram. Information collected can be used to reveal land use practices, hazards and vulnerabilities to inform disaster mitigation and water management.

**A public consultation meeting** was conducted on **24th July 2023** related to the formulation of Solid Waste Management Plan engaging a wide audience who are experienced in solid waste management sectors of the ULB. Municipal council members also participated in this meeting. Remediation of the proposed site was one of the agendas included in the discussion. **Ward level Consultation Meetings** will be conducted during the planning stage in the leadership of ward councilors by engaging the representatives from different resident's associations, commercial establishments and other institutions in the ward for explaining about the remediation process and thereby to gain public support and cooperation. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact.

**FIGURE: 8.1 PHOTOGRAPH OF THE PUBLIC CONSULTATION MEETING AT KALAMASSERY**

## 8.2 Information Disclosure

Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the remediation process at the site. Site control measures should be enforced to prevent unauthorized personnel from entering the work site. Work zones should be delineated around specific bore holes, excavations and other areas that may pose the risk of potential exposure to the hazards.

### 8.3 Information Education and Communication (IEC Plan)

**IEC Plan for Kalamassery dumpsite remediation**

| Target audience | Activity | Topic | Responsibility | Monitoring |
|---|---|---|---|---|
| 1.Street vendor running tea shop | 1 One to one interaction | 1. Process of dumpsite remediation<br>2.Risks involved in the process<br>3.Possible mitigation measures<br>4. Discussion on traffic arrangements<br>5. Listen their concerns & discussion on its remedies<br>6. Health and safety measures | contractor | |
| 2.The workers (Migrant Labours and HKS ) of the MCF functioning inside the dumpsite | 1.Interactive sessions<br>2. Video presentation of dumpsite remediation process through social media like WhatsApp | 1. Process of dumpsite remediation<br>2.Risks involved in the process<br>3.Possible mitigation measures<br>4. Discussion on traffic arrangements<br>5. Listen their concerns & discussion on its remedies<br>6. Health and safety measures | Contractor | PIU/TSC/DPMU/ DPMC |
| 3.General Public, Those who comes to the cemetery . | 1.Placing of hoardings in the visible area of the site | 1.Protocol to the public who reside in nearby areas and also trespassers.<br>2. GRM details | Contractor | PIU/TSC/DPMU/ DPMC |
| 4.General Public | Cautionary notification boards | 1.About vehicle movement and the transit of waste<br>2.precautionary measures should the general public take. | Contractor | PIU/TSC/DPMU/ DPMC |

# ANNEXURE –I

**Environmental Screening Form**

**INITIAL ENVIRONMENTAL EXAMINATION**

Environmental Screening during the Initial Environmental Assessment Stage has been provided below:

**Subproject Details**

| | |
|---|---|
| **Name of Subproject:** | Kalamassery Solid Waste Dumpsite Remediation by Bio mining |
| **Subproject Components:** | Dumpsite Remediation using bio-mining approach |
| **Subproject Location (City / Town/ Village with ward numbers):** | Premier Junction, North Kalamassery, Ward 06, Kalamassery Municipality |

**Stage 1: Exclusion List**

**Is the Project Excluded from Consideration due to the following:**

| ***Sl.No:*** | ***Non-permissible Activities*** |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |

*This dumpsite remediation project involves 1. (i) no construction in demarcated Forest areas or protected areas or their buffers, (ii) no construction of landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) no treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). 2. NO activities which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas, 3. No activities with (i) any impact on or due to Dams or embankments (ii) and project will not purchase, store and use Banned Pesticides.*

*Hence, not excluded.*

*Proceeding to Stage 2 Screening*

**Stage 2: Environmental Screening Checklist**

| Project Details | | |
|---|---|---|
| **Sl.No** | **Components** | **Details** |
| 1 | Project components | Kalamassery Solid Waste Dumpsite Remediation by Bio mining |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, bio mining of dumpsites, including for Linked activities / associated facilities) | Bioremediation of Kalamassery Dumpsite: - A total station survey was conducted to determine the quantity of legacy waste, revealing a total of 55,927.88 cubic meters. |
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination)<br>Site Survey No:/s (attach map) with ownership details, Geographical co-ordinates of the site location [including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | **Location:** Premier Junction, North Kalamassery, Ward 06, Kalamassery Municipality**.**<br>**Survey Number:** 1066/14, 1066/3<br>**Ownership –** Kalamassery Municipality<br>**Land use –** Solid Waste Management Facility<br>**Geographical Coordinates:** Latitude: $10.065159^0$ N<br>Longitude: $76.327607^0$ E<br>**Earthquake zone**: III<br>**Cyclone:** Moderate<br>Access road of width 4m NH-544 (Kochi – Salem Highway) in the north-western direction<br>Dumpsites have been in existence for 40 years. |
| 4 | Land Area proposed to be used: Location wise (in sq. km / sq.m) | Current total land area of 1.95 acres will be fully remediated through bio-mining. |
| 5 | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | For domestic usage 2 KLD will be met from private supplier. |
| 6 | Power Required and Source of Power | No DG set requirement for this sub-project. Electricity connection is available within the site. Source: KSEB |

***Baseline Environmental Conditions***

| ***Sl. No*** | ***Environmental Aspects*** | ***Yes*** | ***No*** | ***Details (include distance in Km, info on its importance)*** |
|---|---|---|---|---|
| 1 | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | | |
| *(i)* | Critically Vulnerable Coastal Areas (CVCAs), Eco-sensitive Areas (ESAs) | | ✓ | No Critically Vulnerable Coastal Areas and Eco sensitive Areas in the study area |
| *(ii)* | Cultural Heritage site, Protected monuments - listed by ASI/State | ✓ | | Thrikkakkara Vamana Moorthy Temple – 4.5 Km away |
| *(iii)* | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive | | ✓ | No Eco-Sensitive Areas in the study area. |

| | | | | |
|---|---|---|---|---|
| | area, with any schedule 1 species? If Yes, which is the area? | | | |
| *(iv)* | Other Wetlands/ Mangrove/ Estuarine Region | | ✓ | There is no Wetlands/ Mangrove/ Estuarine Region in the study area |
| *(v)* | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | ✓ | There is no Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves in the study area |
| *(vi)* | Other Sensitive Environmental Components listed in EMF | | ✓ | There is no other Sensitive Environmental Components in the study area as listed in EMF |
| *(vii)* | Drinking water source, upstream and downstream uses of rivers, etc. | ✓ | | A Nallah 30 m away from the dumpsite north-east direction. |
| *(viii)* | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | ✓ | The location is not in a low lying area and not in a CRZ region. |
| *(ix)* | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | ✓ | | SCMS Cochin School of Business within 200 metre. There are no Residential habitats within 200 metres from the site. |
| *2* | Is the site in Critical / Over Exploited Ground Water Block. Provide the level of the groundwater table | | ✓ | The site is not in critical/over exploited block. Water level ranges from 5 to 10 m |
| *3* | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | ✓ | | Yes, the site is vulnerable to fire. The site has history of Fire accident i.e. on Feb-2022. Bio-mining will be carried out by considering the fire control and safety measures. |
| *4* | Describe the type of soil and vegetation on site | ✓ | | Gravely Clayey soil is the most predominant soil type, presence of vegetation is (shrubs) |
| *5* | Is the site present in the flood plains as recorded in the last 100 years? Provide the HFL level of the site/region | | ✓ | Site is not located in a flood prone area. |
| *6* | Existing pollution/contamination or degradation on site | ✓ | | Dumpsites have been in existence for 40 years. |
| *7* | Any other remark on baseline condition | | ✓ | Based on the baseline data the AAQ, surface and ground water, noise analysis indicates that the respective results are well within permissible limits. |

***Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils***

| *Sl. No* | *Impacts on Land / Soil Environment* | *Yes* | *No* | *Remarks* |
|---|---|---|---|---|
| *8* | Total extend of land to be covered/built | ✓ | | The existing dumpsite area of 1.95 acres will be remediated by bio-mining. |
| *9* | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | | ✓ | The existing dumpsite area of 1.95 acres will be remediated by bio-mining. |
| *10* | Extend of Land to be remediated | ✓ | | The existing dumpsite area of 1.95 acres will be remediated by bio-mining. |
| *11* | Extend of land expected to be under green belt | | ✓ | Currently the dumpsite has no greenbelt. The Area of 1.95 acres will be fully remediated and utilized for further use by ULB. |
| *12* | Will the proposed project cause the following on Land / Soil: | | | After bio-mining the land will be remediated and will have a positive impact to the land and soil. |
| *(i)* | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | ✓ | No Impact on Surrounding Environmental Conditions due to the proposed sub-project. |
| *(ii)* | Substantial removal of Top Soil (mention area in sq.m) | ✓ | | The dumpsite has legacy wastes of 8.5 m below ground level and 2.5 m above ground level.<br>However, the legacy waste is combined with soil will be remediated till the depth of 8.5 m below ground level. |
| *(iii)* | Any degradation of land / eco-systems expected due to the project? | | ✓ | No land use change or ecosystem change due to implementation of this project since the land will be reclaimed. |
| *(iv)* | Loss or impacts on Cultural/heritage areas/properties | | ✓ | No impacts or loss of cultural/ heritage areas/properties due the implementation of the project |
| *(v)* | Does the project activity involve cutting and filling/ blasting etc.? | | ✓ | The project activity not involve any cutting, filling or blasting. The bio-mining sub-project involves only excavation of wastes which is to be remediated. |
| *(vi)* | Will the project cause physical changes in the project area (e.g., changes to the topography) | ✓ | | Waste is about 8.5 m below Ground Level which is to be |

| | | | | |
|---|---|---|---|---|
| | due to excavation, earthwork, or any other activity? | | | excavated and remediated. So there is change in topography. |
| *(vii)* | Will the project involve any quarrying/ mining etc.? | | ✓ | The project does not involve quarrying/ mining |
| *(viii)* | Will the project / any of its component contaminate or pollute the Land? | | ✓ | The existing dumpsite will be remediated and utilized for further use, henceforth there won't be any contamination to the land. |
| *(ix)* | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | ✓ | Due to the proposed bioremediation, the site will be remediated and bio diversity of the surroundings will be enhanced and it will be positive impact in the longer term. |
| *(x)* | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | ✓ | The proposed subproject involves only remediation through bio-mining. Hence no negative impact to the land. |

| ***Sl. No*** | ***Impacts on Air and Noise Environment*** | ***Yes*** | ***No*** | ***Details/Remarks*** |
|---|---|---|---|---|
| *13* | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | ✓ | | The process of bioremediation may cause dust emission from process and vehicle movement which shall be managed by effective mitigative measures |
| *14* | Will the project cause or increase pollution due to GHG emissions? | ✓ | | Chances of GHG emissions due to un-stabilised waste. |
| *15* | Will the project cause or increase odor nuisance? | ✓ | | The process of bioremediation may cause odour during remediation for the shorter time duration, which shall be managed by effective mitigative measures |
| *16* | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | ✓ | | Chances of toxic gases release during excavation of legacy wastes. |
| *17* | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | | ✓ | Project activity stage (during the process of bio remediation, the noise may arise due to vehicular movements & working of machineries). The proposed mitigation measures will ensure the ambient noise within the permissible limits. The duration of work will be 8 hours/day. |

| ***Sl. No*** | ***Impacts on Water Environment*** | ***Yes*** | ***No*** | ***Details/Remarks*** |
|---|---|---|---|---|
| *18* | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | ✓ | Due to the proposed remediation will only enhance the ground water/surface water quality in the long term. |

| | | | | |
|---|---|---|---|---|
| *19* | Will the activities proposed at the site(s) impact water resource availability and use - leachate, runoff, wastes deposition, erosion? | | ✓ | The proposed remediation will only enhance the ground water/surface water quality in the long term. |
| *20* | Chances of Pollution of Water bodies/groundwater wells, nearby or downstream | | ✓ | The proposed remediation will only enhance the ground water/surface water quality in the long term. |
| *21* | Will the activities proposed at the site(s) hinder natural drainage | | ✓ | No the proposed remediation activity does not hinder natural drainage. |
| *22* | Will the activities proposed at the site(s) decrease permeability/rainwater percolation | | ✓ | The proposed remediation will clear the legacy wastes and the land will be remediated. After remediation the permeability/rainwater percolation of the soil will be increased. |

| ***Sl. No*** | ***Impacts on Biodiversity and Host Communities*** | ***Yes*** | ***No*** | ***Details/Remarks*** |
|---|---|---|---|---|
| *23* | Will the project necessitates cutting of Trees / Loss of Vegetation | | ✓ | Cutting of trees are not required for the proposed remediation activity. |
| *24* | Will the project necessitate substantial removal of Top Soil (mention area in sq.m) | ✓ | | The dumpsite has legacy wastes of 8.5 m below ground level and 2.5 m above ground level.<br>However, the legacy waste is combined with soil will be remediated till the depth of 8.5 m below ground level. |
| *25* | Any degradation of land / eco-systems expected due to the project? | | ✓ | The proposed process of bio-mining ensures that there will be no degradation of the land. |
| *26* | Will the project result in Health & Safety Risks in the neighborhood including the release of toxic gases, leachate, accident risks | | ✓ | There is no habitable area within 300 m from the dumpsite. However health and safety management measures will be maintained periodically for the workers involved in remediation activity. |
| *28* | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | | ✓ | There is no habitable area within 300 m from the dumpsite. |
| *29* | Potential disruption to common property, accessibility, traffic disruptions, conflicts, or disruption to the local community within the subproject area? | | ✓ | No disruption, there will be a marginal increase in traffic of medium sized vehicle (trucks) due to the forward linking of recovered products from dump site (i.e. For compost, plastic and other recyclable waste). The total number of vehicles operational at the dumpsite is 5 numbers per day which increase the traffic load by only 0.1% per hour. |

**Enclosures:**

***Project Categorisation and Need for Safeguards Instruments, Oversight***

| ***Project Category*** | □ ✓***E2*** |
|---|---|
| **Key Reasons (for categorisation)** | During screening, it has found that the proposed subproject is moderately causing impact to the base line environment, land/ soil / water /noise environment, biodiversity or to the community. Site is not close to any Environmental Sensitive Receptor. Moreover, Project results positive impacts on Environment. The Environmental Baseline analysis reveals that dumpsite not having any Heavy metal contamination. Hence it is categorized as E2. |
| **Safeguards Instruments Required** | a) E2: Project-specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities) |
| **Additional Responsibilities Expected** (such as i) Specialists to be hired for Physical/Cultural resources, Natural Habitats/others, etc. for EIA preparation, and/or supervision), ii) Consultations, iii) any other aspect | |

| ***Status*** | ***Agency / Official*** | ***Name, Signature with Date and Seal*** |

# ANNEXURE II FIRE RISK ASSESSMENT

**Objectives:** The important elements of fire risk Management planning can be classified as:

- Identifying the disaster potential scenarios and advance planning to combat and minimize the damage.
- Vulnerable zone delineation.
- Assessment of loss probability and its severity.
- To deal with such emergencies expeditiously.
- Warning, protective actions like evacuation of personnel.
- To contain the disaster by isolating the area, firefighting etc.
- To make efforts to return to normal condition when the situation is controlled.

*Causes of fire and Risk:*

| Ignition (heat) sources | Fuel Sources | Oxygen Sources |
|---|---|---|
| Lit cigarettes/ butts, matches, lighters<br>Improperly stored batteries<br>Bushfire<br>Self-heating piles<br>Hot loads/contaminated waste<br>Hot work operations<br>Arson<br>Lightning<br>Fires from neighbouring activities<br>Faulty electrical wires | Flammable liquids, gases and solids<br>Combustible goods and waste (e.g. CRWM[2])<br>Contamination in CRWM storage<br>Dry and unmanaged vegetation | Oxidising chemicals such as oxy-acetylene sets, bleach, hydrogen peroxide, nitrates<br>Physical introduction of oxygen through unbaling or turning of loose piles |

**Fire Prevention & Management Plan**

It is a strategy well evolved, organized and rehearsed to contain the adverse effects of a possible disaster. It aims to mobilize the internal resources and use these with minimal dependence on external agencies for the following purposes:

- To control and contain incidents.
- To safeguard employees and people in the vicinity.
- To inform employees, the general public and the authorities about the hazards/risks assessed, safeguards provided, residual risk, if any, and the role to be played by them in the event of disaster.
- To effect rescue and treatment of casualties.
- To prevent recurrence of such a disaster.
- To establish machinery for review, rectification/modification of the emergency
- To ensure safety of works before personnel re-enter and resume work.

- To work out a plan with all provisions to handle and to provide for emergency preparedness and the periodic rehearsal of the plan.

**Pre-Disaster Stage**

The prevention of disaster is of vital importance and is the moral responsibility of each and every individual employed in the dumpsite site. It can be prevented by observance of precautionary and preventive measures. During pre-disaster stage following points will be followed to avert the occurrence of disaster:

The emergency operation procedures of the dumpsite site will be written down, so that no confusion is caused in the event of emergency taking place.

- To reduce the probabilities of accidental leakage of methane.
- Smoking will be prohibited in the areas where handling of dumpsite will be done. “NO SMOKING” boards will be prominently displayed in Local Language i.e., Malayalam and English languages.
- All electrical wiring, fittings, cables, equipment will be checked periodically. Temporary wiring will not be permitted to be installed inside the dumpsite area. No inflammable material including papers, Oils, wooden racks will be stored within 1 meter of any electrical fittings. No un authorized person will be allowed to tamper with electrical fittings.
- Welding, Burning, cutting, Chipping, soldering work, etc. will only be carried out by authorized person.
- Necessary compliance with various Statutory Guidelines and other relevant instructions as issued from time to time will be done by the contractor.
- Safety Department will arrange to educate all concerned regarding operational hazards of non-compliance of the safety guidelines. They will also provide necessary guidance and support in proper implementation of the program. They will also arrange mock exercises periodically.
- Safety Department will display at prominent places important telephone numbers and instructions, in Mizo & English languages. The Security Control Room located at the dumpsite site will be equipped with the following:
- Sufficient number of copies of On-Site Disaster/Emergency Management Plan.
- Master plan of the dumpsite site indicating vital locations and possible sources of disaster.
- Important Telephone numbers
- Emergency lights (portable) and Wireless sets if required and possible).
- First Aid boxes

**Disaster Stage**

The most probable disaster which may occur at dumpsite site is because of accidental leakage and fire. To control leakage and fire the following measures/precautions will be taken at the dumpsite site:

The guidelines as given below for the protection of fire will be followed:

- The dumpsite’s fire protection will consist of structural solutions, fire extinguishing systems and fire alarm systems. The fire extinguishing system will consist of the fire system with fire pumps, distribution pipelines, hydrants and fire hoses and the portable extinguishers.
- The fire alarm system will be a part of the primary systems and take care of the places which are unmanned or will not have any fixed fire extinguishing system.
- The major operation areas shall be equipped with fixed smoke detectors, CO2 extinguisher near the door in the control room.

- All the rooms in the office shall be equipped with fixed smoke detectors.
- The ventilation rooms shall be equipped with fixed smoke detectors. One CO2 extinguisher will be located near the door to ventilation room.
- The fire alarm and detection system shall be designed, installed, maintained and tested according to relevant standards.
- The water for firefighting shall be stored in the fire water tank (water reservoir).
- CO2 fire extinguishers contain extinguishing carbon dioxide which either by it or under expected conditions of use gives off CO2 to prevent fire.
- Dry fire extinguishers contain extinguishing medium which either by itself or under expected conditions of use will give fine powder to prevent fire to get oxygen.
- As soon as a fire takes place inside the premises of dumpsite, action to be taken by various persons/officials.

**Post Disaster Stage**

After the incident, an incident report will be prepared regarding occurrence of event/losses incurred and recommendations thereof for restoration of normalcy.

**Reporting of Accidents**

Situation in totality will be studied thoroughly, investigated with respect to the cause of the incident, extent of loss of life and property and a detailed report prepared by the individual/team nominated by dumpsite site authorities for this purpose. Based on the investigation report, rescue team would finalise time bound programmes for implementation of corrective measures proposed and regularly monitor the progress thereafter. Rescue, medical and welfare operations would be continued by the concerned agencies.

## Executive Summary

Kalamassery is a municipality in the Ernakulam district of Kerala, India. It is located 9.6 km northeast of the Kochi centre and is a part of the Kochi metropolitan area. Even though the ULB has an excellent practice of waste management, the primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing the dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. Consequently, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project for the remediation of legacy waste dumpsites in all the ULBs of Kerala. As part of the project, in phase1 the existing dumpsite at Kalamassery, ward no 6 was proposed for remediation.

The Kalamassery Municipality has an area of 27 sq.km with 42 wards. The municipality, with the financial and technical support of KSWMP, has taken up steps to remediate the existing legacy waste dumpsite located in around 1.95 acres of land in ward 06, and to recover land for future developmental activities. The Kalamassery dumpsite was used for dumping municipal solid waste from the year 1990. Considering the impending threat of fire hazards and leachate issues, the Municipal Council has taken up the remediation of legacy dumpsite as a priority and to utilize the remediated land for setting up other solid waste management facilities. Since the cessation of dumping activities in 2020, only sweeping waste from towns and streets were dumped at the facility daily and has now been discontinued.

The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. To assess the quantity & composition of legacy waste & also evaluate the environmental baseline of the dumpsite, samples from representative locations were collected and analyzed for various parameters viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Groundwater and Surface Water. As part of the study, detailed site investigations were carried out for; – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical and Environmental Analysis by M/s Polluchem laboratories. From the results of the investigations, it was found that the waste was seen up to a depth of 8.5 m. The total estimated quantity of legacy waste is around 55,927.88 Cubic meters. (Above GL 33569.128 and Below GL 22358.88 Cubic meter)

As per the SWM Rules 2016, selection of an applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out, and based on the results, remediation can be done by a) Capping without land recovery, b) Bio-mining – reclamation/recovery of land & c) capping with partial land recovery. The selection of technology shall also depend on the available resources viz., manpower, machineries, money, and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/ by-products. Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Selection of machineries for screening of the

stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, stationary trommel screening machineries shall be optimum for processing the legacy waste within the stipulated timeline of 31st March 2024.

Environmental & Social safeguards: The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project attracts moderate social risks based on the social mapping, transect walk and consultation with the people living around the proposed project site to assess the problems associated with the legacy waste dumpsite and the impact during the execution of the project.

The activities of bio-mining will commence from Dec 2023 and are expected to end by May 2024. An area of 1.95 acres will be reclaimed and will be utilized for setting up other solid waste management facilities. Total cost of the project is Rs. [redacted]

## 1.0 Introduction

In view of the environmental and social issues connected with dumpsites, the SWM Rules 2016, directs all local bodies to identify the legacy dumpsites and to scientifically remediate them in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the remediation projects of legacy waste dumpsites in all the ULBs. As part of the project, in phase -1, the existing dumpsite of Kalamassery ULB was proposed for remediation.

For arriving at a methodology for remediating the legacy waste in the dumpsites, as per the Project Implementation Manual, a feasibility study outlining the technical, economic, and socio- environmental factors has been carried out. As a result of the feasibility study that involved detailed field investigations & assessment, and market sounding, the method proposed for remediation of legacy waste dumpsite is biomining, which will ensure long-term sustainability and environmentally sound treatment, which is found technically feasible, economically viable, and socially acceptable. The details of various steps involved in the feasibility study are described in the following sections.

## 2.0 General Description about the Project

Kalamassery, Ernakulam in the State of Kerala is experiencing the issues of treatment and disposal of MSW. The KSWMP project aims to improve the overall SWM system in all the 93 ULBs and covers the waste collection, transportation, processing, and disposal of rejects in a scientific landfill. The existing waste dumpsite at Kalamassery needs to be remediated scientifically and the land reclaimed for productive use. The site is close to a stream that eventually joins the Periyar River.

## 3.0 Profile of ULB- Kalamassery Municipality

### 3.1 Location

Kalamassery Municipality is located at latitude 10°3'53.611’N and longitude 76°19' 40.463"E. The total geographical area of Kalamassery municipality is 27 sq. km. The Municipality is divided into 42 administrative wards. Kalamassery was raised to the status of a Municipality in the year 1990 from a panchayat.

**Figure 3.1 Location Map of Kalamassery ULB**

## 3.2 Demographic & Socio-Economic Status

The municipality has a total population of 71,038 of which 35,331 are males while 35,707 are females as per report released by Census of India 2011 indicating a sex ratio is of 1.011 against state average of 1.084. The overall literacy rate of Kalamassery town is 95.87 % which is higher than the state average of 94.00 %. The estimated population in 2023 is 83,909 with a decadal growth rate of 16.71 %.

*Source: Census Data 2011*

## 3.3 Connectivity

Kalamassery town is well connected to neighbouring local bodies and towns through National Highways, State Highways, and other Major and minor road networks. National Highway 544 passes through the municipality. Kochi – Salem Highway also passes through the town. The Main Central Road section of about 6.45 kms is also passing through the municipality.

The nearest railway station is Kalamassery whereas Aluva railway station is located 7 kms from the town centre, which is the second largest railway station in Ernakulam. The nearest airport is Kochi International airport located 18 kms away from the town. The town is well connected by a water way network which brings a wide opportunity of inland navigation.

**Figure 3.2 Base Map of Kalamassery Showing Major Connectivity**

## 3.4 Climatic Condition

Kalamassery has a tropical climate. Rainfall is significant in most months of the year, and the short dry season has little effect. The average annual temperature is 27.6 °C in Kalamassery. Precipitation here averages 3,570 mm. The driest month is January, with 22 mm of rainfall. Most of the precipitation here falls in June-July with an average of 541 mm. The warmest month of the year is March with an average temperature of 28.3 °C. July and August are the coldest month, with temperatures averaging 25.3 °C. The data is presented in **Table 3.2**

**Table 3.1 Meteorological data for Kalamassery**

| | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sept | Oct | Nov | Dec |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Avg. Temp °C** | 26.7 °C | 27.5 °C | 28.3 °C | 28 °C | 27.2 °C | 25.7 °C | 25.3 °C | 25.3 °C | 25.6 °C | 25.9 °C | 26.1 °C | 26.2 °C |
| **Min. Temp °C** | 23.1 °C | 24 °C | 25.2 °C | 25.6 °C | 25.3 °C | 24.4 °C | 24 °C | 23.9 °C | 23.9 °C | 23.9 °C | 23.7 °C | 23.1 °C |
| **Max. Temp °C** | 31 °C | 31.0 °C | 32.2 °C | 31.2 °C | 29.8 °C | 27.8 °C | 27.4 °C | 27.4 °C | 28.1 °C | 28.5 °C | 28.1 °C | 29.0 °C |

| **Humidity (%)** | 71% | 70% | 73% | 81% | 85% | 90% | 90% | 89% | 88% | 87% | 84% | 76% |

*(Source: en.climate-data.org/asia/india/kerala/kalamassery), Time Period: 1991 to 2021*

Summer begins in March and ends in May. The climate in Kalamassery during the season is moderately hot and humid. Like all other places in Kerala, Kalamassery experiences heavy showers during the monsoon season. From June to August, the place get rainfall. The catchment area has very high humidity of more than 75%.

## 3.5 Ground Water Level

From monitoring wells dispersed across the state, the depth to water level is observed in the months of April, August, November, and January. According to information published by the CGWB, the Government of India, the water level in Kalamassery fluctuates from 1.2 to 2.77 MBGL.

## 3.6 Land use

The landuse survey of 2023 revealed that the predominant land use of Kalamassery Municipality is agricultural (45.91%). 24.72% of the total area is under residentials and commercial etc. Existing land use analysis shows following breakups as shown in table. The details of analysis of the land use survey and the resultant findings of existing land use are given hereunder. The glaring aspect of existing land use of Kalamassery municipality is blessed with potential resources such as agriculture land and water bodies.

The highest percent of land use falls under the category residential/agricultural mix, which include mainly dry agriculture lands where residential developments are co- existent. Rubber is the principal crop followed by paddy, coconut and tapioca. Existing land use analysis shows following breakups as shown in table below.

**Table 3.2 Land use Pattern of Kalamassery Municipality**

| Sl. No. | Zone | % of Total Area |
|---|---|---|
| 1 | Agriculture zone | 45.91 |
| 2 | Residential zone | 24.72 |
| 3 | Industrial zone | 21.13 |
| 4 | Public zone | 5.98 |
| 5 | Park and Playground | 2.23 |

## 4.0 Detailed Description of the Dumpsite

### 4.1 Physical Feature of the Site

Kalamassery dumpsite is located approximately 1.0 Km from the centre of Kalamassery town on the western side and encompasses an area of approximate Kalamassely 1.95 acres of land. The dumps site is not very far from human settlement. The coordinates of the dumpsite are 10.065159° N & 76.327607° E. It is in ward no. 6 of the municipality. Kalamassery municipality holds the ownership of the dumpsite. The dumpsite is surrounded by highways from north-western directions. In the South-eastern direction, a railway line passes through it. The North-eastern side of the dumpsite is vacant land. A small stream flows on the North-eastern side of the dump site within the distance of 100 m.

The exact date for the start of the dumpsite was not available with the municipality; however approximately it had started 40 years ago, the information has been gathered during field visits. Presently, the quantity of waste dumped above ground level at this site is about 33,569 cum as per records available (topographical survey) with the ULB. As of now 60 % of the area is covered with solid waste. The dumping has been irregular with no proper liner system which would allow the leachate from percolating into the groundwater system. There is a high chance of water being contaminated in this area due to the irregular dumping and air pollution because of odour problem to the nearby residents. Average height of the waste heaps is 8.5 below the existing ground level.

**Figure 4.1 Photographs of Kalamassery Dumpsite**

**Table 4.1 Salient Features of Kalamassery Dump Site during Site Visit**

| | |
|---|---|
| Name of Dumpsite | Kalamassery dumpsite |
| Location of Dumpsite | Ward No. 6 of the municipality |
| Coordinates of Dumpsite | Latitude: 10.065159°N<br>Longitude: 76.327607°E |
| Distance from the central part of the town | 1.0 km |
| Total Area of dumpsite | 1.95 Acres |
| Ownership of dumpsite land | Municipality |
| Distance from nearby features- residential, school, offices, temples, institutions, industry etc.) | SCMS Cochin School of Business within 200 metres. There are no Residential habitats within 300 metres from the site. |
| Start year of dumpsite | 1990 |
| Quantity of waste dumped per day | None |
| Utilities on site | Existing Electricity connection is available |
| Details of manpower and vehicles available in ULB | 111 persons & 32 Vehicles |
| Site demarcated | Site is currently demarcated with a boundary wall. |
| Details of weighbridge available at dumpsite | No weighbridge at site |
| Availability of electrical power | 440 LV grid available at 100m from site |
| Availability of water | Water to be supplied by tanker |

## 4.2 Surrounding Features of the Dumpsite

The dumpsite is located adjacent to the National Highway 544 and therefore is easily accessible for the remediation activity. The site offers easy manoeuvrability for heavy vehicles which may be needed for transport of biomining products such as RDF, compost and bio earth. It is bounded by the streamlet on the North, highway to the west, the railway track on the east, ULB operated crematoria, Kalamassery railway station and the Fertilisers and Chemicals Travancore Limited (FACT) godown on the south and southeast. The dumpsite is sloping towards the stream and the railway track. Water may be procured by tankers if needed. The LV electrical line adjacent to the dumpsite is convenient for setting up the biomining facility

## 4.3 Information on Site Management

This section describes the current management of the dumpsite in terms of agency responsibility, profile of workers and numbers, nature of work the labour force is engaged, Waste pickers and other categories of workers at the site.

**Agency responsible for current management of the dumpsite:** Currently, the dumpsite is closed and non-functional. There is currently an MCF & RRF adjacent to dumpsite which is functional.

**Workforce engaged:**

About 69 HKS workers are engaged for collection of waste from the municipal jurisdiction. The MCF is being handled by 22 Workers from Clean Kerala Company Limited (CKCL) who segregate the dry waste. HKS workers are involved in collection and CKCL workers are engaged in segregation of dry waste.

**Waste pickers and other categories of workers at the Site:** The waste is segregated with the help of 54 contract labourers. Recovered materials are collected by the Clean Kerala Company.

## 4.4 Relevance in local or regional SWM plans

The ULB is planning to utilise the dumpsite land after biomining for the construction of a state of art Material Recovery Facility (MRF). MRF can be designed to incorporate the depression created by biomining as an underground parking lot for ULB-owned vehicles. The non-biodegradable waste from the ULB shall be brought to this facility and processed for further use. The project is proposed to be funded under the KSWMP project.

## 4.5 Litigation status of the Site

- This site has been used as a dumpsite for 30 years. The Hon'ble NGT (OA 395 of 2013 SZ) and PCB (PCB/ RO-EKM/ GEN-221/2019 dated 31.12.2021 and PCB/EKM/DO-1/Sup-com 2020 dated 4/01/22 addressed to Secretary Kalamaserry has issued direction to prevent dumping because the canal was polluted.
- Letter from State Pollution control board dated 06/05/2023 Regarding "Direction imposing Environmental compensation for Non-compliance Act,1986."

## 5.0 Scope of Work

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Kalamassery includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.

- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (Optimum land recovery – Biomining, capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the ESMF developed for projects envisaged under KSWMP.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Delineation of baseline assessment, impact & risk assessment, mitigations measures, Environmental Management & monitoring plan, budget for EMP, EMOP, institutional responsibilities for implementing monitoring and reporting
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport.
- Environmental and social monitoring costs, Revenue from the project, Funding for project.
- Project Implementation plan –contractual models and timelines.

## 5.1 Objectives:

- To initiate dumpsite remediation from January 2024.
- To reclaim dumpsite land and by eliminating the chances of dumpsite fires, leachate generation, and foul odour.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.
- To increase nearby social value and benefit the citizens.

# 6 Detailed Investigation Strategy

## 6.1 Investigation Strategy

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected. Samples were collected as mentioned below.

- Bore hole up to a depth of 10 m and collection of 3 (no's) samples from the soil at interval of 1.5 m.
- Waste analysis viz., leachate sample from 1 location and physical analysis from 2 (no's) locations, and chemical analysis from 1 (no's) location.
- Environmental baseline analysis surface water 1 (no's) location and ground water samples from 2 (no's) locations (Well Water Samples -1 up gradient, 1 down gradient) and Air sampling from 2 (no's) locations and noise sampling from 1 (no's) location.

## 6.2 Investigation Plan

The detailed investigations carried out for the legacy waste dumpsite in line with PIM is given in the table below:

| Sr.No | Parameters | Sampling Nos |
|---|---|---|
| 1 | **Geotechnical Investigation** | |
| A | Bore Holes up to 10m depth (1No./2 Hectares) (as per CPHEEO) | 1 |
| B | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, Strength compressibility (vertically-3 samples per borehole). | 1 |
| 2 | **Waste & Environmental Analysis** | |
| A | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammoniacal nitrogen (as N), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | 3 |
| B | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | 2 |
| C | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), Total carbon, C/N ratio, calorific value, Biochemical and Biodegradable factor. | 1 |
| D | Ground water (well water samples-1 up gradient, 2 down gradient)- (shallow and deep wells) Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, E. coli and Total coliform (IS 10500-2012). | 3 |

| Sr.No | Parameters | Sampling Nos |
|---|---|---|
| E | Surface water (pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, E. coli and Total coliforms (IS 10500-2012). | 1 |
| F | Ambient Air Quality (Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise level [E(P)] for 24 hours. | 1 |

## 6.3 Sampling Methodology

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

**Table 6.1 Detailed Investigation Plan Executed for Waste Dumpsite at Kalamassery**

| S. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | Within the Dumpsite<br>Dumpsite boundary | Air monitoring points are selected as per the Wind-rose diagram of the Kalamassery site for the month of July. |
| 2 | Noise (1 Location) | Ambient Noise level [E(P)] for 24 hours | Entrance of the dumpsite | Noise Points are selected from the boundary points of the site, and it is east side for this site because of the close access to the metro railway track and highway. |
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, E. coli and Total coliforms (IS 10500-2012). | Stream adjoining the dumpsite | Surface water sample points are selected based on the water flow from upwards to downwards and for this site, it is South-east to South-west. |

| S. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 4 | Ground water (1 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, E. coli and Total coliform (IS 10500-2012). | Nearby well (within 100m vicinity) | Nearest well water was considered for analysis of ground water. |
| 5 | Bore Hole (1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, Coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | on the dumpsite | One borehole selected at the centre of the dumpsite as per the CPCB guidelines i.e., Up to one hectare requires one borehole. |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammoniacal nitrogen, TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, cyanide, Chloride, Fluoride, Phenolic compounds. | 3 | |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | 2 | |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium(N-P-K), Total carbon, C/N ratio, calorific value, Biochemical and Biodegradable factor | 1 | |

For the borehole investigation the samples were collected by rotary drilling a 150mm bore hole using a fast rig attached to a drag bit. The soil drillings are removed by a circulating bentonite slurry which also aids in keeping the side walls stable. An SPT sampler was driven in to collect the representative samples, which is carefully packed in double walled polythene bags, sealed, and sent to laboratory for testing. Standard penetration tests were conducted on soil at every

1.5m depth and the number of blows to achieve 300mm penetration were noted. Fractions recovered from the mining of legacy waste should be tested, especially for the presence of toxic metals and organic contaminants.

The total quantity of waste present in the waste dump is calculated based on the topographic study executed by ULB (towards calculating quantum of waste above ground level) and the results of borehole investigation (towards calculating the quantum of waste below ground level).

## 6.4 Analysis and Interpretation of Exploratory Data

The baseline condition of the waste dumpsite at Kalamassery, has been assessed through the geotechnical investigation and Waste & Environmental baseline assessment executed through M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Poluchem Laboratories (P) Ltd respectively. The results of the Topographical survey conducted by ULB in the year 2022 are also considered for the analysis. The signed reports of all analysis are enclosed as Annexures detailed below;

Annexure 1 – Topographical survey report
Annexure 2 –Geotechnical Survey report
Annexure 3- Waste Characterization study report
Annexure 4 - Waste & Environmental baseline assessment reports

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 29/05/2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 28.05.2023 and was completed on 31.05.2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 30.05.2023 by M/s Poluchem Laboratories (P) Ltd.

### 6.4.1 Topographic Survey Results

Topographic survey was conducted for ULB by Spreads Survey in December 2022 towards assessing the quantum of the waste present in the dumpsite above the ground level. The Topographical survey report is presented in **Annexure 1**. The inference of the Topographical survey is as follows.

- Topographical Survey Map shows Approximate 1.95 acres of land used for waste dumping.
- Maximum height of waste dump above soil is 4.2 m

- Estimated waste volume is 33,569 cum which will constitute 28,030.11 MT of waste (Above ground level density of waste is 0.835 T/cum as per the characterization study results presented in subsequent sections)

### 6.4.2 Geotechnical Exploratory Details

The geotechnical investigation at the dumpsite at Kalamassery, Ernakulam district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was drilled through the waste into the ground using a rotary drilling method. The maximum depth of investigation was 12.4 m (depth up to 8.5m is legacy waste and 3.9 m in soil). SPT and collection of undisturbed soil samples were carried out at regular intervals within the ground. Various laboratory tests were carried out on the SPT and undisturbed soil samples. The full geotechnical report is appended as **Annexure 2**. The major inference of the geotechnical investigations is as follows.

- In the borehole investigation it was asserted that the depth of the waste column below ground level is 8.50.m.

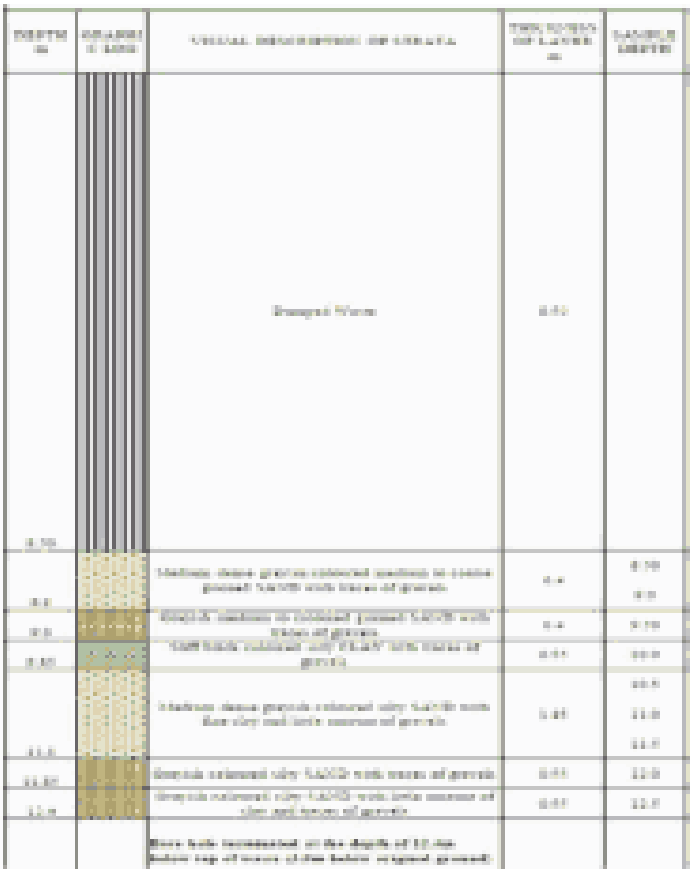

**Figure 6.1 Borehole Strata Obtained for Kalamassery Dumpsite**

- The soil exhibited a plasticity index varying between 17 to 49 and the clay fraction is between 25 to 37%.

- The base soil has a plasticity index greater than 10 and the clay and silt fractions account for more than 40%, which makes it a good soil for the sub-base. The safe bearing capacity of the soil is 150kPA, implying that the maximum height of fill may be only a maximum of 12m.
- During excavation, the side slopes should be maintained at 1 (V) and 3 (H).
- The Cation Exchange Capacity (CEC) of the soil is 11.91 meq/100 gm which can adsorb heavy metals in case it is present in the soil.
- The pre- consolidation pressure is between 70 to 109 KPa.
- The permeability value is between 1.05 to 1.11 E-03m/s.

### 6.4.3 Estimated Total Quantity of Waste

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). As detailed under section 6.4.1 the estimated quantity of the waste above the ground level is 33,569 cum. Quantity of waste below the ground level is estimated as 22,358.88 Cum. The quantity of waste below ground level may vary as per actual site conditions. We recommend taking 4 more bore holes for estimating exact quantity prior to tendering process or the assessment of quantity below ground level may be included in the contractor's scope.

Thus, the total legacy waste present in the Kalamassery dumpsite is calculated as below.

**Table 6.2 Total Waste Quantification for Kalamassery Dumpsite**

| Level | Volume of Legacy Waste (m3) | Density of Waste | Total Quantity of Waste (MT) | Remarks |
|---|---|---|---|---|
| Above Ground | 33,569 | 0.835 | 28,030.12 | Volume is calculated using the Contour Survey Report by ULB |
| Below Ground | 22,358.88 | 0.835 | 18,669.67 | Volume is calculated using assumptions and depth obtained during bore hole test. |
| Total | 55,927.88 | | 46,699.78 | |

### 6.4.4 Legacy Waste Characterization

The characteristics of the **legacy** waste were assessed by collecting a 15 kg sample. The legacy waste samples were collected on 28.05.2023 by M/s Matters lab (P) Ltd. The assessment of waste characteristics. was done based on the results of the analysis. The details of the physical characteristics are provided in the tables below: The detailed legacy waste characterisation reports are enclosed as **Annexure 3.**

**Table 6.3 Physical characterization of legacy waste**

| S. No | Total Quantity of legacy waste (MT) | Parameters | Percentage of Weight (%) | Quantity (MT) |
|---|---|---|---|---|
| 1 | 46699.78 | Bio Earth (-4.75mm) | 29.6 | 13823.14 |
| | | Bio Earth (+4.75 to 8 mm) | 16.4 | 7658.76 |
| 2 | | C&D (+8mm) | 6 | 2801.99 |
| 3 | | Plastics | 34 | 15877.93 |
| 4 | | Paper | 6.4 | 2988.79 |
| 5 | | Cloths | 3.6 | 1681.19 |
| 6 | | Glass | 1.6 | 747.20 |
| 7 | | Metals | 1.2 | 560.40 |
| 8 | | Rubber | 1.2 | 560.40 |
| 9 | | Other | 0.008 | 3.74 |
| 10 | | Leather | 0.004 | 1.87 |

**Table 6.4 By Product Composition**

| Particular | Percentage of Composition (%) |
|---|---|
| RDF | 20.6 |
| Recyclable | 27.412 |
| Inert | 5.2 |
| Compost Soil Enricher | 46 |

**Table 6.5 Physical Characteristics of Waste**

| S. No | Parameter | Test Method | Unit | Value |
|---|---|---|---|---|
| 1 | Moisture @105°C | ASTM D 2216 | % | 14 |
| 2 | Bulk Density | USEPA | kg/m3 | 835 |

**Table 6.6 Chemical Analysis**

| SL No | Parameters tested | Test Method | Unit | Result |
|---|---|---|---|---|
| 01 | pH@25°C | USEPA | .. | 8.44 |
| 02 | Biodegradable Factor | USEPA | % | 6.3 |
| 03 | Total carbon | USEPA 9060A | % | 4.8 |
| 04 | Phosphorus(P) | USEPA | % | 0.027 |
| 05 | Nitrogen(N) | USEPA | % | 0.41 |
| 07 | Potassium(K) | USEPA | % | 0.051 |
| 08 | C/N Ratio | USEPA | .. | 11.7:1 |
| 09 | Calorific Value | ASTM D 5865 | k.cal/kg | 895 |
| 10 | Bulk Density | USEPA | gm/cc | 835 |

*Note: The average Nitrogen, Phosphorus and Potassium (NPK) content in the legacy waste samples are far lower than 0.8, 0.4 and 0.8 as specified by the Fertilizer Control Order (FCO) 1985 for city compost and hence cannot be used as compost. The carbon: nitrogen ratio is 11.7:1 which is much lesser than the specified standard. This could be due to the materials being exposed to sun and air over the years or that the carbon content may have*

*leached into the ground through leachate during the rainy season. Another possible contributor to the reduced carbon levels could be multiple fire incidents at the site. Although the material has very less carbon content, the NPK value can be enriched by adding additives like poultry litter. The enriched material can be given to farmers or used for horticulture purposes.*

### 6.4.5. Soil Conditions of the Dumpsite

As it is an unlined dumpsite, there is a probability of finding traces of contaminant from waste and leachate in the underlying soil. Since it is an uncontrolled disposal site, the mixed waste contains different types of pollutants which may eventually have an impact on the soil. Results of soil analysis of the samples taken from the borehole in the Kalamassery dumpsite is as shown below:

**Table 6.7: Chemical analysis of soil extracted from borehole at Kalamassery dumpsite**

| Sl. No | Parameter | Result | US (NY State-Codes, rules and regulations) Industrial Use |
|---|---|---|---|
| 1 | Cadmium (Cd) mg/Kg | <5.0 | 60 |
| 2 | Chromium (Cr) mg/Kg | 157.4 | 800 (Hexavalent) 6800 (Trivalent) |
| 3 | Copper (Cu) mg/Kg | 120.5 | 10000 |
| 4 | Nickel (Ni) mg/Kg | 46.8 | 10000 |
| 5 | Lead (Pb) mg/Kg | 93.6 | 3900 |
| 6 | Zinc (Zn) mg/Kg | 2012 | 10000 |
| 7 | Mercury (Hg) mg/Kg | <0.1 | 5.7 |
| 8 | Arsenic (As) mg/Kg | 2.0 | 16 |

On comparing results of the report with the US Industrial Use benchmark, it is observed that the values are within the benchmark values. Bioremediation may be carried out to reduce traces of heavy metals in soil and for site clearance. The location may be used for industrial landuse as a site for the SWM facilities like Material Collection and Resource Recovery Facility. However, the solution may be considered after proper soil and groundwater investigation post dump-clearing stage.

### 6.4.6 Leachate Characterization and Quantification

There is no leachate collection/management system in the dumpsite. To address the concern of contamination of the groundwater and soil due to uncontrolled dumping, leachate samples are picked for analysis. The data is presented in **Annexure 4**. The data indicates that the TDS is

about 23,400 mg/l while the suspended solids is about 864 mg/l. The chlorides are high at 12535 mg/l, while the COD, BOD are 88,000 mg/l and 20,000 mg/l respectively. The sample does not indicate any traces of contamination hence the soil is unlikely to be contaminated by heavy metals from waste.

**Table 6.8 Leachate characteristics at Kalamassery Dumpsite**

| Parameters tested | Test method | Results |
|---|---|---|
| Sampling Location | N-9°59'23.582" E-76°33'51.031 | |
| pH | IS 3025 (P) 11 –1983RA2017 | 3.81 |

*BDL- Below Detection Level, MDL- Minimum Detection Level*

All the heavy metals are significantly low or below detectable limits. The ground water quality results (presented under ESIA Section) indicate that the dumpsite has not caused any major increase in pollution levels and the quality parameters are within the IS 10500:2012.

### 6.4.7 Environmental Baseline

The environmental baseline was assessed from the analytical results of air, surface & groundwater, noise and leachate. The samples by M/s Poluchem Laboratories (P) Ltd. The Environmental baseline was analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the ESIA Section in **Annexure 5**

### 6.4.8 Risk Assessment

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquid comes into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and

pathogens. Proper containment and management of leachate are essential to prevent water pollution.

The analysis of surface water reveals that all the parameters are within the acceptable limit, except it is slightly acidic and the dissolved oxygen content is less than prescribed limit, so also the BOD is greater than the allowable limit, indicating that the water contains organic load.

**Table 6.9 Risk Assessment- surface water**

| Risk Assessment | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite -BOD Higher than the acceptable limits |
| **Pathway** | Water/Run off |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | High BOD Indicates the water is highly polluted and it is harmful to ecosystem as fish and other aquatic life may suffocate in oxygen-depleted waters. Also, it will contain more Pathogen and make the water unfit for human and animal |

**Ground Water**: Pollutants from dumpsite can infiltrate into underlying groundwater, particularly if the dumpsite is not adequately lined or if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

The analysis of ground water samples taken at one location reveals that except pH, all other parameters are within the limit as per IS 10500:2012. The pH of the sample analysis is 6.71, which is in a slightly acidic range which can make the water not fit for any industrial purpose as it is more corrosive.

**Table 6.10 Risk Assessment - Groundwater**

| Risk Assessment | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite - pH is acidic in nature |
| **Pathway** | Water, soil |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health is.<br>• Diarrhoea<br>• Nausea and Vomiting |

| | |
|---|---|
| | • Abdominal Pain<br>• Weakness<br>• Organ Damage<br><br>Possible risk to flora<br>It can decrease the availability of plant nutrients, such as phosphorus and molybdenum, and increases the availability of some elements to toxic levels, particularly aluminium and manganese. |

**Air**: Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health. Measures to control and mitigate air pollution during dumpsite remediation include covering waste, implementing proper waste management practices viz., dust containment screens, etc. to be ensured.

**Table 6.11 Risk Assessment - Air**

| Risk Assessment | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Within the limits |
| **Pathway** | Air |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | No Anticipated risk |

**Soil**: Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

**Table 6.12 Risk Assessment - Soil**

| Risk Assessment | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pathway** | soil |
| **Receptor** | Human, Animals, Aquatic life and flora fauna |
| **Risk** | Possible risk to human health: Soil that contains substances such as heavy metals which may be toxic to humans can pass those substances on to humans through crop uptake leading to unsafe foods.<br>Possible risks to animals: when farm animals consume the plant grown from contaminated soil it affected the health of animal |

| | |
|---|---|
| | Possible risk to flora: Soil pollution may after plant metabolism and reduce crop yield, also the trees and plants that absorb the soil contaminants enter the food chain |

**Bioaccumulation in Biota**: Pollutants from dumpsites can enter the food chain and bioaccumulate in plants and animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife. Remediation efforts include restoring the land and minimizing the exposure of organisms to contaminated environments

**Table 6.13 Risk Assessment - Bioaccumulation in Biota**

| Risk Assessment | |
|---|---|
| **Source** | Legacy waste Dumpsite |
| **Pollutant** | Leachate |
| **Pathway** | Air, water and soil |
| **Receptor** | Human, Animals, flora and fauna |
| **Risk** | Possible risks to human health, animal flora and fauna<br>Accumulated of contaminants in plants and animals indirectly through food chain affects human health |

## 7.0. Evaluation of Remediation Techniques

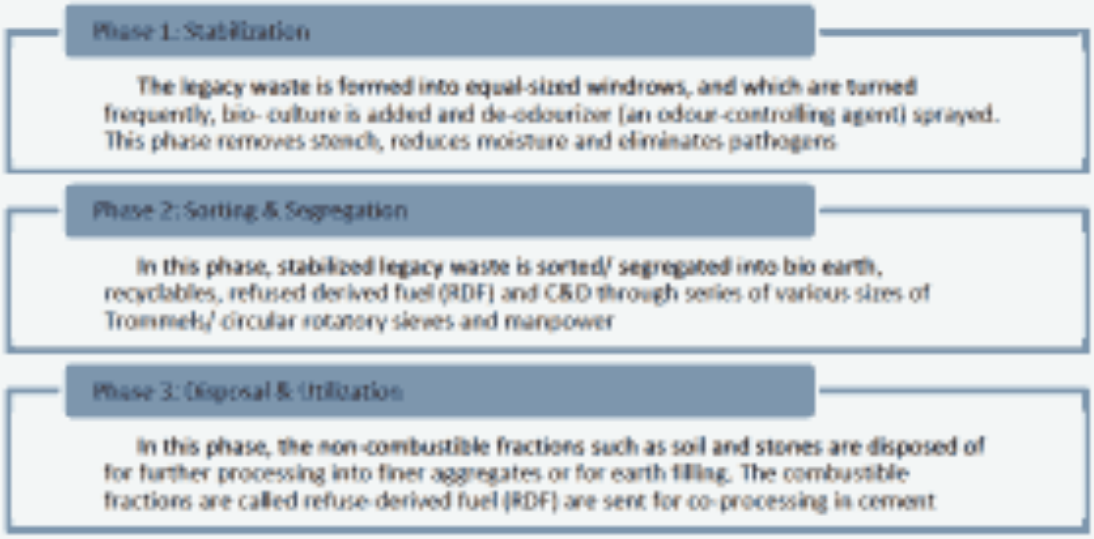
Reclamation of existing unmanaged municipal waste dumpsites is becoming a key requirement for ULB's in India as unscientific and unplanned methods of waste disposal in non-engineered landfills have led to lot of environmental issues including soil and groundwater contamination, uncontrolled landfill gas emissions into the atmosphere and exposure to disease vectors and scavengers. The Hon'ble NGT noted these problems across the country and has ordered the respective authorities to remediate this at the earliest.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

Remediation of waste dumpsite is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

- Environment Enhancement - reduction in greenhouse gas emissions, soil pollution, groundwater contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.

- Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real estate value and rental values.
- Land - Dumpsite land becomes available for utilizing the same for the establishment of other Waste Management Facilities.
- Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels



For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- A survey for assessment of volumetric quantity of legacy waste above the ground level.
- Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- History of the site, Physical features of site, as – is/current situation and compositional analysis of waste.
- Baseline study of heavy metals; subsurface soils and water; rainfall; soil type; surface hydrology; topography; wind direction etc. Shall be studied prior to bioremediation.
- Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows:

## 7.1 Bio-Mining – Reclamation/Recovery of Land

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

| | |
|---|---|
| Salient Features | • Land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>• Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>• Compliance to SWM Rules and NGT orders.<br>• Improvement in aesthetics and quality of life & health. |
| Applicability | • The ownership is well defined.<br>• Working space is available in the dumpsite.<br>• Linkage for utilization by-products is available |

## 7.2 Capping Without Land Recovery

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas after monitoring period.<br>• Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years |

| | |
|---|---|
| | • Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep- rooted vegetation.<br>• Recurring expenditure will be incurred for regular maintenance. On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio-mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>• SWM rules 2016 do not permit habitation over it for at least 15 years because of the danger posed by toxic gases released by the waste. |
| Applicability | • Simple & robust, least expensive method among various available technologies |

## 7.3 Capping with Partial Land Recovery

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bioremediation i.e., exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can be linked to relevant buyers and the inert material will be capped over lower footprints, with well-designed slopes to prevent further degradation of the environment.

The top layer of capped material may also be provided with gas collection wells and pipes to trap the methane and the collected gasses are typically passed through an oxidation layer of passive venting or flared. If the gas quantity is substantial then, power generation may be a possibility. The capped area should have drains to collect the surface water flow as well as any leachate that may be generated. Such leachate is collected and treated in leachate treatment plants. The reclaimed land may be covered with loamy soil that has plants with high transpiration rates.

| | |
|---|---|
| Salient Features | • The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>• Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>• Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |

| | |
|---|---|
| Applicability | ● Legacy waste dumpsite area is partially of steep terrain, inaccessible ravines and narrow valleys.<br>● Lack of linkage for disposal of inert<br>● Recovery land for public use is not a priority |

## 7.4 Selection of Remediation Option

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. Moreover, as per Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping

However, after the bioremediation municipality wants to use the land for setting up of Material Recovery Facility. Hence backfilling of the site with inert and soil enricher is proposed.

For the execution of dumpsite bio-mining two strategies can be adopted.

- *In situ biomining*: Here the biomining is carried out within the premises of the dumpsite after clearing the waste and reaching the original ground level or in a land adjoining the dumpsite. The advantage is that only the finished products are moved out of the premises, inert may be used for gradation and filling up low lying areas within the site, or in a newly developed sanitary landfill. This is quite economical when legacy waste quantities are significant. The possibility of gaseous emissions, noise and odor and formation of leachate exist as the processing takes place at the site. The location would remain affected for the time till all waste is processed.
- *Ex Situ biomining:* In small dumpsites, or where the area is a constraint, the entire waste is excavated and taken away to an alternate location for processing. The work in the dumpsite can be completed quickly and the disturbance due to the excavation can be minimized. The cost of transportation of the whole waste adds to the cost of bio mining. But since the process plant can serve multiple locations, economies of scale may be achieved and may also compensate for the added transport cost.

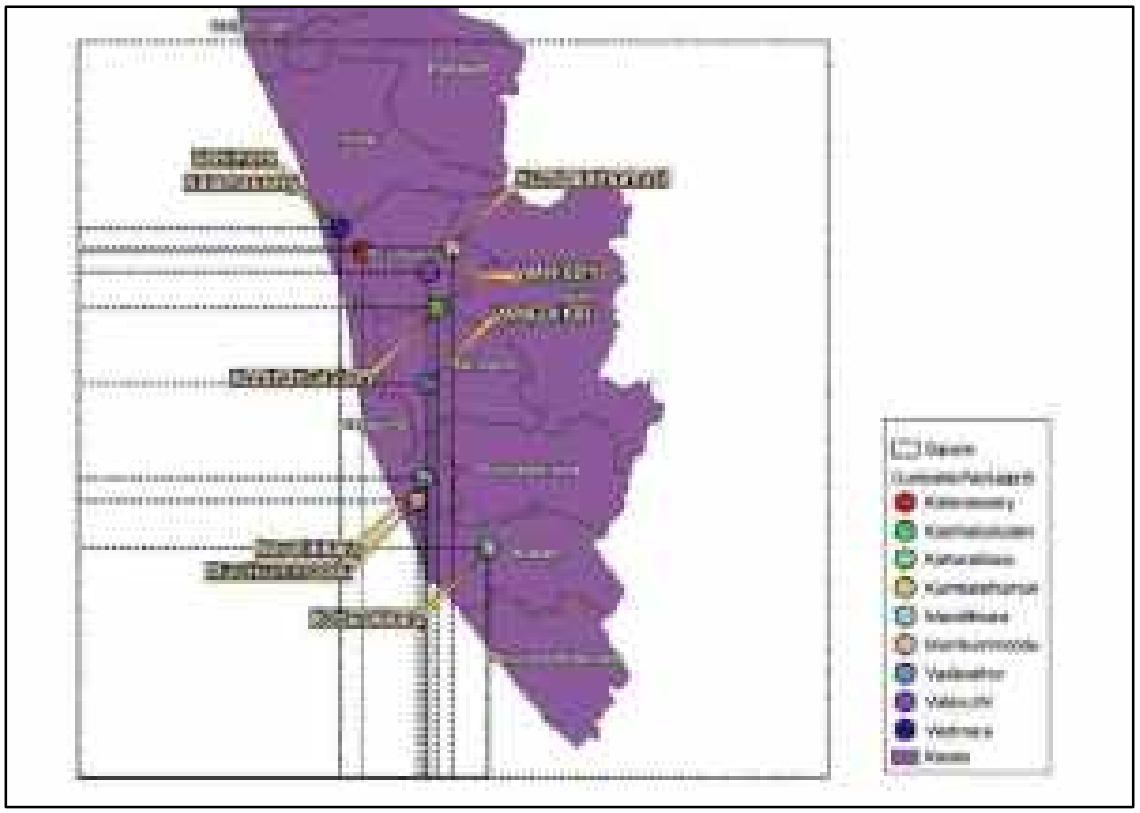


**Figure 7.1 Location of Other Dumpsites nearby**

## 8.0 Technical Description of the Selected Option

### 8.1 Methodology

The legacy waste dumpsite reclamation through bio-mining with recovery of land involves

Phase 1: stabilization

Phase 2: sorting & segregation

Phase 3: disposal & utilization

Phase 4: Back filling of boulders and inert

### 8.2 Selection of Machineries

The type of machinery, capacity and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type of machinery available for the bio mining are as follows:

- Stationary screening machinery and

- Mobile/compact machinery

### 8.2.1 Stationary Screening Machinery

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 metre diameter and 10 metre length can vary depending on the specific requirements of the waste treatment process.
- Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process
- Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

### 8.2.2 Mobile/Compact Screening Machinery

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation

***Structure***: The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length.

***Screening Mechanism***: The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

***Separation System***: Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

***Treatment Process***: In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

***Transport***: Quick and easy folding of conveyor helps in quick setup time.

***Discharge height***: Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, stationary trammel machine shall be the optimum screening machinery

## 8.3 System Requirements

The following are the infrastructural facilities required for setting up of machineries and equipment in biomining of a dumpsite: These are required irrespective of the option of in-situ or ex-situ processing.

- Fencing and secure entrance gate
- Security and reception office
- Weighing bridge
- Records room
- Laboratory
- Medical room
- Workers' area
- Parking for vehicles (heavy earth equipment, trucks, etc.) with tire washing facility.
- Administrative building
- Fire control unit (Detailed fire management plan)
- Toilet–bath complex, with personnel protection equipment (PPE) storage room)
- Overhead water tank
- Leachate collection and treatment unit
- Environmental monitoring unit
- Segregation and processing area
- Temporary storage area for rejects, domestic hazardous waste and sanitary waste
- Material storage area
- Waste drying and windrow area.
- DG set

The total area required is about 900 sqm in an in-situ bio mining plant. Temporary construction power at 440V needs to be obtained from KSEB. This can be easily availed as there is an existing electrical infrastructure passing through the site. A 440V, 125KVA needs to be established for the project. Water storage tanks needs to be provided for the duration of the project. The water may be supplied by tankers. Labour will reside in Kalamassery and commute daily to the site, hence no labour sheds are envisaged during this project. The requirements are only indicative, and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards.

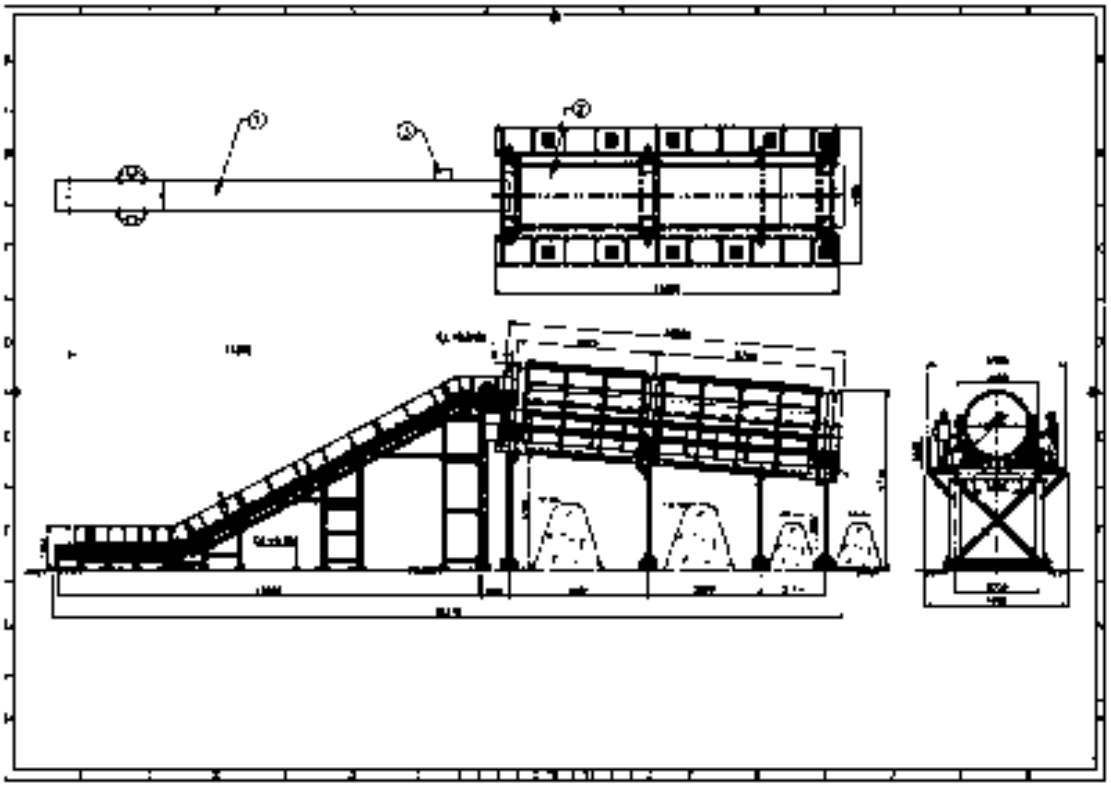

**Figure 8.1 Schematic of the Segregation System**

## 8.4 Site Reclamation Requirement

As detailed under section 6 the Kalamassery Dumpsite has a waste spread of Approx.1.95 acres of land with a max of waste dump height 4.2 m from the ground level. Estimated volume of waste above the ground level is: 33,569 Cum which will be around 28,030.115 MT by taking density as 0.835 T/cum. *(source: Topographical survey result for the Kalamassery Dumpsite conducted in the year 2022 by ULB)*

In the borehole investigation it was asserted that the depth of the waste column is 8.5.m and the quantity of waste below ground level is estimated 22,358.88 Cum as detailed under section 6. *(Source: Borehole investigation survey conducted by KSWMP through Matter Labs for the Kalamassery Dumpsite in June 2023)*

# 9 Scope of Disposal Including Location of Disposal for RDF, Bio Soils, Inerts

## 9.1 Utilization of By Products

The details of the utilization of aggregates/by–products screened out by processing of the stabilized legacy waste are provided in the table below

**Table 9.1 By Product Composition**

| By-products | Percentage Composition by weight (%) | Quantity (MT) | Utilization/Linkage/Usage |
|---|---|---|---|
| RDF | 20.60 | 9,620.15 | RDF will be sent to cement factories for co-processing i.e., for utilization as alternative fuel, supplementing the conventional fuel with necessary documentation for traceability. |
| Recyclables | 27.41 | 12,801.34 | To be sent for recycling to authorised recyclers. |
| Inert | 6.00 | 2,801.99 | Can be utilized for filling at the site itself / filling other low-lying areas inside the ULB boundary after ensuring that it is meeting the required standards and no hazardous contamination is found. |
| Compost/ Soil Enricher | 46.00 | 21,481.90 | Can be used as a soil enricher and given to farmers. The same cannot be sold as fertilizer unless it is enriched with carbon content to meet the standards suggested by FCO for city compost. |

RDF / SCF consists largely of combustible components which are shredded into a uniform size, in order to produce a homogenous material which can be used as substitute for fossil fuels in e.g., cement plants, lime plants, coal fired power plants or as reduction agent in steel furnaces. The calorific value of the RDF should be higher than 1500 kcal/kg for use in cement plants. The RDF material can be compacted and carried for disposal to WtE plants or cement factories which can use this material in their kiln for co-processing as long as it meets the specification for SCF/RDF. However, there may not be any financial value to the supplier or to the ULB as this is more for the disposal of RDF / SCF rather than a revenue-making stream.

The nearest cement Industry that can accept the RDF / SCF from Kalamassery city is located near Trichy, Tamil Nadu at a distance varying between 360-380 kms from the dumpsite site. The other sites in Karnataka are between 740 km to 1074 km, while cement plants at Andhra are at 740 km to 900 kms.

**Table 9.2 Distance to potential RDF / SCF users**

| Name of the cement plant | Location | State | Distance from Kochi (KM) |
|---|---|---|---|
| Dalmia Bharath | Ariyalur | Tamil Nadu | 458 |

| | | | |
|---|---|---|---|
| Dalmia Bharath | Dalmiapuram | Tamil Nadu | 424 |
| ACC | Wadi | Karnataka | 1,075 |
| Chettinad | Karikazhi | Tamil Nadu | 315 |
| Chettinad | Kallur | Tamil Nadu | 386 |
| Dalmia Bharath | Belagavi | Karnataka | 956 |
| JK | Muddapur | Karnataka | 965 |
| Dalmia Bharath | Kadapa | Karnataka | 739 |
| Bharathi VICAT | Kalburgi | Karnataka | 1,074 |
| JSW | Kurnool | Andhra Pradesh | 901 |
| Bharathi VICAT | Kadapa | Andhra Pradesh | 739 |
| Ultratech | Tadipatri | Andhra Pradesh | 815 |
| Zuari | Yerraguntla | Andhra Pradesh | 877 |

The screened compost materials having size less than 4 mm shall be heaped to form windrows, the leachate from excavation shall be used for enriching the compost qualities to the FCO standards and its amendments from time to time. The materials shall be tested for carbon content and NPK values during execution of works, the materials may be sold to farmers depending on the test outcomes. If the compost materials are not meeting with the standards, the same shall be used as soil enricher for refilling within the site itself.

Inert is a course fraction received from the biomining of MSW. It consists of stones, construction debris, ceramics, etc. This is helpful in backfilling in the site or can be used as a subgrade material for highways, low land filling.

## 10 Estimated Project Cost

The details of the estimated cost for bio-mining - recovery of land by remediating legacy waste dumpsite is provided in the table below:

**Table 10.1 Details of Estimated Project Cost**

| Sl. No. | Activity | Rate/ MT | Quantity (MT) | Amount (INR) |
|---|---|---|---|---|
| 1 | **Bio-mining Operations** | | | |
| a | Processing the Waste | [redacted] | [redacted] | [redacted] |
| 2 | Disposal Cost | | | |
| a | Disposal of RDF | [redacted] | [redacted] | [redacted] |

| | | | | |
|---|---|---|---|---|
| b | Disposal of Compost/ Soil enricher | [redacted] | [redacted] | [redacted] |
| c | Sale of recyclables | [redacted] | [redacted] | [redacted] |
| d | Disposal of Inert | [redacted] | [redacted] | [redacted] |
| | Total (1+2) | | | [redacted] |
| | E & S Safeguards from ESIA | | | [redacted] |
| | Contractors Profit and Overheads at 15% | | | [redacted] |
| | Net Cost | | | [redacted] |
| | Average Cost Index for Kerala based on DSR 2018 is –1.35 at present. Considering the same, the Grand Total | | | [redacted] |
| | Cost per MT (INR) | | | [redacted] |

## 10.1 Revenue from the Project

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by selling Bio earth, C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at free cost and transportation cost is also not borne by the cement industries.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable

## 10.2 Funding for Project

The estimated cost of INR [redacted] for the project Dumpsite Remediation. The sources and funding pattern is given below:

**Table 10.2 Sources of funds in Crores**

| Sr. No | Item wise funding pattern | | | |
|---|---|---|---|---|
| | Item | External (70%) (INR) | State Govt. (30%) (INR) | Total Cost (INR) |
| 1 | Dumpsite remediation for the Kalamassery | [redacted] | [redacted] | [redacted] |

## 11.0 Project Implementation Plan

Kalamassery Municipality intends to complete this project as early as possible. However, considering the time required for mobilisation, installation, sieving and handling recoverable etc, a time frame of about 06 months is considered.

### 11.1 Timeline

The broad timeline for the execution of this project is given below.

**Table 11.1 Project Timeline**

| TIMELINE CHART FOR EXECUTION | | | | | | | |
|---|---|---|---|---|---|---|---|
| S. No. | Task Name | M 1 | M 2 | M 3 | M 4 | M 5 | M 6 |
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Foundation & Civil Works (Cover Shed installation) for machineries, Hiring & Installation of Machineries, Electrical Works | ■ | ■ | ■ | ■ | ■ | ■ |
| 3 | Excavation of Legacy Waste | | ■ | ■ | | | |
| 4 | Site Development for Windrows & Leachate Collection | | | ■ | ■ | | |
| 5 | Windrow Formation & Spraying of Bio culture | | | | ■ | ■ | |
| 6 | Sieving Operations | | | | | ■ | ■ |
| 7 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | ■ | ■ |

### 11.2 Contract Model

***Execution Method:***

Design, Own, Operate and disposal/Management of by-products/aggregates with -zero residues and land recovery. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

***Working Model***

- 100% work to outsourced to selected private contractor
- TSC will assess the quantity of waste and the ULB will hand over the land for setting up the facility to the Contractor.

- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- ULB shall facilitate the disposal/Utilization of By-products and contractor is responsibility for disposal of RDF, recyclables and aggregates

## 12. Benefits of the Project

The project benefits of dumpsite remediation at Kalamassery are;

- Reclamation of Land: An area of 1.95 acres (waste spread area) will be reclaimed which can be used for resetting SWM facilities of ULB
- Environmental Protection: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity
- Health Improvement: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- Enhanced Water Quality: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to safe drinking water.
- Aesthetic and Social Benefits: Remediation of legacy waste dumpsites can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- Operational & Life cycle Aspects - Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through a bio-mining process.

## 13. Conclusion

- The activities of the bio-mining will be commenced from Nov 2023 to Mar 2024. An area of 1.95 acres will be reclaimed and will be used for setting up other solid waste management facilities in future.
- Minimum 85% of the land will be reclaimed and recovered through the biomining process, and this will by ensuring environmental safeguards.

For the optimum screening of the **55,927.88 m3** of legacy waste, mobile / compact screening machinery shall be used.

- Favourable site conditions for bio-mining:
  - The legacy waste dumpsite is located near NH 544 and easily accessible for multi-axial trucks or trailer trucks, which is needed for bioremediation activities.

- Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite. (Responsibility- Contractor)
- Piped water supply is available at the dumpsite. (Responsibility- Contractor)

- The project activity requires "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, CPCB 2018 Guidelines for legacy waste management, NGT orders, KSPCB norms, World Bank guidelines and KSWMP ESMF and other regulatory rules & norms Environmental & Social safeguards:
  - The project attracts E2 Environmental category based on the project activities and status of the environment baseline.
  - Site specific Environmental Assessment and Environmental Management Plan has been developed.
  - The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is Rs [redacted]

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the bio-mining and remediation of dumpsite in Kalamassery, Ernakulam, Ernakulam district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 23rd May 2023. During the site visit it was observed that the dumpsite is situated near to a stream flow and between road and railway tracks. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 28th May 2023 and was completed on 31st May 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Disturbed soil samples as well as undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.
- Bearing capacity evaluation for the ground encountered after drilling through the waste.

## 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department during the third week of May 2023, in order to collect the information regarding the site prior to mobilising the equipment for drilling, along with dumpsite specialists (Mr. Ajit Kumar Nayan and Mr. Ravi Kumar) related to IPE Global.

The location of the dumpsite is situated near to a cemetery ground and located between a highway and railway tracks. It was also noted that the surrounding area of the dumpsite is uninhabited.

**Figure 1 :** Location of the borehole drilled at the dumpsite

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste in the landfill.

## 4.2 Drilling equipment

Mechanical rigs of rotary drilling machine were used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The boring diameter of 150mm was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

## 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved

in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log:

The commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant standard codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing of soil and waste are appended in **Appendix II** and **Appendix III** respectively.

**Table 1: Details of various laboratory tests of soil conducted and relevant codes followed**

**Figure 2** : Laboratory tests performed at MatterLab.

## 6 SUMMARY

The geotechnical examination on the soil samples collected after boring through the waste at the dumpsite at Kalamassery, Ernakulam was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was bored using a rotary drill. The maximum depth of investigation was 13.0m (8.5m in waste and 4.5m in the ground).

It was observed from the laboratory results and samples obtained from SPT and the undisturbed samples collected, that the ground encountered after drilling through the waste is clayey layer sandwiched between sandy layers. As per the information provided by the client,

the waste in the dumpsite needs to be excavated, segregated using a few machinery and the inert material left after the bio-mining needs to be dumped within the site. As informed by the client, during the process of bio-mining the waste would be excavated from one feasible location of the site and transferred to another location of the site. During these operations, any temporary storage waste in the form of heaps should be carried out ensuring the stability of the sloping face of the waste. It is suggested that for slopes with height ≤ 1.5 m the angle of face should not be steeper than 45°. For slopes of height greater than 1.5 m the slope should be limited to 300 to horizontal or flatter. It is not advisable to use slope heights > 5 m without a proper stability analysis. If the inert material is being disposed at the site with no further plans of transporting it or transferring it, it is recommended to compact the material into layers using an 8-10 T roller with compacted lift thickness not exceeding 300 mm.

**The Safe Bearing Capacity (SBC)** is calculated as per IS 6403:1981 (Reaffirmed 2021). For any temporary structures planned at the site, the **recommended allowable bearing pressure** for isolated footings at a minimum depth of 0.5 m below **original ground level** is **150 kPa.** For any slope stability calculations involving the natural ground, the parameters presented in the summary sheet of laboratory results can be used.

The above recommendations are made based on the subsoil profile and laboratory test results obtained on the samples collected from the site. If there is any variation in soil profile during execution, fresh recommendation may be obtained from M/s Matter Material Testing & Research Laboratory (P) Ltd. or from a qualified and experienced geotechnical engineer.

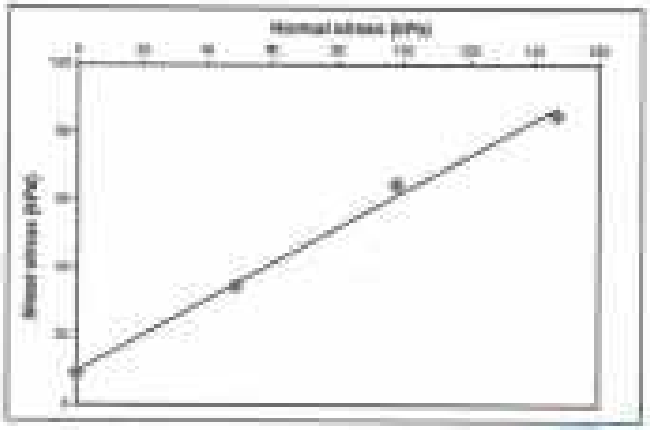
### Sample Details

| | | | |
|---|---|---|---|
| Received Date: | 09/06/2023 | Client Sample Ref.*: | Soil (UDS-4), BH 01, Depth 11.00m |
| Work Order ID: | ML23W-01986 | Sample Submitted By: | Geotechnical Division |
| Sample ID: | ML23W-01986/S5 | Source:* | BH 01, Depth 11.00m |
| Date Sampled: | 28/05/2023 | Sampled By: | Geotechnical Division |
| Sampling Method: | IS: 2131 - 1981 | Sample Size(kg): | 5 Approx |
| Sample Location:* | Kalamassery, Ernakulam | Date Tested : | 14/06/2023 - 15/06/2023 |
| Sample Cert. No: | - | Test Method Variation: | None |
| Test Location: | Matterlab - Kozhikode | Lab Sample Desc.: | Soil (UDS-4), BH 01, Depth 11.00m |
| Tested By: | DK | Client Sample Desc.: | Soil (UDS-4), BH 01, Depth 11.00m |

### Test Results



Method: IS 2720 (Part 13)-1986

| | | |
|---|---|---|
| Area of specimen (cm²) | : | 36 |
| Height of specimen (mm) | : | 25 |
| Rate of strain (mm/min) | : | 1.25 |
| Test Condition | : | Unconsolidated Drained |
| Bulk Density (Mg/m³) | : | 1.87 |
| Moisture content (%) | : | 8.1 |
| Dry Density (Mg/m³) | : | 1.54 |

| Load Increment | Applied Normal Stress (kPa) | Maximum Shear Stress (kPa) | Displacement at Max. Stress (mm) |
|---|---|---|---|
| 1 | 49 | 34.8 | 2.0 |
| 2 | 98 | 64.8 | 2.4 |
| 3 | 147 | 85.2 | 2.8 |

Cohesion Intercept (C') kPa : 9

Angle of Internal friction (ϕ') : 29°

For and on behalf of MatterLab

### Comments

*Information provided by client

Material tested was passing 4.75 mm test sieve, reconstacted at maximum achievable density and moisture content

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the contractor to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

## 1.INTRODUCTION

Social safeguard aspects during dump site remediation mainly focusing on meaningful stakeholder engagement, understanding stakeholder's risk perception and restoring them to a safe and environmentally sustainable state. It involves a series of systematic social actions which include social inclusion, effective labour management, prevention of gender violence during the process, successive rehabilitation of the affected people and reduction of health risk of the host community. The bio mining process of Kalamassery municipal dumpsite has been included in the World Bank supported KSWMP project. This chapter addresses the current situation of the dumpsite, potential possible social impacts due to the implementation of the project, recent fire incidents, remediation efforts, the quantity of legacy waste, the dumpsite's location within the solid waste management facility, and the complaints received from nearby communities.

## 2. KALAMASSERY MUNICIPALITY- BRIEF PROFILE

Kalamassery Municipality is in Ernakulum district in the state of Kerala. The Municipality is spread over an area of 27 sq. Km. The Municipality is divided into 42 wards. The dump site is situated in ward 6 which is located at Central part of the municipality and comprise a population of 1769 and 842 households (Source: Census handbook of Ernakulum 2011), which comprises 2.4% of the ULB population. Socio-Economic profile of Kalamassery is presented below in the Table.

| SOCIO ECONOMIC PROFILE DATA | |
|---|---|
| District Name | Ernakulum |
| Sub District Name | Kanayannur |
| Town Name | Kalamassery (m) |
| Total Households | 17844 |
| Total Population of Town | 71038 |
| Total Male Population of Town | 35331 |
| Total Female Population of Town | 35707 |
| Total Scheduled Castes Population of Town | 5630 |
| Total Scheduled Castes Male Population of Town | 2762 |
| Total Scheduled Castes Female Population of Town | 2868 |
| Total Scheduled Tribes Population of Town | 384 |
| Total Scheduled Tribes Male Population of Town | 190 |
| Total Scheduled Tribes Female Population of Town | 194 |

*(Based on Census Report -2011*

## 3.PROFILE OF KALAMASSERY DUMPSITE

The dumpsite is located near Kalamassery Apollo Tyres, specifically in Ward 6. of Kalamassery Municipality in Kanayannur taluk, Ernakulam district. The GPS coordinates of the site are 10°03'55.1"N 76°19'41.0"E. Total land owned by the Municipality is 1.95 Acres in which 1.25

Acres are covered by waste. This has been operational since 1990 and stopped in 2021 after deputing CKCL for forward linkage purposes. Estimated quantity of legacy waste to be removed is 3356 Cum based on the study conducted by the ULB. The dumpsite has road access through the National Highway (NH) on its west side.

## 4. SOCIO ECONOMIC BASELINE OF HOST COMMUNITY

It is identified that there are no households situated within the 200 meters from the dumpsite.

## 5. VULNERABILITY MAPPING OF HOST COMMUNITY

There is no vulnerable community identified in and around the dump site within 200m radius. There is no risk with respect to the social and economic conditions of the host communities except the street vendor who is running the Petty Shop near the site.

## 6.DATA COLLECTION TOOLS

### 6.1 SOCIAL SCREENING CHECK LIST

Social screening of the proposed site was conducted by a joint team of social and communication experts from KSWMP-DPMU and TSC following a screening checklist to identify the potential social risks anticipated during the dumpsite remediation. A screening report has been prepared based on the checklist.

### 6.2TRANSECT WALK

A transect walk was conducted in and around the dumpsite on 06/06/2023. The aim of transect walk was to identify the potential social impacts of the project, issues of land availability, any adverse impacts and elicit necessary community participation in the program. A team of experts from Technical Support Consultancy, District Project Management Consultancy, and the District Project Management Unit, along with representatives of ULB such as ward councillor and Health Supervisor participated in the transect walk.

The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions, and systems by observing, asking, listening, looking, and producing a transect diagram. Information collected can be used to reveal land use practices, hazards, and vulnerabilities to inform disaster mitigation and water management.

### 6.3 FOCUSSED GROUP DISCUSSION

A preliminary discussion was conducted on 31$^{st}$ July 2023 in the Municipal Hall with the ULB council and officials of health section about the remediation process. During the meeting discussion have been held about various process, risks and benefits associated with the dump site remediation process.

## 6.4 SITE SPECIFIC OBSERVATIONS FROM TRANSECT WALK AND SOCIAL SCREENING

- Dumpsite is located more than 200 meters from the habitation/settlements
- The dumpsite is located within the existing common solid waste management facility of the Kalamassery Municipality. The facility includes a Transfer Station, Material Collection Facility (MCF), and a Resource Recovery Facility (RRF).
- 20 migrant labourers including 5 women, deployed by the CKCL are working there and 5 sanitation workers of the ULB are also engaged in the waste management process at the site.
- 1 HKS member is deployed in Dump site for monitoring of the waste segregation and transportation activities related to the functioning of MCF and RRF.
- Municipal Crematorium and Cemetery of St Marys Jacobite Church, Kalamassery are located very close to the site. A good number of people used to gather in these areas
- HKS member and contract workers involved in waste management were unaware of the dumpsite remediation process going to be executed.
- During the transect walk, it was observed that there are no rag pickers associated with the dumpsite. Therefore, there are no livelihood risks for rag pickers in this context.
- No toilet facility is available in the premises of the site. The workers are using the toilets in the side of the crematorium which is not having adequate hygiene and lighting facilities and is at least 70 meters from the site
- The total scheduled tribal population in the ULB is 104, but there are no scheduled tribes staying near the dumpsite, and no impact on their land, customary rights, or livelihoods of tribes is observed.
- There is one street vendor along with his wife runs a petty shop near to the Dumpsite. The proposed activity will not have much impact on his livelihood. Temporarily relocation may be considered based on the site conditions during the remediation.
- There are no households affected by the proposed project activity, including non-titleholders or squatters. Most of the people in the ward 6 are currently using the public crematorium.
- There is no requirement for government, forest, or private land acquisition for the dumpsite remediation project. The currently designated plot has space for the transportation or mobilization of construction materials.

## 7. STAKEHOLDER ANALYSIS

The remediation process requires collaboration of the following stakeholders.

| SL No | Stakeholders | Roles of the stakeholders associated with the remediation process |
|---|---|---|
| **Service Providers** | | |
| 1 | ULB Council | Tendering, finalization and deputing contractor/agency for remediation |
| 2 | Govt institutions like PCB, KSEB, KWA, Fire Station, Police Station, Thaluk Hospital etc | To deliver necessary approvals and provide necessary services in emergency situations during remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | KSWMP-DPMU | Monitoring and Evaluation |
| 5 | TSC and DPMC Unit | Technical support and supervising |
| 6 | Contractor | Execution of the Remediation process |
| 7 | Haritha Karma Sena workers | Proper collection and waste segregation to prevent further dumping after remediation |
| 8 | Rag Pickers | Participation in informal collection to strengthen the collection process to prevent further dumping |
| 9 | Scrap dealers | Informal participation in NBD waste management to prevent further dumping after remediation |
| 10 | End recyclers | Process the inert and legacy waste safely after remediation |
| **Affected Community** | | |
| 1 | Workers in Crematorium and cemetery functioning in the same compound | Support and cooperation for the remediation process |
| 2 | Public coming to the crematorium and cemetery | Support and cooperation for the remediation process |
| 3 | HKS and CKCL workers in MCF and RRF | Attending in orientation programs about the remediation process, comply with health and safety measures and |

| | | |
|---|---|---|
| | | deliver support and cooperation to the remediation process |
| 4 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 13 | Street vendor running petty shop near the site | Cooperating with the remediation process and relocating the shop with the support of ULB if required |

## 8. POSITIVE SOCIAL IMPACTS AFTER REMEDIATION.

### 8.1 ENHANCED QUALITY OF LIFE

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing in ward 6, the project can contribute to an improved sense of well-being. Also, it results to a clean and hygienic work environment for the workers engaged in MCF and RRF.

### 8.2 LIVELIHOOD AND EMPLOYMENT OF VULNERABLE COMMUNITY

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

### 8.3 ECONOMIC OPPORTUNITIES

After remediating the site, the Municipality is planning to enhance the capacity of the MCF and RRF to process more non-biodegradable waste and to set up a centralized waste management unit to process the bio degradable waste. These projects will create more job opportunities to the people who are looking for employment in waste management sector.

### 8.4 ACCESS TO SERVICE

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the exiting site.

### 8.5 LAND AVAILABILITY

2.5 acres of land is available in the in the existing dumpsite, which is owned by the Kalamassery Municipality, so there is no need of land acquisition/transfer or purchase. Dumpsite remediation will create acres of vacant land which can be effectively useful for other purposes of ULB especially for the waste management. Recovered land can be converted to Transfer Station for the temporary storage of the inert waste. The cleaned-up land can potentially be used for new construction, commercial development, or recreational activities. The property value after the remediation will be very high.

## 9.EXPECTED SITE-SPECIFIC SOCIAL IMPACTS/RISKS

- Since there is not enough space for vehicle movements and machinery installation during remediation process, it may be required to shift the MCF and RRF to another space.
- livelihood issue of 20 migrant labourers of CKCL currently employed in the MCF and RRF functioning at the site.
- Health and safety issues of the labours at site during remediation period
- Health and safety issues of the public coming to Crematorium and Cemetery.

## 10. SUGGESTIONS/RECOMMENDATIONS

- A temporary parallel facility /spaces should be provided by ULB to continue the same process currently going on in the dumpsite. So the waste management activities will run accordingly and it may not affect the livelihood and income of the waste workers and HKS.
- Proper gender friendly toilet facility should be provided in the dumpsite for the labours as well as for the workers engaged in MCF and RRF.
- The public access towards the dumpsite should be restricted during the execution of the project.
- Adequate health and safety measures to be provided to the contractor to his labours during the process.
- Site specific action plans to be formulated and followed during the remediation process.
- Female Workers may be included in the dumpsite remediation project works. Gender friendly washrooms and dressing rooms should be provided
- A project-level grievance redressal mechanism will be instituted to receive and facilitate the resolution of stakeholders' concerns and grievances. Awareness campaigns about the Grievance Redressal Mechanism (GRM) will be conducted through Information, Education, and Communication (IEC) activities for the community and Urban Local Body (ULB) functionaries
- Proper capacity building is essential for municipal councilors, health wing officials, SWM workers of the Urban Local Body (ULB), and other functionaries involved in the operation and management of this project.

- It is recommended to install essential facilities such as water supply and separate toilet facilities at the dumpsite.

## 11. SCOPING OF SOCIAL IMPACT ASSESSMENT AND REQUIRED ACTION PLANS

All the social risks were identified through the social screening and Transect walk conducted at site. Considering the social impact assessment, certain action plans have been formulated to be followed at site

- **Labour Management Plan**

Maximum of 15 labours are expected to be engaged in remediation process at a time. A detailed labour Management plan has been prepared and attached as Annexure.

- **Labour Influx Management Plan**

No family is residing near the site. So there will not be any impact to the community due to the labour influx. But considering the workers in Crematorium and Cemetery near the site, a Labour Influx Management plan has been prepared and attached as Annexure.

- **Preventive GBV Action plan**

Considering the labours at site during the work a detailed GBV action plan has been prepared and attached as Annexure.

- **Citizen Engagement Plan**

A detailed citizen engagement plan has been prepared considering the workers employed in Crematorium and Cemetery near the site and the same is attached as Annexure.

As per the detailed assessment of potential social risk during the remediation process, the identification from social screening with screening checklist, transect walk and focus group discussion indicates that there will be a chance of temporary loss of livelihood of SWM workers in the existing MCF and RRF located in the same site. A detailed impact assessment shall be conducted by the TSC, and Livelihood Action Plan will be prepared, if required

It is identified that land acquisition is not required as sufficient land is available.

## 12. CONCLUSION.

During the screening, it has been observed that the only anticipated risk is associated with labour, with no other adverse social impacts on dwellings, land, livelihood, or community resources for the execution of the proposed remediation process. The dumpsite has enough road access through the National Highway (NH) on its west side, thus there will not be any disruption to the public properties and commercial establishments nearby the site. There are no scheduled tribes, rag pickers and other vulnerable communities near to the dumpsite. Since there is not much risk with respect to the social and economic conditions of the host communities, the dumpsite can be categorized into “Moderate Risk” and dumpsite remediation will create a positive impact on environmental and social aspects.

# Annexure I: Citizen Engagement Plan

## 1. Brief introduction about the project

Project for the remediation of Dumpsite at Kalamassery, in ward no 6 of Kalamassery Municipality.

## 2. Stakeholder identification

As part of social safeguard initiatives for the Bioremediation of dumpsite at Kalamassery, the social experts of TSC, DPMC and DPMU conducted brainstorming exercises with locals, functionaries of Kalamassery Municipality, Suchithwa Mission. A detailed list of primary and secondary stakeholders is prepared based on these exercises.

### 2.1 Waste Generators

Kalamassery dumpsite is currently functioning as a transfer station of NBDW from the nearby primary stakeholders. WM facilities like MCF and RRF are also functioning inside the compound. The identified waste generators are as follows.

| Sl.No | Waste Generators |
|---|---|
| 1 | **General Households** |
| 2 | **Shops** |
| 3 | **Institutions** |
| 4 | **Commercial establishments** |

### 2.2 Service Providers

The identified service providers of the dumpsite are as follows:

| Sl.No | Primary Service Providers | Male | Female |
|---|---|---|---|
| 1 | Migrant labors of CKCL | 15 | 5 |
| 2 | Sanitation workers of ULB | 5 | Nil |
| 3 | HKS | Nil | 1 |
| 4 | Drivers | | |
| | Staff-CKCL | 1 | Nil |

| Sl.No | Secondary Service Providers |
|---|---|
| 1 | ULB Health staff |
| 2 | Elected representatives of ULB |
| 3 | CKCL |
| 4 | Suchithwa Mission |
| 5 | PCB |
| 6 | Police |
| 7 | KSWMP |
| 8 | Taluk Hospital |
| 9 | Contractor |
| 10 | Recyclers |
| 11 | Labors engaged in remediation |

## 3. Need of the plan

Citizen engagement as part of the proposed bioremediation of dumpsite in Kalamassery municipality aims to facilitate two-way communication between the project and its stakeholders to make better informed decisions. Such an engagement will certainly pave the way for better implementation of the project, and it will ensure public participation in trouble shooting at all the stages of the implementation of the project.

## 4. Objective of the plan

The citizen engagement plan for the proposed dump site remediation is prepared with following objectives.

- To create a conducive environment for the smooth implementation of the proposed bioremediation of the dumpsite by promoting constructive dialogues between the project and its stakeholders.
- To ensure stakeholder participation in the planning, implementation, and monitoring of the sub-project.
- To suggest appropriate activities with a monitoring plan and an expected budget for engaging the stakeholders with the motive of enhancing their ownership in the project through increased participation.

## 5. Stakeholder concern

### 5.1 Waste Generators

- The waste collection may get delayed/stopped due the remediation process.

### 5.2 Service Providers

- Livelihood of SWM workers currently working in the dumpsite and nearby vendor may get affected
- The entire waste management system of the ULB may get disturbed because of remediation process

## 6. Community/citizen Awareness

- Conducting Sensitization programs to care takers of municipal crematorium and authorities concerned of nearby st.marys Jacobite church.
- Detailed awareness shall be given to the street vendor functioning near to dumpsite.

## 7. Awareness to Service providers

- Awareness regarding the dumpsite remediation and its procedures shall be given to the ULB council/Staff and CKCL.
- Sensitization programs shall be provided to Fire Force, Police and PCB regarding dumpsite remediation.
- The SWM workers currently working in the site, drivers and related workers should be oriented regarding the dumpsite remediation process and its benefits.

## 8. Citizen Engagement Plan Matrix

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Lack of Awareness on Project activities | Non-co-operation from Community/stakeholders | Awareness campaigns / sensitization programs to the stakeholders | Contractor/TSC |
| 2 | Delay in decision making and timely support from the ULB | To establish transparency and building confidence in the project commitments to ULB elected members and officials | Sensitization on bio remediation activities for the Kalamassery Municipality council and staffs before the commencement of the remediation | Contractor/TSC |

| | | | | |
|---|---|---|---|---|
| 3 | GRM committee | Delay in the execution of remediation work | Constitution of a project level GRM Committee to take-up any social issues raised at site level | Contractor/TSC |
| 4 | To understand the actual operational plans (Time of operations ,Machineries involved, number of workers, actions to be initiated for dust /odor/and sound pollution, vehicle movements) | To inform actual plan of operation to the host community and prevent any social & environmental issues and plan mitigation measures | Meeting with the contractor to understand the plan of operation, number of labors going to involve, duration of the work | TSC |

**9. Budget**

| S. No | Activity | Specification | Quantity | Cost |
|---|---|---|---|---|
| 1 | Sensitization program | Physical meeting with identified staffs/caretakers of Municipal crematorium and St.marys church | Sensitization training- 1No's<br><br>Total expected members-10 | [redacted] |
| 2 | Awareness programs for ULB Council/staff and CKCL | Physical meeting at ULB council hall | Number of meetings -2<br><br>Total expected participants-60 | [redacted] |
| 3 | Sensitization programme to the concerned officials of Fire Force, Police and | Physical meeting with Officials | 1 No's of meeting with each department | [redacted] |

| | | | | |
|---|---|---|---|---|
| | PCB regarding dumpsite remediation. | | Total expected participants-20 | |
| **Total** | | | | [redacted] |

# Annexure II: Preventive GBV Action plan

## 1. Sub project information

Bioremediation of existing dumpsite in ward -6 of Kalamassery Municipality

### 1.1 Details of labors

The project is under pre planning stage. ULB must finalize contactor/Agency for Remediation. So the exact number of Labors are not available. But approximately we can expect maximum of 12 labors

| | |
|---|---|
| Total number of labors | : 12 (Approx.) |
| Category of labors (Age/sex/gender) | : Not available |
| Data of migrant labors, if any | : Not available |

## 2. GBV Issues likely to be identified at site

1. Issues against female workers at site
2. Lack of safe and Gender friendly toilets at work sites
3. Disparity in work and wages based on gender

## 3. Activities under GBV Action plan

1. **Formation of Internal Complaints Committee (ICC)**
   The committee should be Presided by a senior woman, and more than half of the total Committee members should be women. There should be an external member who has experience in dealing with issues related to women. Preferably a Social Worker /Advocate/NGO Representative.

2. **Placing of ICC informatory board at Work site**

| Insert Logos of KSWMP,WB,AIIB | | | |
|---|---|---|---|
| Project Name (KERALA SOLID WASTE MANAGEMENT PROJECT) | | | |
| Sub Project Name: | | | |
| Internal Complaints Committee | | | |
| Sl.No | Name | Designation | Contact Number |
| | | | |
| EMERGENCY CONTACT NUMBER | | | |

3. **Gender Sensitization trainings for Labors**

The Project expect around 12 labours will be employed in a day and women participation in the labor force is limited, even the project is taking precaution to protect and prevent any GBV incidence at the site. Taking into consideration all these aspects, the project plan to conduct a half day sensitization program in the following subjects, viz. the type of GBV, the action to be taken by the victim, the laws and the support organizations which extend support to the victim of GVB and the role of ICC and their contact details etc.

**Allocation of Gender friendly and safe toilet facilities for women**

Project has taken special care to arrange a separate toilet, wash and rest facility for female workers to protect their privacy and safety, and the same must be arranged by the contractor.

**Keeping of wage register at site to restrict wage disparity based on gender**

The project actively opposes gender-based wage disparity at any site funded under the KSWMP-supported SWM project. To ensure gender parity in various aspects such as wages, division of labor, and facilities, an appropriate monitoring mechanism, such as a wage register, should be maintained for the scrutiny of the project implementers.

**Details of GBV Service Providers identified**

The government of Kerala has constituted a help desk under Kudumbashree to support or to prevent and extend support to the GBV victims, and their details are given below.

**Kudumbashree Snehitha Gender Help Desk**
Contact Number – 0484-2428745
Toll free number - 180042555678

**Preventive GBV Implementation Plan Matrix**

| Sl No | Activity | Timeline | Primary Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Formation of Internal complaint committee | Pre-Construction Phase. | TSC/Contractor | DPMU |
| 2 | Placing of ICC informatory Board at worksite | Pre-Construction Phase. | Contractor | DPMU/TSC |
| 3 | Gender sensitization Training to labors | During Construction | Contractor/TSC | DPMU |
| 4 | Ensuring Gender friendly and safe toilet facilities | Construction stage | Contractor | DPMU |
| 5 | Keeping Wage Register at site | Construction stage | Contractor | DPMU |

**Budget**

| Sl No | Particulars | Cost |
|---|---|---|
| 1 | Placing of ICC Informatory board | [redacted] |
| 2 | Gender sensitization trainings to labor | [redacted] |
| 3 | FGD | [redacted] |
| | **Total Cost** | [redacted] |

**Monitoring plan**

| Activity | Monitoring Indicators | Means of Monitoring | Reporting Period | Responsibility |
|---|---|---|---|---|
| Formation of Internal complaint committee | Minutes of Meeting/Bye Law of Committee/Reports | Verification of Minutes of Meeting and Reports | 15 days after commencement of work | DPMU |
| Placing of ICC informatory board at worksite | Photos of Boards placed | Physical verification | 15 days after the commencement of work | DPMU |
| Gender sensitization Training to labors | Attendance and Photographs | Verification of Documents | 5 days after the commencement of work | DPMU |
| Ensuring Gender friendly and safe toilet facilities | Gender friendly signage's, Condition of latches, Floor Condition, Status of Flush | Physical verification | Before Commencement of work | DPMU |
| Keeping Wage Register at site | Photographs | Verification of Register | 5 days after the commencement of work | DPMU |

# Annexure III: Labour Management Plan

## 1. INTRODUCTION

### 1.1 Project Title

Project for the remediation of dumpsite at ward 6 owned by Kalamassery Municipality

### 1.2. Project Area

The Dumpsite of Kalamassery Municipality is situated in ward 6 of the municipality, covering an area of 2.5 acres.

## 2. SCOPE AND STRUCTURE OF THE LABOUR MANAGEMENT PLAN

The scope of the LMP shall be as outlined in the World Bank's ESMF. The engagement will be planned as an integral part of the project's social assessment and project design and implementation. This document has 10 chapters. This chapter viz., chapter 1 served as introduction. Scope and structure of LMP is provided in chapter 2. An overview of labour use in the project is presented in chapter 3. Key potential labour risks are listed in chapter 4. Legislative framework governing labour employment in India/Kerala is discussed in chapter 5. Implementation Arrangements, policies and procedures follow in the subsequent chapter. Grievance redressal mechanism, contractor management are presented in the last chapters.

## 3. OVERVIEW OF LABOUR USE ON THE PROJECT

### 3.1 Details of Labours

The proposed remediation process requires following category and number labors

| Sl.No | Equipment | Category of labors | Required No.of labors |
|---|---|---|---|
| 1 | One trommel | Labours for waste segregated purpose | 5 |
| 2 | One excavator | Operator | 1 |
| 3 | One JCB | Operator | 1 |
| 4 | Two small tippers | drivers | 2 |

| | | | |
|---|---|---|---|
| | | Helpers | 2 |
| 5 | | Supervisor | 1 |
| **Total Labours** | | | 12 |

## 4. ASSESSMENT OF KEY POTENTIAL LABOUR RISKS

### 4.1 Project Activities:

The bioremediation of the dumpsite includes the following activities;

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement
- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

### 4.2 Key Labour Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.

- Forced labour or trafficking.
- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female SWM workers are engaged.
- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form worker's organizations, etc.
- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

## 5. BRIEF OVERVIEW OF LABOUR LEGISLATION: TERMS AND CONDITIONS

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |

| | | |
|---|---|---|
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |

| | | |
|---|---|---|
| 10. | Industrial Disputes Act 1947: | the Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

## 6. RESPONSIBILITY MAPPING

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring labourers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing labourers, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the labourers. The ULB will actively monitor the contractor's compliance with legal and welfare requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

## 7. CODE OF CONDUCT

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured;

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances

- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favors or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)
- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favors, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

## 8. SYSTEMATIZING THE CODE OF CONDUCT

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

## 9. TRANSPARENCY IN CONTRACT SPECIFIC TERMS AND CONDITIONS

All contracts must contain

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave

- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism

## LABOUR MANAGEMENT PLAN INDEX

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | PIU |
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on.To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different | One notice board | As soon as the work is started. | Photographs of the notice board where the license is displayed. | Contractor |

| | | | | |
|---|---|---|---|---|
| categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board | Do | do | |
| To conduct pre- employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the construction period | Photographs of the facility | Contractor |

| | | | | |
|---|---|---|---|---|
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. Female members should be minimum 50%. ) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |

| | | | | |
|---|---|---|---|---|
| Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act<br>2. The Employee Compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act<br>5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity Benefit Act | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| Conduct HIV/AIDS awareness programs | As per requirement | Once in six months | Reports, photographs etc | Contractor |
| All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of license ids to be collected | PIU |
| All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

| | | | | |
|---|---|---|---|---|
| | after procurement of third-party insurance to the vehicle | | | |

**Budget for LMP**

| S.No | Item | Cost |
|---|---|---|
| 1 | Labour compliance as per LMP | [redacted] |

## ANNEXURE IV: LABOUR INFLUX MANAGEMENT PLAN

| RISK | MITIGATION MEASURES | IMPLEMENTATION RESPONSIBILITY | MONITORING INDICATORS | MONITORING RESPONSIBILITY |
|---|---|---|---|---|
| Social and Community wellbeing | 1. Joint Meeting with the community by ULB officials and Elected members | Contractor/PIU | • Risk identification report<br>• Proposed action/mitigation plan<br>• Action taken report/progress report | TSC/DPMU |

## Summary

### Introduction

The Kalpetta municipality is an Urban Local Body (ULB) of the Wayanad district of Kerala, covering an area of 40.74 square kilometers and divided into 28 administrative wards. This municipality generates 13.82 tons per day (TPD) of solid waste. However, Kalpetta ULB do not possess adequate solid waste treatment and disposal facilities as mandated by the Solid Waste Management (SWM) rules, 2016. Consequently, unsegregated waste was disposed of in an unscientific manner; essentially dumped at the ULBs trenching ground (where feces/night soil used to be dumped from pit latrines) at Adlaid in ward 23. In order to promote a healthy and sustainable environment, it is imperative to undertake the remediation of the existing dumpsite

### Subproject Description

The Bio-mining and Bioremediation at the Kalpetta ULB dumpsite are proposed as part of the Kerala Solid Waste Management Project (KSWMP) with support from the World Bank and the Asian Infrastructure Investment Bank. The dumpsite situated in Ward 23, Adlaid, covers a total area of 3.65 acres and contains a legacy waste quantity of 7640 tons. The waste at the site is approximately 40 years old, with dumping activities started in 1970 and stopped in 2010. Initially, the dumpsite served as a trenching ground for the disposal of sewage from pit latrines. The total volume of waste accumulated is approximately 9485.37 cubic meters, and the dumpsite spans across an area of 1.12 acres.

### Status of Subproject Development at the time of EIA

Currently, the dumpsite has stopped at site and solid waste of the ULB is treated and disposed at multiple decentralized facilities across the city. The entry to the dumpsite is facilitated by a 3.5-meter-wide approach road in good condition, located in Kalpetta –Adlaid and there is existing MCF (Material Collection Facility).

### Technical Aspects

Following a comprehensive evaluation, the method or technique of Bio-mining with a goal of achieving 100% land reclamation and recovery is found to be the most suitable remediation approach, ensuring long-term sustainability and environmentally responsible treatment of legacy waste, leading to the complete remediation of the dumpsite. Based on the Feasibility and site conditions, Mobile trommel machinery would be the most suitable option for the small site at Adlaid, Kalpetta. The optimal time frame for conducting the Biomining Process would be from December to April Months, a period characterized by lower rainfall levels as per climate data.

**Application of Regulatory and Guidance Framework**

In accordance with the SWM Rules of 2016, the selection of an appropriate method or technique for remediating a dumpsite should be determined through a feasibility study that consider technical, financial and Environmental aspects complying with regulatory requirements (CPCB, KSPCB and NGT). The formulation of the subproject adhered to the State/National and World Bank ESMF/ safeguards policies, both in its planning phase and will continue to do so during the implementation and monitoring stages. This commitment to compliance will be upheld by the ULB during the project period.

**Baseline Environmental Scenario**

A detailed environmental baseline study was conducted for analyzing quality of air, groundwater, surface water, noise levels, and leachate characteristics. The preliminary Environmental Screening [Annexure -1] and the detailed assessment showed that this sub project falls under "E2" category. (Please note that suggestive environmental categorization of dumpsite biomining / bioremediation as per EMF for KSWMP is E1. However, considering the very small extent of the dumpsite, absence of any sensitive environmental feature in or around the site, short biomining period, and the overall positive impacts of the proposed development post mitigation measures; this is categorized as E2. At this stage, locations for disposal of biomined wastes is unknown, the sub project would be recategorized if the locations are near any sensitive areas. In case the biomining is clubbed with other multiple sites also, the overall categorization would be reconsidered)

An analysis has been conducted at the site to review and comprehend the physiography, climate, soil, cultural heritage, ecology, and biodiversity of the dumpsite. This assessment aims to identify potential impacts on the environment, human health, and biodiversity. Additionally, a traffic assessment has been performed to analyze traffic patterns and movements during the project's implementation phase.

**Terrestrial Ecology:**

The nearest Forest/Protected Area, known as Meppadi Forest, is located approximately 6 kilometers away from the site. Various indigenous flora and fauna species commonly inhabit the vicinity of the site, which generally include Some common tree species seen here include rose-wood, anjili *(Artocarpus),* mullumurikku *(Erythrina),* several species of cassia and many other non-descript varieties. variety of large wild animals such as gaur, Indian elephant, deer and Bengal tiger are found there. *Ailanthus sp. (*Tree), *Areca catechu (Tree), Cyathula prostrate (Herb) and Aporosa cardiosperma (Shrub).* The species listed were not classified as Critically Endangered by International Union for Conservation of Nature (IUCN).

Copyright © 2023. KSWMP| All rights reserved

**Air Quality:**

Air monitoring was conducted continuously for a 24-hour duration at all sites, and the obtained results were meticulously analyzed against the National Ambient Air Quality Standards (NAAQS) of 2009. It is noteworthy that all measured pollutants' concentrations were found to be well within the permissible limits. Furthermore, no presence of hazardous or toxic gases was detected during the monitoring process.

**Water Quality:**

The monitoring of water quality was carried out at 3 locations for Ground water & 1 Location for Surface Water.

Groundwater samples were collected from three distinct locations, each within a radius of 200 meters from residences. The analysis of these samples revealed that all parameters examined fall within acceptable limits, with the exception of pH levels.

Surface water assessment indicates that the Kabini River is located approximately 3 kilometers aerial distance from the site. A Surface water sample was obtained from a specific location very near to the dumpsite, which is at an aerial distance of 90 meters from the site. Upon analysis, it was determined that all examined parameters are within acceptable limits, with the exception of Biological Oxygen Demand (BoD).

**Noise Level**

Sample for noise level monitoring were collected within the dumpsite to assess the current ambient noise levels. The results indicate that the noise levels observed are comfortably within the permissible limits. However, it shall be noted that there is no activity currently on site. And noise levels are expected to increase with biomining activity.

**Assessment of Risks/Impacts and Proposed Mitigation measures and Monitoring**

The anticipated impacts of the interventions proposed have been analyzed in detail and mitigation measures proposed. The Environmental Impact Assessment (EIA) and Social Impact Assessment (SIA) documents, which assess the potential environmental and social impacts of the proposed subproject, serve to identify potential risks, formulate mitigation measures and ensure compliance with environmental and social standards regulations. This dumpsite remediation project comprises an overview of the current environmental conditions within the project area. Furthermore, the report delineates the environmental baseline data, Disaster Management Plan, identification of sensitive receptors and a Fire Risk Assessment. Another significant concern is the accessibility of the dumpsite, which may not be sufficient for a fire rescue vehicle. In such a scenario, it is imperative to establish comprehensive fire and safety precautions at the site. Key environmental risks include leachate and storm water from the site impacting the nearby areas, odour (including gas), visual blight, flies & pests, storage and disposal of retrieved materials, fire, accidents & other

Copyright © 2023. KSWMP| All rights reserved

disasters, and health and safety of workers. Possible future dumping of wastes after biomining is also a concern. Mitigation and management measures for these in line with mitigation hierarchy are included in the EMP.

Proposed mitigation measures are designed to address environmental and social impacts effectively, with the goal of minimizing negative consequences while maximizing positive outcomes. Additionally, this report encompasses an Environmental Management Plan (EMP) and scope of Social Management Plan (SMP), providing detailed strategies for the management of the project's environmental and social facets.
In addition, a detailed Environment Monitoring Plan and Social Monitoring Plan will outline the monitoring procedures to assess the efficiency of mitigation measures and guarantee adherence to environmental and social standards. To ensure seamless and timely execution, the dumpsite remediation subproject report also includes an Environmental and Social Budget. This ensures a sustainable and responsible bio-mining process that prioritizes the protection of the environment and the well-being of nearby communities throughout the waste remediation process.

**Implementation Mechanism & Budget**

The Bio-mining project, with the objective of achieving 100% land recovery, will be carried out exclusively through an outsourcing model. If the land is found to be contaminated with hazardous wastes, the subproject shall be excluded. For solid waste/leachate contamination on site proper remedial measures will be followed before utilizing for future facilities. Retrieved materials and recyclables may be handed over to the authorized recyclers and the usage of these retrieved fractions is unknown today as it would be as per the Contractors proposal/plan. However, such reuse/recycling/disposal would be in line with National/State regulations which are stringent. . The land will be restored to its pre-waste dumping condition, necessitating the complete removal of all legacy waste until it reaches the original land surface. Following the completion of the bio-mining process, the machinery and vehicles belonging to the implementing agency must be vacated within 7 days. No waste material shall remain on site after contract period. The reclaimed land, free of any encumbrances, will then be transferred to the Urban Local Body (ULB).

The total budget proposed for Environmental Management & monitoring budget is [redacted] /- and including social budget of [redacted] /-.

**Consultation &Disclosure**

A transect walk was also carried out to assess the socio-environmental characteristics in the vicinity of the dumpsite. To understand the social dynamics, demographic profile, livelihood patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community, a transect walk was carried out on 01.06.2023, which was

[redacted]

Copyright © 2023. KSWMP| All rights reserved

crucial for developing effective dumpsite remediation strategies that align with their priorities. The findings and recommendation of the transect walk is shown in the following table.

| S.No | Social risks | Findings and Recommendations |
|---|---|---|
| 1 | Labours working in the MCF | The MCF facility is located in 35m way from the dumpsite. The bio mining process may affect the smooth functioning of MCF. |
| 2 | Lanour influx | The bio mining process requires 30-40 labours in a day. The contractor has to arrange the facilities for the labours include accommodation, food, compliances of labours laws etc |
| 3 | Gender Based Violences (Prevention) Action Plan | Different gender groups will be engaged in the bio-mining process. It is the responsibility of the contractor to take necessary pre cautions to prevent atrocities. Also ensure the compliances of relevant Acts |

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# 1. INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake biomining of multiple Legacy Waste Dumpsites in various districts. As per the Feasibility Study and methodology statement for implementing the subproject, proposed dumpsites for biomining are grouped into a single cluster of 12 dumpsites. It is expected that one single contractor bids for one Cluster. However, bidding modality is yet to be finalized- whether as a single site, or as a clusters.

## 1.2 The rationale for the Proposed Sub-Project

Adlaid dumpsite in Kalpetta ULB at ward no.23 has a total waste quantity of 7640 Tons, spreading over 1.12 acres. The site is located between Lat- 11°35'25.8"N and Long - 76°03'19.2"E and has an elevation of MSL +790 (m), with a gentle slope towards the south-eastern part. During monsoon season, due to geography of the site waste water flows downhill towards residential areas located at southern side of the site. Kalpetta ULB proposes biomining and bioremediation of the Adlaid legacy waste dumpsite under KSWMP supported by the World Bank and Feasibility Report has been prepared for this subproject. Considering the environmental and social impacts associated with legacy dumpsite biomining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

Copyright © 2023. KSWMP| All rights reserved

### 1.3 Objectives and scope of Environmental & Social Impact Assessment

***Environmental Categorisation and Assessment:***

As per indicative categorization for dumpsite biomining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (3.65 acres) and waste spread (1.12acres) and absence of environmentally sensitive features around, this subproject is individually considered as E2, and EIA is prepared accordingly. Required monitoring and analysis are carried out considering the possible impacts.

***Social Impact Assessment***

The site is situated in an isolated area. No households, public facilities/ utilities etc are not found. Since the site is located in an isolated area, it comes under moderate risk category. Under this category social impact assessment is also a key factor to be considered. Accordingly, detailed assessment of the environmental and social impacts was carried out.

### 1.4 Proposed sub project details

*Table 1 Proposed sub project details*

| Description | Details |
|---|---|
| Name of ULB | Kalpetta |
| District | Wayanad |
| Taluk | Vythiri |
| Total present population in the ULB | 41,797 |
| Name of the sub-project | Dumpsite Remediation at Adlaid |
| Location of the sub-project | Adlaid at ward no 23 |
| Total dumpsite area (in acres) | 3.65 |
| Total waste accumulated area (in acres) | 1.12 |
| GPS Co-ordinate of the Site | Latitude: 11°35'26.2"N,<br>Longitude 76°03'21.1"E |
| Legacy waste quantity | 7,640 tons |

Copyright © 2023 KSWMP| All rights reserved

*Figure 1 Legacy Waste Dumpsite at Adlayed*

The technology proposed is Bio mining and bioremediation in line with CPCB's Legacy Waste Biomining Guidelines, 2019. The various phases in the biomining process (as per Legacy Waste biomining Guidelines of CPCB) are shown below.

Table 2 Phases of Biomining

| Phases of Bio-mining | |
|---|---|
| **Phase 1: Stabilization** | The legacy waste is formed into equal-sized windrows and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| **Phase 2: Sorting & Segregation** | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels /circular rotatory sieves and manpower. |

Copyright © 2023. KSWMP | All rights reserved

| | |
|---|---|
| **Phase 3: Disposal & Utilization** | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |

### 1.5 Site management plan

The plan aims to minimize potential adverse impacts on sensitive receptors while maximizing the recovery of valuable resources and promoting site restoration.

Mobile machineries will be used for biomining of the small Kalpetta dumpsite and they do not require a separate area for erection. The waste will be excavated and directly fed into mobile screeners for processing. This approach minimizes the need for additional infrastructure and optimises the efficiency for the biomining process. The proposed plan is as follows

Copyright © 2023 KSWMP| All rights reserved

## 2. POLICY AND REGULATORY FRAMEWORK

### 2.1 National, State Legislations and Technical Guidelines related to environmental and social aspects of dumpsite remediation

*Table 4 Applicable rules and regulations for Kalpetta dumpsite Biomining and Bioremediation*

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| 1 | The Motor Vehicle Act. 1988 | All vehicles used for installation and operation will need to comply with the provisions of this act and should have valid Pollution Under Control Certificate. |
| 2 | Authorization from PCB for storing Hazardous material like diesel for DG sets as per Hazardous and Other Wastes (Management & Trans boundary Movement) Rules, 2016 | Hazardous waste (used oil from DG Sets) is likely to be generated during the erection and operation stage. Hence, authorization under the purview of the rule shall be requiring. |
| 3 | Labour Act. | Occupational safety and health administration. |
| 4 | Solid Waste Management Rules, 2016 (MSW Rules) | To operate the mobile Bio mining plant, it is necessary to follow the existing MSW rules. |
| 5 | The Water (Prevention and Control of Pollution) Act, 1974 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 6 | The Air (Prevention and Control of Pollution) Act. 1981 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 7 | safety of the workers as per the ILO Convention No. 62 | Safety aspects |
| 8 | NOC from fire department | Safety aspects. |
| 9 | Tree felling permission:<br>If felling of trees as defined in Kerala Preservation of Trees Act, 1986 | If any tree needs to be cut or replanted concerned permission is required from Forest |

Copyright © 2023 KSWMP| All rights reserved

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| | | Dept. Government of Kerala. The ULB will take the necessary permission. |
| 10 | NGT guidelines upto date | Relevant to the subproject to be considered for the successful implementation of the project. |
| 11 | Building and Other Construction Workers (Welfare Cess Act) 1996, | Discusses Health and Safety and environmental aspects associated with construction and allied works |
| **Other Applicable Rules** | | |
| 12 | Solid Waste Management Rules, 2016 (SWM Rules) | |
| 13 | Biomedical Waste Management Rules, 2016 (BMWM Rules, 2016) | |
| 14 | Plastic waste Management Rules, 2016 | |
| 15 | Construction & Demolition, Waste Management Rules, 2016 | |
| 16 | Batteries (Management and Handling) Rules, 2001 | |
| 17 | E-Waste (Management) Rules, 2016 | |
| 18 | SBM-Urban Advisory on Landfill Reclamation, CPHEEO, June 2020. | |
| 19 | Kerala Municipality Act, 1994 & Rules | |
| 20 | Hazardous & Other Wastes (Management And Trans boundary Movement) Rules, 2016 | |
| 21 | The Operational Policies (Safeguards) of the World Bank and the Environmental and Social Management Framework and the World Bank EHS Guidelines | |

Copyright © 2023 KSWMP | All rights reserved

## 2.2 The World Bank Safeguards Policies

*Table 5 World Bank Safeguard Policies*

| S.No. | WB Policy | Safeguard policy applicable | Description |
|---|---|---|---|
| 1 | Environmental Assessment (OP/BP 4.01) | Yes | The project has potential impacts and pose risks to various environmental factors during the implementation phase. Consequently, this policy is triggered, necessitating assessment and management of E&S risks and impacts, and ensuring a structured approach to safeguard management for risk mitigation including (health & safety risks, risks and impacts due to linked activities) in alignment with regulatory requirements, and Environmental and Social Management Framework (ESMF). |
| 2. | Natural Habitats (OP/BP 4.04) | Yes | Though the project will not support any activities that involve conversion or degradation of natural habitats. However, impacts on any flora/fauna on site during the proposed activity is important. |
| 3 | Pest Management (OP 4.09) | Yes | Considering the possible pest related issues as the project deals with wastes and improvements to dump sites, OP 4.09 Pest Management is triggered. As per this policy the banned pesticides/insecticides listed by the Nation / State and the World Health Organization (WHO) other national/state bodies should not be used in the project, and as much as possible Integrated Pest Management Options shall be followed |
| 4 | Physical Cultural Resources [PCR] (OP 4.11) | Yes | The proposed project will not support any activities that could potentially harm nearby cultural heritage, archaeological sites and physical resources valuable to the community |

Copyright © 2023 KSWMP| All rights reserved

## 3. BASELINE ENVIRONMENTAL SCENARIO

### 3.1 Project location of the site

Adlaid dumpsite in Kalpetta ULB at ward No.23 is non-operational and dumping of waste stopped due to public protests during the year 2010. In accordance with the implementation of the Biomining Project, the disposal of street sweeping waste was subsequently discontinued. The location detailed are described in the previous section of 1.1 and 1.4.

*Table 6 Sensitive receptor around the Dumpsite*

| S.No | Sensitive Receptors | Distance |
|---|---|---|
| 1 | Residential buildings | No households are located within 200 m radius of the dumpsite |
| 2 | Educational institutions such as Govt. Sanskrit HSS | 500 m |
| 3 | Kabini river | 3.00 Km |
| 4 | Nearest Pond | 1.34 Km |

### 3.2 Methodology for Environmental Baseline studies

Baseline Study in EIA process usually includes data collection and analysis of various aspects in the project area, such as: Physical Environment (e.g., topography, geology, soil, water, air quality, and climate) and Biological Environment (e.g., flora and fauna, Land/Soil, habitat, biodiversity, and ecological processes). The overall methodology of EIA

1) Scoping, Environmental Screening, Exclusion and Categorization
2) Environmental Baseline study like analysis of Air, Water, Soil and Noise/Vibration and impacts on biodiversity, workers and people around
3) Environmental Impact Assessment
4) Avoidance of adverse impacts, minimization, mitigation and management measures
5) Environmental Management Plan (EMP)
6) Environmental Monitoring Plan (EMoP)
7) Budget for implementation of EMP and EMoP

The below table indicates the environmental attributes and frequency of monitoring

Copyright © 2023 KSWMP| All rights reserved

*Table 7 Environmental Attributes*

| S.No | Attributes | Parameters | Latitude & Longitude | No. of sampling locations | Frequency of monitoring / Data collection |
|---|---|---|---|---|---|
| 1 | Meteorology | Temperature humidity and rainfall | - | Study area | Data collected from IMD |

### 3.3 Existing Facilities on site and its Environmental Audit

There is no proper compound wall all around the dumpsite, and there is an MCF facility present adjacent to the site. However, we can ensure that the biomining process will not hinder the functioning of the existing MCF.

*Table 8 Existing Facilities on Site*

| S. No | Aspects | Remarks |
|---|---|---|
| 1 | Structural Characteristics | MCF/RRF/Windrow Compost facility situated near by the Dumpsite.<br>Buffer/setback around the MCF – 2 ft<br>Distance from waste pile of dumpsite- 40 m.<br>Roof: (GI Sheet Roof, Good condition)<br>Floor (Cement Floor, Good Condition)<br>Walls: (Concrete, Good Condition)<br>Doors & windows: Steel gate and Windows with mesh.<br>dust emission and odor can impact the MCF/RRF facility. |
| 2 | Functional Characteristics | Activities in the MCF: Waste Segregation, Windrow composting<br>Materials and condition of stacking: Segregated and Stacked in RRF area<br>Activities spilling out onto the dumpsite: NIL<br>Access to the MCF (Common access for MCF & Dumpsite. Both are in the same premises. But proposed separate entry for dumpsite while biomining)<br>No. of workers :12 to 14 HKS workers |
| 3 | Facilities | Parking area-Available<br>Loading/unloading area-NIL<br>Storage room & area: Available in the Same facility around 304 sq.m<br>Worker snack/rest areas: Available<br>Worker / other washrooms & sewerage: Available<br>Water supply for Cleaning, Washroom: Available within the premise<br>Greenbelt: Available. |

Copyright © 2023. KSWMP | All rights reserved

**NOTE:** As the site access road measures below 3 meters in numerous areas, making it unpassable for many heavy vehicles, including firefighting vehicles, a suggested solution to address potential future fire issues involves constructing a 25,000-liter water tank with firefighting capabilities.

### 3.4 Analysis of Environmental Baseline

*Table 9 Environmental Baseline*

<table>
<tr><th>S No</th><th>Environmental Aspect</th><th>Discussion on Baseline Scenario</th><th>Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject</th></tr>
<tr><td>1</td><td>Topography</td><td>The elevation of the Kalpetta site is MSL +790 m, gentle slope towards the western section from the site. The land area in dumpsite is high land. Soil is predominantly Hard Laterite in nature. | S No | Environmental Aspect | Discusssion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| 7.1 | Traffic and Transportation | A detailed incremental load by vehicles during the operation phase is assessed and given under the traffic assessment reported. Through assessment it is identified additional 3 trucks/day will be the traffic load due to the activity. | The implementing agency shall ensure staggering of the traffic movements from site considering peak hours/school timings. Also, night time vehicular movements can be implemented. More accurate information shall be available once Contractor is being on boarded. EIA to be updated by the contractor based on his work plan. |
| 7.2 | Water Supply<br>a) Surface water<br>b) Ground Water | A) Surface water collected from 1 site and results found – all parameters are well within limits except BoD, slightly exceeding.<br>B)Ground Water collected from 3 different location and results found – all parameters are well within limits except for pH. | Site Drainage & leachate Impacts due to biomining activity (esp during any seasonal rain) is important as far as the nearby soil & water environment are concerned. |
| 7.3 | Drainage, Sewerage and Sanitation | Region has an unplanned network of drains eventually leading to Kabani- River. The nearest swamp area is 90 m distance from the site. Site drains into this swamp which may not be accessible.<br>Kalpetta is mainly served with septic tanks for individual premises.<br>Leachate samples collected at site, showed BOD value exceeding the limit and all other parameters were within limit | |
| 7.4 | Air Quality | Air Samples collected from 2 locations within the dumpsite and results found to be well within the permissible Limits. | |

Copyright © 2023. KSWMP | All rights reserved

| S No | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| 7.5 | Noise Level | Noise Level monitoring samples collected within the dumpsite in order to identify the present noise level and results found well within permissible limit | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity. |

### 3.5 Description of Environmental Parameters

Under this baseline environmental attributes are arrived at after analysis of samples taken from the dumpsite and surroundings viz ground water, surface water, Noise level and air. The map showing sampling locations and the analysis with observations are given below:

Copyright © 2023 KSWMP| All rights reserved

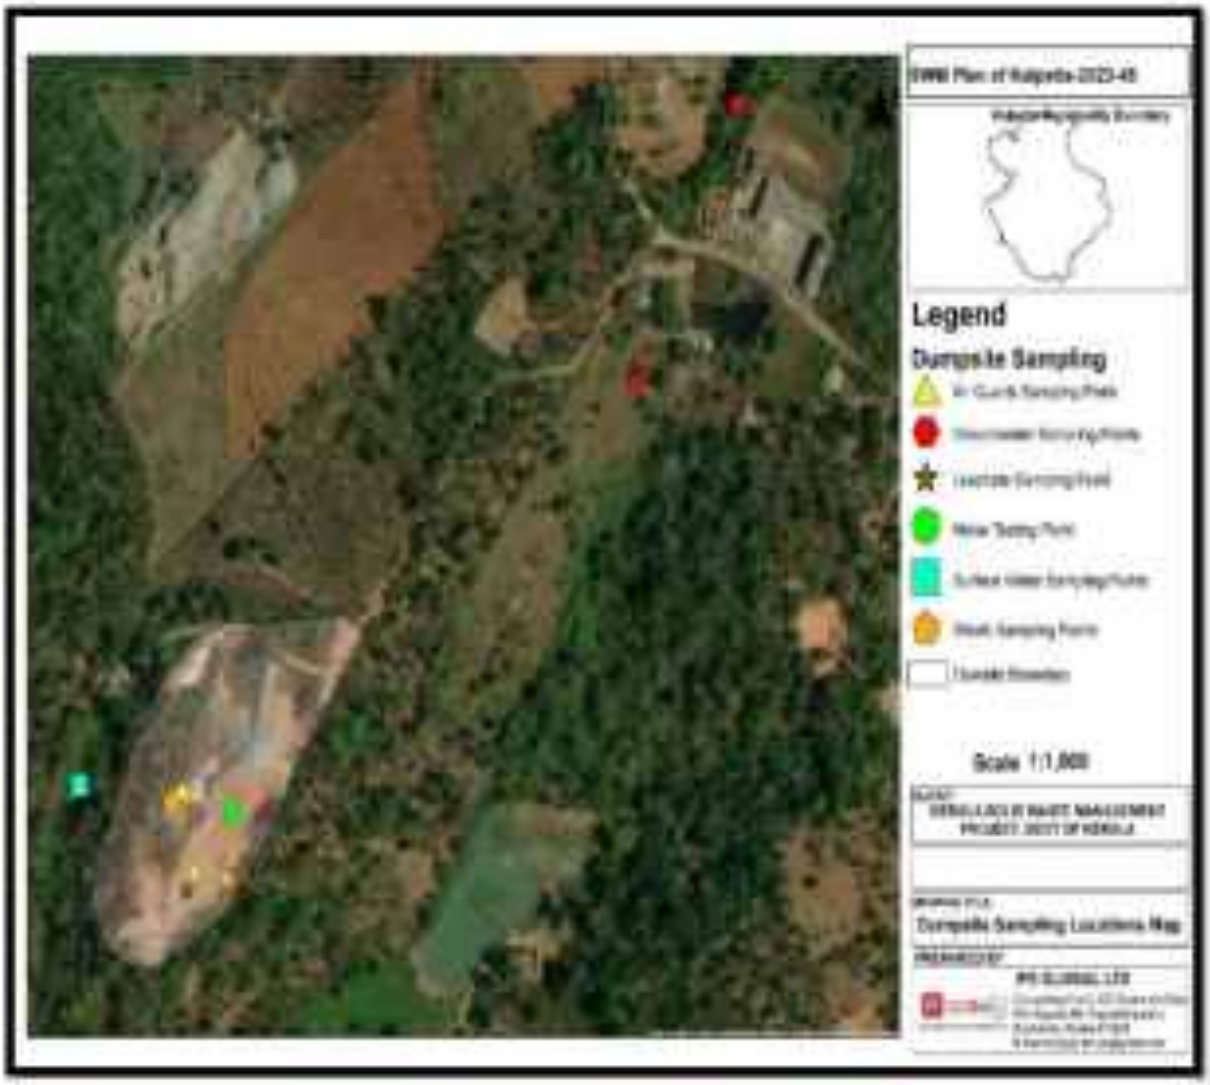

*Figure 3 Sampling Location Near Dumpsite*

*Table 10 Distance & Direction of Sampling locations*

| S.No. | Description | Direction | From Boundary of the dumpsite (m) |
|---|---|---|---|
| 1 | Surface Water | North | 55 |
| 2 | Ground water-1 | East | 300 |
| 3 | Ground water-2 | North | 40 |
| 4 | Ground water-3 | East | 460 |

Copyright © 2023. KSWMP | All rights reserved

### 3.6 Identification of sampling location:

*Table 11 Identification of sampling location*

| S.No | Description | Place identified | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Inside the dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing windrose data the air sampling location fixed at two locations |
| 2 | Noise (1 Location) | Inside the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. The adjacent MCF is operational. To mitigate any potential disruption to the workforce in close proximity to the MCF/RRF facility, a dedicated access point has been established for entry to the biomining worksite. |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite [stream] | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope on North direction possesses a potential risk of leachate runoff, which could result in the contamination of surface water on that particular side of the site. So, the location of surface water is taken on the North direction. |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope (North). The infiltration of leachate which could result in the contamination of ground water.<br><br>Based on the possible infiltration and slope direction the ground water samples are collected in the North and East direction outside of the dumpsite. |

Copyright © 2023 KSWMP | All rights reserved

### 3.7 Sampling Methodology

*Table 12 Sampling Methodology*

| S.No | Description | Method |
|---|---|---|
| 1 | Air sampling | Calibrated High Volume Sampler, Calibrated rotameter & calibrated Dry gas maters and sampling locations selected based on wind rose and impacts on surrounding land uses. |
| 2 | Noise | Calibrated sound level meter and sampling locations selected based on highest noise level on site and impacts on surroundings |
| 3 | Ground water | Water collected in polyethylene and sampling locations selected based on leachate and run off flow and impacts on surroundings |
| 4 | Surface water | Water collected in polyethylene bottles and sampling locations selected based on leachate and run off flow and impacts on surrounding surface water bodies and drains (line sources of pollution) used be communities |
| NOTE: Sampling Photographs added as Annexure-C in the FR Report. | | |

### 3.8 Site Connectivity

The access road leading to the dumpsite, known as Puzhamudy-Adlaid road, measures 5 meters in width. The link from the Puzhamudy-Adlaid Road to the dumpsite is crucial, but it presents a significant challenge as it is quite narrow, with widths dropping below 3 meters in certain sections. This limited width poses a concern for fire rescue vehicles, and it also makes it impractical for larger vehicles such as the Mobile trommel and other heavy vehicles to reach the dumpsite via this narrow road.

NH 766 is only about 1.5 kilometers away. It provides access to other major cities in Kerala, such as Kannur and Kozhikode. This highway provides access to other parts of Wayanad city. To mitigate any potential disruption to the workforce in close proximity to the MCF/RRF facility, a dedicated access point has been established for entry to the biomining worksite.

### 3.9 Traffic Assessment

Traffic assessment refers to the process of evaluating and analyzing the flow of vehicles, pedestrians, and other modes of transportation on roadways, intersections, or specific areas. This assessment helps in understanding current traffic conditions, identifying potential issues, and developing appropriate strategies to improve traffic flow, safety, and efficiency.

Copyright © 2023 KSWMP| All rights reserved

**Traffic load:**

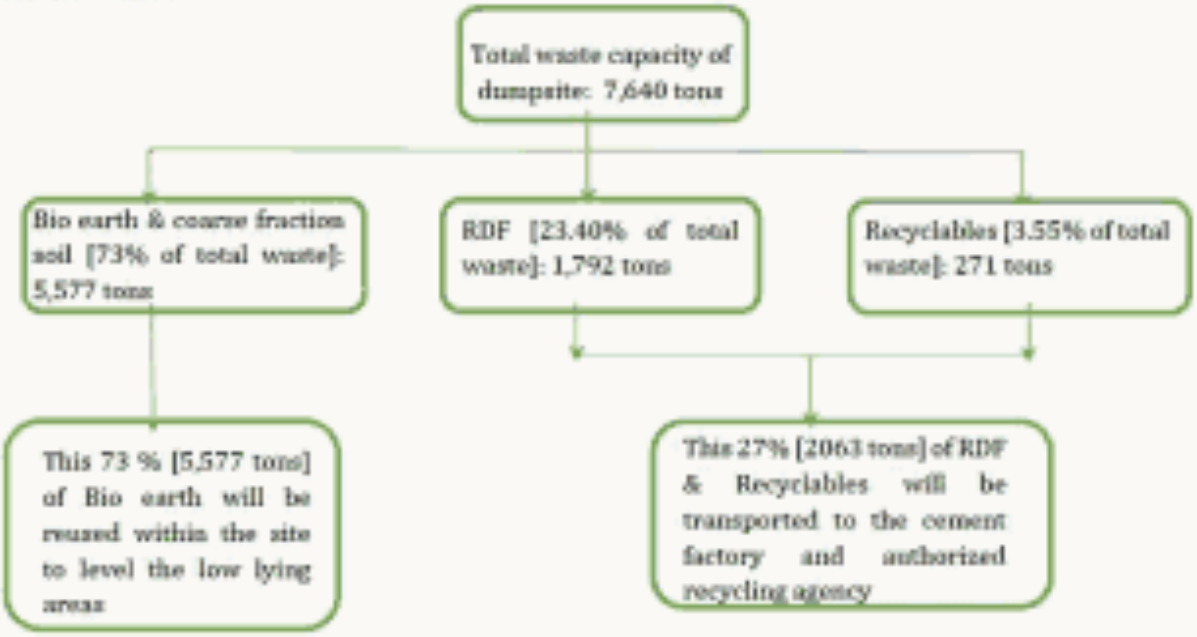

*Figure 4 Traffic Incremental load due to Project*

The dumpsite access road is 5m width and connecting with Puzhamudy - Adlaid road. Considering 90 days of operation phase the trips are planned and the inward & outward of the vehicle to be made during off peak hours.

To promote safety and avoid traffic congestion, it is recommended to impose restrictions on the movement of vehicles used for the Biomining process. These restrictions should be applied one hour before the start of school timings and one hour after school closing time.

*Table 13 Required* Truck capacity & trips for transporting By-Products

| S.No | Materials | % of Materials | Weight of each materials(t) | Vehicle Type | Max Capacity of load carrying Truck (t) | No. of Trips |
|---|---|---|---|---|---|---|
| 1 | RDF | 23.5 | 1792 | 12 Wheeler Dumper | 18 | 100 |
| 2 | Glass | 1.6 | 122 | 12 Wheeler Dumper | 25 | 5 |
| 3 | Metals | 1.95 | 149 | Goods Truck | 2 | 75 |

Copyright © 2023 KSWMP| All rights reserved

| Total Weight | 2063 | Total No. of Trips | 180 |
|---|---|---|---|

*Table 14 Total Trips planned per day*

| S.No. | Materials | Total Trip | Total Days for Disposal | Trip/Day | Remarks |
|---|---|---|---|---|---|
| 1 | RDF | 100 | 90 | 1 | One Trip per day |
| 2 | GLASS | 5 | 90 | 0.1 | Ten days once one trip |
| 3 | Metals | 75 | 90 | 1 | One Trip Per day |

## 4. ANALYSIS OF ALTERNATIVES

### 4.1 Alternative 1: No project (without project scenario)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.

If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.

1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.

2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.

3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.

4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.

5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

### 4.2 Alternative 2: Mode of execution / Management Alternative

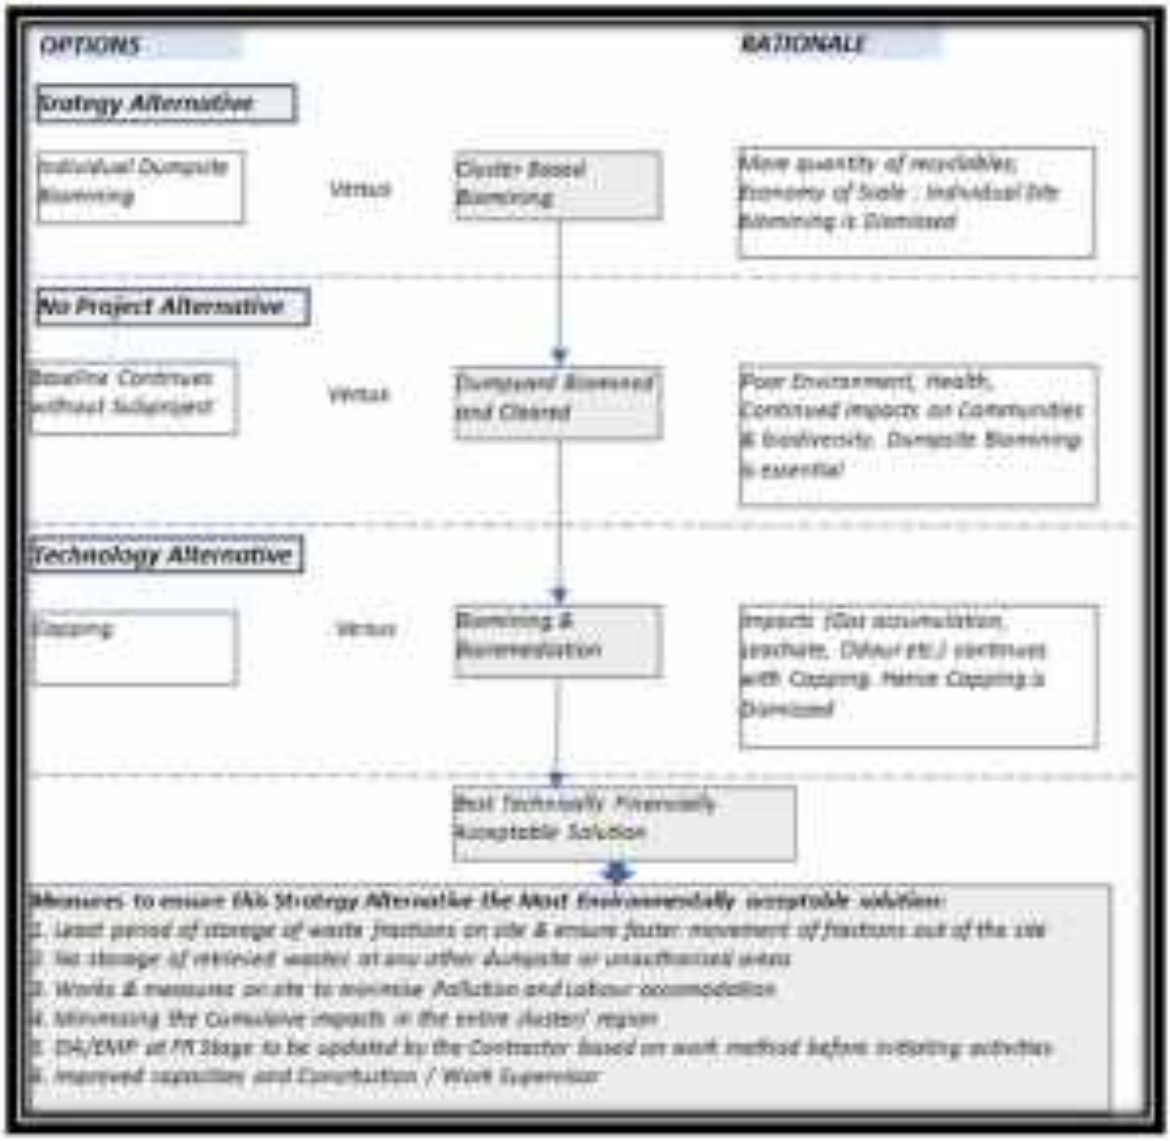
Regarding the execution strategy, the outcomes of a Transect walk have substantiated the impracticality of waste transfer between ULBs. As a result, the imperative is for the waste remediation procedure to take place on the premises, allowing only the byproducts to be considered for potential transfer.

The logistical aspects of arranging machinery and designating storage space for these byproducts will hinge upon the extent of land available. At the outset, the existing underutilized, partially constructed Material Collection Facility (MCF) will be employed to cater to the initial storage requirements.

### 4.3 Technology Alternative

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as

[redacted]



Copyright © 2023. KSWMP| All rights reserved

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

## 5. ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISK IMPACTS

Biomining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, biomining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition, cumulative impacts of simultaneous biomining of multiple such legacy waste sites on the environment is important. Especially with respect to

(i) Drainage and leachate flow into regional water bodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,

(ii) Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,

(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and

(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

### 5.1 Impacts on Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Kalpetta dumpsite.

#### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Biomining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;

Copyright © 2023. KSWMP| All rights reserved

- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table 15 - Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity However, magnitude of cumulative impacts of various dumpsite remediations might be High.

*Table 15 Aspects for Determining the Magnitude of Impacts*

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite biomining activities will be on larger extent) | A specific location within program component or site boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and** | Against national/approved | Complies with limits | Meets minimum | Not applicable |

Copyright © 2023 KSWMP| All rights reserved

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **established professional criteria** | standards and or international guidelines/obligations | given in national standards but not confirming to international lender guidelines in one or more parameters | national standard limits or international guidelines | |
| **Likelihood of potential impacts occurring** | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

**NOTE: Anticipated Project Duration - 5 to 6 months**

### 5.1.2 Sensitivity of Receptor

The dumpsite is surrounded by majority plantation and other establishments such as Fecal Sludge Treatment plant, Batching Plant, during the time of site assessment the experts observed, some sensitive receptors within 500m from the site. Namely some schools, religious places and households. The sensitivity of these receptors is High due to the transport of wastes and byproducts from the project.

### 5.1.3 Significance of the impact

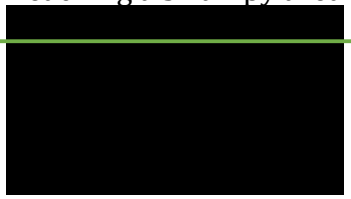
- Significance if the impact is high as it would even result in community resistance to biomining and bioremediation.

Since the project operational time 5 to 6 months, then the magnitude of the negative impact can be considered as small and medium sensitivity. In other hand magnitude of the positive impact, after the biomining of the existing land can be used for the recreational park for the public use.

Copyright © 2023 KSWMP] All rights reserved

### 5.2. Cumulative Impacts in The Region / Cluster

The impacts that may arise due to clustering of different dumpsites. The following impacts could result from the clustering while implementation, requiring thorough assessment.



1. If a sensitive environmental component (River, mangrove, wetland, etc.) is served by the leachate/drainage from one or more nearby dumpsites, the impacts can be regional.
2. Presence of other projects outside KSWMP; existing or forthcoming landfills, transfer stations or those considered under Track one investments may together create a cumulative impact with this activity.
4. Impact of vehicular movement from various subprojects on biomining of dumpsites may have cumulative impacts on air, odour, traffic issues, and pollution incase of spills/accidents/emergencies due to this clustering approach.
5. Storage of materials if any at common sites, impacts during rains, floods/emergencies in multiple sites of same water/air shed.

However, such impacts will be known only based on final work plan, location and schedule for disposal of Legacy Waste once Contractor is on board. The need to update EIA/EMP based on this will be included in the Bid & Contract Documents.

**Source-Pathway-Receptor Analysis**

**A) Source**: The source of contamination is the legacy waste remaining and being deposited at the Kalpetta closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is 50 years old, as dumping had started in year 1970and ceased 2010 due to public protest. Initially the dumpsite was acting as a trenching ground, depositing sewage (night soil) from pit latrines. The total waste volume is 9485.375 cu.m with the dumpsite spread over 1.12 acres and rises to a height of approximately 5m from the base. In addition to the landfill gas and leachate, material spill over from the existing MCF/RRF in the compound and windblown dust and litter are also considered as sources of contamination.

**B) Pathways**: The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards North direction acts as a pathway for the uncovered waste to flow into the natural slope to North side, there is a chance that leachate from the dumpsite could drain towards the North, following the natural slope of the hilly terrain and potentially reaching a swampy area.

Copyright © 2023. KSWMP| All rights reserved

Lateritic Soil acts as a pathway for transport of leachate to the groundwater and for uptake of contaminated surface run-off.

The leachate flows with groundwater and acts as the pathway. Surface water Contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals, rivers and streams are further transported by surface waters and in this case the surface water acts as the pathway.

**Receptors:**

Receptors are air, surface water and ground water. For drinking purpose, they mainly use municipal water supply. (Within 200 m there is no residences and 1 school within 550 m), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the residences and institutions living nearby in adelayed ward. As the dump is not contaminated, remediation would improve the pollution scenario provided the bioearth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from biomining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after biomining activity, activities in biomined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post biomining activity.

### 5.3. Impacts on Air Environment

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCF in this case), nearby communities of Adlaid Ward.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.
- When the legacy site is opened, existing gases would get emitted. Further, any delay / unexpected stoppage of biomining activity, might further the process of gas formation depending on waste composition, odour and fire risks. In the case of Adalayed, since the analysis of wastes shows calorific value of 1305 combustibles

Copyright © 2023. KSWMP| All rights reserved

with around 17 percent plastics, 2.5 % paper and 3.8 % cloth rags, it's well combustible; and the risk of fire is high during summers and incidents

### 5.4. Water Environment

Ground water

- Post and pre-monsoon water levels are 6.31 and 7.68mbgl. Borehole data indicates waste upto depth of 3 m with Light Brownish Red laterite strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. With the slope of the ground of the dumpsite, this tends to get accumulated at low-lying gradients and flows into slope up till9 0 m and terminates at swamp. High BOD levels of the drain and ground water wells around are indicative leachate and runoff pollution. Oozing & Pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during biomining to prevent ground water contamination. Also, a separate out site drainage and leachate should be made.
- Leachate samples: BOD, COD, TDS, E.coli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution.
- Borehole data: Dump below water table; impacts on water resources, wells nearby
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

Surface water

- The dumpsite experienced flooding during 2018 floods. The site is at a higher elevation, and hence no submergence was experienced at the site during the floods. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas.
- There are no surface waterbodies near the site, except that swamp area at 90 m aerial distance.
- Predominant slope is in the North Direction. At North direction, (end direction) there are mixed vegetation are seen. The drainage and leachate from the site flows to nearby open drainage channel which flows through and ends at swamp area. It is important to contain and treat leachate from the proposed biomining activities on site. Treated leachate may be recirculated or used for other purposes.

### 5.5 Impacts on Land/Soil

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it

Copyright © 2023. KSWMP| All rights reserved

shall be excluded from the site as biomining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.

- Spillover of activities to nearby road, and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste biomining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.
- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Adlaid, all heavy- metals are falling within the limit as per Fertilizers Control Order. (2009). Adlaid does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while biomining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste),Feb 2019) and World Bank EHS Guidelines. A plan shall be auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.
- Wherever fuel, combustibles and retrieved waste is stored, it shall be on impervious surface, at appropriate elevation, protection against rains, flooding (such as cut off drains, berms etc.), wind and fly / pest menace (screens, green cover etc), watch and ward, lighting, remote monitoring measures etc). Risk of fire, dust and leachate contamination shall be well assessed by the contractor. Emergency Action Plan shall be prepared and mitigation measures shall be updated based on work plan/DPR, and implemented. Communities shall be made aware of works and advice to follow measures such as use of fly/dust covers/nets on wells etc.
- Of the waste samples analysed, 50 percent comprises of Bio earth; 33 % being <4.75mm size; C/N ratio (12:14) indicating slight unpleasant odour (high Nitrogen; releasing ammonia) less than that suitable for good compost.

### 5.6 Impacts due to Noise and Vibration

- Various machines vehicles and activities contribute to noise and vibration on and off site. This includes vehicles carrying recyclables, operation of JCB, and other machines, diesel generator sets, motors on site, etc. In addition, activities on the site and in

Copyright © 2023. KSWMP| All rights reserved

relation to the existing MCFs such as vehicles transporting the dry waste from households to MCF, loading / unloading of collected waste materials, and workers activities on site would add to noise and vibration. Impacts include disturbance to fauna flora on site, health impacts on communities around due to exposure to large volume of sound.

### 5.7 Other impacts on Biodiversity - Fauna/Flora

- There is Malabar wildlife sanctuary areas within 10km of the site. There will be no direct impact due to the project. However, since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 20 km from the site there are many tourist places like Wayanad Tea Museum, Meppadi Range Forest. Depending on the contractors plan for disposal of retrieved waste fractions, EIA shall be updated for biodiversity impacts.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke effects
- Disturbance to other fauna and flora on site: SWM activities onsite including those related to MCF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available Biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species listed by IUCN.

### 5.8. Other impacts on Workers and Communities

- Contaminants in soil and water: Direct or indirect contact with polluted soil or water by neighboring water users. Additionally, because of their locations, recovered lands are subsequently used as parks, or for SWM facilities or office spaces etc. This may pose risk of bioaccumulation of metals which can constitute a health risk. Also impacts on buildings due to gaseous emissions, risk of fire etc if used after clearing.
- Health Risks: One of the primary health risks of dumps is the spreading of diseases - diarrhea, hepatitis etc. The ways such infection can be spread are numerous but are often related to direct contact with the waste (e.g., clinical waste, fecal matter) by scavengers and other unauthorized persons being on the site. The other main pathway is by vectors such as, foraging animals, rats, birds, flies and mosquitoes etc. - Flies, mosquitoes, rodents, crows, pigeons, pest menace on site, for workers & communities & their assets (such as wells) due to exposure of putrefied wastes

Copyright © 2023. KSWMP| All rights reserved

- Impacts if separate common site/s or a site among these dumpsites is chosen to store wastes from other dumps till it is disposed, or as transfer stations or for common processing of certain fractions: Such activities would result in Air, odor, dust, noise, water, vibration, flora, fauna, communities around the new site. There is also risk of contamination due to newly placed wastes, and pollution impacts and disturbances to communities due to works/activities on this site. Such sites and activities shall be avoided, and if quintessential for the project, be carefully chosen and approved only after thorough discussions with KSPCB, and all stakeholders. An assessment of their sensitivity and appropriateness shall be undertaken considering the environmental risks. They shall be audited and assessed for existing and future environmental impacts of such activities and mitigation shall be implemented. However, details on such sites shall be known only based on the final schema of implementation proposed by the contractor. Hence, the Contractor shall update EIA based on this before starting any activity on site.
- OHS impacts: Infectious wastes, fecal matter, clinical wastes and sharps; batteries, e-waste and possible bursting; Hazardous wastes like asbestos and other chemicals dumped; pesticides / insecticides, inoculum storage, handling and use on wastes/land leading to diarrhea, hepatitis, insect & reptile bites, interactions with foraging animals like rats, dogs, cattle, vector (mosquitoes, flies etc) transmitted diseases etc.
- This activity would result in large influx of workers from the region and beyond as this involves dumpsites in two .s. Worker facilities in the labour Camp if any, & site are important, as the density of population is high in Kerala. It is important that camp sites are not set up in the land to be remediated. Periodic health checkups (once a week) are very important as the work involves handling of waste. It is important to also provide periodic health checkup and co-ordination with local Primary Health Center/Central Health Services for medical camps for residents, schools and others during the biomining period.
- Risk of Fire during biomining and due to retrieved material storage; possible Burning of retrieved materials; storage and use of firewood for various purposes, fuel for vehicles. The smoke from burning solid waste can result in respiratory complaints, dizziness, and headaches in the short-term, as well as potentially more serious diseases such as cancers and heart disease in the long term.
- Impacts of other site development works shall be well assessed, EIA/EMP updated, and mitigation measures included in Project costs and implemented by the contractor/ULB (whoever is responsible as per FR/Final Bid document)

### 5.9 Visual impacts, Noise, Odour, Vibrations

- Odour & impacts on workers and communities during biomining, storage and Transport are key determinants of community agreement to the activity. Such odour

Copyright © 2023. KSWMP| All rights reserved

would attract flies and vectors in large numbers, who may also contaminate the food, and water sources of nearby communities. It is important to minimize odor emission as guided by the CPCB Guidelines on Legacy Waste Biomining, 2019. also provide periodic health checkup and co-ordination with local PHC/CHS for medical camps for residents, schools and others during the biomining period.

- Visual impacts of the waste being dug up, screened ad heaped/stored is not appealing. It is important to mask this appropriately.

### 5.10 Traffic impacts

- Impacts due to new access road construction/upgradation. Access road to the site is unpaved and slushy during rains. It is important to minimize temporary pollution due to increased movement men, and materials from and to the site during biomining activity and beyond as it is proposed to store material on site including air and noise pollution, access restrictions to properties nearby, and vehicular conflicts
- Large vehicles moving in and out of the site carrying materials, tools, equipment & pedestrian/worker -vehicular conflicts; increased traffic on roads, large equipments & vehicles, noise, air pollution: vehicle emissions, DG sets
- Vehicles, equipment's not adhering to pollution standards

### 5.11 Other Impacts on existing or proposed activities on site/s

- There may be approvals from various agencies for biomining activities and associated facilities; depending on utilities and uses on site. & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of biomining on existing facilities on site such as MRF, MCF, composting yard etc (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post biomining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped & impacts if this is dumped elsewhere or not processed. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health &Safety impacts on workers, communities. Also forward linkages are considered as associated facilities/linked activities. Impacts of Transportation of these fractions (traffic increase, odor, leachate, dust) impacts during rains & emergencies, and its handling, storage at the identified locations, reuse etc. shall be mitigated.

## 6. ENVIRONMENTAL AND SOCIAL MANAGEMENT & MONITORING PLAN

### 6.1 Scope of Environmental Management & Monitoring Plan

An Environmental Management Plan (EMP) is a comprehensive strategy designed to manage and mitigate the impacts of activities on humans and the environment, particularly concerning air, water, soil, land, and noise and vibration, and impacts on biodiversity and people.

### 6.2 Environmental Management Plan

The detailed anticipated impacts and corresponding mitigation measures/management of the impacts are given below.

*Table 16 Environmental Management Plan*

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| *A* | | **Planning and Pre-Construction Stage** | | |
| *1* | ***Planning for biomining facility*** | | | |
| 1 | Biomining & Bioremediation Plan & Capacities | • Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / biomined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these biomined material in line with the agreements with such facility owners and National, State regulations and WB EHS<br>• Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate management Plan.<br>• The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>• Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP] All rights reserved

| S. No | Probable negative impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>• The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>• To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>• Grading shall be performed where necessary to provide a neat appearance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ULB |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality, odor, water contamination due to leachate. Health and safety impacts of the people working in the site assessment* | • Carry out site assessments as per Guidelines for Biomining of Legacy waste Dumpsites of CPCB<br>• Consider safe biomining & gas / leachate generation from existing capped portion of the site<br>• Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>• Provision of appropriate PPE's to the team undertaking the site assessments<br>• Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>• Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>• Plan for machinery operated which will be operated by skilled operators at all times.<br>• Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. | TSC, ULB, Contractor | SPMU/DPMU/ULB |

Copyright © 2023 KSWMP] All rights reserved

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | | |
| 4 | Absence / Delay in Permissions for Developing the biomining facility and associated works as per National regulations | • Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labor Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes<br><br>*(Air Pollution) and Visual Blight due to excavation* | • Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>• Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>• PPEs to be used by workers<br>• Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU/ULB |
| 6 | Material sourcing, transport, and stacking of construction materials<br><br>*(Occupational Health and Safety issues and Air noise pollution)* | • Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>• Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>• Materials shall be sourced only from approved quarries<br>• Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>• The driver should be with required license and follow speed regulations<br>• Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>• Material transport and unloading activities should not result in noise disturbance to locals and should be during day time | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP| All rights reserved

| S. No | Probable negative impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>• Provide vehicle wheel wash area on site<br>• Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves.<br>• Proper rest area on site shall be provided with water, first aid, toilets | | |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | • Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>• Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>• Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>• It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with land owners wherever the labour is accommodated<br>• Camp must not be provided in an area prone to Hazards<br>• Camp should be adequately at higher plinth levels to prevent water intrusion<br>• Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>• Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>• The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>(Refer ECOP section 06 and section 11 of EMF for KSWMP) | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |
| 8 | Nearness/disturbance to sensitive areas such as | • Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in biomining site) based on the screening checklist and the | Contractor | SPMU/DPMU/ULB |

Copyright © 2023, KSWMP] All rights reserved

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | forests, wildlife habitations, etc. especially in case of providing support facilities<br><br>*(Impacts on Fauna / Flora)* | master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate and Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>• Identify appropriate government site to avoid land acquisition and resettlement impacts<br>• Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences (2 no's near west side,2 no's near south,1 no's in east side and 1 no's in north of the site), slope (towards north east) other landuses | | |
| 9 | Contamination of groundwater due to leaching, Leachate parameters: BOD, COD, TDS, Ecoli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | • During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>• Depending on the contractors plan for biomining of the capped area on site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ULB |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke – burning, trampling/machinery | • Movement routes of vehicles to be planned to avoid key fauna/flora on site such as<br>*Ailanthus sp.*(Tree) & *Funambulus tristriatus* ( Jungle Palm Squirrel)<br>• Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU/ULB |
| 11 | Nuisance hazards to neighboring areas | • Ensure proper design and adequate compound wall; high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements | Contractor | |

Copyright © 2023. KSWMP] All rights reserved

| S. No | Probable negative impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • In case of waste mound and site edges are sliding or unsafe; provide engineered retention walls. | | SPMU/DPMU/ULB |
| 12 | Treatment & Disposal of wastes and rejects | • Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & inert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Biosarth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>• Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| *B* | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| **Implementation of biomining of the dumpsite** | | | | |
| 1 | Impact due to the vehicular movement<br><br>*(Air and noise environment & Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | • Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>• All vehicles and machinery should obtain Pollution Under Control Certificates<br>• HORN PROHIBITION signpost to be erected.<br>• Rumble strips/speed breaker to be provided on access roads.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>• Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle | Contractor, ULB | SPMU/DPMU/ULB |

Copyright © 2023 KSWMP| All rights reserved

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>• Avoid heavy vehicle movement through Kalpetta roads during peak hours 7 a.m to 10 a.m – mention: school hrs / peak hrs; and during important period / festivals when people use the road to access temple<br>• Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | | |
| 2 | Impact due to the use of heavy vehicle and equipment<br><br>*(Air and Noise environment)* | • Mixing equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>• Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>• Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>• Labor to be provided masks / PPEs.<br>• Construction / Biomining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighboring sensitive land uses<br>• Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>  ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>  ▪ Using modern, well-maintained and regularly serviced vehicles.<br>  ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>  ▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>• Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>• As Adlaid dumpsite has sensitive receptors and settlement areas within 150m of it, noisy works shall be stopped from 22:00 to 06:00. | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP| All rights reserved

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>• Avoid noisy activities/machines near south west side of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near south west side of the dumpsite<br>• Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities<br><br>*(water environment)* | • Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>• Vehicle washing or maintenance near water bodies are to be avoided.<br>• Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ULB |
| 4 | Leachate and Runoff from biomining activities<br><br>*(Soil contamination and groundwater contamination)* | • Provide site cut off drain around the site to divert off stormwater from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>• Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>• Ensure stormwater drains will lead to drain outlets (along the north east boundary of the site) on roads adjoining the dump yard<br>• Provide leachate drains – lined – from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area preferably to the north east of the site<br>• Provide proper treatment of leachate and stormwater that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by biomining activities like excavation and waste segregation and stabilization | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP| All rights reserved

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>• The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>• Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>• Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>• Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>• Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | | |
| 5 | Soil decontamination from accumulated waste levels<br><br>*(Impact on leachate, odor)* | • Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bioculture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>• Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>• Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU/ULB |
| 6 | Excavation of waste from the waste mound | • The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound. | Contractor | SPMU/DPMU/ULB |

Copyright © 2023 KSWMP| All rights reserved

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *(Health and safety impacts)* | • Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>• Machinery operated for excavation should be operated by skilled operators at all times.<br>• Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>• Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>• In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>• When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | | |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles<br><br>*(Air, Odour nuisances, spills and littering impacts on Air, Water, Land)* | • All vehicles shall carry only approved load of weight<br>• Regular cleaning of roads & drains and removal of spills if any.<br>• All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>• Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>• Adopt required measures as per CPCB guidelines, and site specific safety requirements. | Contractor | SPMU/DPMU/ULB |
| 8 | Spreading and compaction of waste<br><br>*(Safety)* | • Follow technical details in line with CPCB Guidelines<br>• The active working face should be minimized as much as practical an appropriate size is about 2 to 3 times the width of the compactor vehicle. | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP] All rights reserved

| S. No | Probable negative impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Waste should be spread and compacted in layers not greater than 0.6m (2ft.) after compaction.<br>• Compaction of the waste should be on a slope of about 20-30% as guided via the permissible levels and worked from the bottom of the slope to the top | | |
| 9 | Occupational health and safety impacts of the workers during the biomining & construction of support facilities:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, bicultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | • Avoid direct & double handling of wastes through avoidance measures(suitable planning & equipments), engineering controls & use PPEs<br>• Work area & Labour camps shall be provided with First Aid and other related activities.<br>• Emergency Preparedness plans shall be prepared and implemented for all manpower working centers and its field extension centers.<br>• An Environment Health & Safety policy shall be prepared and implemented<br>• Adequate manpower shall be provided and manager & staff shall listen and act upon the manpower related grievances.<br>• Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles<br>• Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed with out slip, trip, fall especially on waste, leachate or trenches<br>• Proper training will be provided regarding the maintenance of health<br>• Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper handwash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>• First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>• Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers | Contractor, ULB | SPMU/DPMU/ULB |

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | working on waste heaps<br>• Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>• Measures such as deferred timings and stretch break to be adopted<br>• Secure all installations from unauthorized intrusion and accident risks;<br>• Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every days start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipments, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>• EHS specialist with adequate experience & third party supervision are important for biomining activity<br>• Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>• Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>• Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas;<br>• Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>• Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit. | | |

Copyright © 2023 KSWMP| All rights reserved

| S. No | Probable negative impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near those .In close proximity to this location, there is a transformer. to be marked well & safe kept before activity start near those<br>• Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>• All workers shall be registered as per prevalent labor laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>• Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractors person/insurance agent<br>• While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>• While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>• Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>• A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>• No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor<br>• All works related to working at heights will be undertaken only during the | | |

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | among waste heaps or work areas and access to adequate water supply.<br>• Ensure workers are briefed of fire hazard & its management<br>• No unauthorized entry shall be permitted to the site; including of workers during holidays, night time, or hours other than normal work hours under the supervision of site engineer / supervisor. Fencing and barricades with proper signage boards indicating "trespassers not allowed"<br>• The following activities should be implemented to prevent fires from occurring at the facility<br>○ adequate fire-fighting equipment should be made available on-site and stored in an accessible manner,<br>○ All operating staff should be trained and able to manage fire outbreaks at any part of the facility.<br>○ Clear signage should be established to inform workers and the public that flammable liquids are not permitted on the site. This should be reinforced by advice to customers at the gatehouse and inspection of loads at the organic reception area.<br>○ Approved quantities of combustible contaminants that have been separated (such as tires and plastic bottles) should be stockpiled in small piles or windrows.<br>○ All fuels or flammable solvents for operational use should be stored in an appropriately ventilated and secure store (at appropriate height). This store should be located away from the biomining, storage, and processing areas.<br>○ All flammable liquids should be stored within a bund that can hold 110% of the volume of the flammable liquids stored there so that any release of raw or burning fuel cannot cause a fire in the combustible organics present on the site or have an impact on contaminating stormwater.<br>• The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented throughout the biomining activity in line with National State regulations, guidelines and international good practices<br>• Ensure that appropriate fire safety standards, facilities, equipment are in place | | |

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | for storage and transportation stages. Fire mock drills to be conducted monthly once.<br>• Contain all local smokes/small fires inside the dump asap. Fire brigade help shall e sought on all smokes/fires outside the dump asap<br>• Ash from fires to be contained at the earliest within the site using bunds or screens, rather than allowing to disturb nearby receptors. Early clearing and disposal of such ash at TSDF to be ensured.<br>• Provide contact details of Fire Department & ambulance other essential emergency services on site & ensure training to the workers by such service providers | | |
| 11 | Construction of new facilities in retrieved land | • The excavated site shall be protected from any dumping during or after the biomining activity and shall be reserved for SWM activities in line with SWM Rules 2016<br>• Any new facility under KSWMP to be constructed on the retrieved land, shall follow EMF procedures & National State regulations | ULB | SPMU/DPMU |
| 12 | Pest / Vermin Control & Visual impacts<br><br>(Odour, flies, rodent / other pest menaces) | • Regular cleaning and approved pest control measures to be adopted; preferably in coordination with Health section of ULB & local Health Center<br>• Communities around shall be made aware of possible pest menace & ULB shall support those in need with required pest management measures and offered health checkups<br>• Biopesticides / biological control shall be followed. However, biopesticides, or bio cultures used shall be tested to ensure the presence of no banned chemicals or hazardous materials<br>• Banned pesticides/insecticides shall not be used.<br>• Workers shall be made aware of storage and use of pest control measures and PPEs to be used<br>• Visual blight to be curtailed by screens, proper lighting, housekeeping, leachate management | Contractor, ULB | DPMU, SPMU |
| 13 | Odour nuisance | • Waste with a strong odor to be covered immediately they are emptied from vehicles.<br>• Control and manage leachate treatment to minimize odor. | Contractor, ULB | DPMU, SPMU |

Copyright © 2023. KSWMP| All rights reserved

| S. No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Provide buffers screens to curtail odor from reaching surrounding communities especially to –South west side of site.<br>• Using natural deodorizers such as lemongrass, eucalyptus etc. and planting fragrant flowering plants around the site to mask odor. | | |
| 14 | Storage, Collection, Transport, Treatment & Disposal of wastes and rejects | • Storage, Collection, Treatment, treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste<br>• Storage, Collection, Transport, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc); & adequate protection shall be made to prevent such impacts even during rains / disasters<br>• Waste handling shall be in line with existing regulations & guidelines & avoid health & safety impacts<br>• No material is allowed to remain on site after the contract period<br>• Adequate fire safety arrangements & awareness & training to workers shall be ensured on site & at disposal / treatment areas for wastes in discussion with Local Fire Brigade to prevent any fire on legacy waste site or retrieved & stored wastes or that is transported<br>• Vehicles movement shall be tracked by ULB to ensure disposal of material/rejects/inerts in designated or agreed area & are in line with schedule; using GPS | Contractor, ULB | DPMU, SPMU |
| 15 | Other activities | • No activity other than biomining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>• If existing MCF shall be used for storing bio mining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after biomining works shall be after proper cleaning / washing & disposal of all rejects/inerts & tools to ensure good housekeeping & no H&S impacts | | |

Copyright © 2023. KSWMP] All rights reserved

| S. No | Probable negative impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • If existing MCF shall be used by the ULB for storing dry wastes from Town, during biomining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 16 | Energy Efficiency & Water Use efficiency | • All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & biomining / construction techniques<br>• Landscaping & green belts to use local / indigenous plants & trees<br>• Waste water and Leachate to be treated & recycled/reused | Contractor | ULB |
| C | **Future Site Usage (EMP shall be updated in line with EMF & used if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Biomining, but of the future facility operator & ULB** | | | |
| 1 | Future use of the biomined site: Green Park, MCF, MRF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | • ULB to ensure that the site will not be used for future dumping.<br>• Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around.<br>• ULB shall plan the future use of the site shall be in consultation with the communities.<br>• Phase 1 Environmental Assessment to be carried out, EA for existing facilities & EIA for proposed development in line with EMF in case this is proposed to be developed under KSWMP<br>• All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF/MRF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment, a nuisance to biodiversity,* | • The movement route shall be scheduled for each vehicle.<br>• Enforce speed limits applicable and make drivers aware of this<br>• Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule; preferably using GPS<br>• Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles<br>• Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards<br>• Proper lubrication shall be provided to minimize squeaking noise due to friction | Future Facility operator | ULB |

## 6.3 Emergency & Disaster Management Plan

### Hazards Associated with Dumpsite Activities

The Disaster Management Act, 2005 mandates every Government Department to prepare, review and update Disaster Management Plan

### 6.3.1 Identified Emergency Situations

*Table 17 Hazards associated with Dumpsite Biomining & Bioremediation*

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| As per World Bank EHS Guidelines | |
| Waste Storage | **Regular visual inspection of all waste storage collection and storage areas for evidence of accidental releases** |
| Waste Segregation | **Regular audit of segregation of biomined wastes** |
| Monitoring records for hazardous waste collected,stored, or shipped should include | **1. Material Identification:**<br>- Name and identification number of the hazardous material(s) present in the waste.<br><br>**2. Physical State:**<br>- Indicates whether the waste is in a solid, liquid, gaseous form, or a combination of these.<br><br>**3. Quantity:**<br>- Specify the amount of hazardous waste, and biomedical waste retrieved from site typically measured in kilograms or liters, or by the number of containers. All such waste shall be staked in appropriate places/ containers for disposal; duly marked & records kept.<br><br>**4. Waste Shipment Tracking:**<br>- Documentation tracking details include:<br>- Quantity and type of hazardous waste.<br>- Dates of dispatch, transportation, and receipt.<br>- Records of the originator, receiver, and transporter involved in the waste shipment. |

Copyright © 2023 KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| | **5. Handling and Treatment:**<br>- Describes the method and date of various actions taken with the retrived waste, such as storing, repacking, treating, or disposing it.<br>- Cross-referenced with specific manifest document numbers relevant to the hazardous waste.<br><br>**6. Location within Facility:**<br>- Specifies the specific locations within the facility where retrived – various type shall be stored or processed.<br>- Includes information about the quantity of waste at each location. |
| Falls and Slips at the dumpsite<br>Slippery surfaces or uneven surfaces and poor access to work areas climbing on and off the facility, equipments/machinery or the waste segregation/other facilities set up | Tidy workplace by maintaining good housekeeping. Handholds wherever necessary and clear/ safe access to work areas with proper PPE to the persons working at the site. |
| Fire Hazard<br>Fire risk may occur due to the following<br>Storage of flammable liquids / Gas like LPG, Diesel<br>Any combustible materials<br>Sparks<br>Open flames<br>Absence of Fire hydrant network may increase the risk in case of major fire accident | Combustible/flammable materials should be properly managed and stored/used. Fire extinguishers and Fire hydrant Network with reserve water (As per NFPA Code) should be made available. Emergency Plan in case of fire. |

Copyright © 2023. KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| Absence of Personal Protective Equipment Lack of adequate footwear, Helmets, hearing/ eye protection, gloves & goggles may lead to injuries and death. | Proper footwear, Helmets, hearing/ eye protection, gloves & goggles should be given to the workers at the dumpsite. Proper training should be given to the workers on the use of PPE. |
| Electrical Hazard<br>Electric wires if any damaged<br>Poorly insulated<br>During temporary repairs<br>Circuits overloaded may lead to major accident | Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit. |
| Ladders<br>Risk may occur due to the following<br>Not secured against dislodgement<br>Defective ladders<br>Not sufficient length<br>Incorrectly placed | Ladder risk can be mitigated by the following<br>Secured against movement or footed<br>Ladders in good condition<br>Regular inspection<br>Ladder should be extended one (1 m) meter above platform to avoid injuries |
| Excavations<br>Risk may occur due to the following<br>Trench collapse<br>Gas emission | Risk can be mitigated by the following<br>• Soil stability should be known before excavation<br>• No water accumulation<br>• V500 mask should be used at the in order to counter the gas emission.<br>• Emergency Plan |
| Defective or wrong Hand Tools<br>Wrong/defective tool may end up with injuries to the workers using the tool | Right tool for the job should be used properly and it should be in good condition |
| Accidents due to vehicular movement<br><br>Vehicle movement inside the site | Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents |

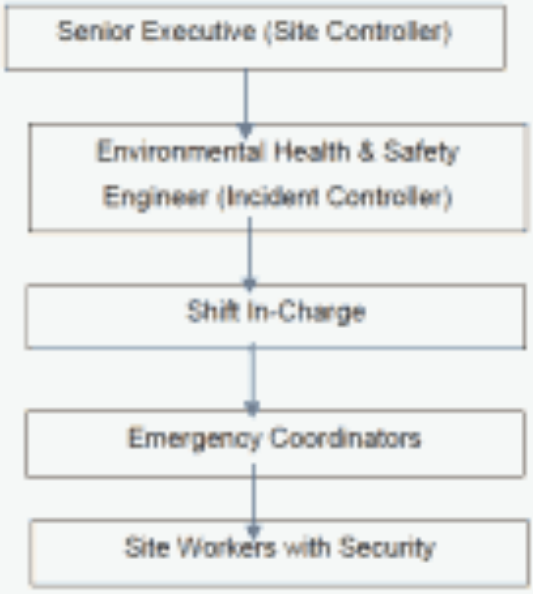
Copyright © 2023. KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| Noise Hazard<br>Noise levels over 85 decibels would cause trouble to the people working at the site | Noise Levels should be maintained below 85 decibels and with proper protection |
| Falling Material<br>Fall during carrying/Lifting of waste and materials from overhead work areas. | Risk can be mitigated by preventing the falls by barriers, training, strengthening the materials used for works and the following<br>Use of hard hats.<br>Person operating the Jcb/machine must be provided with walkie talkie/hand signals to know about the clearances. Also the services of flag staff with flag & whistle to be arranged |
| Visitors Presence at site<br>Insufficient fencing may lead to attract pedestrians to enter the site. | Fencing and barricades with proper signage boards indicating "trespassers not allowed" |

### 6.3.2. Proposed Organizational Structure for Disaster Management

The Organizational structure for the Disaster management contains the following team members.

**Emergency Response Team:**



A response team needs to be set in assistance with a senior executive (Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

Incident controller would be reporting to the Site Controller. Incident Controller organizes a team responsible for controlling the incidents with the personnel under his control.

Shift In-charge would be the reporting officer, who would bring the incidence to the notice of the Incidence Controller and Site Controller.

Emergency Coordinators would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.

Copyright © 2023 KSWMP| All rights reserved

**Organizational structure for the Disaster Management Team**

### 6.3.3 Emergency Response Facilities

Emergency Control Center – with access for emergency shutdown procedures, duties and contact details of key personnel and government agencies, emergency equipment, etc.

- Assembly Point – with minimum facilities for safety and rescue
- Emergency Power Supply – connected with diesel generator, flame proof emergency lamps, etc.
- Fire Fighting Facilities – first aid fire-fighting equipment, fire alarms, etc.
- Location of Wind Stock – located at appropriate location to indicate the direction of wind for emergency escape
- Emergency Medical Facilities – Stretchers, gas masks, general first aid, emergency control room, breathing apparatus, other emergency medical equipment, ambulance The medical centre should display poster for treating burns and first aid. Some medicines and facilities to be kept in the medical centre are suggested.

**Health and Safety Measure for the workers**

All workmen employed in working conditions will be provided with adequate personal safety equipment as applicable to the work including (but not limited to):

- Safety shoes/boots
- Safety Helmets
- Hand gloves
- Ear muffs

Copyright © 2023 KSWMP| All rights reserved

**Monitoring Plan**

The considerations in an emergency planning include the following:

- Identification and assessment of hazards and risks
- Hazard consequences analysis
- Alarm and communication procedures
- Identification and equipping emergency control centre identify assembly, rescue points, medical facilities
- Emergency preparedness plan, procedure, steps to be taken before during and after emergency
- Formulation of plan and emergency sources
- Training rehearsal, evaluation and updating the plan
- Machinery should be examined regularly
- Medical examination: Every employee shall be examined by doctors at least 3 months in a calendar. Health register should be maintained by the individual industry coming in the project site

**Emergency Action Plan for Fire**

In case of Fire the immediate plan of action will be "RACE" that stands:

R - Rescue: When you discover a fire, rescue people in immediate danger if you can do so without endangering yourself.

A - Alarm: Sound the alarm by pulling a fire pull station and call fire station, from a safe distance, notify security of precise location of fire

C - Confine: if possible

E - Evacuate: Evacuate the place

Immediately informed the response team on the site and local fire brigade. Response team moves to the point of fire and take all necessary steps to stop the fire. Fire brigade to join at the earliest. If the fire is not controllable and spreads then the manager in charge should inform the district authorities and call for additional external help. Complete an Incident/Accident Report within 24 hours.

Firefighting system is proposed to prevent and control fire outbreaks. The firefighting system will consist of portable fire extinguishers, hose reel, wet riser, yard hydrant, automatic sprinkler system, and manual fire alarm system. In case of dumpsite biomining it is also important to shave fire lines in the biomining area & also in the storage area where material retrieved is stored.

**Emergency Action Plan for Electric Fire**

Copyright © 2023. KSWMP| All rights reserved

- Disconnect the affected areas electric supply
- If fire is small scale than $NAHCO_3$ or Sand will be effective.
- Attempt to extinguish fire with the help of CO2 based extinguisher
- Seek support of fire brigade

Action Plan of on-site Emergency Plan

- The action plan considered is given as follows:
- To constitute Disaster Management Committee under senior officer not below the rank of General Manager
- To identify potential hazards areas in the layout map
- To predict degree of burns and distance of the risk zone by using model
- To evacuate the area within risk zone
- To localize the emergency and if possible eliminate it
- To minimize the effects of accidents on people and property
- To take remedial measures in the quickest possible time to contain the incident and control it with minimum damage
- To mobilize the internal resource and utilize them in the most effective way
- To get help from the local community and government official to supplement internal manpower and resources
- To minimize the damage in other sections
- To keep the required emergency equipment in stock at right places and ensure that they are in working condition
- To keep the concerned personnel fully trained in the use of emergency equipment
- To give immediate warning to the surrounding localities in case of emergency situation arising
- To mobilize transport and medical treatment of the injured
- To educate the public in the surrounding village regarding hazards
- To arrange treatment of causalities
- To safe guard the people
- To identify the causalities and communicate to persons known to them
- To render necessary help to concerned
- To rehabilitate area affected

**Urban Floods:**

Floods are extreme events, usually triggered by extreme precipitation (river/inland floods) and/or storms (coastal floods). If these rainfalls exceed the retention capacity of the basins, drainage speed and volume, it causes floods.

Copyright © 2023. KSWMP| All rights reserved

**Different Types of Flooding:**

1) Localized flooding due to inadequate drainage;

2) Flooding due to overflows from Rivers/channels/drains where the dumpsite is on or near flood plains or when flood plains are occupied by various settlements & other infrastructure without space for water to flow.

**Stakeholders in Disaster Management:**

The policy also systematizes a frame work of operation for the following set of stakeholders that play key roles in disaster management.

- Kerala State Disaster Management Authority
- State and Central Government Departments and Disaster response forces
- District Disaster Management Authorities
- Local authorities including Municipal Corporations/Municipalities, District/Block/Grama Panchayaths, Taluk/Village Officers etc.
- Voluntary and Civil Society Organizations
- Red Cross, multilateral aid agencies and U.N agencies
- Community – Village Disaster Management Committees / Task Forces
- Public sector Undertakings
- Private sector undertakings
- Army, Navy, Air Force, Coast guard, Airport Authority, National Disaster Response Force etc.

- District disaster teams shall be informed of the proposed activity and its schedule

### 6.4 Environmental Monitoring Plan

Monitoring at a dumpsite site is carried out in four physical zones as follows:

i. On and within the dumpsite
ii. In the unsaturated subsurface zone beneath and around the dumpsite
iii. In the groundwater (saturated) zone beneath and around the dumpsite
iv. In the atmosphere/local air above and around the dumpsite

The Environmental Monitoring Program involves the following:

- Conducting survey and sampling program.
- Analysis of samples and data / information collected, and interpretation of data and information.
- Preparation of reports for submitting to management and statutory authorities.
- Environmental monitoring is carried throughout the project operation to detect changes in the key environment quality parameters, which can be attributed to the project.

Copyright © 2023. KSWMP| All rights reserved

The results of the monitoring program used to evaluate the following.

- Extent and severity of the environmental impacts against the predicted impacts
- Performance of the environmental protection measures or compliance with pertinent rules and regulations.

### 6.4.1 Air Environment

The potential sources of air pollution from the dumpsite include vehicular movement, emission of dust from biomining activities & wastes retrieved and stacked. Passive leakage of landfill gas from the disposal site. Other important contributor is odour emissions from the existing legacy site disturbed. Monitoring of the air environment will be carried out during the operational phase in and around the project site.

### 6.4.2 Noise Environment

The operations shall induce noise due to operations of transport trucks (men & material), JCB loaders and other types of machinery required at the dumpsite for moving wastes, screening, stacking, turning etc and the biomining activity. Monitoring of ambient noise levels and also the exposure of the workers to that environment is essential.

### 6.4.3 Water Environment

Water quality to be monitored during the operational phase. The monitoring frequency needs to be increased if higher concentrations are expected. Both groundwater regime and surface water domain is anticipated to be most-affected, through leachate contamination. Therefore surface & ground water will be periodically monitored for the parameters particularly increase in BOD, heavy metals and the hazardous chemicals.

### 6.4.4 Land Environment

The soil in the dumpsite and neighboring areas will be analyzed for the relevant parameters.

The details of Environmental Monitoring Programs are given below:

*Table 18 Environmental Monitoring Parameters*

| Environmental components | Locations | Frequency | Parameters |
|---|---|---|---|
| Ambient Air quality | Nearby habitations and locations | Quarterly [1 sample] | $PM_{10}$, $PM_{2.5}$, NOx, CH4, CO. Ammonia |
| Noise | Outside the site towards residential area | Monthly | Noise levels |
| Ground and Surface water | Ground water from the nearest well, | Quarterly | IS 10500:2012 drinking water |

Copyright © 2023 KSWMP| All rights reserved

| | | | |
|---|---|---|---|
| | drain upstream & downstream of where leachate is disposed, and Thodu upstream & downstream of were the drain joins | | parameter for ground water welks, class D, E for drain & Thodu (if these are not used as drinking water source) |
| Accidental release | Chemical, oil and fuel spills | Daily | Near chemical, oil, storage areas Incident reports |
| Health safety Hazards | Medical records, documentation of injuries and accidents, Health and safety assessments | As and when accident/injury occurs | Incident reports |
| Leachate | 1 point per leachate at swamp area. | Weekly during biomining activity | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins |

In case, any deviation from FR, this would be updated and mitigation and monitoring measures would be revisited. Currently the location of disposal of biomined material, or type of transport of biomined material is unknown & hence, these impacts & mitigation,

Copyright © 2023 KSWMP| All rights reserved

monitoring requirements will be updated & implemented by the Contractor. This aspect should be made a Bid condition

### 6.5 Environmental & Social Safeguard Budget

The details of Environmental Budget for Implementation and Supervision of Environmental Management Plan (EMP) is given below:

*Table 19 Detailed Cost Breakup*

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| | **Environmental Safeguards** | | | | |
| 1 | Deodorizer equipment (power sprayer) | Only Once | | | |
| 2 | Green Net ( Approx., 350 m Length – Height – 3 m) and installation charges | Based on requirement | | | |
| 3 | Spillage Kit | Only Once | | | |
| 4 | Monitoring of Environmental parameters [Air, Ground water, Surface water, Noise, Soil and Leachate] Actual Noise abatement, odour management, dust management measures to be included in DPR cost | Quarterly, first six months by contractor and next two years by ULB | | | |
| 5 | Gas monitoring to check the gas accumulation at the dumpsite | Gas monitoring should be conducted at least twice a day for about 7 consecutive days | | | |
| 6 | Personal protective equipment | Entire Process | | | |
| 7 | Training on capacity building | Entire Process | | | |
| 8 | Leachate Management (Full costs included in DPR. This | Only gap incidental costs. | | | |

Copyright © 2023 KSWMP | All rights reserved

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| | is only for incidental mitigation of odur, leaks, spillage, flies etc. ) | The rest are all included in DPR | | | |
| 9 | Site Accesss Improvisation | Only once | [redacted] | [redacted] | [redacted] |
| | **Social Safeguards** | | | | |
| 10 | Overall Budget for Social Safeguards | | [redacted] | [redacted] | [redacted] |
| **TOTAL (actual costs for works involved for mitigation measures are to be included by the contractor in DPR costs based on his work method. This is only indicative cost for incidental mitigation & management measures. EHS in Labour camp also not included here; but shall be included by the contractor based on his work plan as this is combined with multiple other dumpsite biomining works)** | | | | | [redacted] |

## 7. INSTITUTIONAL ARRANGEMENTS

### 7.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of Terms of Reference (ToR) for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organization will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and
social safeguards to D-ESDU.

Copyright © 2023. KSWMP| All rights reserved

### 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity
- Training program for HKS (Health & Hygiene, source level waste segregation and source level treatment, Fire and Safety)
- Training program for ULB Councilors and Ward convener (Proposed SWM project plan of KSWMP)
- Training program for Political and trade union leaders (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for workers of Municipal Sanitary workers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for school / college students (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for ULB officials (Proposed SWM project plan of KSWMP, proposed policies, existing policies etc. to improve the existing pattern into zero waste concept of the municipality)

### 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – https://kswmp.org/grievances / grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

Copyright © 2023. KSWMP| All rights reserved

## 8. PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

"Public Consultation" refers to the process by which the concerns of local affected persons and others who have plausible stake in the environmental impacts of the project or activity are ascertained with a view to taking into account all the material concerns in the project or activity design as appropriate.

In 2010 the waste dumping stopped after result of public agitation. Now the proposal is to remediate the existing site in order to protect the environment and human health. The summary of the document will be made available in the website, which will also be featured in a newspaper advertisement in Malayalam language for public disclosure.

### 8.1 Public Consultation

In connection with the dumpsite remediation, a consultation meeting was conducted on 01.06.2023 at Municipal office Kalpetta. Stakeholders from different social entities participated in consultation meeting followed by a transect walk. Municipal ward councilor, HKS, Kudumbashree officials from DPMU, ULB, PIU and TSC were participated.

In the meeting, Environmental Engineer, DPMU explained about the proposed dumpsite remediation activities with a positive note on how the remediation activities beneficial to the local community. The ward councilor extended whole support from the side of local people. Further, a detailed description on dumpsite remediation was given by Social and Communication expert, DPMU. Participants expressed their concerns regarding the proposed project activities and its implementation modalities. The participants were happy that the lifelong bad image of 'trenching ground' would get removed since it was highly a stigmatized usage.

### 8.2 Outcome of the meeting

A transect walk was carried out followed by the meeting with the participation of stakeholders. The local community, after the meeting and interactions, extended support for the dumpsite remediation activity. The meeting also discussed various aspects of dumpsite remediation in detail including the possible social and environmental issues that may affect their routine life as well as the free movement during the time of operation

Copyright © 2023. KSWMP| All rights reserved

*Figure 5 Transect Walk at Dumpsite - Kalpetta*

Copyright © 2023. KSWMP| All rights reserved

### 8.3 Information, Education and Communication (IEC) Plan

*Table 20 IEC Plan for Kalpetta dumpsite remediation*

| Programme | Methodology | Topic | Responsibility | Monitoring |
|---|---|---|---|---|
| **Sensitization/ Awareness programme** | Meeting with all concerned Stakeholder's with prior notification to discuss about the process and remediation methods | Process of dumpsite remediation Developing as a Recreational park | Contractor | TSC/ DPMU/ DPMC |
| **Informative standees in all** | Visible places nearby the dumpsite | Protocol to the public who residing in nearby areas and also trespassers. | Contractor | TSC/DPMU/ DPMC |
| **Announcement vehicle** | All across places near the dumpsite | Health and hygiene protocols during the dumpsite remediation process | Contractor | TSC/DPMU/ DPMC |
| **Digital campaign (Social media)** | Areas surrounding waste dumping and all affected areas | Arrangement of a public audio system to address all people in the surrounding areas.<br><br>Short video presentations to communicate through different digital platforms like WhatsApp pertaining to the existing scenario and proposal of Recreational Park with self-explanation | Contractor | TSC/DPMU/ DPMC |

Copyright © 2023. KSWMP| All rights reserved

| | | | | |
|---|---|---|---|---|
| **Cautionary notification boards** | About vehicle movement and the transit of waste | precautionary measures should the general public take. | Contractor | TSC/DPMU/ DPMC |

**Conclusion**

The dumpsite remediation activity at Kalpetta involves moderate social risks. However, a set of anticipated risks are mentioned in the scoping of social management plan to overcome the identified risks and its negative impacts. Formation and regular meeting of GRM & stakeholder's committee, awareness generation, counseling for the aggrieved parties, gender sensitization, legal awareness are the major proposed mitigation measures. This proposal is made to reduce the social risk associated with dumpsite remediation and to minimize the negative social impacts.

ANNEXURES

## Annexure 1 – Environmental Screening

**Environmental Screening**

**Sub Project Details**

| Name of Subproject: | Dumpsite Biomining and Bioremediation |
|---|---|
| Sub project Components: | Dumpsite Biomining and Bioremediation |
| Subproject Location (City / Town/ Village with ward numbers): | Kalpetta ULB, Ward 23 Adlaid, Wayanad District. |

**Stage 1: Exclusion List**

| Sl.No | Non-permissible Activities |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016 (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible) |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |
| The project does not fall under the above conditions as mentioned under exclusion list | |

Copyright © 2023 KSWMP| All rights reserved

**Stage 2: Environmental Screening Checklist**

| Sl.No | Components | Details |
|---|---|---|
| 1 | Project Components | Dumpsite Biomining and Bioremediation |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities / associated facilities) | This proposed project involves biomining of existing dumpsite.<br>This remediation process involves<br>**Pre-processing of legacy waste**<br>1. Clearing and grubbing of site<br>2. Windrow formation for stabilising the excavated waste<br>3. Windrow turning, tilling and cone formation<br>**Machinery erection**<br>1. Site levelling for Plant erection on the site and commissioning of machineries.<br>2. Operation of plant for processing the waste.<br>3. Office set up and fire safety measures<br>The byproducts of the process are<br>1. Bio earth and coarse fraction soil – will be used within the site<br>2. RDF – will be send to nearby waste to energy plants like cement plant and power plant which further processing it will be used as fuel<br>3. Recyclables – will be send to the authorised recycling agency |

Copyright © 2023 KSWMP | All rights reserved

| Sl.No | Components | Details |
|---|---|---|
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination) Site Survey No:/s (attach map) with ownership details, Geographical co-ordinates of the site location (including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | Latitude: 11°35'26.2"N,<br>Longitude 76°03'21.1"E<br><br>Land ownership: Kalpetta Municipality<br><br>Land use: Public<br><br>Disaster Zone: It falls under Zone III (Moderate) |
| 4 | Land Area proposed to be used: Location wise (in sq. km / sq. m) | It is remediation of land and hence no land required |
| 5 | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | Operational phase – 0.5 KL/day<br>Domestic use – 1.0 KL/day |
| 6 | Power Required and Source of Power | Demand load for the proposed equipment during the remediation process is available and additional power required will be made available by DG sets |

**Baseline Environmental Conditions**

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| 1<br><br>(i) | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | No | The project site is not located near any Critically Vulnerable Coastal Areas (CVCAs), Eco sensitive Areas (ESAs) |

Copyright © 2023 [redacted] All rights reserved

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| | Critically Vulnerable Coastal Areas (CVCAs), Eco sensitive Areas (ESAs) | | | |
| (ii) | Cultural Heritage site, protected monuments - listed by ASI/State | | No | The project site is not located near any cultural Heritage or protected monuments as listed by ASI/state |
| (iii) | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensative area, with any schedule 1 species? If yes, which is the area? | | No | The project site is not located near Natural Forests / Protected Areas / Bio-Reserves |
| (iv) | Other Wetlands/ Mangrove/ Estuarine Region | | No | The project site is not located near any Wetlands/ Mangrove/ Estuarine Region |
| (v) | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | No | The project site is not located near any Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas areas with natural features like waterfalls, sacred groves<br>Banasuramala Meenmutty water falls located an aerial distance of 15 km from the proposed project site. |
| (vi) | Other Sensitive Environmental Components listed in EMF | | No | No other sensitive environmental components listed in EMF exist nearby the project site |
| (vii) | Drinking water source, upstream and downstream uses of rivers, etc | | No | No river source is resorted for drinking water use<br>Downstream the ground water source is available |

Copyright © 2023 KSWMP | All rights reserved

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| (viii) | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | No | The sea is located 3 km (Aerial Distance) from the project site. There won't be any influence of tidal influence |
| (ix) | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | Yes | | a. Nearest Habitation- Houses are located at an aerial distance of 700 m<br>b. Religious Place- Temple (Padapuram Sree Maheswari Temple) is located at an aerial distance of 1.35 km away from unit<br>c. School – Kristu Raja Public School is located at an radial distance of 450 m<br>d. Tourist Places – Chembra peak view point is located at an aerial distance of 5.75 km from the proposed project site. |
| 2 | Is the site in Critical / Over Exploited Ground Water Block. Provide the level of the groundwater table | | No | Semi critical |
| 3 | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | | No | The site does not fall under major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion.<br>There may be chance of fire due to<br>1. Fire breaking due to high temperature<br>2. Electrical short circuit due to poor maintenance.<br>3. Smoking in the premises near the waste storage.<br>4. Burning of the waste by unauthorized persons<br>5. Keeping highly flammable materials like, cooking gas, kerosene, match boxes, etc.<br>6. Not having provisions for proper fire/smoke detecting system. |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| 4 | Describe the type of soil and vegetation on site | Yes | | Hard laterite soil with few trees present in the site |
| 5 | Is the site present in the flood plains as recorded in the last 100 years. Provide the HFL level of the site/region | | No | The sea is located 45 km (Aerial Distance) from the project site.<br>During 2018 peak flood the site experienced minimal problems or issues. |
| 6 | Existing pollution/contamination or degradation on site | Yes | | Dumpsite located in Kalpetta ULB is the existing contamination and detailed under chapter 5 |
| 7 | Any other remark on baseline condition | Yes | | Based on the test result of environmental baseline for Kalpetta dumpsite certain parameters exceeds the permissible limits and test report are given under chapter 5 |

**Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils**

| S.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Total extend of land to be covered/built | Yes | | 3.65 acres |
| 2 | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | Yes | | Due to open dumped area |
| 3 | Extend of Land to be remediated | Yes | | 1.12 acres |
| 4 | Extend of land expected to be under green belt | Yes | | Will be under the scope of contractor |
| | proposed project cause the following on Land / Soil: | | | |
| (i) | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | No | There will be no major impact other than the operational phase as this project is remediation project. |

Copyright © 2023 KSWMP | All rights reserved

| S.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| | | | | During operational phase the anticipated impacts are identified and mitigation measures are provided |
| (ii) | Substantial removal of Top Soil (mention area in sqm) | | No | Nil |
| (iii) | Any degradation of land / eco-systems expected due to the project? | | No | There will be no Land degradation instead it will be a remediation of land from further contamination |
| (iv) | Loss or impacts on Cultural/heritage areas/properties | | No | There will be no loss or impacts onCultural/heritage areas /properties |
| (v) | Does the project activity involve cutting and filling/ blasting etc? | | No | The project does not involve cutting and filling/ blasting as the building is existing |
| (vi) | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | | No | The project will have change in a positive way by clearing the waste dumped into vacant land |
| (vii) | Will the project involve any quarrying/ mining etc? | | No | The project does not involve any quarrying/ mining |
| (viii) | Will the project / any of its component contaminate or pollute the Land? | | No | Presently there is contamination and due to the project activity the further contamination shall be eliminated and natural system shall be restored |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| (ix) | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | No | There will be no negative impact due to the proposed project |
| (x) | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | No | There will be no negative impact due to the proposed project |

| S.No | Impacts on Air and Noise Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | Yes | | It will be temporary and adequate mitigation measures will be taken to reduce the impact during the operational phase. |
| 2 | Will the project cause or increase pollution due to GHG emissions? | | No | Nil |
| 3 | Will the project cause or increase odour nuisance? | Yes | | The Biomining project will be create odour nuisance but it is temporary and once the process is completed there will be no odour nuisance. |
| 4 | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | Yes | | There may be chance for any release of toxic gases or potential fire outbreaks which will be mitigated through proper mitigation plan by adopting gas collection system. |
| 5 | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | Yes | | The Biomining project will create increase in noise level but it is temporary and once the process is completed there will be no noise. |

Copyright © 2023 KSWMP | All rights reserved

| S.No | Impacts on Water Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the activities proposed at the site(s) impact water quality (surface or ground) – leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 2 | Will the activities proposed at the site(s) impact water resource availability and use – leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 3 | Chances of Pollution of Water bodies / groundwater wells, nearby or downstream | | No | There will not be any chance of pollution of water bodies / groundwater wells, nearby or downstream |
| 4 | Will the activities proposed at the site(s) hinder natural drainage | | No | As the existing dumpsite will hinder the natural drainage pattern. The proposed activity once completed will improve the natural pathway without any obstacles. |
| 5 | Will the activities proposed at the site(s) decrease permeability /rainwater percolation | | No | The activities proposed at the site will not decrease permeability /rainwater percolation |

Copyright © 2023. KSWMP | All rights reserved

| S.No | Impacts on Bio diversity & Host Communities | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project necessitates cutting of Trees /Loss of Vegetation | | No | There will be no cutting of Trees. But there will be Loss of Vegetation due to this project |
| 2 | Will the project necessitate substantial removal of Top Soil (mention area in sqm) | | No | There will be no Substantial removal of Top Soil.<br>During the excavation of waste there is a slight chance of the top soil to get removed and the same will be mitigated with by-product (bio earth) of this activity |
| 3 | Any degradation of land / eco-systems expected due to the project? | | No | There will be no degradation of land / eco-systems expected due to the project activity.<br>Also, the proposed activity will protect the land from further contamination |
| 4 | Will the project result in Health & Safety Risks in the neighbourhood including the release of toxic gases, leachate, accident risks | Yes | | There may be chance of accidental risks due to leachate and toxic gases, which will mitigated by proper lined leachate drain and PPE kits |
| 5 | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | | No | There will be no major impact.<br>During operational phase there will be noise pollution due to movement of vehicles which will be curtailed by adopting mitigation measures. |
| 6 | Potential disruption to common property, accessibility, traffic disruptions, conflicts, or disruption to the local community within the subproject area? | | No | There will be no major impact.<br>During operational phase there will be slight increase in traffic due to movement of vehicles which will be mitigated by adopting movement of vehicles during off peak hours.. |

Copyright © 2023 [illegible] All rights reserved

**Project Categorization and Need for Safeguards Instruments**

| Project category | ☐ E1 ☑ E2 ☐ E3 |
|---|---|
| Key Reasons | During screening, it has found that the proposed subproject is moderately causing impact to the base line environment, land/ soil / water /noise environment, biodiversity or to the community. Site is not close to any Environmental Sensitive Receptor. Moreover, Project results positive impacts on Environment. The Environmental Baseline analysis reveals that dumpsite not having any Heavy metal contamination. Hence it is categorized as E2. |
| Safeguards Instruments Required | a) E1: Project-specific EIA (impact assessment considering the project details & location) by Independent Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>b) E2: Project-specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>c) E3: signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities |

| Status | Agency / Official | Name, Signature with Date and Seal |
|---|---|---|
| Prepared by | PIU or ULB (project in charge) | |
| | Environmental Engineer | |
| Checked, categorised as ___ (E1, E2, E3) & Vetted/signed by: | DESDO / SESDO | |
| | Environmental Specialist | |

## Annexure 2 – Fire and Risk Assessment

A fire and risk assessment is a systematic evaluation of potential fire hazards and associated risks within a particular environment or premises. The assessment aims to identify potential fire hazards, assess the level of risk they pose, and recommend measures to mitigate or manage those risks effectively. Fire and risk assessments are essential for ensuring the safety of the workers, protecting property, and complying with fire safety regulations.

The existing legacy waste dumpsite, occupying about 3.65 acres in ward 23, aims to fully reclaim the land for future development. Bio-mining, a technique chosen after careful evaluation will be used to recover the land and ensure sustainable and environmentally friendly treatment of the waste. The process will yield various by-products, which require immediate attention to prevent fire hazards.

The by-products are as follows:

1. The bio earth & C&D waste 5577 tons.
2. Retrieved plastics, rags, paper & other combustibles that cannot be recycled, but may be used as Refused derived fuel (RDF) 1792 tons.
3. Recyclables 271 tons

The retrieved plastics, rags etc that cannot be recycled and the recyclables if stored on site poses a potential fire risk and requires proper handling. To mitigate the risk, a storage and disposal process spanning 3 to 4 months shall be devised by the contractor in line with his work plan. During this period, the contractor shall implement various protective measures to prevent the possibility of a fire outbreak. These following measures are important for preventing fires, ensuring the safety of workers and nearby communities, and minimizing risks to the environment and property.

### Pre-Construction/Planning Stage:

1. Fire Safety and Emergency Plan: Develop a comprehensive fire safety plan and emergency response plan to address potential fire incidents.
2. Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard.
3. Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.
4. Fire Equipment: Ensure that the site is equipped with fire extinguishers.

### Storage of Waste & RDF:

Copyright © 2023. KSWMP| All rights reserved

**Fire Standards and Facilities:** Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.

Below equipment and their required quantities should be strategically positioned according to the site's specifications.

- Fire extinguisher (A, B, C powder): It will be used to immediately put off fire caused by wood, Paper and textiles, flammable liquids and flammable gases. Commonly can be placed anywhere inside the site
- Fire extinguisher (Foam spray): Mainly used to put off the fire caused by flammable liquids. It should be placed in diesel storage area, lubricant storage area and DG sets.
- Fire extinguisher (Co2): Mainly used to put off the fire caused by Electrical short circuit. It should be placed near the control panel room/operation room.
- Fire bucket filled with sand: It should be placed near the diesel storage area

To ensure rapid response in case of a fire, it's essential to have a water tanker filled with water, equipped with a fire-fighting hose, readily accessible along with the portable motor. The presence of this equipped water tanker ensures timely and effective action during fire emergencies. All requirements in line with National / State regulations and as advised y the Local Brigade shall be arranged & followed

The following points to be considered for assessing the fire risk and procedure to mitigate it.

1. **Identification of Fire Hazards:** The first step involves identifying potential fire hazards in the premises. These hazards could include sources of ignition (e.g., electrical equipment), combustible materials (e.g., flammable liquids, paper, cardboard), and other factors that could contribute to the outbreak of a fire.
2. **Assessment of Risk:** Once the hazards are identified, the next step is to assess the level of risk associated with each hazard. This involves evaluating the likelihood of a fire occurring and the potential consequences if a fire were to break out.
3. **Escape Routes**: Since operational phase occurs in an open environment, the need for conventional escape routes in the event of a fire emergency may not be required.
4. **Fire Safety Measures:** The assessment reviews existing fire safety measures in place, such as fire alarms, fire fighting equipment, and fire suppression systems. Proper assembly point is required in case of fire break out
5. **Emergency Procedures:** The assessment evaluates the effectiveness of emergency procedures and evacuation plans in the event of a fire, ensuring that workers can safely evacuate the premises.
6. **Fire Training and Awareness:** The assessment considers the level of fire safety training provided to workers and the awareness of fire hazards and evacuation procedures.

Copyright © 2023 KSWMP| All rights reserved

7. **Record-Keeping:** Detailed records of the assessment process, findings, and recommended actions are maintained for future reference and regulatory compliance.
8. **Recommendations:** Based on the assessment, the fire risk assessor provides recommendations for improving fire safety, which may include installing additional fire safety equipment, conducting training programmes, or implementing any changes to reduce fire risks.
9. **Review and Updates:** Fire and risk assessments should be regularly reviewed and updated to account for any changes in the premises or regulations.

Fire and risk assessments play a crucial role in preventing fires and minimizing their impact if they occur. They are particularly important for dumpsites and other places with a higher risk of fire hazards to ensure the safety and well-being of workers.

NOTE: The major assessments had been referred based on the EMF Vol-II Part A - Indicative EMP.

## Annexure 3 – Dumpsite screening checklist

Checklist for screening of dumpsites for potential landfill/ processing facility

| Name of the contact person from ULB/ Phone number and email Address | Kalpetta |
|---|---|

| S.No. | Item | Norm | Information |
|---|---|---|---|
| 1 | Land ownership (including that required for approach road) (in line with revenue records) (supporting data to be provided as annex) | | Kalpetta Municipality |
| 2 | Name of the location of site and Map of the site (include as an annex) | | Adlaid, Kalpettaa |
| 3 | GPS coordinates of site | | Latitude: 11°35'24.276"N, Longitude 75°03'19.277"E |
| 4 | Is there a Pollution Control Board permit for dumping/SWM activity? | | Yes |
| 5 | Is there a notified no development zone or buffer or green belt around the dump? | | No |
| 6 | Possible area to be kept as buffer green belt around (within / outside the site for purchase) | | Not available |
| | Site Selection Criteria - give distances, wherever applicable | | |
| 7 | Groundwater (m below liner bottom) | 2m | No |
| 8 | Private water sources (well etc.)- distance from site boundary (to be | 100 m (river) | No |
| | | 200 m (Pond) | No |
| | | 30 m (Local Canal) | No dumpsite |

Copyright © 2023 KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| | adjudged based on approx. distances during screening exercise) | | |
| 9 | Env. Sensitive Areas/ Wetlands | Not Permitted | No |
| 10 | Site having Rare and Endangered Species | Not Permitted | No |
| 11 | Site should not be within Protected/ Reserve Forests | Not Permitted | Site is Not within the Protected/ Reserve Forests |
| 12 | Residential Development within prescribed buffer zone of 200 m | Not Permitted | No. Local Residents nearby Dumpsite within 400 m |
| 13 | Perennial Stream within site | Not Permitted | No |
| 14 | Airport | 20 Km | No |

| S.No | Item | Norm | Information |
|---|---|---|---|
| 15 | Distance to the nearest village in the predominant wind (m)direction | | Adlaid |
| 16 | Flood prone site | | No |
| 17 | Accessibility - Road access for heavy vehicles | | 5 m wide Approach road. Adlaid - Kalpetta |
| | i. Starting point of the access road | | Kalpetta |
| | ii. length and width of the access road | | 3.5 m wide |
| | iii. Current condition of the access road (visual assessment) | | Tarring Road with good condition. |

| S.No. | Site Description | | |
|---|---|---|---|
| 18 | Is the site flat/sloping to nearby uses | | Flat |
| 19 | Soil base-soft soil/murrum,soft rock etc | | Hard Laterite soil |
| 20 | Direction of Leachate flow out of the site, if any | | No. The biodegradable waste |

Copyright © 2023 KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| | | | dumping stopped since 2010 |
| 21 | Other uses within the dumpsite(recycling yard, compost pad etc) | | Existing MCF&RRF building. |
| 22 | Boundary conditions-walls/fence/what land uses along boundary | | Compound wall |
| 23 | Year since the dump site is existing | | 1970 |
| 24 | Is the dumping Operation Ongoing | | Stopped the Biodegradable waste since 2010 |
| 25 | Any underground utility/gas line etc near the site | | No |
| 26 | Existing power supply, water supply, electric poles going through/over/in the site etc. | | No |
| 27 | Are there pools of leachate ,rat and fly infestations, domestic animals roaming freely, odours,dust, vermin and birds,waste being burnt at dumpsites or families of scavangers picking through the wastes | | No |

| Geography and Climatic aspects | | | |
|---|---|---|---|
| 28 | Average annual rain fall | | 3502 mm |
| 29 | Duration of rainfall | | May to August |
| 30 | Whether any incidents of flooding reported at site/other hazards | | |
| | No | | |
| | Very Rare | | Very Rare |
| | Some times | | |
| | Frequent | | |
| 31 | Any geological fault | | No |

Copyright © 2023 KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| **Waste Characteristics** | | | |
| 32 | Characteristics of the dumps, such as the height and area, characteristics of solid waste based on visual inspection and degree of compaction (subjective), and any details of variability of wastes within the site. | | 7640 tons |
| 33 | Type of waste (MSW/HW) (subjective assessment based on visual inspection) | | MSW |
| | i. 100% MSW | | |
| | ii. 75% MSW +25% (domestic and/ or biomedical/ HW/EW) | | Yes |
| | iii. 50% MSW +50% (domestic and/ or biomedical /HW/EW) | | |
| | iv. > 50% (domestic and/ orbiomedical /HW/EW) | | |
| 34 | Expected waste contamination (visual check of ground water, littering, dust pollution, Smell/odour, Is the ground water being used for drinking purpose) | | Ground water not used for drinking |
| 35 | How much quantum of fresh waste is dumped every day? | | Stopped the dumping of waste. |
| **General Information** | | | |
| 36 | Any reported Environmental and health impacts of existing dump (from ULB eg-media report or complaint) | | NO |
| 37 | Any ongoing litigation or disputes related to site usage | | NO |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| 38 | Potential for mining decomposed organic materials (compost from the existing dumps (By visual inspection) | | NO |
| 39 | Presence of rag pickers and approx.. How many/ Male/Female and age group | | Not available as on visit time. |
| 40 | Number of sensitive receptors close to dumpsite (approx.200 m which is buffer zone criteria) (mention distance to closest residence, social profile of the people, school, religious structure, wetland, forest, river, canal, Eco sensitive area, well, lake/pond) | | Nearby Kabini river with in 2 km named as Kabini river ,Kristu raja public school within 500m. |
| 41 | Available open / clean space in the dump yard which can used to develop a treatment facility till such time the dump is cleaned, and land is recovered (percentage of land available for use) | | Yes |
| 42 | Space / covered shed (which may be renovated to house segregation & storage facility) | | No |
| 43 | Estimated time for dumpsite capping/ mining/ remediation. Does it fall within the project lifetime? | | 150 days |
| 44 | Possible Range of solutions: rehabilitate existing open dumps through landfill mining where the resource recovery might serve as a source of energy, recycle and reuse of metals, plastic and glass ware, use of compost as fertilizer for agriculture and as a cover material for future landfills, etc. | | RDF materials can be processed and used for cement kilns. |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| 45 | Is dumpsite remediation likely to benefit in regaining a suitable site for an engineered landfill cell or for setting up any other waste management facility? If yes, what could be set up? | | According to feedback from nearby residents, there is a demand for the establishment of a Recreational Park. |
| 46 | Likely area of the site which can be salvaged for future use More than 70%, 50-70%, 30-50%, Less than 30% | | 50 % . |

| | | | |
|---|---|---|---|
| **Upstream Linkages required** | | | |
| 47 | Stop the waste coming to the site or delineate a separate area for proper processing of waste. | | Dumping of waste stopped |
| 48 | Intention of anchor ULB (where the site is located) to allow the facility to be used as a regional facility, with other ULBs falling in the cluster, on a cost sharing basis. | | After thorough stakeholder consultation, the recommendation is to process the waste at a standalone site. |
| **Downstream Linkages required.** | | | |
| 49 | Off-take of all the products coming out of the biomining - Plastic & RDF - cement factories, soil/bio-earth - farmers or gardens, inert - SLF/closure | | Forward linkage for the RDF yet to be finalized |
| 50 | Any wastewater treatment facility whether available within 10 km where leachate can be transported for treatment. | | No |

## Annexure 4 - Occupational Health and Safety

Occupational Health and Safety Risk Assessment for Dumpsite Remediation is as follows

**1. Introduction:**

The purpose of this Occupational Health and Safety (OHS) Risk Assessment is to identify, assess, and mitigate potential hazards and risks associated with the implementation of a Biomining project for dumpsite remediation. Biomining is a sustainable and environmentally friendly method used for the disposal of dumped waste and reclamation of land.

**2. Scope:**

This risk assessment focuses on the occupational health and safety aspects of the Biomining process for dumpsite remediation. It covers the potential hazards and risks that workers may encounter during site preparation, Biomining operations, and waste disposal activities. The assessment will also outline control measures to minimize or eliminate these risks.

**3. Hazard Identification:**

Biomining process identifies potential hazards, which include but are not limited to:

a. Chemical Hazards: Exposure to hazardous chemicals present in the dumpsite waste and chemicals used in the Biomining process.

b. Biological Hazards: Potential health risks associated with the presence of pathogens, disease-causing microorganisms, and vectors within the waste. These hazards can arise from the decomposition of organic matter, the presence of infectious materials, and the attraction of disease-carrying organisms such as rodents, insects, and other vermin.

c. Physical Hazards: Potential for slips, trips, and falls on uneven terrain or during equipment operation.

d. Mechanical Hazards: Risks associated with operating and maintaining heavy machinery.

e. Ergonomic Hazards: Strain and injuries related to improper handling of equipment or materials.

f. Environmental Hazards: Adverse effects on air and water quality during the Biomining process.

**4. Risk Assessment:** The risk assessment will categorize the identified hazards based on their severity and likelihood of occurrence. Each hazard will be evaluated using a risk matrix to determine the level of risk and priority for mitigation.

**5. Risk Mitigation Measures:**

Copyright © 2023. KSWMP| All rights reserved

To ensure the safety of personnel involved in the Biomining project, the following risk mitigation measures will be implemented:

a. Engineering Controls:

- Regular maintenance and inspection of machinery to prevent mechanical failures.

- Providing appropriate personal protective equipment (PPE) to workers.

b. Administrative Controls:

- Developing standard operating procedures (SOPs) for Biomining operations.

- Implementing a comprehensive training program for all personnel involved in the project.

- Scheduling regular breaks and rotation of tasks to minimize fatigue.

c. Environmental Monitoring:

- Regular monitoring of air and water quality to ensure compliance with safety standards.

- Establishing emergency response protocols in case of any unexpected environmental events.

d. Emergency Preparedness:

- Developing and practicing emergency response plans for potential accidents or incidents.

- Providing workers with first-aid training and easily accessible medical facilities.

e. Personal Protective Equipment (PPE):

- Mandating the use of appropriate PPE, such as respirators, gloves, safety goggles, and protective clothing.

**6. Worker Health Surveillance:**

Implementing a health surveillance program to regularly monitor the health of workers involved in the Biomining project. This may include medical examinations and assessments to detect any health issues related to exposure during the remediation process.

The work site to be equipped with first aid and the contractor must have tie-up with nearest primary health center/ medical facility for the welfare of the labors.

**7. Training and Education:**

Conducting comprehensive training and educational programs for workers and supervisors to raise awareness of potential hazards, proper handling of equipment, and the correct use of PPE.

Copyright © 2023. KSWMP| All rights reserved

## 8. Conclusion:

By proactively identifying potential hazards, assessing risks, and implementing appropriate control measures, this Occupational Health and Safety Risk Assessment aims to ensure the safe and successful execution of the dumpsite remediation Project through Biomining. Continuous monitoring and improvement will be essential throughout the project to maintain a safe work environment.

## EXECUTIVE SUMMARY

Kalpetta is a Municipality in Wayanad District, of Kerala State. Even though the ULB has an excellent practice of waste management, the primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing waste dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. As a consequence, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate it in order to ensure a safe and healthy environment. In acknowledgment of this imperative, the Government of Kerala has undertaken the endeavor through the Kerala State Solid Waste Management Project (KSWMP) to address the issue of remediating legacy waste dumpsites across all Urban Local Bodies (ULBs). As a component of the project's first phase, the remediation of the existing dumpsite located in Adlayed, Kalpetta, has been proposed.

The Kalpetta municipality has an area of 40.74 sq.km with 28 wards. The municipality intend to remediate the existing legacy waste dumpsite at Adlayed and recovery land for development of waste management activities. The Adlayed dumpsite is used for dumping of solid waste from the year 1989 to year 2010. The dumping of the solid waste was stopped due to protest from the local residents for addressing the issues of the problems created by odour and leachate from dumpsite and local residents are in demand to remediate the legacy dumpsite and to utilize the remediated land for social cause. The total quantity of legacy waste is estimated to be approximately 7227.86 Tons. Since the cessation of dumping activities in 2010. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes.

To assess the quantity & composition of the legacy waste & also evaluate the environmental baseline of the dumpsite, the samples from the strategic locations were collected and analyzed for various parameters viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Ground Water and Surface Water. As part of the study, detailed site investigations were carried out as follows – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Chemical, Environmental Analysis by M/s Poluchem Laboratories. From the results of the investigations, it was found that the waste was found to a depth of 3 m. The total estimated quantity of legacy waste was found to be around 9485.375 m3 (7227.86 T)

As per the SWM Rules 2016, selection of the applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out and based on the results, remediation can be done by a) Capping without land recovery, b) Bio-mining – reclamation/recovery of land c) capping with partial land recovery. The selection of technology shall also depend on the available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for optimum land recovery and forward linkages/utilization of processed aggregates/by-products. Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term

Copyright © 2023. KSWMP | All rights reserved.

sustainability and environmentally sound treatment of legacy waste and optimum land recovery/remediation legacy waste dumpsite.

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, mobile/compact screening is the machineries are which shall be the optimum screening machineries for processing the stabilized legacy waste of 9485.375 m3 within the stipulated timeline of 31st March 2024 by NGT for remediation of legacy waste dumpsite.

Environmental & Social safeguards: The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project is categorized as possessing a moderate level of social risk, as determined through social mapping and a transect walk. This involves engaging with the local community residing near the prospective project site to evaluate the challenges posed by the existing legacy waste dumpsite and the potential ramifications during the project's implementation.

By-products utilization/forward linkages/Usage

The bio earth & inerts quantity 4742.69 m3 & 2181.64 m3 and waste will be utilized for development of the reclaimed legacy waste dumpsite as recreational park/facility.

Refused derived fuel (RDF) of 2224.32 m3 will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the processes

Recyclables of 336.73 m3 will be sold to authorized recyclers and will be collected from the dumpsite.

The activities of the bio-mining will be commenced from the Dec 2023 and end by Mar 2024. An expanse of 1.12 Acre is designated for reclamation, aiming to transform it into a facility like potential public-access green park etc., The project is projected to incur a total expenditure of [redacted]/-. The expense linked to the processing and disposal of legacy waste per cubic meter amounts to [redacted]**/-.**

## 1. INTRODUCTION

Kalpetta Municipality stands as a swiftly advancing urban local body within the Wayanad district. While demonstrating commendable waste management practices, the principal environmental concern confronting the municipal authorities pertains to an enduring legacy waste dumpsite. Despite ceasing waste disposal operations, these residual dumpsites persist from an era when waste disposal practices were less sophisticated and ecologically attuned compared to the present standards. Consequently, these sites present substantial environmental, societal, and economic complexities for the neighboring communities and ecosystems.

As the SWM Rules 2016, all local bodies to identify the legacy dumpsites and to scientifically remediate it in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project of remediation of legacy waste dumpsites in all the ULBs. As part of the project, in phase -1 the existing dumpsite of Adlayed, Kalpetta is proposed to be remediated.

The legacy waste dumpsite remediation needs to be arrived from the feasibility study outlining the technical, economic, and social factors which will have implication of the process of remediation of legacy waste dumpsite. Based on the detailed field investigations & assessment and market sounding, the method proposed for remediation of legacy waste dumpsite will ensure long term sustainability and environmentally sound treatment which will be technically feasible, economically viable, and socially acceptable. `

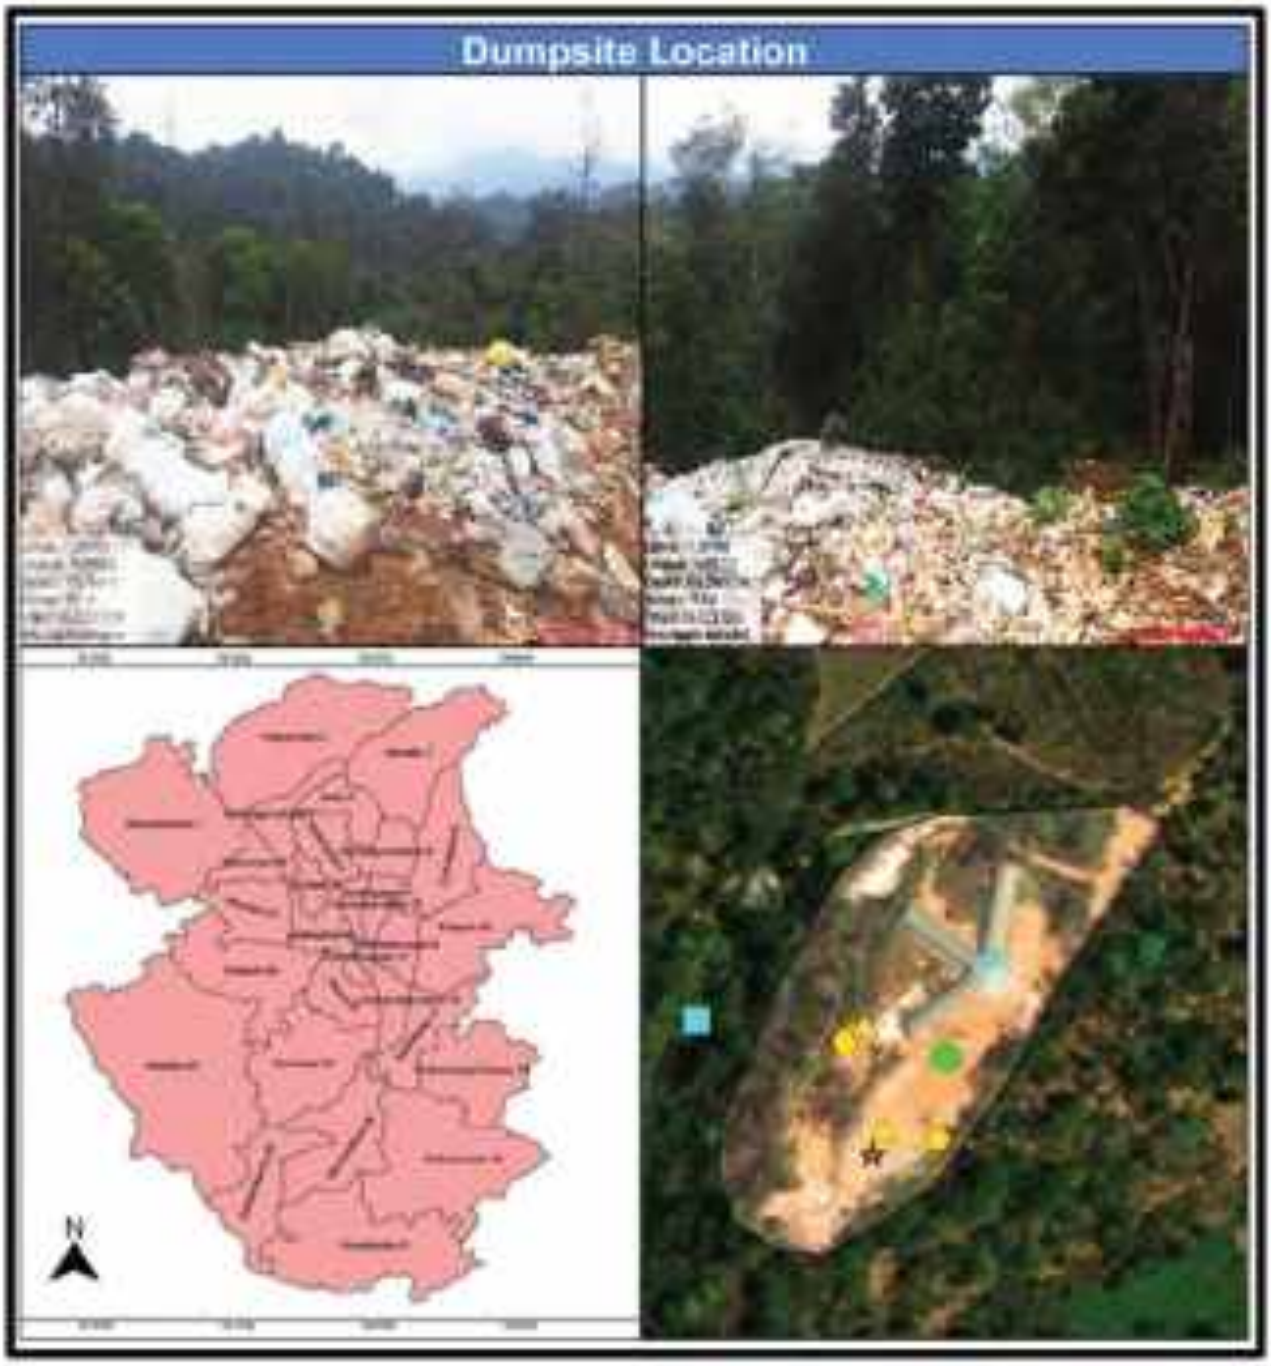
## 2. GENERAL DESCRIPTION ABOUT PROJECT



The Kalpetta municipality has an area of 40.74 sq.km with 28 wards. Solid waste generated from 9216 households and 2492 institutions including commercial establishments. The municipality intend to strengthen and enhance the existing treatment facilities of the bio degradable & non – degradable waste system at household, institutional and community level for effective management of the solid waste generated and also remediation of existing legacy waste dumpsite.

The Adlayed dumpsite was used for dumping of solid waste from the year 1989 to 2010. The dumpsite is closed due to public protest. The legacy waste is spread in an area of 1.12 acres with approximate height of 3 m and a portion of the dumpsite is capped as part of the remediation. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. The municipality intend to remediate the existing legacy waste dumpsite at Adlayed, Kalpetta and recovery land for development of recreational park for the public. The details of the legacy waste dumpsite are provided below:

*Table 1 Dumpsite Details*

| Name of ULB | Kalpetta |
|---|---|
| District | Wayanad |
| Taluk | Kalpetta |
| Location | Adlayed, Kalpetta - ward 23 |
| GPS Co-ordinate of the Site | Latitude: 11°35'24.3"N and Longitude: 76°03'19.2"E |
| Total dumpsite area (in acres) | 3.65 |
| Legacy waste spread (in acres) | 1.12 |

## 3. LOCATION, DEMOGRAPHY, ACCESS, LAND-USE, WATER TABLE AND CLIMATE OF THE ULB

### 3.1 LOCATION

Kalpetta is a major town and municipality in the Wayanad district. Kalpetta is the headquarters of Wayanad district as well as the headquarters of Vythiri taluk. It is a bustling town surrounded by dense coffee and tea plantations and mountains. It lies on the Kozhikode-Mysore National Highway NH 766 at an altitude of about 780 m above sea level.

The Kalpetta municipality has a total area of 40.74 Sq. km. The land use indices of Kalpetta municipality are shown in below figure

Copyright © 2023 KSWMP | All rights reserved.

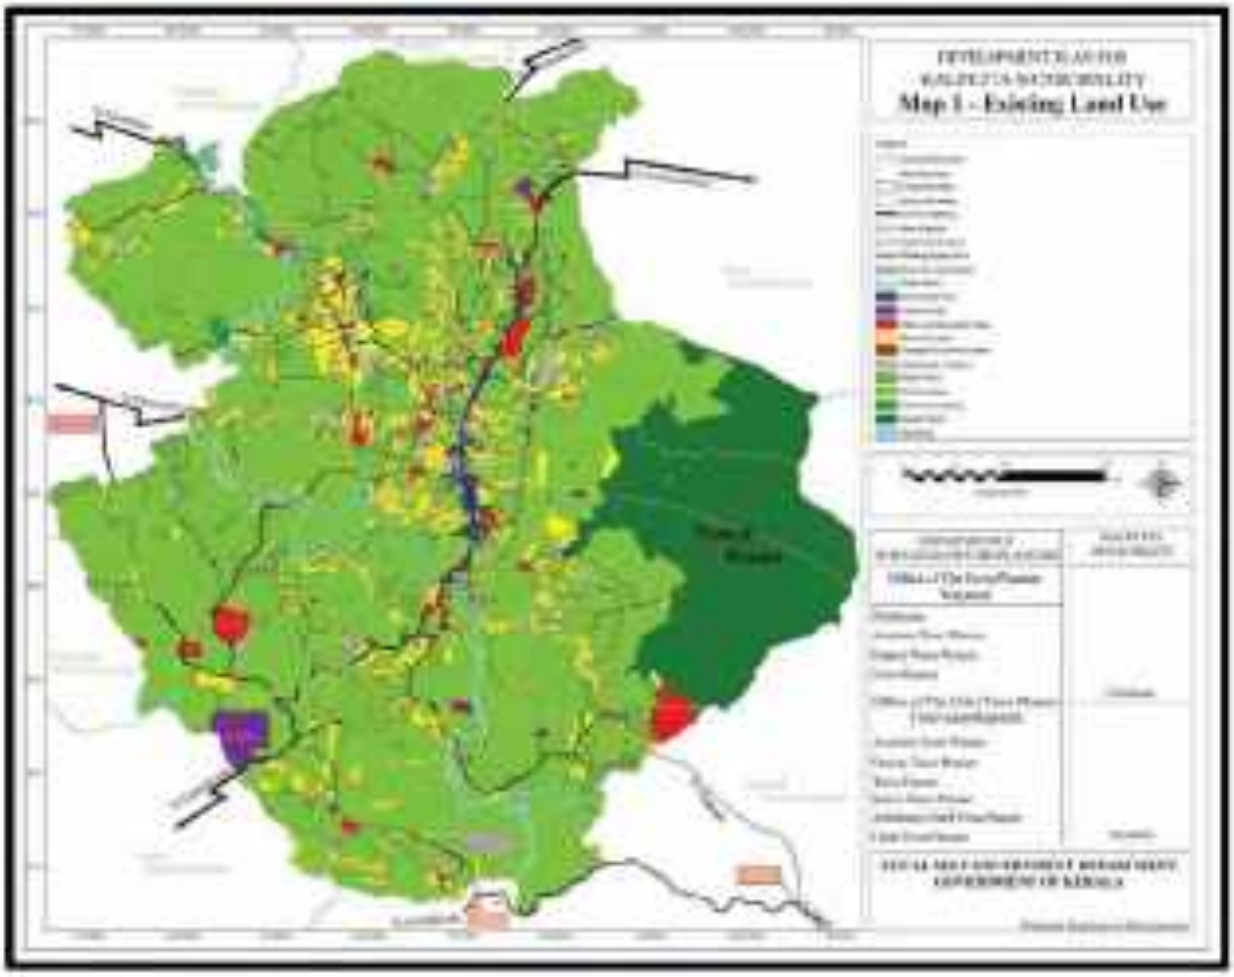

*Figure 4 Land Use Map of Kalpetta Town*

### 3.2 POPULATION, DENSITY AND LITERACY RATE

As of the 2011 Census of India Kalpetta had a population of 31580, with males constituting 15401 of the population and females 16179. The sex ratio is 1051 females for 1000 males. The gross density of population as per 2011 census is 780 persons/sq. km. Kalpetta has an average literacy rate of 91.18%, higher than the national average of 74.04%; male literacy is 94.13%, and female literacy is 88.40%. The population of children below 6 years is 3597.

Copyright © 2023 KSWMP | All rights reserved.

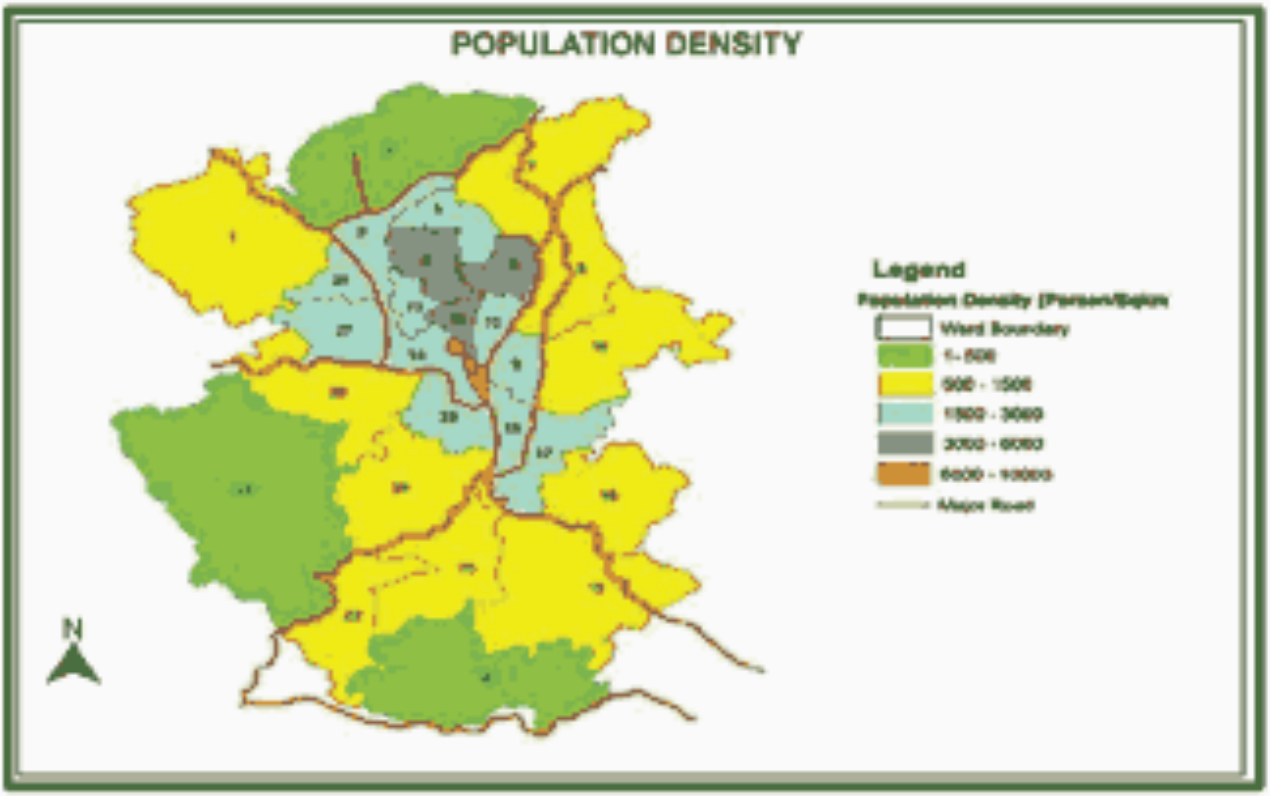

*Figure 5 Ward Wise Population Density (Person/ha)*

### 3.3 LAND USE

The Kalpetta municipality has a total area of 40.74 Sq. km. The land use indices of Kalpetta municipality are shown in below figure. The study area's land use has been assessed through satellite data interpretation and confirmed during on-site visits. The primary findings regarding the Kalpetta Dumpsite from this analysis are as follows:

1. The predominant land use in the area is residential.

2. There is a nearby Fecal Sludge Treatment plant located approximately 120 meters away.

3. A Concrete Batching Plant is situated at an approximate distance of 300 meters.

4.Swamp is located near 350 m from dumpsite.

The land use indices of Kalpetta municipality are shown in below figure.

Table 2 Land use indices

| Description | Area (in sq.km.) | Land Use % |
|---|---|---|
| Residential | 7.4 | 18.2% |
| Commercial | 0.5 | 1.2% |
| Agricultural | 23.4 | 57.6% |
| Recreational, open space | 0.1 | 0.1% |

Copyright © 2023. KSWMP | All rights reserved.

| Description | Area (in sq.km.) | Land Use % |
|---|---|---|
| Transportation | 0.8 | 2.0% |
| Water bodies | 0.9 | 2.1% |
| Forest | 6.2 | 15.2% |
| Revenue Surplus land | 1.0 | 2.4% |
| Other Vacant land | 0.1 | 0.2% |
| Other (specify)- Industries | 0.4 | 0.9% |
| Total | 40.80 | 100 |

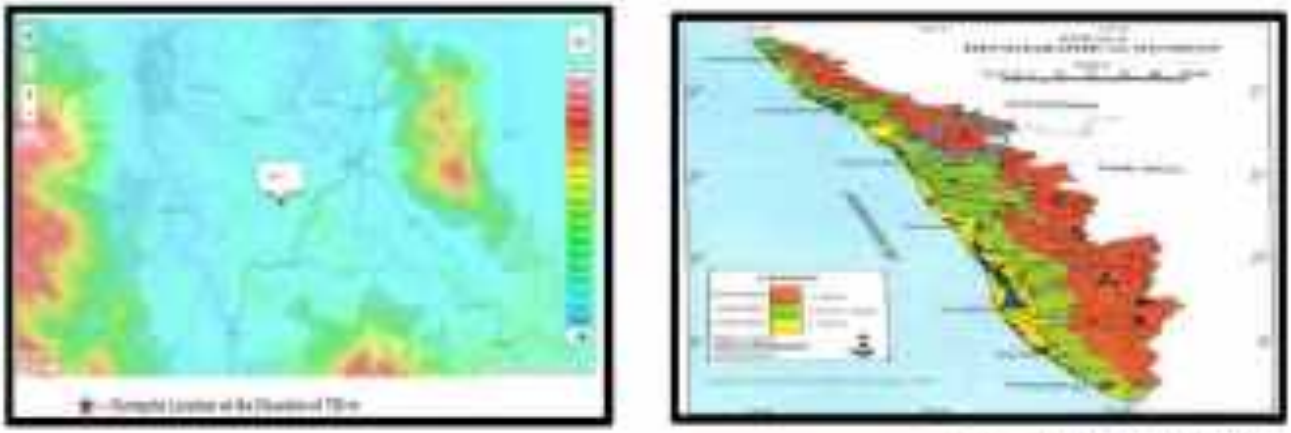
### 3.4 TRANSPORTATION CORRIDOR

*Table 3 Transportation corridor details*

| Mode | Details |
|---|---|
| Road | Kalpetta has very good road connectivity with the rest of Kerala and neighbouring South Indian cities. NH766 connects Kalpetta with Kozhikode and Mysore. State Highways connect Kalpetta with Ooty in Tamil Nadu and Madikeri in Karnataka. En route to Mysore on NH 766, past Wayanad district boundary, NH 766 passes through Bandipur National Park. |
| Train | No railway station in Kalpetta municipality. The nearest major railway stations are Kozhikode (72Km) and Vadakara (83 Km). |



Copyright © 2023. KSWMP | All rights reserved.

| Mode | Details |
|---|---|
| Air | The nearest airport is Calicut International Airport 00 km and Kannur international airport is 95 km from Kalpetta. |

NOTE : The access road leading to the dumpsite, known as Puzhamudy-Adlayed road, measures 5 meters in width. The link from the Puzhamudy-Adlayed Road to the dumpsite is crucial, but it presents a significant challenge as it is quite narrow, with widths dropping below 3 meters in certain sections. This limited width poses a concern for fire rescue vehicles, and it also makes it impractical for larger vehicles such as the Mobile trommel and other heavy vehicles to reach the dumpsite via this narrow road

### 3.5 TOPOGRAPHY

Majority of the land area in Kalpetta is highland. The elevation of Kalpetta Municipality is ranges between 700m to 2000m. The type of land in this area can be classified as predominantly mountainous terrain with undulating hills and valleys. The region is covered with dense forests, tea and coffee plantations, paddy fields, and other agricultural lands. The soil in this area is rich in minerals and organic matter, making it suitable for growing a variety of crops.

*Figure 8 Topography Map for the Kalpetta*

### 3.6 CLIMATIC CONDITION

#### 3.6.1 TEMPERATURE & RAINFALL

Kalpetta Municipality falls within the tropical to sub- tropical climatic region and dominant feature is the monsoon. The maximum temperature in the region varies almost between 24.4°C to 30.4°C and minimum temperature ranges from 16.7°C to 20.8°C. The annual rain fall is 2904mm.

*Table 4 Temperature & Rainfall Data - Kalpetta*

| Month | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Average high °C | 27.2 | 28.8 | 30.4 | 30.4 | 29.4 | 25.9 | 24.4 | 25.1 | 26 | 26.6 | 26.5 | 26.5 |

Copyright © 2023 KSWMP | All rights reserved.

| | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Average low °C | 16.7 | 17.9 | 19.5 | 20.8 | 20.8 | 19.7 | 19.3 | 19.4 | 19.2 | 19.4 | 18.6 | 17 |
| Average precipitation mm | 4 | 10 | 19 | 99 | 210 | 664 | 1229 | 637 | 275 | 239 | 92 | 18 |

Source: Climate-Data.org

According to the Rainfall Data, the most favourable working period spans from December to March due to the lower precipitation levels.

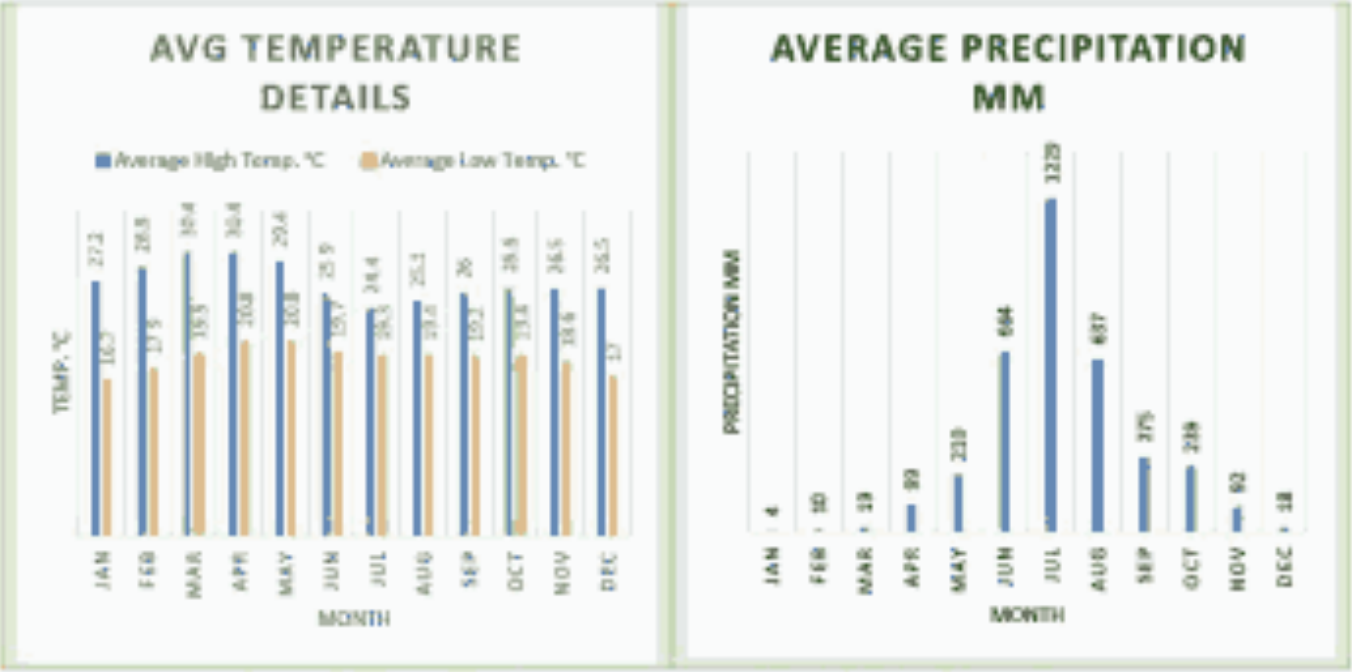

*Figure 9 Monthly Variation of Climate and Rainfall for Kalpetta Town*

### 3.7 FLOOD ZONE

According to the 2022 Flood Probability Report published by the Kerala State Disaster Management Authority, the Kalpetta municipality has an area of 0.31 square kilometers (1.85% of the total area of 16.76 square kilometers) that is susceptible to flooding, with a peak elevation of 1.48 meters.

*Table 5 Flood zone details*

| DESCRIPTION | BASE YEAR | 1 in 10 YEAR (CC - RCP 8.5) | | 1 in 25 YEAR (CC - RCP 8.5) | | 1 in 50 YEAR (CC - RCP 8.5) | | 1 in 100 YEAR (CC - RCP 8.5) | |
|---|---|---|---|---|---|---|---|---|---|
| [illegible] | 2011 | Flood Inundation Area ($km^2$) | Max. Flood Level (m) | Flood Inundation Area( $km^2$) | Max. Flood Level (m) | Flood Inundation Area( $km^2$) | Max. Flood Level (m) | Flood Inundation Area( $km^2$) | Max. Flood Level (m) |
| | | 1.27 | 3.94 | 1.28 | 1.61 | 1.29 | 4.13 | 1.31 | 4.13 |

Source: *Flood Probability Report - KSDMA*

### 3.8 EARTHQUAKE ZONE

The Bureau of Indian Standards (BIS) has grouped the country into four seismic zones viz. zones II, III, IV and V as detailed in the Map below. The Kerala state falls under Seismic Zone 3.

### 3.9 COASTAL REGULATION ZONE

As per the Coastal Regulation Zone (CRZ) notification 2011 and further amendment in CRZ notification 2019, the Kalpetta legacy dumpsite does not fall under the CRZ zone.

### 3.10 GROUND WATER LEVEL

The details of groundwater level during pre-monsoon and post-monsoon, and the average fluctuation is provided in the table below.

*Table 6 Details of Ground Water level*

| Pre-monsoon (m) | Post-monsoon (m) | Avg. Fluctuation (m) |
|---|---|---|
| [illegible] | 6.31 | 1.37 |

## 4. DETAILED DESCRIPTION OF THE DUMPSITE

### 4.1 PHYSICAL FEATURE OF THE SITE

The total expanse of the dumpsite measures approximately 3.65 acres, with a portion of 1.12 acres being occupied by legacy waste. The average elevation of this legacy dumpsite is 5 meters (as per total station survey). This historical waste repository is situated at geographical coordinates Lat: 11° 35'24.276" N, Long: 76°03'19.277" E in the region known as Adlayed (ward-23), within the Kalpetta district of Wayanad.

### 4.2 INFORMATION ON SITE MANAGEMENT

The Adlayed dumpsite has served as a repository for solid waste disposal from 1989 to 2018, spanning a period of over 40 years. This site is closed in 2010. The compound wall is available at front side of dumpsite only.

To mitigate any potential disruption to the workforce in close proximity to the MCF/RRF facility, a dedicated access point has been established for entry to the biomining worksite.

*Figure 10 Proposed New Entry for the Biomining Site*

Copyright © 2025 | All rights reserved

### 4.3 SITE HISTORY INCLUDING PUBLIC PROTEST

In 2009, a protest emerged in response to the disposal of human excreta at a designated dumpsite. Up to 2000 the waste was dumped near to the NH at Vellaramkunnu. Due to public agitation waste transferred to the current land parcel. After the great flood 2018, enormous quantity of waste also dumped in this place. Rather than proper capping for the sake of concealing waste from view and to abate odour spread ULB used to lay a layer of soil intermittently.

### 4.4 DIRECTIONS FROM AUTHORITIES LIKE NGT, PCB, ETC.

#### 4.4.1 NGT DIRECTIONS & ORDERS

The National Green Tribunal (NGT) has set norms and guidelines (O.A. No. 606/2018) to address legacy waste accumulated at long-operating dumpsites, to mitigate environmental and health hazards. The norms focus on closure and remediation of dumpsites, waste segregation and treatment using appropriate technologies, conducting Environmental Impact Assessments (EIAs), implementing land use planning and zoning regulations, monitoring and compliance measures, and promoting public participation and awareness regarding legacy waste management. These guidelines aim to stabilize dumpsites, prevent further pollution, and involve communities in decision-making and risk education.

#### 4.4.2 LOCAL SELF GOVERNMENT DEPARTMENT - GUIDELINES

The remediation of dumpsites is further directed by Honorable NGT in its order OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. Remediation of Legacy Waste Dumpsites through Bioremediation - G.O.(Rt)No.2629/2022/LSGD Dated, Thiruvananthapuram, 29-10- 2022

#### 4.4.3 KSPCB - GUIDELINES FOR DUMPSITE REMEDIATION

The Kerala State Pollution Control Board (KSPCB) has established guidelines (PCB/HO/SEE2/Model City/Kozhikode corporation/2019 dated 09/09/2021) for dumpsite remediation to address the environmental and health impacts of waste disposal. The recommended steps include conducting a site assessment, developing a remediation plan based on risk assessment, selecting appropriate remediation technologies, implementing remediation activities under supervision, verifying the success of remediation, and ensuring long-term management and monitoring of the site. By following these guidelines, the KSPCB aims to mitigate the adverse effects of waste disposal, protect the environment, and safeguard public health.

#### 4.4.4 CPCB GUIDELINES

Hon'ble NGT warned that due to incremental growth of Municipal Solid Waste (MSW), these MSW dumps are converting into virtual mountains. Hon'ble NGT further directed that every city/town should adhere to clause 'J' of Schedule–I (capping is not the first option for environmentally safe legacy waste management) of SWM Rules, 2016. Finally, Hon'ble NGT directed CPCB to propose Standard Operating Procedure (SOP) for implementation of Bio-mining and Bioremediation of legacy solid waste.

#### 4.4.5 SWACHH BHARAT MISSION (SBM) ADVISORY

Copyright © 2023. KSWMP | All rights reserved.

The advisory on dumpsite bioremediation addresses the challenges of legacy waste and promotes sustainable waste management practices and emphasizes the importance of dumpsite bioremediation as a sustainable solution for managing legacy waste. By adopting these guidelines, municipalities can address the environmental and health risks associated with dumpsites and promote a cleaner and healthier living environment for communities.

### 4.4.6 CENTRAL PUBLIC HEALTH AND ENVIRONMENTAL ENGINEERING ORGANIZATION (CPHEEO) GUIDELINES

The guidelines aim to provide a comprehensive approach to remediate dumpsites in a safe and environmentally sustainable manner. Key points from the guidelines include conducting site assessments, segregating waste, and implementing engineering and biological measures to control contamination, treating leachate to prevent groundwater contamination, and conducting post-remediation monitoring. These guidelines are crucial to ensure effective and environmentally sound dumpsite remediation that protects public health and the environment.

# 5 SCOPE OF WORK

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Kalpetta includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (Optimum land recovery – Biomining, Capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the ESMF of World Bank.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Sensitive mapping, Baseline assessment, impact & risk assessment, mitigations measures and Environmental Management & monitoring plan.
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport, Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 OBJECTIVES:

- To remediate the legacy waste of approximately 7227.86 Tons by 31st March 2024.
- To reclaim area i.e., 1.12 acres and to develop waste management activities, thereby eliminating the chances of dump fires, leachate generation, and foul odor.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.

Copyright © 2023. KSWMP | All rights reserved.

# 6 COMPOSITION, CHARACTERISTICS OF LEGACY WASTE AND ITS IMPACTS

## 6.1 DETAILED INVESTIGATION STRATEGY

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below;

- ✓ Bore hole upto a depth of 7.5 m and collection of 3 (nos) samples from the soil at interval of 1.5 m
- ✓ Waste analysis viz., leachate sample from 1 (nos) locations and physical analysis from 2 (nos) location, and chemical analysis from 1 (nos) location.
- ✓ Environmental baseline analysis surface water 1 (nos) location and ground water samples from 3 (nos) location (Well Water Samples -1 up gradient, 2 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location

## 6.2 DETAILED INVESTIGATIONS

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

*Table 7 Investigation details*

| S.No | Parameters | Sampling Nos. |
|---|---|---|
| I | Geotechnical Investigation | |
| A | Boreholes up to 10m depth (as per CPHEEO Manual) | 1 |
| B | Permeability test- (as per CPHEEO Manual) standard penetration test SPT and collection of undisturbed samples - Soil Investigation - Classification, gradation, Atterberg's limit, Bulk density, dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, strength, compressibility (vertically-3 samples per borehole) | 1 |
| 2 | Waste & Environmental Analysis | |
| A | Leachate Analysis (TCLP usepa 1311) (SCHEDULE II of SWM rules, 2016), Suspended solids, Dissolved solids (inorganic),pH, Ammonical nitrogen (as N), Total Kjeldahl nitrogen (as N), BOD, COD, Arsenic (as As), Mercury, Lead, Cadmium, Copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds | 1 |
| B | Physical Analysis of waste (As per CPHEEO manual) including Density, Bulk Density, Moisture Content, Size of waste Constituents, Calorific Value | 2 |
| C | Chemical Analysis of waste/soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), total Carbon, C/N ratio, calorific value, Bio-chemical - biodegradable factor | 1 |
| D | Ground Water (Well Water Samples -1 up gradient, 2 down gradient) - (shallow and deep wells): pH, Colour, EC, Turbidity, SS, TDS, TOC, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, | 3 |

Copyright © 2023 KSWMP | All rights reserved

| S.No | Parameters | Sampling Nos. |
|---|---|---|
| | TKN, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total Coliforms (IS 10500 – 2012) | |
| E | Surface Water (pH, Colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, TKN, Total Alkalinity, Total hardness, Ecoli and Total Coliforms (IS 10500 – 2012) | 1 |
| F | Ambient Air Quality (Sulphur Dioxide (So2), Nitrogen Dioxide (No2), Particulate Matter 2.5, Particulate Matter 10, Ozone (O3), Lead (Pb), Carbon Monoxide (CO), Ammonia (NH3), Benzene (C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise Level (E(p)Rules) for 24 hours | 1 |

## 6.3 METHODOLOGY OF SAMPLING

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed sampling methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat./Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

*Table 8 Details of sampling location*

| S.No | Description | Sampling location | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Within the dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind-rose data the air sampling location fixed at two locations |
| | | Dumpsite entry point | |
| 2 | Noise (1 Location) | Within the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite [stream] | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope. This steep slope on southeast direction possesses a potential risk of leachate runoff, which could result in the contamination of surface water on that particular side of the site. So, the location of surface water is taken on the southeast direction. |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope (SE). The infiltration of leachate which could result in the contamination of ground water. |

Copyright © 2023 KSWMP | All rights reserved.

| S.No | Description | Sampling location | Justification |
|---|---|---|---|
| | | | Based on the possible infiltration and slope direction, two ground water samples are collected in the east direction and one of the west direction |
| 5 | Bore Hole (1 Location) | Within the dumpsite area | Not Applicable |
| 6 | Legacy Waste | Within the dumpsite area | Not Applicable |

*Table 9 Direction and Distance of the sampling location*

| S.No. | Description | Direction | From the Centre of Dumpsite (m) | From the nearest Boundary (m) |
|---|---|---|---|---|
| 1 | Surface Water | North | 350 | 95 |
| 2 | Ground water-1 | East | 415 | 308 |
| 3 | Ground water-2 | North | 108 | 40 |
| 4 | Ground water-3 | East | 575 | 460 |
| Note: Air and Noise Monitoring are monitored inside the dumpsite | | | | |

*Table 10 Quantity of sampling & location*

| S. No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 11 °35'25.572" E -76°03'18.707"<br>Location -2: N- 11 °35'24.126" E -76°03'20.07" |
| 2 | Surface Water | 1.5 Litres | Location -1:N- 11 °35'25.876" E -76°03'16.589" |
| 3 | Ground Water | 1.5 litres | Location -1:N- 11 °35'28.428" E -76°03'18.347"<br>Location -2:N- 11 °35'33.228" E -76°03'29.7"<br>Location -3:N- 11 °35'38.31" E -76°03'32.099" |
| 4 | Leachate | 1.5 litres | Location -1: N- 11 °35'23.91"E -76°03'19.098" |
| 5 | Ambient Air Quality | 2 Nos | Location -1:N- 11 °35'24.276"E -76°03'19.277"<br>Location -2:N- 11 °35'25.777"E -76°03'19.007" |

*Figure 11 Sampling Locations – Borehole & legacy waste sample*

### 6.4 ANALYSIS AND INTERPRETATION OF EXPLORATORY DATA

As part of the feasibility study, Technical Support Consultants (IPE Global Ltd) has entrusted the geotechnical investigation & Environmental baseline assessment to M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Polluchem Laboratories (P) Ltd respectively.

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 05th June 2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 23th June 2023 and was completed on 26th June 2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 14th June 2023 by M/s Polluchem Laboratories (P) Ltd. The lab analysis reports were submitted by the investigation agencies to TSC. The lab analysis reports are provided in Annexures – A & B

#### 6.4.1 GEOTECHNICAL EXPLORATORY DETAILS

For assessing the depth of legacy waste and contamination of the soil below the legacy waste, bore hole samples were collected using rotary drill. The exploratory data of the bore hole revealed a maximum depth of 3.0 m for waste and 4.5 m for the soil. Lateritic rock was encountered below the soil stratum. The Geotechnical investigation was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. The details of the exploratory data of the bore hole is provided below.

Copyright © 2023 KSWMP | All rights reserved.

*Table 11 Exploratory Data of Bore Log*

| S. No | Borehole location | Total Depth of the Borehole (m) | Depth of Soil (m) | Depth of Legacy Waste (m) | Remarks |
|---|---|---|---|---|---|
| 1 | N- 11°35'38.062"<br>E-75°36'20.735" | 7.5 | 4.5 | 3 | Lab Analysis Report provided in Annexure A |
| Note: Bore hole terminated at the depth of 4.5 m below ground level due to Laterite rock. | | | | | |

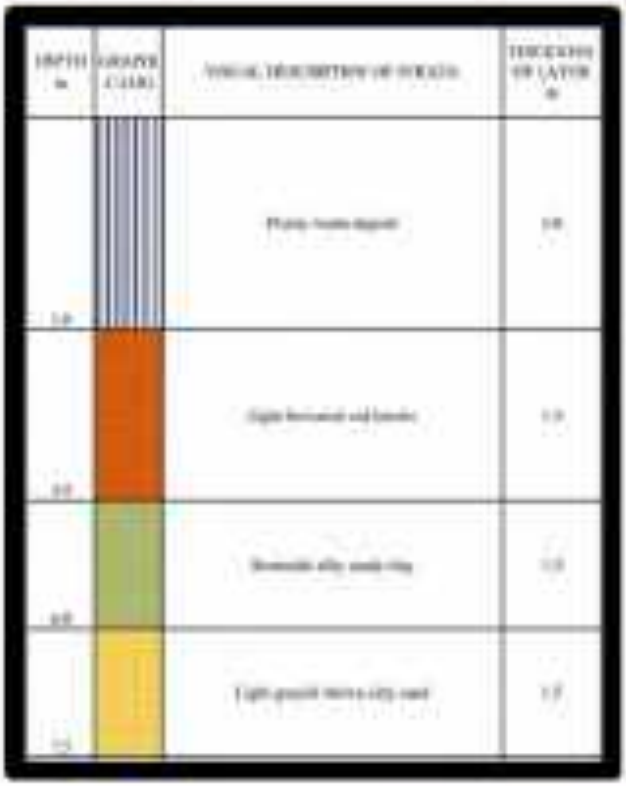

*Figure: SEQ Figure * ARABIC 12 Soil Profile & Geotechnical Investigation*

### 6.4.2 ESTIMATED TOTAL QUANTITY OF WASTE

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). The details of the estimated total quantity of waste is provided below:

*Table 12 Quantity of waste below & above ground level*

| Level | Volume of Legacy Waste ($m^3$) | Density of Waste ($t/m^3$) | Total Quantity of Waste (T) | Remark |
|---|---|---|---|---|
| Below & Above | 9485.375 | 0.762 | 7227.86 | *As per the Contour Survey Report by ULB |

*Table 13 Estimated total quantity of waste*

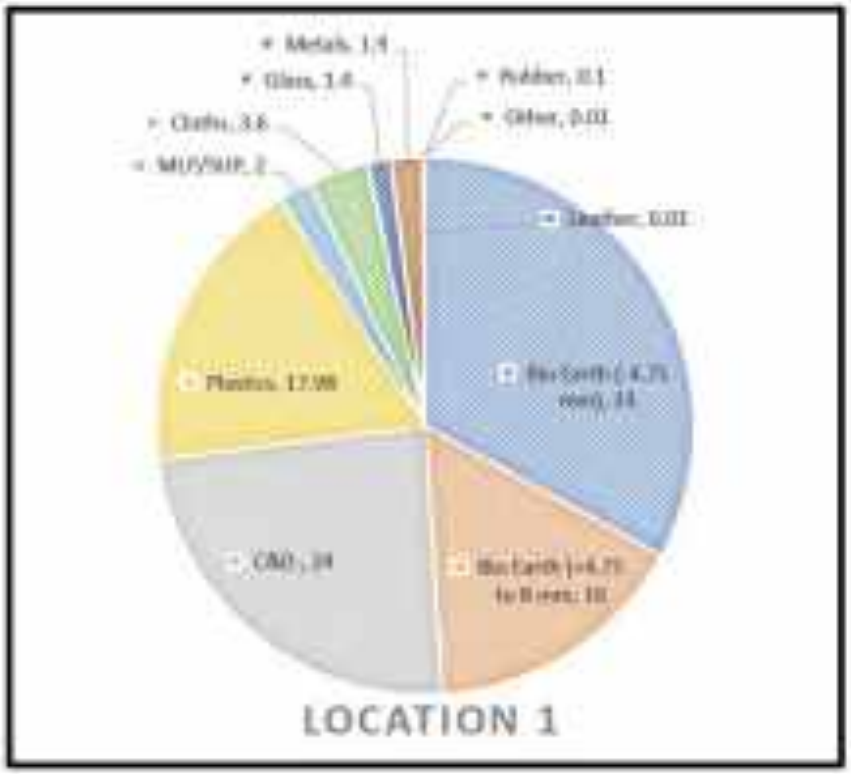
| Estimated total quantity of waste | |
|---|---|
| Total Quantity of Legacy Waste ($m^3$) | 9485.375 |
| Total Quantity of Legacy Waste (T) | 7227.86 |
| Total Quantity of Legacy Waste (T) Approximately | 7223 |

Copyright © 2023. KSWMP | All rights reserved.

### 6.4.3 LEGACY WASTE CHARACTERIZATION

The characteristics of the legacy waste were assessed by collecting 2 samples of 25 kg from 2 (nos) locations within the dumpsite. The legacy waste samples were collected on 14th June 2023 by M/s Polluchem Laboratories (P) Ltd. The assessment of waste characteristics was done based on the results of the analysis. The details of the characteristics viz., composition, physical & chemical characteristics, heavy metals, and estimated quantity of by-products are provided in the tables below:

| S.No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 11°35'25.572" E -76°03'18.707"<br>Location -2: N- 11°35'24.126" E -76°03'20.07" |



**Physical Composition:**

| Quantity (cu.m) | 4742.69 | 2181.64 | 2224.32 | 336.73 |

### 6.4.4 ENVIRONMENTAL BASELINE

The environmental baseline was assessed from the analytical results of air, surface &groundwater, noise and leachate from the location as mentioned in the section 6.3. The samples were collected on 14th June 2023 by M/s Polluchem Laboratories (P) Ltd. The Environmental baseline was analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the tables below:

**Surface Water Analysis:**

*Table 19 Surface water Analysis*

| Parameters | Test method | Result | Limit as per IS-2296 | |
|---|---|---|---|---|
| | | | Class A | Class C |
| pH | IS 3025 (P) 11 – 1983RA2017 | 5.91 | 6.5 – 8.5 | 6.0-9.0 |

# 7 EVALUATION OF REMEDIATION TECHNIQUES

Although the term "legacy waste" has not been defined in any official government document in India, it typically refers to aged municipal solid waste in landfills or dumpsites. These legacy dumpsites are creating various irreversible environmental/health/livelihood hazards. The major sources of pollution are:

- ✓ Puddles of leachate flowing through the adjacent area and reaching the water table long-term issues of greenhouse gas emissions
- ✓ Surface water and groundwater pollution due to erosion and seepage
- ✓ Dumpsite fires
- ✓ Due to the faster urban development and increased waste generation per capita and mismanagement of generated waste.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

**Remediation of legacy waste dumpsite**

Remediation is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

1. Uplift of the environment- reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.
2. Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
3. Land - Dumpsite land becomes available for public use or for setting up SWM facility on the reclaimed land.
4. Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled, or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels.

For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- ✓ A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- ✓ Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- ✓ History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- ✓ Baseline study of heavy metals in surface;

Copyright © 2023. KSWMP | All rights reserved.

- ✓ Water, rainfall, soil type, surface hydrology, topography, wind direction etc. shall be studied before and after bioremediation.
- ✓ Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows

## 7.1 BIO-MINING – RECLAMATION/RECOVERY OF LAND

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

*Table 24 Phases of Bio-mining*

| Phases of Bio-mining | |
|---|---|
| Phase 1: Stabilization | The legacy waste is formed into equal-sized windrows, and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| Phase 2: Sorting & Segregation | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/circular rotatory sieves and manpower. |
| Phase 3: Disposal & Utilization | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |
| Salient Aspects | Optimum land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>Compliance to SWM Rules and NGT orders.<br>Improvement in aesthetics and quality of life & health. |
| Applicability | The ownership is well defined.<br>Working space is available in the dumpsite.<br>Linkage for utilization by-products is available |

Copyright © 2023 KSWMP | All rights reserved

## 7.2 CAPPING WITHOUT LAND RECOVERY

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| Salient Aspects | The capped area becomes a green space and can be developed into parks/recreational areas.<br>Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years.<br>Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep-rooted vegetation. Recurring expenditure will be incurred for regular maintenance.<br>On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio-mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | Capping could be a solution for legacy waste where bio-mining is not possible because of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for utilization/ disposal of segregated components<br>Lack of working space & resources |

## 7.3 CAPPING WITH PARTIAL LAND RECOVERY

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can linked to relevant buyers and the inert material will be capped to prevent further degradation of the environment.

| | |
|---|---|
| Salient Aspects | The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |
| Applicability | Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for disposal of inert |

Copyright © 2023 KSWMP | All rights reserved

Recovery land for public use is not a priority

## 7.4 SELECTION OF REMEDIATION OPTION

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land 100% & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for 100% and recovery and forward linkages/utilization of processed aggregates/by-products.

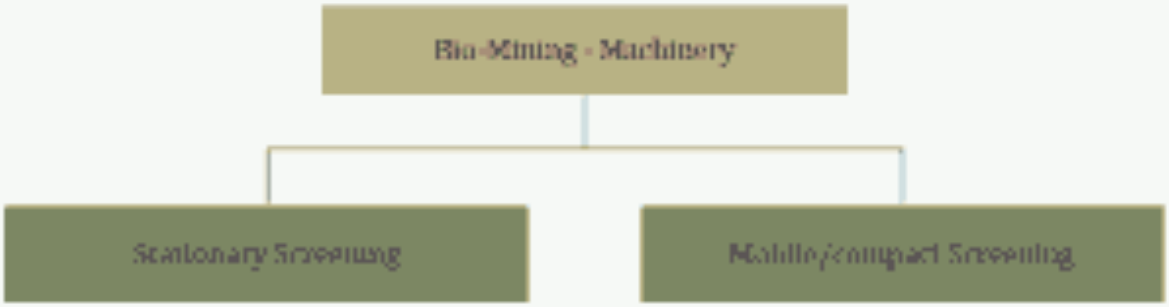
Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land 100% is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and 100% land recovery/remediation legacy waste dumpsite. It may be noted that the bio-earth and C&D material which will be recovered by remediation is proposed to be used for development of the reclaimed legacy waste dumpsite as recreational park/facility (for site development work/ profiling). The bio-earth and C&D material recovered will be subjected to bi-weekly sampling and conform to the parameters mentioned in Schedule II of SWM Rules 2016 before using the material. Considering the same, there won't be any leachate generation using this material. There won't be any capping done and hence the question of erosion etc. doesn't arise.

**Salient parameters for opting the Bio-mining – reclamation/recovery of land 100%.**

1. Based on the assessment from the chemical analysis report from the M/s. Pollechem, all the heavy metals are within the permissible limits as prescribed by the regulatory authorities Soil is free of contamination viz., heavy metals, chemical and other toxic substances.
2. 100% Land recovery, increase in value of land and available for public use/setting of SWM facility with immediate effect. An area of 1.12 acres will be reclaimed through bio-mining
3. Adequate downstream linkages for the management/disposal waste viz., Bio earth and C&D waste will be utilized for development of the reclaimed legacy dumpsite as recreational park/facility, recyclables will be sold to the authorized recyclers & will be collected from the project site and RDF will be sent to Cement industries for co-processing viz., as supplement to the conventional fuel.
4. Ilr products/aggregates generated from the process can be used as alternative construction material (after processing), fuel and recyclables.
5. The Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping.

Copyright © 2021 KSWMP | All rights reserved.

# 8 TECHNICAL DESCRIPTION OF THE SELECTED OPTION



## 8.1 METHODOLOGY

The legacy waste dumpsite reclamation through bio-mining with recovery of land 100% involves Phase 1: stabilization, Phase 2: sorting & segregation and Phase 3: disposal & utilization

The type of machinery, capacity and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type machinery available for the bio mining are as follows:

1. Stationary screening machinery and
2. Mobile/compact machinery.

### 8.1.1 STATIONARY SCREENING MACHINERY

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- ✓ Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- ✓ Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- ✓ Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process.

Copyright © 2023. KSWMP | All rights reserved.

- ✓ Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.
- ✓ Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- ✓ Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

Source: DCC Infra., Gurugram Site

Salient Features of Stationary Screening Machinery:

- Land requirement high for setting of machinery and processing area.
- Erection, Installation and Commissioning is time consuming
- Cost Intensive – CAPEX & OPEX high
- Electrical Power Intensive and Consumption is high
- Breakdown of the Machinery is high, onsite technicians should be available.
- Manpower – skilled & unskilled Intensive
- Suitable for quantity more than 2,00,000 ton of legacy waste.
- Less suitability for reuse of the machinery/screenings for more than one site/location

### 8.1.2 MOBILE/COMPACT SCREENING MACHINERY

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation.

Copyright © 2023. KSWMP | All rights reserved.

**Structure:** The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity.

**Screening Mechanism:** The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

**Separation System:** Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

**Treatment Process:** In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

**Transport:** Quick and easy folding of conveyor helps in quick setup time.

**Discharge height:** Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages.

*te)*

**Salient Features of Mobile/Compact Screening Machinery:**

- Full Mobility: Plants are fully mobile like excavator. Plants can be moved across the most difficult of surfaces and terrain and can accommodate the most inaccessible locations.

Copyright © 2023. KSWMP | All rights reserved.

- Quick Set up time: Track-Mobile plants can normally be set-up within 1 hour, as it normally does not require additional conveyors, feed hopper to link separate machines, thus increasing machine utilization.
- Versatility: Track-Mobile plants can be operated independently or in combination of two or three stage screening depending upon user requirements.
- No Civil works required: Plants do not require any civil works, can be erected & shifted quickly. Thus offer quicker return on investment.
- Manpower requirement is less.

## 8.2 SELECTION OF MACHINERIES

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land 100%) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, mobile / compact screening shall be the optimum screening machinery for the Kalpetta Dumpsite. The 7227.86 tons legacy waste can be remediated within the stipulated time by NGT i.e. 31st March 2024

**Salient parameters for opting the Mobile/Compact screeners.**

1. Sorting/segregation of the stabilized legacy waste of 9485.38 m³/ 7227.86 tons within the stipulated timeline of 31st March 2024.
2. The remediation process will be guided by National, State Regulations & EIA/EMP in line with KSWMP ESMF.
3. Salient Features of Mobile/Compact Screening Machinery – details are in the section 8.1.2

## 8.3 SYSTEM REQUIREMENTS

### 8.3.1 CAPACITY SIZING OF MOBILE COMPACT SCREENER

The capacity of the Mobile compact screener is assessed as **50 TPH.** The calculation shown is only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards. The details of plant capacity sizing are provided in the table below:

*Table 25 Capacity sizing of Mobile Compact Screener*

| Description | Quantity |
|---|---|
| Quantity of waste (Tons) | 7227.86 |
| Mobilization and site preparation (days) | 60 |
| Weekends & Holidays | 20 |
| Rainy Days | 20 |
| Break downs (Days) | 15 |

Copyright © 2023 KSWMP | All rights reserved

| Description | Quantity |
|---|---|
| No of days (Nov 2023 - Mar 2024) | 75 |
| Effective processing days | 25 |
| Processing per day (Tons) | 300 |
| Capacity of the Plant - Considering working 8 hrs/day | 38 |
| Proposed Capacity of plant TPH | 50 |

### 8.3.2 MACHINERIES & VEHICLES

As the site access road measures below 3 meters in numerous areas, making it impassable for many heavy vehicles, including firefighting vehicles, a suggested solution to address potential future fire issues involves constructing a 25,000-liter water tank with firefighting capabilities. Detailed assessment of quantity (nos) of machinery, vehicles, auxiliary items required for effective processing of the legacy waste are provided in the Annexure – E. The summary of machineries and vehicles requirements are provided in the table below:

*Table 26 Machineries & Vehicles*

| S. No. | Description | Quantity(Nos) | Remarks |
|---|---|---|---|
| 1 | Mobile Trommel @ 100TPH | 1 | Detailed Specifications are provided at Annexure –F |
| 2 | Baling Machine @ 50TPD | 1 | |
| 3 | Ballistic Separator @ 30TPH | 1 | |
| 4 | Magnetic Separator | 1 | |
| 5 | Front End Loader @ Bucket Capacity 1Cum | 2 | |
| 6 | Chain Mounted Excavator @ Bucket Capacity 1.1 Cum | 2 | |
| 7 | Weighing bridge - 40 Ton | 1 | |
| 8 | Tipper @ 8Cum | 5 | |
| 9 | Tractor - Trolley shift of Materials | 1 | |
| 10 | Tractor -Trolley Water Tanker | 1 | |
| 11 | Mechanical Sprayer | 2 | |
| 12 | Office - Portable cabin (1 Nos) | 1 | |
| 13 | GPS (5 Nos) & Tracking System (1 Nos) | 5 | |
| 14 | CCTV System (Cameras 5 Nos) | 5 | |
| 15 | Fire Safety System - Fire Extinguisher ABC type 4 Kg/cm2 | 10 | |

Note: Considering the size of the site, it is also advised that the implementing agency liaisons with the Fire Department and deploy a fire tender at the site during the period of the contract to manage any fire incident as part of Fire Safety Plan.

Copyright © 2023 KSWMP | All rights reserved.

## 8.4 OPERATIONS AND MAINTENANCE

### 8.4.1 MANPOWER:

Detailed assessment manpower required for effective processing of the legacy waste are provided in the Annexure – I. The summary of manpower required are provided in the table below:

*Table 27 Manpower details*

| S. No | Manpower | Nos |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental Health & Safety Engineer | 3 |
| 3 | Security (3 X 8 Hrs) | 3 |
| 4 | Operations Supervisor & Accountant | 2 |
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 4 |
| 8 | Labors near Screening machinery | 2 |
| 9 | Labors at Baling facility | 11 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 1 |

### 8.4.2 ELECTRICAL POWER:

*Table 28 Electrical Power details*

| Machineries | Required Electrical Load (KW) | Working Hr. | Total Units (KW-Hr) |
|---|---|---|---|
| Bailing Machine | 5 | 4 | 20 |
| Ballistic Separator | 15 | 6 | 90 |
| Magnetic Separator | 5 | 6 | 30 |
| Weigh bridge | 5 | 6 | 30 |
| Total | 30 | | 170 |

### 8.4.3 FUEL/DIESEL FOR VEHICLES:

*Table 29 Fuel/Diesel for Vehicles*

| Description | Liters per Day |
|---|---|
| Fuel - Diesel Mobile Trommel (12 liters/hour) | 96 |

Copyright © 2023. KSWMP | All rights reserved.

### 8.4.4 WATER REQUIREMENTS:

*Table 30 Water Requirements*

| Description | Liters per Day |
|---|---|
| Water required for workers and other uses. | 5000 Liters Per Day |
| (Source – Municipality water Supply-It can be stored in the 5000 liter water tank in the site.) | |

*Note: The calculation shown above is only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and guidelines as per tender. The responsibility of availing necessary power and water connection shall be with the contractor as condition precedent before starting the work.*

*Further, considering the size of the site, it is required that the contractor liaisons with the Fire Department and deploys a fire tender team at the site during the period of the contract works to manage any fire incident as part of Fire Safety Plan. Alternatively, general SOPs for fire safety detailed herewith are to be followed:*

a) *Fire Fighting System including fire hydrant, pressure pumps, 5000 Ltr (min) water storage, adequate hose reel and fire extinguishers to be provided at site.*
b) *Alternate source of power (DG)*
c) *Manual Fire Alarm System with evacuation plan*
d) *Regular check, maintenance of equipment's for firefighting (before initiating work and then at interval of 1 months thereof)*
e) *Training to all men. (Before initiating work and then at interval of 3 months thereof).*
f) *Maintaining fire line while storage of material (RDF). RDF to not exceed 10% of total estimated waste at site at any given time.*
g) *Any other requirement in consultation with local Fire & Rescue Services office.*

Copyright © 2023. KSWMP | All rights reserved.

# 9 SCOPE OF DISPOSAL INCLUDING LOCATION OF DISPOSAL FOR RDF, BIO SOILS, C & D WASTE, AND OTHERS AS PER LOCAL DEMANDS

## 9.1 UTILIZATION OF BY PRODUCTS

The details of the utilization of aggregates/by-products screened out by processing of the stabilized legacy waste are provided in the table below

*Table 31 Utilization RDF, bio soils, C & D waste*

| S.No | Component | Quantity (Cu.m) | Utilization/Linkage/Usage |
|---|---|---|---|
| 1 | Bio earth and C&D Waste | 6294.32 | The bio earth and C&D and quantity 6924.32 cu.m waste will be utilized for development of the reclaimed legacy waste dumpsite as recreational park/facility. |
| 2 | RDF | 2224.32 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. Currently the indicative nearest location for the RDF disposal is at Dalmia Cements, Trichy which has the necessary infrastructure for co-processing of RDF. |
| 3 | Recyclables & others | 336.73 | Recyclables will be sold to CKCL/recyclers authorized by KSPCB/CPCB. |
| Note: The contractors engaged in biomining will be responsible for ensuring this disposal of Bio Earth, RDF, recyclables, and others. | | | |

## 9.2 SWM Rules 2016 on usage of RDF

A sound policy framework exists in the country as SWM Rules 2016 recommend the following:

| Reference | Rules/Activities |
|---|---|
| Criteria for waste to energy process | (i) Non-recyclable waste having calorific value of 1500 Kcal/kg or more shall not be disposed off on landfills and shall only be utilised for generating energy either or through refuse derived fuel or by giving away as feed stock for preparing refuse derived fuel.<br>(ii) High calorific wastes shall be used for co-processing in cement or thermal power plants. |
| Duties of the industrial units located within one hundred km from the RDF and Waste to Energy plants based on solid waste | All industrial units using fuel and located within 100 km from a solid waste-based RDF plant shall make arrangements within six months from the date of notification of these rules to replace at least 5% of their fuel requirement by RDF so produced |
| Duties of Central Pollution Control Board | Provide guidance to States or Union Territories on inter-state movement of waste |

Copyright © 2023 KSWMP | All rights reserved.

## 10 ESTIMATED PROJECT COST

The details of the estimated cost for bio-mining - recovery of land 100% by remediating legacy waste dumpsite is provided in the table below:

*Table 32 Details of Estimated Project Cost*

| Estimate for Dumpsite remediation considering Forward Linkage | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Sr. No. | Activity | Details | Rate/ m3 | Cost Index @ 1.35 * A | COP @ 1.15 * C | Round off (INR) | Quantity (m3) | Amount (Rs) |
| | | | A | B | D | | | |
| 1 | Remediation/ Biomining | Rate adopted from Calculation from Suchitwa Mission (DSR 2018 including baling) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 2 | Transportation of RDF | The average distance to cement factories works out to be 400 km. The rate of transportation of of RDF can be considered [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 3 | Disposal of recyclable | Considering that the recyclable will be [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 4 | Disposal of Inert | Considering the disposal cost of [redacted] (market rate) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 5 | Disposal of Compost / Soil enricher | Considering the disposal cost of [redacted] (market rate) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| | | | | | | | | [redacted] |
| | Environmental & Social Safeguard estimated amount for the implementation and monitoring | | | | | | | [redacted] |
| | Grand Total | | | | | | | [redacted] |

Copyright © 2023. KSWMP | All rights reserved.

| NOTE | |
|---|---|
| 1 | [redacted] |
| 2 | [redacted] |
| 3 | [redacted] |
| 4 | The estimate is based on the information available. The actual cost may vary from site to site based on results of dumpsite investigations report and contractors forward linkages |

Copyright © 2023. KSWMP | All rights reserved.

## 10.1 REVENUE FROM THE PROJECT

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- Bio earth & C&D waste will be utilized within the remediated dumpsite as filler material for development of recreational park.
- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at no cost whereas transportation cost is required to be borne by the contractor sending the RDF to the cement factory/ WtE facility.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable.

## 10.2 FUNDING FOR PROJECT

The estimated cost of [redacted]/- for the project Dumpsite Remediation which equals to [redacted]/- **per m³**. The sources and funding pattern is given below:

*Table 33 Funding for the project*

| Item | External (70%) Rs. | State Govt.(30%) Rs. | Total cost Rs |
|---|---|---|---|
| Bioremediation | [redacted] | [redacted] | [redacted] |

Copyright © 2023 KSWMP | All rights reserved

# 11 PROJECT IMPLEMENTATION PLAN

## 11.1 PROPOSED OPERATIONAL PLAN

The bioremediation of Kalpetta dumpsite will be done with the land recovery and will be executed through an outsourcing model. The proposed operational plan is provided at the Annexure - I

## 11.2 TIMELINE

In compliance with the National Green Tribunal (NGT) orders, it is mandatory to remediate all dumpsites in Kerala by March 2024. To ensure timely completion and compliance with the deadline, timeline for the implementation of project is provided below.

| S.No | Description | Time frame |
|---|---|---|
| 1 | Start date | 01/12/2023 |
| 2 | End date | 31/03/2024 |

## 11.3 CONTRACT MODEL

**Execution Method:**

- Item Rate Contract and disposal/Management of by-products/aggregates with zero residues and land recovery. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

**Working Model:**

- 100% work to outsourced to selected private contractor
- Technical Support Consultant (TSC) will assess the quantity of waste and the ULB will hand over the land for setting up the plant to the Contractor.
- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- Contractor is responsible for disposal of BioEarth, RDF, recyclables, and aggregates

Copyright © 2023 KSWMP | All rights reserved.

## 12 BENEFITS OF THE PROJECT

Remediation of legacy waste dumpsite in the Kalpetta leads to the following anticipated benefits:

- **Reclamation of Land**: An area of 1.12 acres will be reclaimed and will be developed into an Agricultural Nursery for public use. A contamination assessment is to be carried out before any public use project is taken up at the location.
- **Environmental Protection**: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity. The project shall arrest GHG emissions from the legacy dumpsite.
- **Health Improvement**: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- **Enhanced Water Quality**: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to the safe drinking water.
- **Aesthetic and Social Benefits**: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- **Operational & Life cycle Aspects**

Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through bio-mining process.

- **Employment**

During remediation & post- remediation period, requirement of un-skilled labor will be fulfilled by s local sourcing.

Copyright © 2023. KSWMP | All rights reserved.

# 13 CONCLUSION

- The activities of the bio-mining will be commenced from Dec 2023 to Mar 2024. An area of 1.12 acres will be reclaimed and will be developed into Agricultural Nursery for public use after contamination assessment.
- Through the process of bio mining the dumpsite, complete land reclamation and recovery, while prioritizing environmental safeguards. This means that the land will be reclaimed and put to use.
- Considering site conditions and quantum, screening of the 9485.375 $m^3$ of legacy waste, mobile / compact screening machinery will be preferred.
- Favorable site conditions for bio-mining:
    1. Optimum width of the road (3 m) is available for movement of the vehicles.
    2. Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
    3. Piped water supply and a storage of water tank 5000 liters are available at the dumpsite.
    4. At the dumpsite plot, a vacant land parcel of approx. 0.15 acres is available for the installation of auxiliary infrastructures, supporting conditions movement of processing machinery and vehicles.
- The project activity requires to obtained "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- By-products utilization/forward linkages/Usage
    1. The bio earth & C&D quantity of 4742.69 m3 & 2181.64 $m^3$ respectively is proposed to be utilized after testing for the contamination for development of the reclaimed land as Agricultural Nursery. The contraction shall level the site in consultation with the PIU/TSC/DPMU.
    2. Refused derived fuel (RDF) of 2224.32 $m^3$ will be to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the processes. The indicative location of cement plant is Dalmia Cements, Trichy.
    3. Recyclables of 336.73 $m^3$ will be sold to CKCL /Private recyclers authorized by KSPCB/CPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, NGT orders, KSPCB norms, CPCB guidelines and KSWMP ESMF and other regulatory rules & norms.
- Environmental & Social safeguards:
    1. The project attracts E2 Environmental category based on the Environmental Screening and Exclusions mentioned in the Environmental and Social Framework Guidelines.
    2. Site specific Environmental Assessment and Environmental Management Plan has been developed.
    3. The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is [redacted]/- (INR [redacted]). The cost per $m^3$ for processing and disposal of the legacy waste is [redacted] per $m^3$.

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Vellaramkunnu, Kalpetta, Wayanad district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 05$^{th}$ June 2023. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 23$^{rd}$ June 2023 and was completed on 26$^{th}$ June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

# 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along with Mr. Kamal Kishore Jha of IPE Global during the first week of June 2023, in order to collect the information regarding the site prior to mobilising the equipment for drilling.

The dumpsite is situated well away from any human habitation. The site at this location is a sloping terrain. The surface at this site is made horizontal to make the site accessible for manual opeerations.

**Figure 1 :** Location of the borehole drilled at the dumpsite.

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and cleaning out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste at the dumpsite.

### 4.2 Drilling equipment

Mechanical rigs of rotary drilling machine were used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by

drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log the commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of

each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing are presented in **Appendix II**.

**Table 1: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |
|---|---|---|---|
| 1 | Soil | Grain-Size Analysis | IS: 2720(Part-4)-1985 |
| 2 | | Atterberg's Limit | IS: 2720(Part-5)-1976 |
| 3 | | MDD/OMC(Light Compaction) | IS:2720(Part-7)-1980 |

## 6 SUMMARY

The geotechnical examination on the soil samples collected after boring through the waste at the dumpsite at Vellaramkunnu, Kalpeta, Wayanad was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was bored using a rotary drilling method. The maximum depth of investigation was 7.5 m (3.0 m in waste and 4.5 m in the ground). SPT and collection of undisturbed samples were carried out at regular intervals. Various laboratory tests were carried out on the SPT and undisturbed soil samples.

Based on the investigations carried out, it was observed that the original ground below the waste comprises of a Lateritic soil with an average SPT N-value of 22 until 4.5 m followed by a sandy clay layer having an average SPT N-value of 25 underlain by a silty sand sand layer with an average N-value of 19 until the depth of termination at 7.5 m below the top of waste. The tests mentioned in the above table were performed on the samples in the laboratory following the respective codes to obtain the necessary parameters. The laboratory results on samples obtained from the site are appended in **Appendix II**.

# Liquid Limit, Plastic Limit & Plasticity Index Test Report

Report No: ML23R-023684
Issue No : 1
Report Date: 10/07/2023

| | |
|---|---|
| **Client:** | Project Manger, IPE Global |
| **Address:** | 2nd Floor, 16/3878 - 3879, Kavenatt Building, Kanayannoor Village, Kakkanad, Ernakulam, Kerala-682030 |
| **Contact:** | - |
| **Project No:** | - |
| **Project Name:** | Geotechnical Investigation at Dumpsite in Vellaramkunnu, Kalpetta |
| **Consultant:** | - |
| **Owner:** | KSWMP |
| **Contractor:** | - |
| **Project Location:** | Vellaramkunnu, Kalpetta, Wayanad District |
| **Tel / Email:** | - |

UIN:423107AJ230000049517F

**Sample Details**

| | | | |
|---|---|---|---|
| **Received Date:** | 06/07/2023 | **Client Sample Ref.*:** | Soil, BH 01, Depth 4.50m |
| **Work Order ID:** | ML23WI-023684 | **Sample Submitted By:** | Geotechnical Division |
| **Sample ID:** | ML23WI-023684/S3 | **Source*:** | BH 01, Depth 4.50m |
| **Date Sampled:** | 28/06/2023 | **Sampled By:** | Geotechnical Division |
| **Sampling Method*:** | IS: 2131 - 1981 | **Sample Size(kg):** | 5 Approx. |
| **Sample Location*:** | Vellaramkunnu, Kalpetta, Wayanad District | **Date Tested :** | 06/07/2023 - 09/07/2023 |
| **Sample Cert. No:** | - | **Test Method Variation:** | None |
| **Lot No / Lot Size:** | - | **Lab Sample Desc.:** | Soil, BH 01, Depth 4.50m |
| **Tested By:** | VY | **Client Sample Desc*:** | Soil, BH 01, Depth 4.50m |
| **Condition of Soil:** | Natural | **Period of Soaking:** | 24 Hrs |
| **Test Location:** | MatterLab - Kozhikode | | |

**Test Results**

| Test Method | TestParameters | Result | Specification |
|---|---|---|---|
| IS:2720(Part 5)-1985-Cl.3 Mechanical Method | Liquid Limit,% | 44 | - |
| IS:2720(Part 5)-1985-Cl.7 | Plastic Limit,% | 22 | - |
| IS:2720(Part 5)-1985-Cl.8 | Plasticity Index | 22 | - |

| **Test Location:** | MatterLab - Kozhikode | | |

## Test Results

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Mould volume | | $V_m$ (cm$^3$) | 958 | | | | |
| Test No. | | | 1 | 2 | 3 | 4 | 5 |
| Mass of mould | | $W_m$ (g) | 4053 | | | | |
| Mass of mould + compacted sample | | W (g) | 5859 | 6009 | 6125 | 6089 | 6009 |
| Mass of sample | | | 1798 | 1948 | 2062 | 2026 | 1946 |
| Wet density | $(W-W_m)/V_m$ | $\rho_w$ (Mg/m$^3$) | 1.88 | 1.96 | 2.07 | 2.03 | 1.96 |
| Mass of wet sample | | $W_{ws}$(g) | 477.7 | 488.7 | 498.2 | 477.9 | 526.6 |
| Mass of dry sample | | $W_{ds}$(g) | 426.1 | 411.8 | 430.2 | 426.6 | 440.1 |
| Moisture content | $[(W_{ws}-W_{ds})/W_{ds}]x100$ | m (%) | 12.1 | 13.9 | 15.8 | 17.6 | 19.4 |
| Dry density | $\rho_w/(1+m/100)$ | $\rho_d$ (Mg/m$^3$) | 1.61 | 1.71 | 1.78 | 1.73 | 1.63 |

Method: IS 2720 : Part 7 : 1980

| | |
|---|---|
| Maximum dry density, g/cc: | 1.78 |
| Optimum moisture content, % | 16 |
| Material retained on 20mm,% | Nil |
| Sample used | Single |
| Size of mould | 1000cm$^3$ |
| Weight of rammer | 2.6 kg |

## RESULT OF PESTICIDE ANALYSIS

| Parameters tested | Test method | Result | Acceptable Limit As per IS – 10500 - 2012 |
|---|---|---|---|
| 2,4-D | USEPA 525.2 | Not Detected | 30 µg /l |
| Alachor | | Not Detected | 20 µg /l |
| Aldrin and Dieldrin | | Not Detected | 0.03 µg /l |
| Alpha-HCH | | Not Detected | 0.01 µg /l |
| Endosulfan(Sum of Alpha,beta,isomers and sulphate) | | Not Detected | 0.4 µg /l |
| Atrazine | | Not Detected | 2.0 µg /l |
| Beta -HCH | | Not Detected | 0.04 µg /l |
| Butachlor | | Not Detected | 125 µg /l |
| Chloropyrifos | | Not Detected | 30 µg /l |
| Delta HCH | | Not Detected | 0.04 µg /l |
| Ethion | | Not Detected | 3.0 µg /l |
| Isoproturon | | Not Detected | 9.0 µg /l |
| Lindane(Gamma HCH) | | Not Detected | 2.0 µg /l |
| Monocrotophos | | Not Detected | 1.0 µg /l |
| Malathion(Sum of malathion and malaoxon) | | Not Detected | 190 µg /l |
| Methyl Parathion(Sum of methyl parathion and methyl paraoxon) | | Not Detected | 0.3 µg /l |
| DDT(o p and p p-isomers of DDT,DDE and DDD) | | Not Detected | 1.0 µg /l |
| Phorate(Sum of Phorate,Phorate sulfoxide &Phorate Sulphone) | | Not Detected | 2.0 µg /l |

# Annexure I

# Proposed Operational Plan

## Proposed Operational Plan

The project of the Bio-mining with 100% land recovery will be implemented through 100% outsourcing model. The detailed operations of 100% land recovery is provided below:

1. **Project Kick-off**

   The existing legacy waste dumpsite should be visited jointly by representative of implementation agency, officials ULB and experts of PMU/PMC & TSC for the following

   - ✓ For assessment of ***As –Is Situation*** of local settings viz., human settlement & environmental settings etc.,
   - ✓ For validation of profile, quantity & physical characterization of legacy waste.
   - ✓ Available services viz., electrical power, source of water and access road etc.,
   - ✓ For ground truthing the sampling locations of baseline environmental parameter, locations where monitoring will conduct during operation phase and post reclamation phase
   - ✓ For sensitizing/awareness of the upcoming the project activity to the stakeholders within the vicinity of the dumpsite.
   - ✓ For understanding the sensitive of environmental & social aspects/social considerations viz., educational institutions, religious places and settlements settings.
   - ✓ For ensuring that the implementation agency understands and to complies with all local and national regulations related to project activities.

2. **Site Management Plan**

   The position of the machineries and other auxiliary machineries/equipment's in-line with the defined process of bio-mining with 100% land recovery play imperative role in effective implementation of the project activities.

   A detailed site management plan is prepared including the details of excavation & pre stabilization area in phases (1 to 4), machineries, weigh bridge, area allocation for by-products storage, vehicle parking area and position of CCTV cameras. The detailed site Management plan is provided below:

3. **Site Preparation**

The portion of the legacy waste dumpsite will be clear vegetation and levelling the area to create a stable & level platform for positioning of bio-mining machineries/equipment's and for processing of legacy waste.

4. **Procurement of Machinery & Vehicles and Equipment's**

An indicative list of Machineries &Vehicles and equipment's are proposed to for effective processing the quantity of existing legacy waste in-tune to the timeline of NGT orders. The indicative list of the Machinery & Vehicles and equipment's are provided in the Section 8.3.2

5. **Mobilization of Manpower**

For effective management of the project activities, an indicative list Manpower provided in the Section 8.4.1 shall be mobilize required.

## 6. Statutory Approvals

The implementation agency is responsible for obtaining the all required permission/consent/approvals from the competent authorities. The ULB/DPMU/DPMC will only facilitates implementation agency in obtaining the approvals etc. The indicative list of statutory approvals required for the project is provided below.

a. Site Authorization from KSPCB in conforming to SWM Rules 2016 and Consent to Establish/Operate KSPCB.
b. Dept. of mining and geology
c. Necessary permission for storage of process materials and chemicals
d. NOC from Dept. of Fire and Rescue
e. Segregated Hazardous waste disposal arrangement (eg: KEIL Ambalmedu, Kochi)
f. NOC from Heritage/Archeology, if the site is in regulated zone of heritage/protected building
g. Any other statutory approvals/ permissions

## 7. Establishment of forward linkages

The By-products from the bio-mining process/operations viz., Bio earth/ C&D waste (Inert), RDF and Recyclables will be stored in the designated place (as indicated in the site management plan) within the dumpsite. The implementation is responsible for management/establishment of forward linkages. Utilization of Bio earth/C&D (inert) may be finalized in consultation with ULB. The ULB/DPMU/DPMC only will facilitates in forward linkage establishment. An indicative forward linkage is provided in the Section 9.1 List of Cement industries are provided in the Annexure K and list authorized recyclers are provided in the Annexure L

### Bio-mining operations

#### Step-1 – Waste Stabilization

The initial step involves the use of a front-end loader to excavate the legacy waste, allowing for the leachate to dry out through exposure to solar radiation and for the removal of trapped methane from the heap. To ensure the decomposition of biodegradable waste such as discarded food, fruits, flowers, and garden waste, proper aeration is necessary to prevent the generation of leachate and odors. The top layer of the legacy waste, approximately 150 mm in depth, is repeatedly loosened using the front-end loader. Additionally, the waste is lightly mist-sprayed with bio-cultures to manage odors and disperse decomposing microbes throughout the waste. The loosened legacy waste forms windrows.

#### Step-2 – Windrow Formation

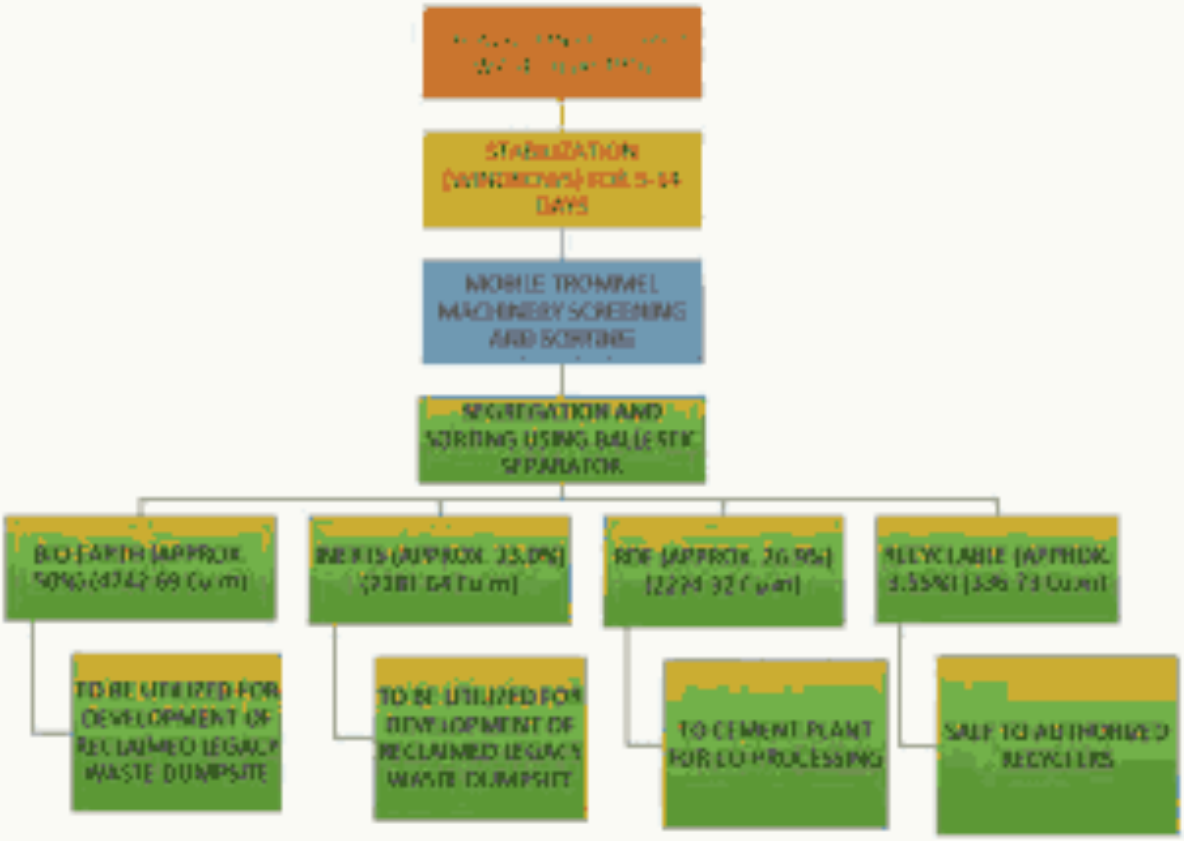
The second step involves creating windrows of the legacy waste using backhoe. Composting bio-cultures are added to accelerate decomposition and generate biological heat within the waste, aiding in drying it out and reducing its volume. These windrows are turned every 3 days to ensure proper biological treatment and moisture loss. After 1-2weeks, when the heaps have reached a suitable consistency for screening, the material is weighed and transferred to a Mobile Trommel, which consists of rotating cylinders with different-sized perforations.

Step-3 – Sorting and Segregation by Mobile Trommel

The third step is to move stabilized waste to mobile trommel to get 3 different sizes of fractions

- ✓ Fraction 1 – (minus 30 mm) – Bio Soil/earth -Used for filling low lying areas.
- ✓ Fraction 2 – (30-80) mm – Mixed fraction – Plastics with C&D (send to Ballistic Separator)
- ✓ Fraction 3 – (80 +) mm – Mixed fraction – (send to Ballistic Separator)

The Fraction-2 & Fraction-3 (30-80) mm & (80 +) mm is required to move for further separation process through ballistic separator.



Step-4 – By - products – C&D materials

In the fourth step, the fraction-2 and fraction-3 are sorted into three types based on their shape and weight: heavy and rolling fraction (referred to as 3D) - C&D Material, light fraction (referred to as 2D) - RDF, and the sieved fraction (or under-screen fine fraction) - Plastic.

Step-5 - Byproducts – RDF

In the fifth step, the RDF sorted by the ballistic separator (30TPH) is moved to the baling machine (50TPD) for packaging the RDF fractions. The baled RDF is then transported to Cement plants via a weigh bridge (30Ton), where a co-processing facility is available.

## 8. Monitoring & Supervising Mechanism

Supervision and monitoring during dumpsite remediation by TSC/PIU/DPMU

## 9. Record keeping and Reporting

i. The Implementation agency shall maintain a record of the daily processed legacy waste and also keep proper record of all the recovered and disposed of materials.

ii. The Implementation agency shall maintain authorized weigh bridge records at the point of receipt by end designated agency. A consolidated weigh bridge records certified by the Plant Manager/competent authority of the authorized Cement plant/ WtE or such units certifying the total RDF received from the Project is a valid proof of compliance.

iii. The Implementation agency shall maintain all the statutory records, as per SWM Rules, 2016, and also conditions stipulated in Site Authorization/Consent to Establish/Operate

by KSPCB if any, KSWMP/WB requirements and other project relevance statutory requirements.

iv. The site shall be operated in CCTV surveillance with data storage of entire contract period. For CCTV surveillance High-Definition IP based cameras in adequate numbers. As per the requirement of the ULB/KSWMP link with mobile compatibility may be provided for online monitoring of the project activities.

v. The vehicles engaged for the project activities shall be equipped with Vehicles Tracking System (VTS) by equipping with GPS and online monitoring system.

## 10. Land recovery/project closure

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the bidder to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site.

Annexure-J

# LSGD GUIDELINES FOR REMEDIATION OF LEGACY WASTE DUMPSITES THROUGH BIOREMEDIATION

# GOVERNMENT OF KERALA

## Abstract

Local Self Government Department - Guidelines for Remediation of Legacy Waste Dumpsites through Bio Remediation - orders issued.

## DEPARTMENT

G.O.(Rt)No.2629/2022/LSGD Dated,Thiruvananthapuram, 29-10-2022

Read 1 Letter No. 2683/C2/2022/SM dated 16.09.2022 from Executive Director Suchitwa Mission.

## ORDER

As per the letter read above, Executive Director, Suchitwa Mission had submitted draft guidelines for implementation of project for remediation of Legacy Waste Dumpsites through Bio Remediation.

2) Government have examined the matter in detail and are pleased to approve the guidelines enclosed herewith for implementation of project for reclamation of legacy waste dumpsites through bio remediation.

(By order of the Governor)
SHIBI ABRAHAM
DEPUTY SECRETARY

**ലെഗസി മാ**ലിന്യ **നിർമ്മാർ**ജന പദ്ധതികളു**ടെ നിർവ്വഹ**ണ ഉദ്യോഗ**സ്ഥ**ൻ

- ലെഗസി മാലിന്യ നിർമാർജന പദ്ധതികളുടെ നിർവ്വഹണ ഉദ്യോഗസ്ഥൻ തദ്ദേശ സ്വയംഭരണ സ്ഥാപനത്തിന്റെ എഞ്ചിനീയർ ആയിരിക്കും

നിർമ്മാർജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യ നിക്ഷേപങ്ങളുടെ അളവ തിട്ടപ്പെടുത്തൽ

- പൊതുവായി, നിർമ്മാർജ്ജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യത്തിന്റെ അളവ (ക്യൂബിക മീറ്ററിൽ) ടോട്ടൽ സ്റ്റേഷൻ സർവേയിലൂടെ കണ്ടെത്താവുന്നതാണ. എന്നാൽ ടോട്ടൽ സ്റ്റേഷൻ സർവേ സാധ്യമല്ലാത്ത സാഹചര്യത്തിൽ, ഒരു ലക്ഷം ക്യൂബിക മീറ്റർ വ്യാപ്തിയിൽ കൂടുതലുള്ള വലിയ ഡംപസൈറ്റുകളുടെ കാര്യത്തിൽ ഡ്രോൺ സർവ്വേ രീതി സ്വീകരിക്കാവുന്നതാണ.

- ആവശ്യമുള്ള പക്ഷം, പുറമെയുള്ള സർവേ ഏജൻസികളെ നിശ്ചിത നടപടിക്രമങ്ങൾ പാലിച്ച ഇതിനായി ഏർപ്പെടുത്താവുന്നതും, അതിനുള്ള ചെലവ ലഭ്യമായ ഫണ്ടിൽ നിന്ന തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം വഹിക്കേണ്ടതുമാണ.

- സൈറ്റിന്റെ കോണ്ടൂർ മാപ്പ തയ്യാറാക്കേണ്ടതും ആയത തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ പരിശോധിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

എസ്റ്റിമേറ്റ തയ്യാറാക്കലും പദ്ധതി രൂപീകരണവും

- സൈറ്റിന്റെ നിലവിലെ അവസ്ഥ, മാലിന്യത്തിന്റെ സ്വഭാവം/തരം, മാലിന്യ നിക്ഷേപത്തിന്റെ കാലയളവ, മറ്റ അടിസ്ഥാന വിശദാംശങ്ങൾ എന്നിവയെക്കുറിച്ചുള്ള വിശദമായ റിപ്പോർട്ട അനുബന്ധം- I ൽ നൽകിയിരിക്കുന്ന പ്രൊഫോർമയിൽ തയ്യാറാക്കേണ്ടതാണ

- അനുബന്ധം-II ൽ നൽകിയിരിക്കുന്ന സ്പെസിഫിക്കേഷനും ഡാറ്റയും അനുസരിച്ച ബയോമൈനിംഗ മുഖേന പ്രവൃത്തി നടപ്പിലാക്കുന്നതിന എസ്റ്റിമേറ്റ തയ്യാറാക്കേണ്ടതാണ.

- പ്രൊപ്പോസൽ തയ്യാറാക്കുന്നതിന്റെ ഭാഗമായി പ്രസ്തുത പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള എല്ലാത്തരം ചെലവുകളും പരിഗണിക്കേണ്ടതാണ.

- വാർഷിക പദ്ധതിയുടെ ഭാഗമായി പ്രോജക്ട ഏറ്റെടുക്കേണ്ടതും ലഭ്യമായ സ്രോതസ്സുകളിൽ നിന്നും ഫണ്ട വകയിരുത്തേണ്ടതുമാണ.

സാങ്കേതിക അനുമതി

നിലവിലുള്ള സാമ്പത്തിക അധികാരങ്ങൾ അനുസരിച്ച തദ്ദേശ സ്വയംഭരണ വകുപ്പ(ലോക്കൽ ഇൻഫ്രാസ്ട്രക്ച്ചർ & എഞ്ചിനീയറിംഗ വിങ) ലെ ബന്ധപ്പെട്ട എഞ്ചിനീയർ പ്രോജക്ടിന സാങ്കേതിക അനുമതി നൽകുകയും മാനദണ്ഡങ്ങൾ പാലിക്കുന്നതിനായി ചീഫ ടെക്നിക്കൽ എക്സാമിനർക്ക (ഫിനാൻസ വിംഗ) ആവശ്യമായ റിപ്പോർട്ടിംഗ ഉറപ്പാക്കുകയും ചെയ്യേണ്ടതാണ.

തദ്ദേശ സ്വയംഭരണ സ്ഥാപനങ്ങൾ ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ/ഭൂമികൾ വീണ്ടെക്കുന്നതിനുള്ള പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള നടപടി ക്രമങ്ങൾ

ടെൻഡറിംഗ

- ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ വീണ്ടെടുക്കുന്നതിനുള്ള പ്രവൃത്തിയുടെ വിശദമായ സ്കോപ്പ ഓഫ വർക്ക, നിബന്ധനകളും വ്യവസ്ഥകളും മുതലായവ വ്യക്തമായി പരാമർശിക്കുന്ന 'ടു കവർ ബിഡ്സ താല്പര്യപത്രം'(Request for Proposa - wo Cover Bd) തയ്യാറാക്കേണ്ടതും ആയത നടപടിക്രമങ്ങൾ പാലിച്ച പ്രസിദ്ധീകരിക്കുകയും ചെയ്യേണ്ടതാണ.

- കേന്ദ്ര പാർപ്പിട-നഗരകാര്യ മന്ത്രാലയവും (MoHUA) സെൻട്രൽ പബ്ലിക ഹെൽത്ത & എൻവയോൺമെന്റൽ എഞ്ചിനീയറിംഗ ഓർഗനൈസേഷനും (CPHEEO) ചേർന്ന പ്രസിദ്ധീകരിച്ച "സ്വച്ഛ ഭാരത മിഷൻ (അർബൻ)-അഡ്വൈസറി ഓൺ ലാൻഡ്ഫിൽ റിക്ലമേഷൻ" ൽ നൽകിയിരിക്കുന്ന മാർഗ്ഗനിർദ്ദേശങ്ങളെ

അടിസ്ഥാനമാക്കി RFP-യിലെ വ്യവസ്ഥകൾ/യോഗ്യതാ മാനദണ്ഡങ്ങൾ നിശ്ചയിക്കാവുന്നതാണ.

- കേന്ദ്ര മലിനീകരണ നിയന്ത്രണ ബോർഡ പുറപ്പെടുവിച്ച "ഗൈഡലൈൻസ ഫോർ ഡിസ്പോസൽ ഓഫ ലെഗസി വേസ്റ്റ (ഓൾഡ മുനിസിപ്പൽ സോളിഡ വേസ്റ്റ) " പ്രകാരം ലെഗസി മാലിന്യ നിക്ഷേപങ്ങൾ നിർമ്മാർജ്ജനം ചെയ്യേണ്ടതാണെന്ന നിബന്ധന പ്രവൃത്തിയുടെ 'സ്കോപ്പ ഓഫ വർക്കിൽ' ഉൾപ്പെടുത്തുന്നുണ്ടെന്ന ഉറപ്പ വരുത്തേണ്ടതാണ.

- ലഭ്യമാകുന്ന ടെക്നിക്കൽ ബിഡ്സുകൾ പരിശോധിച്ച വിലയിരുത്തേണ്ടതും സാങ്കേതിക യോഗ്യത നേടുന്ന ബിഡ്ഡർമാരെ ബിഡ/ടെൻഡർ അംഗീകാരത്തിന്റെ തുടർ ഘട്ടത്തിനായി ഷോർട്ടലിസ്റ്റ ചെയ്യേണ്ടതുമാണ. ടെക്നിക്കൽ ബിഡ്സുകളുടെ മൂല്യനിർണ്ണയം നടത്തുന്നതിനായി താഴെപ്പറയുന്ന അംഗങ്ങളെ ഉൾപ്പെടുത്തി തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതിക സമിതി രൂപീകരിക്കേണ്ടതാണ;

    - സെക്രട്ടറി
    - LSGD (LID & EW) എഞ്ചിനീയർ
    - ഹെൽത്ത വിഭാഗം ഉദ്യോഗസ്ഥൻ (നഗര തദ്ദേശ സ്ഥാപനങ്ങളുടെ കാര്യത്തിൽ)
    - ജില്ലാ ശുചിത്വ മിഷനിൽ നിന്നുള്ള സാങ്കേതിക വിദഗ്ധൻ
    - ജില്ലാ മലിനീകരണ നിയന്ത്രണ ബോർഡിന്റെ പ്രതിനിധി
    - അക്കാദമിക സ്ഥാപനങ്ങളിൽ നിന്നുള്ള മറ്റ വിദഗ്ധർ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതികമായി ഷോർട്ടലിസ്റ്റ ചെയ്ത ബിഡഡർമാരുടെ ഫിനാൻഷ്യൽ ബിഡ്സുകൾ തുറക്കേണ്ടതും നടപടിക്രമങ്ങളും മാനദണ്ഡങ്ങളും പാലിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

- തിരഞ്ഞെടുത്ത കരാറുകാരന/ഏജൻസിക്ക ലെറ്റർ ഓഫ അവാർഡ (L O A) നൽകുകയും കരാറിൽ ഏർപ്പെടേണ്ടതുമാണ.

നിർവ്വഹണം, മേൽനോട്ടം, ബില്ലുകൾ തയ്യാറാക്കൽ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയറും മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങളുടെ നിരീക്ഷണ ചുമതലയുള്ള ഉദ്യോഗസ്ഥനും അടങ്ങുന്ന ഒരു മേൽനോട്ട സമിതി (Superv s on Commttee) രൂപീകരിക്കേണ്ടതാണ

- R F P ഡോകുമെന്റിലും കരാറിലും ഉൾപ്പെടുത്തിയിട്ടുള്ള 'സ്കോപ്പ ഓഫ വർക്ക' കരാറുകാരൻ കൃത്യമായി പാലിക്കുന്നുണ്ടോ എന്ന നിരീക്ഷിക്കുന്നതിനായി തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം മേൽനോട്ട സമിതിയെ ചുമതലപ്പെടുത്തേണ്ടതാണ.

- പ്രസ്തുത പ്രവൃത്തി 'സ്കോപ്പ ഓഫ വർക്കിൽ' നിഷ്കർഷിക്കുന്ന പ്രകാരമാണോ നടപ്പിലാക്കുന്നതെന്ന മേൽനോട്ട സമിതി കൃത്യമായും പരിശോധിക്കുകയും നിരീക്ഷിക്കുകയും ചെയ്യേണ്ടതാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ കരാറുകാരന/ ഏജൻസിയ്ക്ക സൈറ്റ ഹാൻഡ ഓവർ ചെയ്ത നൽകേണ്ടതും പ്രവൃത്തി നടപ്പിലാക്കുന്നതിനുള്ള/ നിർവഹിക്കുന്നതിനുള്ള പിന്തുണ നൽകുകയും ചെയ്യേണ്ടതാണ.

- മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങൾ നിരീക്ഷിക്കുന്നതിന്റെ ചുമതലയുള്ള ഉദ്യോഗസ്ഥൻ പ്രസ്തുത പ്രവൃത്തിയിൽ ഉൾപ്പെടുന്ന മാലിന്യ പരിപാലനവുമായി ബന്ധപ്പെട്ട പ്രവർത്തനങ്ങളായ വിൻട്രോ ഫോർമേഷൻ, മാലിന്യം

തരംതിരിക്കൽ, മലിനീകരണ നിയന്ത്രണ മുൻകരുതലുകളും ആരോഗ്യപരമായ കാര്യങ്ങളും ഉറപ്പുവരുത്തൽ എന്നിവയ്ക്ക മേൽനോട്ടം വഹിക്കേണ്ടതും കരാറുകാരന/ഏജൻസിക്ക മേൽനോട്ട സമിതി മുഖേന ആവശ്യമായ നിർദ്ദേശങ്ങൾ നൽകേണ്ടതുമാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ എംബുക്കിൽ 'ഇനിഷ്യൽ', 'ഇന്റർമീഡിയറ്റ്', 'ഫൈനൽ' ലെവലുകൾ എന്നിവ എടുത്ത അളവുകൾ രേഖപ്പെടുത്തേണ്ടതും, തദ്ദേശ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- കരാറിൽ വിശദമാക്കിയിട്ടുള്ള ജോലിയുടെ വിവിധ ഘട്ടങ്ങൾ പൂർത്തിയാക്കിയ ശേഷം കരാറുകാരൻ/ഏജൻസി ക്ലെയിം ചെയ്യുന്ന പ്രവൃത്തിയുടെ വർക്ക ബില്ലുകൾ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ തയ്യാറാക്കേണ്ടതും തദ്ദേശ സ്വയംഭരണ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- <u>GUIDELINES FOR IMPLEMENTATION OF PROJECTS FOR RECLAMATION OF LEGACY WASTE DUMPSITES THROUGH BIO REMEDIATION (BIO MINING AND MANAGEMENT OF RECOVERABLES AND REJECTS)</u>

As per the provisions of Solid Waste Management Rules 2016, local bodies are mandated to remediate legacy waste dumpsites and reclaim the land based on the guidelines issued by CPCB. Remediation of legacy dumpsites involves various activities such as assessment of the nature and quantity of waste to be remediated, excavation works to open the dumps, screening and sorting to segregate the waste fractions, reuse and sale/marketing of recovered materials, scientific disposal of rejects as per the norms. The remediation of dumpsites is further directed by Honorable NGT in its order on OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. However, the progress of implementation of such projects has not been satisfactory so far. One of the main reasons is that there is a lack of clarity in the procedures to be followed for legacy waste remediation projects right from the approval of the project to the mode of execution (including sale and disposal of recovered materials) by LSGIs since the nature of such projects is not similar to the general public construction/civil works. Also, the nature, quality and quantity of material that can be recovered from an existing legacy dumpsite cannot be accurately predetermined without opening up such dumpsites and hence it is not practical to prepare a workable estimate for the same like other public works . In order to tackle these issues, Swachh Bharat Mission(Urban) and CPHEEO have issued an "Advisory on Landfill reclamation", and suitable provisions of this advisory can be adopted for the State of Kerala. In these circumstances, the Government has examined this matter in detail, and the following guidelines are issued for the implementation of projects for remediation of legacy dumpsites by Local Self Government Institutions.

**<u>Standards, guidelines and advisories to be followed</u>**

- "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" issued by Central Pollution Control Board
- "SBM-U Advisory on Landfill Reclamation" published by MoHUA and

CPHEEO

- Guidelines issued by Government of Kerala in this regard from time to time

**Models for implementing legacy waste dumpsite remediation by LSGI's**

- 100% outsourced model (As per "SBM -U Advisory on Landfill Reclamation" published byMoHUA and CPHEEO)

**Implementing officer for legacy waste dumpsite remediation projects**

The implementing officer for legacy waste remediation shall be the Engineer of the LSGI

**Quantification of legacy waste to be remediated**

- The volume of legacy waste (in m3) to be remediated shall be generally assessed through Total Station Survey. If a total station survey is not feasible, a drone survey may be adopted for large dumpsites having a volume of more than 1 (One) Lakh m3.
- If required, external survey agencies may be engaged following laid down procedures and the cost for the same shall be met by LSGI from available funds.
- Contour mapping of the site shall be prepared and approved by the Engineer of the LSG

**Project Cost Estimation and Formulation by LSGI**

- Detailed report regarding the site conditions, nature of dump, history of dumping and other basic details shall be prepared in the format given in **Annexure - I**
- The estimate for biomining shall be prepared as per the specification and data given in
  - **Annexure -II**
- The overall cost for the implementation of the project shall be considered as part of the proposal.
- Project shall be taken up as per annual projects and funds from available sources shall be ear marked

**Technical Sanction**

- Technical sanction for the project shall be issued by the concerned Engineer in LSGD (LID & EW) as per the existing financial powers and necessary reporting to the Chief Technical Examiner (Finance Wing) may be ensured for compliance as per norms

**Implementation steps for remediation of legacy waste dumpsites by LSGIs**

**Tendering**

- Request for Proposals (RFPs-Two cover bid) clearly mentioning the scope of work, terms and conditions for reclamation of legacy waste dump sites shall be prepared and published as per laid down procedures.
- Conditions/eligibility criteria in the RFP shall be fixed based on the guidelines given in"**SBM-U Advisory on Landfill Reclamation"** published by MoHUA and CPHEEO
- It shall be ensured to mention in the scope of work that remediation of legacy waste dumpsites shall be undertaken as per the **"Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)"** issued by Central Pollution Control Board.
- The technical proposals received should be evaluated and technically qualified bidders shortlisted for further stage of bid approval. A Technical committee shall be formed at LSGI level for evaluation of the technical bids with the following members;
    - Secretary
    - LSGD (LID & EW) Engineer
    - Health Official (in the case of Urban local bodies)
    - Technical expert from District Suchitwa Mission
    - Representative from District Pollution Control Board
    - Other experts from academic institutions if any
- Financial bids of the technically shortlisted firms should be opened at LSGI level and approved as per procedures and norms
- Letter of Award (LoA) is to be issued to the selected contractor agency and agreement executed

**Execution, Supervision and preparation of bills**

- LSGI shall constitute a supervision committee consisting of LSGI Engineer and the officer in charge of monitoring waste management activity
    - LSGI shall authorise the supervision committee to monitor that the contractor correctly follows the scope of work included in the RFP document and agreement
- The supervision committee shall inspect and monitor that the work is being carried out as per the scope defined.
- LSGI Engineer shall hand over the site and provide support for execution of work at the site by the contractor/agency
- The officer in charge of monitoring waste management shall oversee the waste management related activities such as formation of windrows, segregation of waste into various streams,ensuring pollution control measures and health matters involved in the project and shall give direction to the contractor/agency through the supervision committee.

- LSGI Engineer shall measure, record quantities by taking initial, intermediate and final levels in M-book and Check measurements shall be done by the officials of LSGD (LID & EW) as per the powers vested with in the Local Self Government Department.
- LSGI Engineer shall prepare the work bills claimed by the contractor/agency after completing stages of work detailed in the agreement and check measurement shall be made by the officials of LSGD (LID & EW) as per the powers vested within Local Self Government Department.

## 1. Introduction

Social safeguard aspects during dump site remediation mainly focusing on meaningful stakeholder engagement, understanding stakeholder's risk perception and restoring them to a safe and environmentally sustainable state. It involves a series of systematic social actions which include social inclusion, effective labor management, and prevention of gender violence during the process, successive rehabilitation of the affected people and reduction of health risk of the host community. The bio mining process of Kalpetta municipal dumpsite has been included in the World Bank supported KSWMP project.

### 1.1 Profile of the ULB

The Kalpetta municipality is an Urban Local Body (ULB) of the Wayanad district of Kerala, covering an area of 40.74 square kilometers and it's divided into 28 administrative divisions. This municipality generates 13.82 tons per day (TPD) of solid waste. However, Kalpetta ULB do not possess adequate solid waste treatment and disposal facilities as mandated by the Solid Waste Management (SWM) rules, 2016. Consequently, unsegregated waste was disposed of in an unscientific manner; essentially dumped at the ULBs trenching ground (where feces/night soil used to be dumped from pit latrines) at Adlayed in ward 23. In order to promote a healthy and sustainable environment, it is imperative to undertake the remediation of the existing dumpsite. The socio-economic profile of Kalpetta is presented below table.

| Socio Economic Profile | |
|---|---|
| District Name | Wayanad |
| ULB | Kalpetta |
| Total Population of the ULB | 31,580 |
| Total Projected Population of the ULB (2023) | 37,997 |
| Total Male Population of the ULB | 15,401 |
| Total Female Population of the ULB | 16,179 |
| Total Scheduled Castes Population of the ULB | 2200 |
| Total Scheduled Castes Male Population of the ULB | 1125 |
| Total Scheduled Castes Female Population of the ULB | 1075 |
| Total Scheduled Tribes Population of the ULB | 3228 |

Table 2 Socio Economic Profile Data *Source: Census Data, 2011*

### 1.2 Profile of the Dumpsite

The Biomining and Bioremediation at the Kalpetta ULB dumpsite are proposed as part of the Kerala Solid Waste Management Project (KSWMP) with support from the World Bank and the Asian Infrastructure Investment Bank. The dumpsite in Ward 23, Adlayed spans an area of 1.12

acres and has accumulated waste for about 20 years since its establishment in 2000. The quantity of legacy waste slated for removal is approximately 9485.37 cubic meters. This site falls within an 8.5-acre land owned by the ULB, specifically designated for waste management. Within this area, a windrow composting unit, FSTP, and an RRF operate, maintaining a safe distance of 25 meters from the dumpsite. Importantly, the remediation process is planned to safeguard the physical assets of the waste management facility, ensuring no disruption to its operations.

### 1.3 Socio economic baseline of host community

Within a 200-meter radius from the dumpsite, there are no households, settlements, or establishments present. The RRF unit at the dumpsite engages six HKS workers, while the windrow composting unit employs nine workers. Access to the dumpsite is limited to a 3-meter road. Importantly, nearby public properties and commercial establishments will remain unaffected without any disruptions. There are no scheduled tribes, rag pickers, or other vulnerable communities residing in close proximity to the dumpsite. Approximately 700 meters away from the site, both a school and a college are operational. Throughout the dumpsite remediation process, waste transportation will utilize the road passing by these educational institutions.

### 1.4 Vulnerability mapping of Host community

The Vellaramkunnu dumpsite is situated within an isolated, hilly terrain spanning 8.5 acres, owned by the ULB. There are no vulnerable communities residing within a 200-meter radius of the dumpsite.

## 2. Output of the Social screening

### 2.1 Social Screening Checklist

The social screening has been conducted with a social screening checklist to assess potential social risks associated with the dumpsite remediation, yielding key findings:

- The dumpsite is inside the ULB's existing waste management facility, accommodating a windrow composting unit, RRF, and an FSTP, with approximately 16 workers employed across these units.
- No households are situated within a 200-meter radius of the dumpsite, and the project poses no threat to the religious or customary practices of any community members. Scheduled tribes or rag pickers do not reside nearby.
- In the Year-2 projects, the municipality plans to construct a new Material Collection Facility (MCF) within the same compound.
- Presently, no waste dumping occurs at the site. Bio waste is managed at the windrow unit, while non-bio waste is handled at the RRF facility.
- There are no expected adverse social impacts on dwellings, land, labor, livelihoods, or community resources of the host communities, and land acquisition or loss is irrelevant for project execution.
- Within a 700-meter radius, both a school and a college are located. Waste transportation during the remediation process will utilize the road passing these educational institutions.
- Given the low risk concerning the social and economic conditions of the host communities, the dumpsite falls into the "Moderate Risk" category.

### 2.2 Transect walk

On June 1, 2023, a transect walk was carried out as an integral component of the dumpsite bioremediation process. The primary objective was to evaluate the site, collect data on its positioning, potential social risks, existing infrastructure, and the effects on neighboring communities. The team engaged in observing, inquiring, listening, and visually documenting a transect diagram to investigate environmental and social resources, conditions, and systems.

### 2.3 Key Informant Interview

The Stakeholder meeting are required for understanding and addressing community concerns crucial for the success of projects like solid waste management. At the Vellaramkunnu dumpsite in Kalpetta, initial assessments conducted through social screening and transect walks revealed the absence of a host community within 200 meters, ensuring minimal impact on livelihoods or practices. However, a school and college within 700 meters were identified as the host community, as their students and staff use the same road for their transportation. Consequently, during the dumpsite remediation process, there might be a need for traffic control measures to ensure minimal disruption or inconvenience to the students.

On June 5, 2023, a stakeholder meeting was organised for the Vellaramkunnu dumpsite's remediation marked a crucial step in the project. Its primary aim was to engage the nearby community and open discussions about the remediation process going to start under the Kerala Solid Waste Management Project (KSWMP), backed by World Bank funding.

Notable attendees included the ward councillor, elected representatives, ULB officials HKS workers, representatives from Kristuraja school, NMSM College, TSC, and DPMU staff. The meeting focused on raising awareness about the dumpsite's challenges, addressing legacy waste issues, and discussing environmental concerns.

A detailed presentation showcased the proposed remediation process, outlining the required efforts from workers, ULB, contractors, and stakeholders, clarifying anticipated outcomes. Engaged participants raised queries about the process, which were addressed by TSC and DPMU experts.

This meeting proved vital in fostering community engagement, offering transparent communication about the remediation's particulars. It effectively disseminated essential information, addressed concerns, and garnered active participation from stakeholders. Such proactive engagement promises a smoother, more comprehensive implementation of the remediation efforts.

### 2.4 Stakeholder Consultation Meeting

At the Vellaramkunnu dumpsite in Kalpetta, initial assessments conducted through social screening and transect walks revealed the absence of a host community within 200 meters, ensuring minimal impact on livelihoods or practices. However, a school and college within 700 meters were identified as the host community, as their students and staff use the same road for their transportation. Consequently, during the dumpsite remediation process, there might be a need for traffic control measures to ensure minimal disruption or inconvenience to the students.

On June 5, 2023, a stakeholder meeting was organised for the Vellaramkunnu dumpsite's remediation marked a crucial step in the project. Its primary aim was to engage the nearby community and open discussions about the remediation process going to start under the Kerala Solid Waste Management Project (KSWMP), backed by World Bank funding.

Notable attendees included the ward councillor, elected representatives, ULB officials HKS workers, representatives from Kristuraja school, NMSM College, TSC, and DPMU staff. The meeting focused on raising awareness about the dumpsite's challenges, addressing legacy waste issues, and discussing environmental concerns.

A detailed presentation showcased the proposed remediation process, outlining the required efforts from workers, ULB, contractors, and stakeholders, clarifying anticipated outcomes.

Engaged participants raised queries about the process, which were addressed by TSC and DPMU experts.

This meeting proved vital in fostering community engagement, offering transparent communication about the remediation's particulars. It effectively disseminated essential information, addressed concerns, and garnered active participation from stakeholders. Such proactive engagement promises a smoother, more comprehensive implementation of the remediation efforts.

### 2.5 Findings of Social Screening

- The dumpsite's remote location suggests moderate associated risks.
- Throughout the dumpsite remediation, potential issues may arise concerning labor, gender-related matters, heavy noise, foul odors, dust emissions, and leachate affecting the wider region.
- Absence of rag pickers linked to the dumpsite implies no livelihood risks for them in this context.
- No necessity for government, forest, or private land acquisition is identified for the remediation project.
- Despite a total scheduled tribal population of 3228 within the ULB, no scheduled tribes reside near the dumpsite, with no observed impact on their land, customary rights, or livelihoods.
- Waste dumping at the site commenced in 2000 following a previous practice of depositing all waste from the Kalpetta ULB near the national highway opposite the Vellaramkunnu bus stop. Due to many protests, the ULB identified the present location and started to dump all the wastes. A significant amount of waste was deposited at the site following the 2018 flood.
- Despite its distance from settlements, there have been no reported protests at the current site.
- As part of this assessment, a social map was collaboratively created with local input, including that of the ward councillor.

### 2.6 Group discussions

A group discussion was organized at the ULB engaging various stakeholders, including people representative, Kudumbashree members, HKS, sanitation workers, and other stakeholder groups, to identify fundamental aspects of SIA with regard to the remediation process. This helped in understanding their perspectives, concerns, and aspirations related to the activity.

### 2.7 Key informants Interviews

As part of the assessment, DPMU and TSC conducted key informants' interviews (KIIs) among the nearby communities and gathered data on socio-economic conditions, waste management practices, and opinion on the proposed remediation project to develop suitable and adequate mitigation plans. The interviewer gathered information and concerns over the dumpsite from the interviewees. The present ward councillor, ex- ward councillor and a political party leader were interviewed as part of KIIs

### 2.8 Expected positive impacts on host community after remediation

#### 2.8.1 Waste free ULB

Creating a municipality free of waste is the major goal of addressing the dumpsite issue. The Vellaramkunnu dumpsite holds waste accumulated over two decades. Presently, due to the area's geography, this old waste isn't causing immediate problems for the community. However, it's crucial to acknowledge that potential future issues cannot be dismissed. Therefore, remediating the dumpsite serves as a proactive measure to prevent future complications arising from inadequate waste management.

#### 2.8.2 Enhanced quality of life

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. Also it results to a clean and hygienic work environment for the workers engaged in Windrow unit and the RRF.

#### 2.8.3 Economic opportunities

After remediating the site, the Municipality can plan for more solid waste management facilities such as enhancing the capacity of the MCF and RRF to process more non bio degradable waste and to set up a centralized waste management unit to process the bio degradable waste. These projects will create more job opportunities to the people who are looking for employment in waste management sector. The cleaned-up land can potentially be used for new construction, commercial development, or recreational activities.

#### 2.8.4 Land availability

The removal of the legacy wastes can improve the aesthetics of the area, reduce odour and noise pollution, and increase property values for surrounding residents.

## 3. Stakeholder Analysis

The significant stakeholders in the ULB with regard to the dumpsite remediation are as follows in the table:-

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| Service Providers | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt. institutions like PCB,KSEB, KWA, Kerala Fire & Rescue Services, DDMA etc | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | DPMU | Monitoring and Evaluation |
| 5 | TSC/PMC | Technical support and consultation |
| 6 | Contractor | Execution of the Remediation process |
| 7 | Service providers/ HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| Community | | |
| 8 | 16 Workers in the RRF and the windrow compost unit | Support and cooperation for the remediation process |
| 9 | School and college in between 500-700 mtr distance | Support and cooperation for awareness generation activities regarding the remediation |
| 11 | Labours of contractor/ Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |
| 12 | Rag Pickers | Participation in informal collection to strengthen the collection process to prevent further dumping |
| 12 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 13 | Owner of the Workshop and Grocery shop | Cooperating with the remediation process |

| SL. No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| 14 | Scrap dealers | Informal participation in NBD waste management to prevent further dumping after remediation |
| 15 | End recyclers | Process the inert and legacy waste safely after remediation |

*Table 4 Stakeholder Details*

# 4. Required Action plans

All the social risks were identified through the social screening and Transect walk conducted at site. Since there are families and institutions in the proximity of the dumpsite, below shown action plans have been formulated to be followed at site

### 4.1 Labour Management Plan

Approximately 30 labors are expected to be engaged in remediation process at a time.

A detailed labour Management plan has been prepared and attached as Annexure.

### 4.2 Labour Influx Management Plan

Anticipated labour influx to the site is approximately 20 laborers. Considering the potential risk due to the influx, a detailed labour Influx Management plan has been prepared and attached as Annexure.

### 4.3 Preventive GBV Action plan

Since an RRF and Bio waste processing units are functioning inside the dumpsite location there is chance of occurrence GBV incidents. A detailed GBV action plan has been prepared and attached as Annexure.

### 4.4 Citizen Engagement Plan

A Citizen Engagement Plan is crucial for addressing social issues during dumpsite remediation. It acts as a bridge between the project implementers and the affected community, for fostering collaboration, understanding, and collective action towards mitigating social issues during dumpsite remediation. A detailed citizen engagement plan has been prepared and attached as Annexure.

The assessment of potential social risk during the remediation process and the identification from social screening with screening checklist, transect walk and focus group discussion indicates that there will not be any impact on the livelihood of the community and service providers.

It is identified that land acquisition is not required as sufficient land is available.

**Annexure 1: Labour Management Plan**

### 4.1.1. Introduction

Project Tittle: Project for the Dumpsite biomining and bioremediation, Adlayed, Kalpetta Municipality

Project area: The Dumpsite of Kalpetta Municipality is situated in ward 23 of the municipality, covering an area of 1.12 acres.

### 4.1.2. Scope and structure of the labour management plan

The scope of the LMP shall be as outlined in the World Bank's ESMF. The engagement will be planned as an integral part of the project's social assessment and project design and implementation. This document has 10 chapters. This chapter viz., chapter 1 served as introduction. Scope and structure of LMP is provided in chapter 2. An overview of labour use in the project is presented in chapter 3. Key potential labour risks are listed in chapter 4. Legislative framework governing labour employment in India/Kerala is discussed in chapter 5. Implementation Arrangements, policies and procedures follow in the subsequent chapter. Grievance redressal mechanism, contractor management are presented in the last chapters.

### 4.1.3. Details of Labours

The proposed remediation process requires following category and number labors

| S. No | Manpower | Nos |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental Health & Safety Engineer | 3 |
| 3 | Security (3 X 8 Hrs) | 2 |
| 4 | Operations Supervisor & Accountant | 2 |
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 4 |
| 8 | Labors near Screening machinery | 2 |
| 9 | Labors at Baling facility | 11 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 1 |
| | **Total** | **30** |

### 4.1.4. Assessment of key potential labour risks

**Project Activities:**

The bioremediation of the dumpsite includes the following activities.

- Mobilization of plant and machinery for bio-mining
- waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement
- sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

**Key Labour Risks**

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to:

- Injuries/accidents/ fatalities leading to even death, while at work.
- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.
- Security of women workforce.

- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female SWM workers are engaged.
- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form workers organizations, etc.
- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

### 4.1.5. Brief overview of labour legislation: Terms and conditions

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923 | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the |

| Sl No | Applicable Acts | Details |
|---|---|---|
| | | Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the Central Government. The |

| Sl No | Applicable Acts | Details |
|---|---|---|
| | | Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10. | Industrial Disputes Act 1947: | The Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

#### 4.1.6. Responsibility Mapping

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring labourers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing labourers, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the labourers. The ULB will actively monitor the contractor's compliance with legal and welfare

requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

### 4.1.7. Code of conduct

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured.

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favors or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)
- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)

- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favors, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

### 4.1.8. Systematizing the code of conduct

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

### 4.1.9. Transparency in contract specific terms and conditions

**All contracts must contain**

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism

**4.1.10. Labour management plan matrix**

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively. | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | ULB |
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | 2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being | One notice board | As soon as the work is started. | Photographs of the notice board where the license is | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| carried on.<br><br>To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board | Do | displayed.<br><br>do | |
| To conduct pre- employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| | | | registered medical practitioner. | |
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| To arrange separate First Aid room at work site | Allot one specified room | To be made available during the construction period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labours or staff members through an authorised agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the | Letters issued by the hospital | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| | | commencement of the work | or correspondence and agreement with the hospital. | |
| To establish rest room at work site or camp site | | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. Female members should be minimum 50%. ) | | As and when work starts | Copy of register and minutes of meeting. Complaint box | Contractor |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| | | | etc | |
| Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | Contractor |
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act<br>2. The Employee compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act<br>5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity Benefit Act | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| Conduct HIV/AIDS awareness programmes | As per requirement | Once in six months | Reports, photographs etc | Contractor |
| All the Drivers should possess effective and valid | Drivers should be selected after | As and when drivers are | Photocopy of license ids to be | PIU |

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| Driving Licence | verification of DL | appointed | collected | |
| All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only after procurement of third-party insurance to the vehicle | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

**Budget for LMP**

## Annexure 3: CITIZEN ENGAGEMENT PLAN

### 4.3.1. Stakeholder identification

Host community: Close to the Vellaramkunnu Dumpsite, there are no residences or communities within a 200-meter radius. However, within 1 KM distance, both a school and colleges are in operation. The students of these institutions should be considered as the host community. The students of these institutions utilize the same road for their transportation. Consequently, during the dumpsite remediation process, there might be a need for traffic control measures to ensure minimal disruption or inconvenience to the students.

Waste Generators: The identified service providers of the dumpsite are as follows:

| Sl.No | Waste Generators | Nos |
|---|---|---|
| 1 | General Households | 100 |
| 2 | Shops | 3 |
| 3 | Institutions | 7 |

Service Providers: The identified service providers of the dumpsite are as follows:

| Sl. No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| Service Providers | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like District administration and line departments, PCB,KSEB,KWA, Fire&Safety, Police and Geology Dept. | To deliver necessary approvals and provide necessary services. |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | Contractor | Execution of the Remediation process |
| 5 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| 6 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |

### 4.3.2. Need of the plan

Creating a Citizen Engagement Plan for dumpsite remediation is crucial for involving and addressing the concerns of the community. Ultimately, the primary objective is to create a

collaborative and inclusive environment that empowers the community, ensures their concerns are heard and addressed, and leads to a successful and mutually beneficial dumpsite remediation project. Citizen engagement as part of the proposed bioremediation of dumpsite in Kalpetta municipality aims to facilitate two-way communication between the project and its stakeholders to make better informed decisions. Such an engagement will certainly pave the way for better implementation of the project, and it will ensure public participation in trouble shooting at all the stages of the implementation of the project.

### 4.3.3. Objective of the plan

The citizen engagement plan for the proposed dump site remediation is prepared with following objectives.

- To build and maintain trust between the project implementers and the affected community by fostering open communication, addressing concerns, and demonstrating a commitment to community welfare.
- To actively involve the community in the decision-making processes related to the remediation, allowing them to voice concerns, provide feedback, and contribute ideas
- To empower community members by providing them with the necessary information, skills, and opportunities to actively participate in and potentially benefit from the remediation project.
- To suggest appropriate activities with a monitoring plan and an expected budget for engaging the stakeholders with the motive of enhancing their ownership in the project through increased participation
- To ensure that the engagement plan contributes to sustainable outcomes by fostering community support, minimizing social disruptions, and maximizing the positive social, economic, and environmental impacts of the remediation effort.

### 4.3.4. Stakeholder concerns

#### 4.1 **Waste Generators**

There are no host community within 200-meter distance. Within a 700-meter radius, both a school and a college are located. Waste transportation during the remediation process will utilize the road passing these educational institutions. Thus, these two institutions can be considered as the host community. Major concerns of the host community can be understood as: -

1. Concerns about air pollution during the remediation process.
2. Worries about disruptions to daily life due to noise, increased traffic, temporary road closures, or alterations in access to local amenities.

Addressing these concerns through transparent communication, community engagement, robust safety measures, and considering the community's input in the remediation process is crucial to gaining their trust and support for the project.

1. **Service Providers**

Major concerns of the service providers which has to be addressed by the citizen's engagement plan can be summarized as follows;

- The Kalpetta Municipality authorities are unaware about the urgency and importance of remediating the dumpsite. Their improved involvement through proper sensitization is essential to the effective implementation.
- SWM related Service providers/HKS of Municipality should be trained and motivated for proper timely collection, segregation and transportation of waste to appropriate processing units to prevent the formation of such dumping yards in the future
- Compliance with Regulations: Ensuring that the remediation process complies with local, regional, and national environmental, labour regulations and standards to avoid legal repercussions.
- Health and Safety: Prioritizing the health and safety of workers and the environment during the remediation process to mitigate potential risks or hazards.
- Community Relations: Managing community relations and concerns by maintaining open communication, addressing grievances, and ensuring community involvement in decision-making processes.
- Long-term Sustainability: Ensuring that the remediation efforts result in a sustainable and long-term solution at the site.
- Monitoring and Maintenance: Establishing post-remediation monitoring and maintenance plans to ensure the continued effectiveness of the cleanup efforts and prevent future recontamination.

Addressing these concerns involves careful planning, adherence to regulations, effective resource management, community engagement, and a commitment to long-term sustainability to ensure successful dumpsite remediation.

### 4.3.5. Activities proposed

5.1 **Community/citizen Awareness**

- Awareness programs focused to the students of the nearby schools.
- Organize exposure visit for the identified members from host community and council members
- Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency.
- Sensitization programs to nearby vendors

**Awareness to Service providers**

1. **Training and Workshops**: Providing comprehensive training sessions or workshops to service providers, including contractors, waste management personnel, and other relevant parties. These sessions could cover safety protocols, handling of hazardous materials, proper waste disposal techniques, and adherence to project timelines.
2. **Information Dissemination**: Distributing detailed information packets, manuals, or guides outlining the remediation plan, activities, and protocols to service providers. This ensures everyone involved understands their roles, responsibilities, and the overall objectives of the project.
3. **Continuous Updates**: Providing regular updates and progress reports to service providers to keep them informed about any changes, challenges, or developments in the project. This enables them to adapt and align their activities accordingly.
4. **Risk Mitigation Strategies**: Educating service providers about potential risks associated with the remediation process and implementing strategies to mitigate these risks. This could include safety measures, emergency response protocols, and environmental protection procedures.
5. **Collaborative Engagement**: Encouraging open communication and collaboration among service providers, fostering a team approach to problem-solving and ensuring a cohesive effort toward achieving the project goals.

By raising awareness and providing comprehensive information and guidance to service providers, the remediation project can be executed more effectively, ensuring adherence to standards, safety, and the overall success of the dumpsite remediation initiative.

### 4.3.6. Citizen Engagement Plan

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Limited Awareness and Information | • Misleading information on the project<br>• Lack of understanding on the scientific information about the project | Consultation meeting in the school, college and the ULB level<br>Awareness campaign | Contractor |
| 2 | Communication Barriers | Lack of effective communication channels, or difficulties in reaching all community members, lack of apt communication strategies/ materials can hinder engagement efforts | Location specific communication strategies are to be designed and developed | Contractor |
| 3 | Delay in decision making and timely support from the ULB | The community people will lose the hope about the project | Sensitization on bioremediation activities for the Kalpetta Municipality council and staff before the commencement of the remediation | ULB |
| 4 | GRM committee | If proper GRM system is not in place, it will affect the project's goodwill.<br>And there are possibilities of emergence of issues from the community people. | Constitution of a project level GRM Committee to take-up any social issues raised at site level | ULB/ Contractor |
| 5 | Time and | Engaging the community | Proper planning | Contractor |

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| | Resource Constraints | requires time, resources, and sustained effort. Communities might have limited time or resources to dedicate to engagement activities. | for the activities based on the host community's convenience. | |
| 6 | Complexity of Information | Dumpsite remediation processes can be complex, involving technical or scientific information that might be challenging for the community to understand, hindering meaningful engagement | Circulation of communication materials in simple local language with attractive pictorial representation | Contractor |

**4.3.7. Monitoring Plan**

| S. No | Activity | Means of Communications | Monitoring Indicator | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activities for the Municipal Council and officials | Presentation and group discussion | No of councilors and officials attended | DPMU/DPMC/ TSC |
| 2 | Sensitization meeting to host community | Presentation and group discussion | No of persons attended. | DPMU/DPMC/ TSC |
| 3 | Formation of GRM committee | Meeting and presentation | Office order/ proceedings | DPMU/DPMC/ TSC |
| 4 | One to one meeting district administration, | Presentation | No of one-to-one meeting | DPMU/DPMC/ TSC |

| S. No | Activity | Means of Communications | Monitoring Indicator | Monitoring Responsibility |
|---|---|---|---|---|
| | line departments, PCB, KSEB, KWA, Fire & Safety and Police | | conducted / no of officials attended | |
| 5 | Organize exposure visit incorporating the GRM members and council members | meeting | No of person gone for exposure | DPMU/ TSC/DPMC |
| | IEC display board | IEC boards | No of IEC developed and displayed | DPMU/DPMC/ TSC |
| 6 | Orientation to the Service providers/HKS of Municipality | Presentation / meeting | No of HKS attended the orientation | DPMU/DPMC/ TSC |
| 7 | Issue based one to one meeting with Govt institutions like PCB,KSEB,KWA, Health Department | Presentation / meeting | No of officials attended the meeting | DPMU/DPMC/ TSC |

**4.3.8. Budget**

| S. No | Activity | Specification | Quantity | Cost |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activity is to be conducted for the Municipal Council and officials prior to the commencement of the actual bio-remediation process | Half day Program for Councilors and Health Staff | 1 | [redacted] |
| 2 | Sensitization meeting to | Half day Program by | 2 | [redacted] |

| S. No | Activity | Specification | Quantity | Cost |
|---|---|---|---|---|
| | host community | incorporating all host community members | | |
| 3 | Formation of GRM committee at local level to take up any issue raised at site level and help to resolve an emergency. | Committee formation | 1 | [redacted] |
| 4 | Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc. | One to one interaction | As required | [redacted] |
| 5 | Organize exposure visit incorporating the GRM members and council members | Exposure visit to Alappuzha | 15 participants-1programme | [redacted] |
| 6 | Orientation to the Service providers/HKS of Municipality | Half day programme | 2 | [redacted] |
| 7 | Issue based one to one meeting with Govt institutions like PCB,KSEB,KWA, Health Department and police | One to one | As required | [redacted] |
| **Total** | | | | [redacted] |

## Summary

### Introduction

The Kasaragod municipality is an Urban Local Body (ULB) of in the Kasaragod district of Kerala, covering an area of 16.7 square kilometers (sq.m) and divided into 38 administrative wards. This municipality generates 35.60 tons per day (TPD) of solid waste. However, Kasaragod ULB does not possess an adequate solid waste treatment and disposal facilities as mandated by the Solid Waste Management (SWM) Rules of 2016. Consequently, un-segregated waste was disposed of in an unscientific manner; essentially dumped at the ULBs trenching ground (where feceas/night soil used to be dumped from pit latrines) at Thalipaduppu in ward 4. Over the years of past 50 years, Thalipaduppu dumpsite saw various types of wastes dumped there. In order to promote a healthy and sustainable environment, it is imperative to undertake the remediation of the dumpsite

### Subproject Description

The Biomining and Bioremediation at the Kasaragod ULB dumpsite is proposed as part of the Kerala Solid Waste Management Project (KSWMP) in collaboration with funding from the World Bank and the Asian Infrastructure Investment Bank. The dumpsite situated in Ward 4, Kasaragod, covers a total area of 1.1 acres and contains a legacy waste quantity of 16,736 tons. The waste at the site is approximately 50 years old, with dumping activities started in 1970 and stopped in 2010. Initially, the dumpsite served as a trenching ground for the disposal of sewage from pit latrines. The total volume of waste accumulated is approximately 20,115 cubic meters, and the dumpsite spans across an area of 1.1 acres.

i. **Status of Subproject Development at the time of EIA**

   Currently, the dumping has stopped at site and solid waste of the ULB is treated and disposed at multiple decentralized facilities across the city. The entry to the dumpsite is facilitated by a 4-meter-wide approach road in good condition, located in Adkathbail - Kasaragod.

ii. **Technical Aspects**

Following a comprehensive evaluation, the method or technique of Bio-mining with a goal of achieving 100% land reclamation and recovery is found to be the most suitable remediation approach, ensuring long-term sustainability and environmentally responsible treatment of legacy waste, leading to the complete remediation of the dumpsite. Based on the Feasibility and site conditions, Mobile Trommel machinery would be the most suitable option for the small site at Thalipaduppu Kasaragod. The optimal time frame for conducting the Bio mining Process would be from December to April Months, a period characterized by lower rainfall levels as per climate data.

**Application of Regulatory and Guidance Framework**

In accordance with the SWM Rules of 2016, the selection of an appropriate method or technique for remediating a dumpsite should be determined through a feasibility study that considers technical, financial and Environmental aspects complying with regulatory requirements (CPCB, KSPCB and NGT). The formulation of the subproject adhered to the State/National and World Bank safeguards policies, both in its planning phase and will continue to do so during the implementation and monitoring stages. This commitment to compliance will be upheld by the ULB the project period.

**Baseline Environmental Scenario**

A detailed environmental baseline study was conducted for analyzing quality of air, groundwater, surface water, noise levels, and leachate characteristics. The preliminary Environmental Screening [Annexure -1] and the detailed assessment showed that this sub project falls under “E2” category.(Please note that suggestive environmental categorization of dumpsite bio mining/ bioremediation as per EMF for KSWMP is E1.However,considering the very small extent of the dumpsite, absence of any sensitive environmental feature in or around the site , short bio mining period, and the overall positive impacts of the proposed development post mitigation measures; this is categorized as E2. At this stage, locations for disposal of bio mined wastes is unknown, the subproject would be re categorized if the

Copyright © 2023. KSWMP| All rights reserved

locations are near any sensitive areas. In case the bio mining is clubbed with other multiple sites also, the overall categorization would be reconsidered)

An analysis has been conducted at the site to review and comprehend the physiography, climate, soil, cultural heritage, ecology, and biodiversity of the dumpsite. This assessment aims to identify potential impacts on the environment, human health, and biodiversity. Additionally, a traffic assessment has been performed to analyze traffic patterns and movements during the project's implementation phase

**Terrestrial Ecology:**

The nearest Forest/Protected Area, known as Parappa Forest, is located approximately 26 kilometers away from the site. Various indigenous flora and fauna species commonly inhabit the vicinity of the site.

*Tinospora cordifolia. Miers (Amruthu or Chittamruthu), Strobilanthes heyneanus. Nees (karikurunhi), Vitex negundo L (Karinotchi), Strychnos nux-vomica (kanjira maram), Haliaeetus leucogaster (white bellied sea eagle), Ailanthus sp. (Tree), Areca catechu (Tree), Cyathula prostrate (Herb) Aporosa cardiosperma (Shrub).* Among the reptile population, the Indian rat snake *(Ptyas mucosa) has been noted.* Additionally, several plant species, including *Macaranga peltata, Bauhinia sp., Ficus sp. (Banyan), and Ficus hispida (Parakam),* are also present. The species listed were not classified as Critically Endangered by International Union for Conservation of Nature (IUCN)

**Air Quality:**

Air monitoring was conducted continuously for a 24-hour duration at all sites, and the obtained results were meticulously analyzed against the National Ambient Air Quality Standards (NAAQS) of 2009. It is noteworthy that all measured pollutants' concentrations were found to be well within the permissible limits. Furthermore, no presence of hazardous or toxic gases was detected during the monitoring process.

**Water Quality:**

The monitoring of water quality was carried out at 3 locations for Ground water & 1 Location for Surface Water.

Groundwater samples were collected from three distinct locations, each within a radius of 200 m from the site. The analysis of these samples revealed that all parameters examined fall within acceptable limits, with the exception of Iron, Color and turbidity. Surface water

Copyright © 2023. KSWMP| All rights reserved

assessment indicates that the Madhuvahini River is located approximately 4.5 kilometers from the site. Additionally, there is a nearby drain that transports surface runoff, wastewater from the surrounding area, as well as leachate and drainage from the site. A Surface water sample was obtained from a specific location known as Shankarankuzhi thodu, which is at an aerial distance of 300 meters from the site. Upon analysis, it was determined that all examined parameters are within acceptable limits, with the exception of Biological Oxygen Demand (BoD).

**Noise Level:**

Sample for noise level monitoring were collected within the dumpsite to assess the current ambient noise levels. The results indicate that the noise levels observed are comfortably within the permissible limits. However, it shall be noted that there is no activity currently on site. And noise levels are expected to increase with bio mining activity.

**Assessment of Risks/Impacts and Proposed Mitigation measures and Monitoring**

The anticipated impacts of the interventions proposed have been analyzed in detail and mitigation measures proposed. The Environmental Impact Assessment (EIA) and Social Impact Assessment (SIA) documents, which assess the potential environmental and social impacts of the proposed sub project, serve to identify potential risks, formulate mitigation measures and ensure compliance with environmental and social standards regulations. This dumpsite remediation project comprises an overview of the current environmental conditions within the project area. Furthermore, the report delineates the environmental baseline data, Disaster Management Plan, identification of sensitive receptors and a Fire Risk Assessment. key environmental risks include leachate and storm water from the site impacting the nearby areas, odor (including gas), visual blight ,flies& pests, storage and disposal of retrieved materials, fire, accident& other disasters, and health and safety of workers. Possible future dumping of wastes after bio mining is also a concern. Mitigation and management measures for these in line with mitigation hierarchy are included in the EMP.

Proposed mitigation measures are designed to address environmental and social impacts effectively, with the goal of minimizing negative consequences while maximizing positive outcomes. Additionally, this report encompasses an Environmental Management Plan

Copyright © 2023. KSWMP| All rights reserved

(EMP) and a Social Management Plan (SMP), providing detailed strategies for the management of the project's environmental and social facets.

In addition, a detailed Environment Monitoring Plan and Social Monitoring Plan will outline the monitoring procedures to assess the efficiency of mitigation measures and guarantee adherence to environmental and social standards. To ensure seamless and timely execution, the dumpsite remediation subproject report also includes an Environmental and Social Budget. This ensures a sustainable and responsible bio-mining process that prioritizes the protection of the environment and the well-being of nearby communities throughout the waste remediation process.

**Implementation Mechanism & Budget**

The Bio-mining project, with the objective of achieving 100% land recovery, will be carried out exclusively through an outsourcing model. The bio mining process will be conducted separately at each ULB. If the land is found to be contaminated with hazardous wastes, the subproject shall be excluded. For solid waste/leachate contamination on site proper remedial measures will be followed before utilizing for future facilities. Retrieved materials and recyclables may be handed over to the authorized recyclers and the usage of these retrieved fractions is unknown today as it would be as per the contractors proposal /plan. However, such reuse/recycling/disposal would be in line with National/State regulations which are stringent. The land will be restored to its pre-waste dumping condition, necessitating the complete removal of all legacy waste until it reaches the original land surface. Following the completion of the bio-mining process, the machinery and vehicles belonging to the implementing agency must be vacated within 7 days. No waste material shall remain on site after contract period. The reclaimed land, free of any encumbrances, will then be transferred to the Urban Local Body (ULB).

The total budget proposed for Environmental Management and monitoring Budget is [redacted] /- including social budget.

**Consultation &Disclosure**

A transect walk was also carried out to assess the socio-environmental characteristics in the vicinity of the dumpsite. To understand the social dynamics, demographic profile,

Copyright © 2023. KSWMP| All rights reserved

livelihood patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community, a transect walk was carried out on 30.05.2023, (Attendees – 17 no.s) which was crucial for developing effective dumpsite remediation strategies that align with their priorities. The findings and recommendation of the transect walk is shown in the following table.

| S.No | Social risks | Findings and Recommendations |
|---|---|---|
| 1 | Presence of 100 families, institutions, shops, establishments, and other public utilities near (200m) the dumpsite. | • Free movement of the residents needs to be ensured<br>• The livelihoods of the workers attached to these facilities should not be affected if the working hours of public utilities including shops and establishments are restricted, at any cost |
| 2 | Sound pollution, health issues and foul smell most affects 6 families residing very close to the site (50m). | SIA and SMP will consider the detailed impact and proper mitigation measures |
| 3 | Health risk of vulnerable groups residing near to the site (especially 6 families) which includes patients with breathing issues, pregnant women, PWDs, cancer patients, children below the age of two and elderly above the age of seventy-five. | Health issues may aggregate during work operations.<br>These factors should strongly be considered especially for all vulnerable groups |

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# 1. INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake biomining of multiple Legacy Waste Dumpsites in various districts.

## 1.2 The rationale for the Proposed Sub-Project

Thalipaduppu (Kelugudde) dumpsite in Kasargod ULB at ward no.4 has a total waste quantity of 16,736 Tons, spreading over 1.1 acres. The site is located between Lat-12°30'59.0"N and Long - 74°59'20.7"E and has an elevation of MSL +27 (m), with a gentle slope towards the North-eastern part. During monsoon season, due to geography of the site waste flows downhill towards residential areas located at northern side of the site. Kasaragod ULB proposes biomining and bioremediation of the Thalipaduppu legacy waste dumpsite site under KSWMP supported by the World Bank and Feasibility Report has been prepared for this subproject. Considering the environmental and social impacts associated with legacy dumpsite biomining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

## 1.3 Objectives and scope of Environmental & Social Impact Assessment

***Environmental Categorisation and Assessment:***

As per indicative categorization for dumpsite biomining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation waste spread (1.1acres) and absence of environmentally sensitive features around, this subproject is individually considered as E2, and EIA is prepared accordingly. Required monitoring and analysis are carried out considering the possible impacts.

***Social Impact Assessment***

Under this category social impact assessment is also a key factor to be considered. Accordingly, detailed assessment of the environmental and social impacts was carried out.

**1.4 Proposed sub project details**

*Table 1Proposed sub project details*

| Description | Details |
|---|---|
| Name of ULB | Kasaragod |
| District | Kasaragod |
| Taluk | Kasaragod |
| Total present population in the ULB | 57,005 |
| Name of the sub-project | Dumpsite Remediation at Thalipaduppu |
| Location of the sub-project | (Kehugudde) Thalipaduppu at ward no 4 |
| Total dumpsite area (in acres) | 1.1 |
| Total waste accumulated area (in acres) | 1.1 |
| GPS Co-ordinate of the Site | Latitude: 12°30'59.0"N,<br>Longitude 74°59'1037"E |
| Legacy waste quantity | 16,736 tons |

Copyright © 2023 KSWMP| All rights reserved

*Figure 1Legacy Waste Dumpsite at Thalipadappu*

The technology proposed is Bio mining and bio remediation in line with CPCB's Legacy Waste Bio mining Guidelines, 2019. The various phases in the biomining process (as per Legacy Waste biomining Guidelines of CPCB) are shown below.

Copyright © 2023. KSWMP | All rights reserved

*Table 2 Phases of Biomining*

| Phases of Bio-mining | |
|---|---|
| **Phase 1: Stabilization** | The legacy waste is formed into equal-sized windrows and which are turned frequently, bio-culture is added and de-odor izer (an odor-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| **Phase 2: Sorting & Segregation** | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommel/circular rotator sieves and manpower. |
| **Phase 3: Disposal & Utilization** | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |

**1.5 Site management plan**

The plan aims to minimize potential adverse impacts on sensitive receptors while maximizing the recovery of valuable resources and promoting site restoration.

Mobile machineries will be used for biomining of the small Thalipaduppu, Kasaragod dumpsite, and they do not require a separate area for erection. The waste will be excavated and directly fed into mobile screeners for processing. This approach minimizes the need for additional infrastructure and optimizes the efficiency for the biomining process. The proposed plan is as follows

Copyright © 2023 KSWMP| All rights reserved

## 2. POLICY AND REGULATORY FRAMEWORK

### 2.1 National, State Legislations and Technical Guidelines related to environmental and social aspects of dumpsite remediation

*Table 4 Applicable rules and regulations for Thalipadappu dumpsite remediation*

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| 1 | The Motor Vehicle Act, 1988 | All vehicles used for installation and operation will need to comply with the provisions of this act and should have valid Pollution Under Control Certificate. |
| 2 | Authorization from PCB for storing Hazardous material like diesel for DG sets as per Hazardous and Other Wastes (Management & Transboundary Movement) Rules, 2016 | Hazardous waste (used oil from DG Sets) is likely to be generated during the erection and operation stage. Hence, authorization under the purview of the rule shall be requiring. |
| 3 | Labour Act | Occupational safety and health administration. |
| 4 | Solid Waste Management Rules, 2016 (MSW Rules) | To operate the mobile Bio mining plant, it is necessary to follow the existing MSW rules. |
| 5 | The Water (Prevention and Control of Pollution) Act, 1974 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 6 | The Air (Prevention and Control of Pollution) Act, 1981 | Consent to Establish and Consent to Operate to be obtained during the construction phase and operation of waste recycling/disposal facilities |
| 7 | safety of the workers as per the ILO Convention No. 62 | Safety aspects |
| 8 | NOC from fire department | Safety aspects |
| 9 | Tree felling permission:<br>If felling of trees as defined in Kerala Preservation of Trees Act, 1986 | If any tree needs to be cut or replanted concerned permission is required from Forest Dept. Government of Kerala. The ULB will take the necessary permission. |
| 10 | NGT guidelines upto date | Relevant to the subproject to be considered for the successful implementation of the project. |

Copyright © 2023 KSWMP | All rights reserved

| S. No | Rules and Regulations | Relevance |
|---|---|---|
| 11 | Building and Other Construction Workers (Welfare Cess Act) 1996, | Discusses Health and Safety and environmental aspects associated with construction and allied works |
| **Other Applicable Rules** | | |
| 12 | Solid Waste Management Rules, 2016 (SWM Rules) | |
| 13 | Plastic waste Management Rules, 2016 | |
| 14 | Construction & Demolition, Waste Management Rules, 2016 | |
| 15 | Batteries (Management and Handling) Rules, 2001 | |
| 16 | E-Waste (Management) Rules, 2016 | |
| 17 | SBM-Urban Advisory on Landfill Reclamation, CPHEEO, June 2020. | |
| 18 | Kerala Municipality Act, 1994 & Rules | |
| 19 | Hazardous & Other Wastes (Management And Transboundary Movement) Rules, 2016 | |
| 20 | The Operational Policies (Safeguards) of the World Bank and the Environmental and Social Management Framework; and the World Bank EHS Guidelines | |

## 2.2 The World Bank Safeguards Policies

*Table 5World Bank Safeguard Policies*

| S.No. | WB Policy | Safeguard policy applicable | Description |
|---|---|---|---|
| 1 | Environmental Assessment (OP/BP 4.01) | Yes | The project has potential impacts and pose risks to various environmental factors during the implementation phase. Consequently, this policy is triggered, necessitating assessment and management of E&S risks and impacts, and ensuring a structured approach to safeguard management for risk mitigation including (health &safety risks, risks and impacts due to linked activities) in alignment with regulatory requirements, and Environmental and Social Management Framework (ESMF). |
| 2. | Natural Habitats (OP/BP 4.04) | Yes | Though the project will not support any activities that involve conversion or degradation of natural habitats; However, impacts on any flora/fauna on site during the proposed activity is important. |
| 3 | Pest Management (OP 4.09) | Yes | Considering the possible pest related issues as the project deals with wastes and improvements to dump sites. OP 4.09 Pest Management is triggered. As per this policy the banned pesticides/insecticideslisted by the Nation / State and the World Health Organization (WHO) other national/ state bodiesshould not be used in the project, and as much as possible Integrated Pest Management Options shall be followed |
| 4 | Physical Cultural Resources [PCR] (OP 4.11) | Yes | The proposed project will not support any activities that could potentially harm nearby cultural heritage, archaeological sites and physical resources valuable to the community |

Copyright © 2023 KSWMP | All rights reserved

## 3. BASELINE ENVIRONMENTAL SCENARIO

### 3.1 Project location of the site

Thalipaduppu dumpsite in Kasaragod ULB at ward no. 4 is non-operational and dumping of waste stopped due to public protests during the year 2010.The location detailed are described in the previous section of 1.1 and 1.4.

*Table 6Sensitive receptor around the Dumpsite*

| S.No | Sensitive Receptors | Distance |
|---|---|---|
| 1 | Residential buildings | 60 households are located within 200 m radius of the dumpsite |
| 2 | Educational institutions such as Govt. UP school Adkathbail | 750 m |
| 3 | Arabian Sea | 1.86 Km |
| 4 | Nearest Stream (Sankaran Kuzhi thodu) | 300 m |

### 3.2 Methodology for Environmental Baseline studies

Baseline Study in EIA process usually includes data collection and analysis of various aspects in the project area, such as: Physical Environment (e.g., topography, geology, soil, water, air quality, and climate) and Biological Environment (e.g., flora and fauna, Land/Soil, habitat, biodiversity, and ecological processes). The overall methodology of EIA

1) Scoping, Environmental Screening, Exclusion and Categorization
2) Environmental Baseline study like analysis of Air, Water, Soil and Noise/Vibration and impacts on biodiversity, workers and people around
3) Environmental Impact Assessment
4) Avoidance of adverse impacts, minimization, mitigation, and management measures
5) Environmental Management Plan (EMP)
6) Environmental Monitoring Plan (EMoP)
7) Budget for implementation of EMP and EMoP

The below table indicates the environmental attributes and frequency of monitoring

Copyright © 2023 KSWMP| All rights reserved

*Table 7Environmental Attributes*

| S.No | Attributes | Parameters | Latitude & Longitude | No. of sampling locations | Frequency of monitoring / Data collection |

### 3.5 Description of Environmental Parameters

Under this baseline environmental attributes are arrived at after analysis of samples taken from the dumpsite and surroundings viz ground water, surface water, Noise level and air.

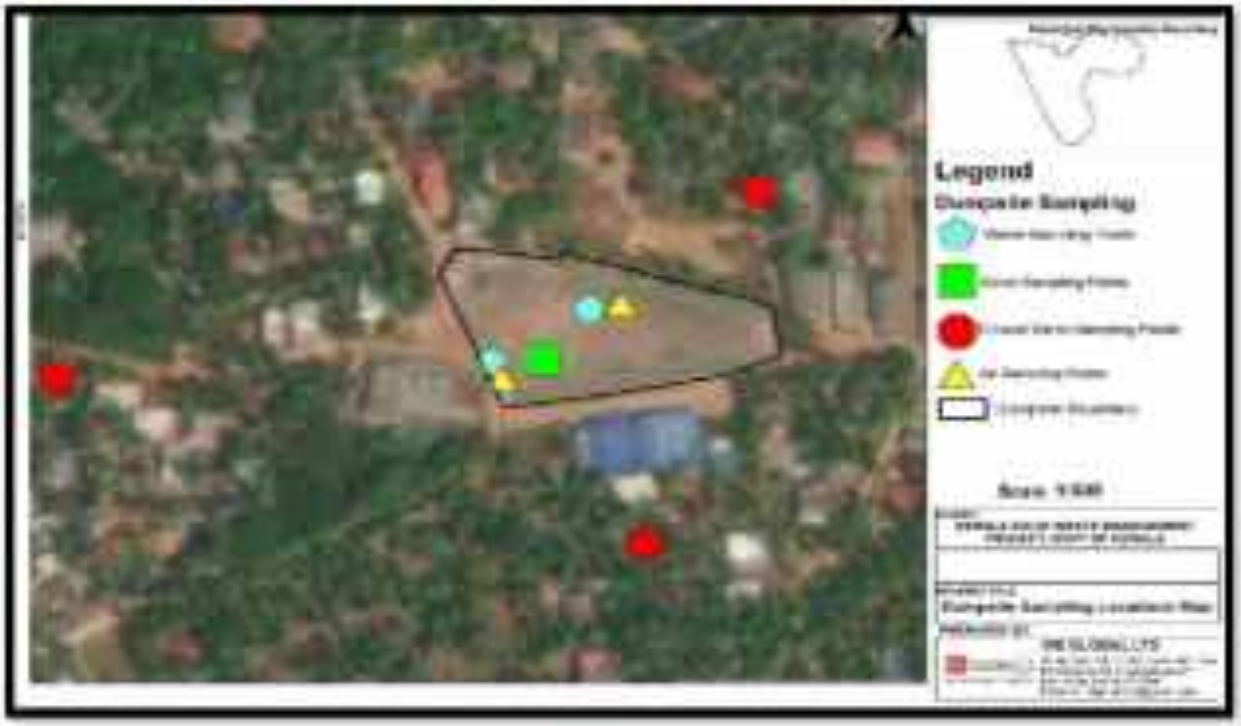

*Figure 3 Distance of the Sampling locations*

The map showing sampling locations and the analysis with observations are given below:

*Table 10 Distance & Direction of Sampling locations*

| S.No. | Description | Direction | From Boundary of the dumpsite (m) |
|---|---|---|---|
| 1 | Surface Water | North East | 300 |
| 2 | Ground water-1 | South West | 65 |
| 3 | Ground water-2 | East | 63 |
| 4 | Ground water-3 | South West | 115 |

Copyright © 2023. KSWMP | All rights reserved

### 3.6 Identification of sampling location:

*Table 11 Identification of sampling location*

| S.No | Description | Place identified | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Inside the dumpsite | As per the wind rose diagram, the direction and speed of the wind are determined and based on the existing wind rose data the air sampling location fixed at two locations |
| 2 | Noise (1 Location) | Inside the dumpsite | As per the lab experts' advice the sampling location was identified |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite (stream) | It is important to identify area very near to the dumpsite to asses any contamination due to the project thus location was identified |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain, except for one side characterized by a steep slope (NE). The infiltration of leachate which could result in the contamination of ground water.<br>Based on the possible infiltration and slope direction the ground water samples are collected in the West, Northeast and Southeast direction outside of the dumpsite. |

### 3.7 Sampling Methodology

*Table 12Sampling Methodology*

| S.No | Description | Method |
|---|---|---|
| 1 | Air sampling | Calibrated High Volume Sampler, Calibrated rotameter & calibrated Dry gas meters and sampling locations selected based on wind rose and impacts on surrounding land uses. |
| 2 | Noise | Calibrated sound level meter and sampling locations selected based on highest noise level on site and impacts |

| S.No | Description | Method |
|---|---|---|
| | | on surroundings |
| 3 | Ground water | Water collected in polyethylene and sampling locations selected based on leachate and run off flow and impacts on surroundings |
| 4 | Surface water | Water collected in polyethylene bottles and sampling locations selected based on leachate and run off flow and impacts on surrounding surface water bodies and drains (line sources of pollution) used be communities |
| NOTE: Sampling Photographs added as Annexure C in the FR Report. | | |

### 3.8Site Connectivity

The width of site access road is approximately 5m which is partly concrete and partly bituminized. NH 66 is only about 0.75 kilometers away. NH66 provides access to other major cities in Kerala, such as Kannur and Kozhikode. The industrial and trade city of Mangalore in Karnataka also is connected through this NH66. This highway provides access to other parts of Kasaragod city.

*Figure 4 Access Roads for the Site*

Copyright © 2023 KSWMP | All rights reserved

### 3.9 Traffic Assessment

Traffic assessment refers to the process of evaluating and analyzing the flow of vehicles, pedestrians, and other modes of transportation on roadways, intersections, or specific areas. This assessment helps in understanding current traffic conditions, identifying potential issues, and developing appropriate strategies to improve traffic flow, safety, and efficiency.

Copyright © 2023. KSWMP| All rights reserved

**Traffic load:**

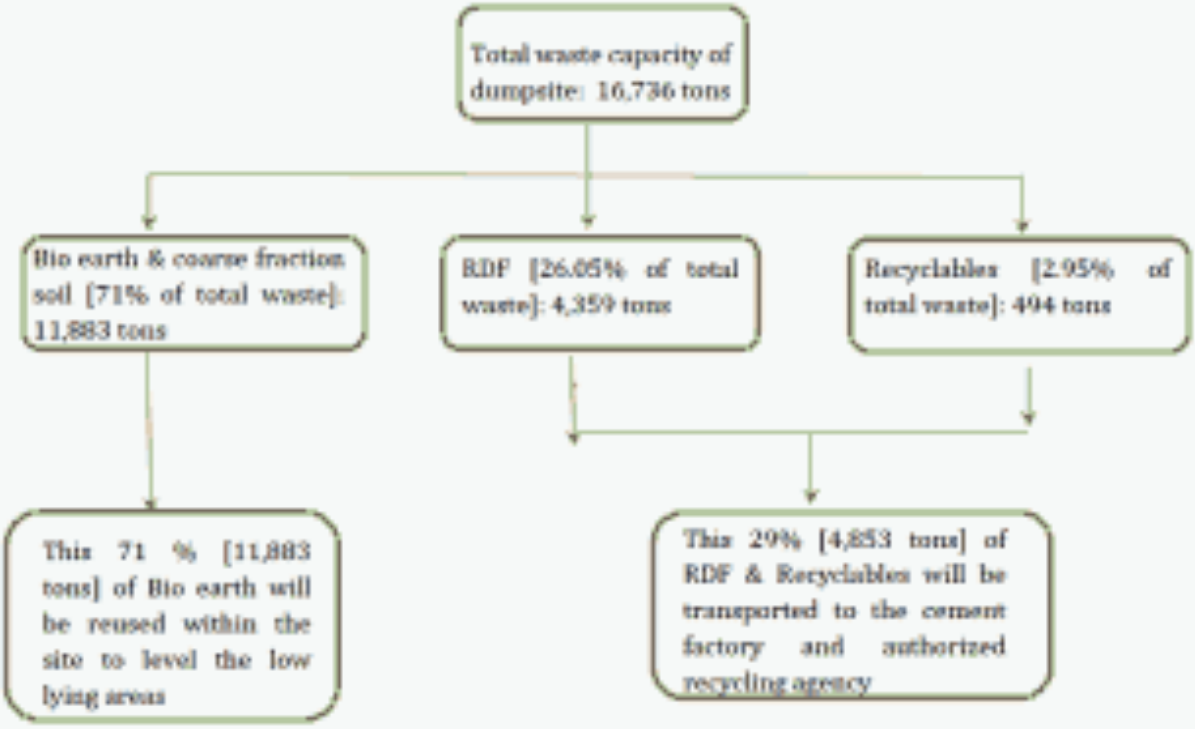

*Figure 5 Traffic load*

Access road is of 5m wide of partly concrete and partly bituminized. The road starts from NH66 at Adkathbail which is 720m to the site. The road is Thalipaduppu cross road. Considering 90 days of operation phase the trips are planned and the inward & outward of the vehicle to be made during off peak hours.

To promote safety and avoid traffic congestion, it is recommended to impose restrictions on the movement of vehicles used for the Bio mining process. These restrictions should be applied one hour before the start of school timings and one hour after school closing time.

## 4. ANALYSIS OF ALTERNATIVES

### 4.1 Alternative 1: No project (without project scenario)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.

If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.

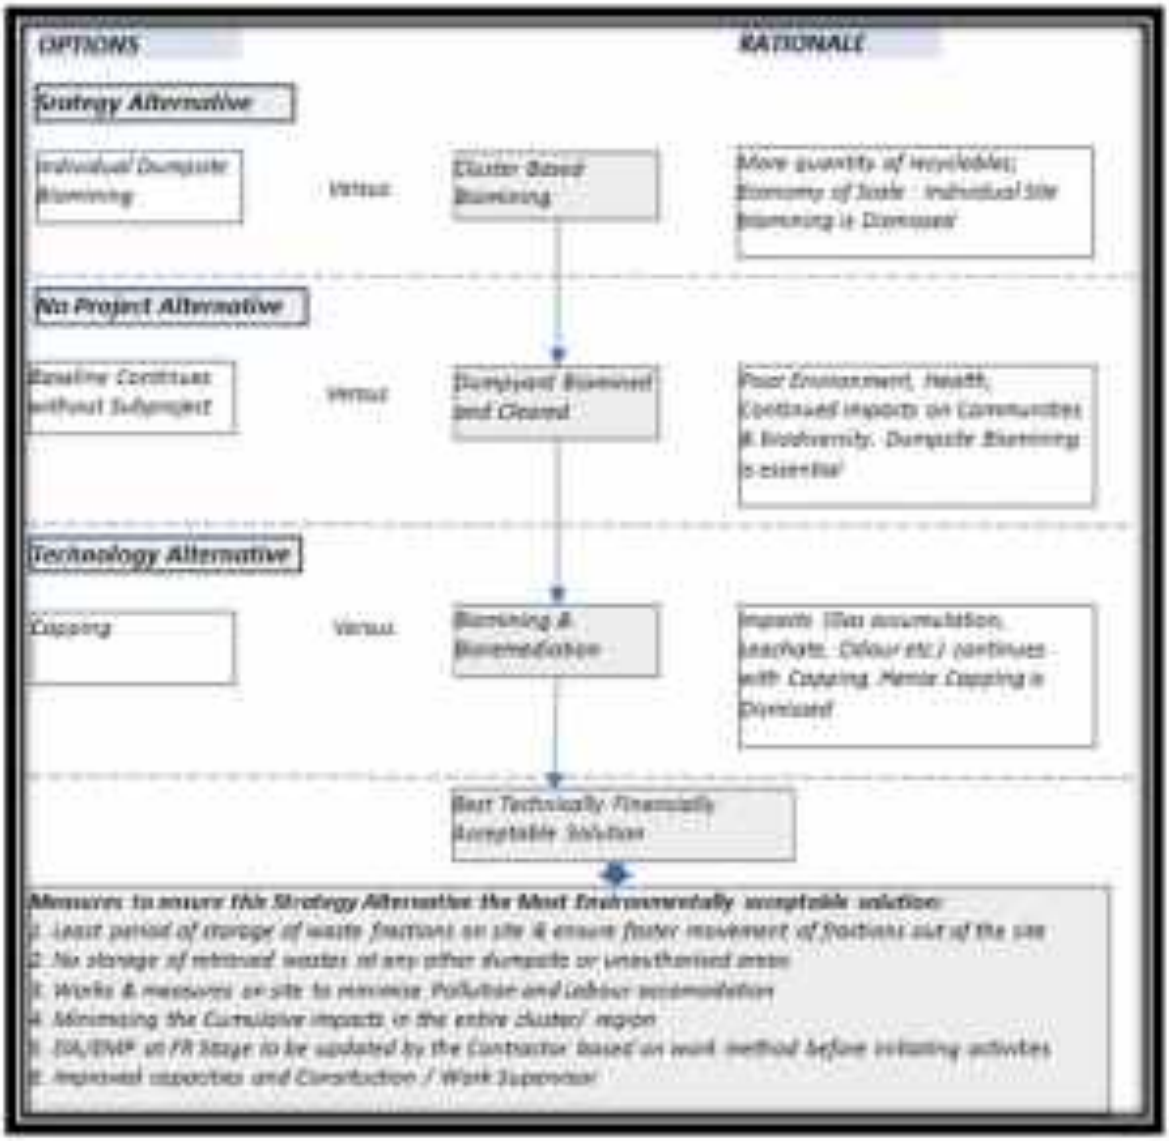
1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.
2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.
3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.
4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.
5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

### 4.2 Alternative 2: Mode of execution / Management Alternative

Regarding the execution strategy, the outcomes of a Transect walk have substantiated the impracticality of waste transfer between ULBs. As a result, the imperative is for the waste remediation procedure to take place on the premises, allowing only the byproducts to be considered for potential transfer.

The logistical aspects of arranging machinery and designating storage space for these byproducts will hinge upon the extent of land available.

### 4.3 Technology Alternative



The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as

1. Capping without land recovery,
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Copyright © 2023. KSWMP| All rights reserved

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

Copyright © 2023 KSWMP | All rights reserved

## 5. ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISK IMPACTS

Biomining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, biomining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration)are important in this case. In addition, cumulative impacts of simultaneous biomining of multiple such legacy waste sites on the environment are important. Especially with respect to

(i) Drainage and leachate flow into regional water bodies(& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,

(ii) Pollution on land/soil, dust and odor nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,

(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and

(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

Copyright © 2023. KSWMP| All rights reserved

### 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Kasaragod dumpsite

#### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Bio mining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;
- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table 1 - Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity However, magnitude of cumulative impacts of various dumpsite remediation might be High.

*Table 15 Aspects for Determining the Magnitude of Impacts*

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite bio | A specific location within program component or site boundaries |

Copyright © 2023 KSWMP| All rights reserved

| | | | | |
|---|---|---|---|---|
| | | | mining activities will be on larger extent) | with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international leader guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| **Likelihood of potential impacts occurring** | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions (Occasional) | Unlikely to occur |

**NOTE: Anticipated Project Duration - 5 to 6 months**

Copyright © 2023 KSWMP| All rights reserved

### 5.1.2 Sensitivity of Receptor

The dumpsite is surrounded by residential buildings and some commercial establishment, during the time of site assessment the experts observed, some sensitive receptors within 500m from the site. Namely some Anganwadi, religious places and households. The project's lies near residences, within a 200-meter radius, and its potential air, odor, fire, noise, vibration, ground water impact on over 60 families (250 people) over a duration of 5 to 6 months. The sensitivity of these receptors is high. In addition, there is a drain which flows through the residential areas of Thalipaduppu (North East) which drains the runoff and leachate from the site. The sensitivity of this receptor is also estimated as High.

### 5.1.3 Significance of the impact

- Significance if the impact is high as it would even result in community resistance to biomining and bioremediation.

Since the project operational time 5 to 6 months, then the magnitude of the negative impact can be considered as small and medium sensitivity. In other hand magnitude of the positive impact, after the biomining of the existing land can be used for the recreational park for the public use.

## 5.2 Source-Pathway-Receptor Analysis

**A) Source**: The source of contamination is the legacy waste remaining and being deposited at the Thalipaduppu closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is 50 years old, as dumping had started in year 1970and ceased in 2010-. The total waste volume is 20,115 cu.m with the dumpsite spread over 0.44ha and rises to a height of approximately 5m from the base. Waste is seen 2.5m above ground level and 2.5 m below ground level. In addition to the landfill gas and leachate, material spill over from the existing compound and windblown dust and litter are also considered as sources of contamination.

**B) Pathways**: The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the

Copyright © 2023. KSWMP| All rights reserved

surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards North East direction acts as a pathway for the uncovered waste to flow into the unlined drainage canal along the boundary to North Eastern side. Which may not affect surface water body which runs through the residential areas and terminates at Sankarankuzhithodu canal at 300 m aerial distance from the dumpsite?

Lateritic Soil acts as a pathway for transport of leachate to the groundwater and for uptake of contaminated surface run-off.

The leachate flows with groundwater and acts as the pathway. Surface water Contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals, rivers and streams are further transported by surface waters and in this case the surface water acts as the pathway.

**Receptors:**

Receptors are air, surface water (drain passing through residential areas)and ground water. For drinking purpose, they mainly use mini water supply scheme by KWA. (6 nearby Households within 50 m and 1 school within 750 m), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the residences and institutions living nearby in Adkathbail. As the dump is not contaminated, remediation would improve the pollution scenario provided the bioearth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from biomining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after biomining activity, activities in biomined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post biomining activity.

Copyright © 2023. KSWMP| All rights reserved

### 5.3Impacts on Air Environment

Key impacts on air include:

- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site, nearby communities of Ward 4-Thalipaduppu.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odor, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.
- When the legacy site is opened, existing gases would get emitted. Further, any delay / unexpected stoppage of biomining activity, might further the process of gas formation depending on waste composition, odor and fire risks. In the case of Thalipaduppu, since the analysis of wastes shows calorific value of 1300 for combustibles with around 17 percent plastics, 4 % paper and 2% cloth rags, it's well combustible; and the risk of fire is high during summers and incidents

### 5.4 Impacts on Water Environment

Ground water

- Post and pre-monsoon water levels are 11.02 m and 13.22mbgl. Borehole data indicates waste upto depth of 5m with hard lateritic strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. With the slope of the ground of the dumpsite, this tends to get accumulated at low-lying gradients and flows into unlined drain up till300m and terminates at Sankarankuzhi thodu. High BOD levels of the drain and ground water wells around are indicative leachate and runoff pollution. Oozing & Pooling of leachate &it draining to nearby areas during rains would be an important aspect to

Copyright © 2023. KSWMP| All rights reserved

be managed during biomining to prevent ground water contamination. There a need to separate out site drainage and leachate

- Leachate samples: BOD, COD, TDS, E.coli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution.
- Borehole data: Dump below water table; impacts on water resources, wells nearby
- Ground beneath the dump remains polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

Surface water

- The dumpsite experienced flooding during 2018 floods. The site is at a higher elevation, and hence no submergence was experienced at the site during the floods. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas.
- There are no surface water bodies near the site, except Sankaran Kuzhi canal at 300 m distance.
- Predominant slope is in the North East Direction At Northeast direction, (end direction) there are residential households and mixed vegetation are seen. The drainage and leachate from the site flows to nearby open drainage channel which flows through residential areas, and ends at Sankarankuzhi thodu. It is important to contain and treat leachate from the proposed bio mining activities on site. Treated leachate may be recirculated or used for other purposes.

### 5.5Impacts on Land/Soil

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as biomining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.

Copyright © 2023. KSWMP| All rights reserved

- Spillover of activities to nearby road, and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste biomining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.
- Ground beneath dump remains polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Thalipaduppu, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Thalipaduppu does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while biomining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste),Feb 2019) and World Bank EHS Guidelines. A plan shall be auditing of all wastes, management, eliminating pollution & OHS risks and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.
- Wherever fuel, combustibles and retrieved waste is stored, it shall be on impervious surface, at appropriate elevation, protection against rains, flooding (such as cut off drains, berms etc.), wind and fly / pest menace (screens, green cover etc), intruders (compound wall existing at Thalipaduppu), watch and ward, lighting, remote monitoring measures etc). Risk of fire, dust and leachate contamination shall be well assessed by the contractor. Emergency Action Plan shall be prepared and mitigation measures shall be updated based on work plan/DPR, and implemented.

Copyright © 2023. KSWMP| All rights reserved

Communities shall be made aware of works and advice to follow measures such as use of fly/dust covers/nets on wells etc.

- Of the waste samples analyzed, 50 to 60 percent comprises of Bio earth; 30% being <4.75mm size; C/N ratio (15:01) indicating slight unpleasant odor (high Nitrogen; releasing ammonia) less than that suitable for good compost.

### 5.6Impacts due to Noise and Vibration

- Various machines vehicles and activities contribute to noise and vibration on and off site. This includes vehicles carrying recyclables, operation of JCB, and other machines, diesel generator sets, motors on site, etc. In addition, activities on the site such as vehicles transporting the dry waste from households to MCF, loading / unloading of collected waste materials, and workers activities on site would add to noise and vibration. Impacts include disturbance to fauna flora on site, health impacts on communities around due to exposure to large volume of sound.

### 5.7Other impacts on Biodiversity - Fauna/Flora

- There are no sensitive biodiversity areas within 10km of the site. However, since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 50km from the site is Western Ghats, World Heritage biodiversity site, and 4 key biodiversity areas; including Kottancheri Hills, Malom Wild life area, Kareem Forest Park, and Elephant Park Charladka which hosts multiple species. Depending on the contractors plan for disposal of retrieved waste fractions, EIA shall be updated for biodiversity impacts.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke effects

Copyright © 2023. KSWMP| All rights reserved

- Disturbance to other fauna and flora on site: SWM activities onsite including those related to MCF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available Biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species listed by IUCN.

### 5.8 Other impacts on Workers and Communities

- Contaminants in soil and water: Direct or indirect contact with polluted soil or water by neighboring water users. Additionally, because of their locations, recovered lands are subsequently used as parks, or for SWM facilities or office spaces etc. This may pose risk of bioaccumulation of metals which can constitute a health risk. Also impacts on buildings due to gaseous emissions, risk of fire etc if used after clearing.
- Health Risks: One of the primary health risks of dumps is the spreading of diseases - diarrhea, hepatitis etc. The ways such infection can be spread are numerous but are often related to direct contact with the waste (e.g., clinical waste, fecal matter) by scavengers and other unauthorized persons being on the site. The other main pathway is by vectors such as, foraging animals, rats, birds, flies and mosquitoes etc. - Flies, mosquitoes, rodents, crows, pigeons, pest menace on site, for workers & communities & their assets (such as wells) due to exposure of putrefied wastes
- Impacts if separate common site/s or a site among these dumpsites is chosen to store wastes from other dumps till it is disposed, or as transfer stations or for common processing of certain fractions: Such activities would result in Air, odor, dust, noise, water, vibration, flora, fauna, communities around the new site. There is also risk of contamination due to newly placed wastes, and pollution impacts and disturbances to communities due to works/activities on this site. Such sites and activities shall be avoided, and if quintessential for the project, be carefully chosen and approved only after thorough discussions with KSPCB, and all stakeholders. An assessment of their sensitivity and appropriateness shall be undertaken considering the environmental risks. They shall be audited and assessed for existing and future environmental impacts of such activities and mitigation shall be implemented.

Copyright © 2023. KSWMP| All rights reserved

However, details on such sites shall be known only based on the final schema of implementation proposed by the contractor. Hence, the Contractor shall update EIA based on this before starting any activity on site.

- OHS impacts: Infectious wastes, fecal matter, clinical wastes and sharps; batteries, e-waste and possible bursting; Hazardous wastes like asbestos and other chemicals dumped; pesticides / insecticides, inoculum storage, handling and use on wastes/land leading to diarrhea, hepatitis, insect & reptile bites, interactions with foraging animals like rats, dogs, cattle, vector (mosquitoes, flies etc) transmitted diseases etc.
- This activity would result in large influx of workers from the region and beyond as this involves 20 dumpsites in two clusters. Worker facilities in the labour Camp if any, & site are important, as the density of population is high in Kerala. It is important that camp sites are not set up in the land to be remediated. Periodic health checkups (once a week) are very important as the work involves handling of waste. It is important to also provide periodic health checkup and co-ordination with local Primary Health Center/Central Health Services for medical camps for residents, schools and others during the biomining period.
- Risk of Fire during biomining and due to retrieved material storage; possible Burning of retrieved materials; storage and use of firewood for various purposes, fuel for vehicles. The smoke from burning solid waste can result in respiratory complaints, dizziness, and headaches in the short-term, as well as potentially more serious diseases such as cancers and heart disease in the long term.
- Impacts of other site development works shall be well assessed, EIA/EMP updated, and mitigation measures included in Project costs and implemented by the contractor/ULB (whoever is responsible as per FR/Final Bid document)

**5.9Visual impacts, Noise, Odor , Vibrations**

- Odor & impacts on workers and communities during biomining, storage and Transport are key determinants of community agreement to the activity. Such odor would attract flies and vectors in large numbers, who may also contaminate the food, and water sources of nearby communities. It is important to minimize odor

Copyright © 2023. KSWMP| All rights reserved

emission as guided by the CPCB Guidelines on Legacy Waste Biomining, 2019. also provide periodic health checkup and co-ordination with local PHC/CHS for medical camps for residents, schools and others during the biomining period.

- Visual impacts of the waste being dug up, screened ad heaped/stored is not appealing. It is important to mask this appropriately.

### 5.10 Traffic impacts

- Impacts due to new access road construction/upgradation. Access road to the site is unpaved and slushy during rains. It is important to minimize temporary pollution due to increased movement men, and materials from and to the site during biomining activity and beyond as it is proposed to store material on site including air and noise pollution, access restrictions to properties nearby, and vehicular conflicts
- Large vehicles moving in and out of the site carrying materials, tools, equipment & pedestrian/worker -vehicular conflicts; increased traffic on roads, large equipments & vehicles, noise, air pollution: vehicle emissions, DG sets
- Vehicles, equipment's not adhering to pollution standards

### 5.11 Other Impacts on existing or proposed activities on sites

- There may be approvals from various agencies for biomining activities and associated facilities; depending on utilities and uses on site. & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of biomining on existing facilities on site such as Compound wall, MRF, MCF, composting yard etc (disturbance to activities & people due to dust, leachate, noise, odor, additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post biomining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped & impacts if this is dumped elsewhere or not processed. This alternate

Copyright © 2023. KSWMP| All rights reserved

location, being associated facility need mitigation measures to avoid/minimize pollution, Health &Safety impacts on workers, communities. Also forward linkages are considered as associated facilities/linked activities. Impacts of Transportation of these fractions (traffic increase, odor, leachate, dust) impacts during rains & emergencies, and its handling, storage at the identified locations, reuse etc. shall be mitigated.

## 6. ENVIRONMENTAL AND SOCIAL MANAGEMENT & MONITORING PLAN

### 6.1 Scope of Environmental Management & Monitoring Plan

An Environmental Management Plan (EMP) is a comprehensive strategy designed to manage and mitigate the impacts of activities on humans and the environment, particularly concerning air, water, soil, and biodiversity.

### 6.2 Environmental Management Plan

The detailed anticipated impacts and corresponding mitigation measures/management of the impacts are given in the below.

*Table 16 Environmental Management Plan*

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| *A* | **Planning and Pre-Construction Stage** | | | |
| *1* | ***Planning for biomining facility*** | | | |
| 1 | Biomining & Bioremediation Plan & Capacities | • Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / biomined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these biomined material in line with the agreements with such facility owners and National, State regulations and WB EHS<br>• Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odor and Leachate Management Plan.<br>• The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>• Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU/ULB |
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP| All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | risk to the public.<br>▪ The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>▪ To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>▪ Grading shall be performed where necessary to provide a neat appearance | | |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality, odor, water contamination due to leachate, health and safety impacts of the people working in the site assessment* | ▪ Carry out site assessments as per Guidelines for Biomining of Legacy waste Dumpsites of CPCB<br>▪ Consider safe biomining & gas / leachate generation from existing capped portion of the site<br>▪ Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>▪ Provision of appropriate PPE's to the team undertaking the site assessments<br>▪ Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>▪ Plan for machinery operated which will be operated by skilled operators at all times.<br>▪ Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>▪ Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | TSC, ULB, Contractor | SPMU/DPMU/ULB |
| 4 | Absence / Delay in Permissions for Developing the | ▪ Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; | Contractor, ULB | SPMU/DPMU/ULB |

Copyright © 2023 KSWMP| All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | biomining facility and associated works as per National regulations | and other licenses including those as per Labor Laws, before the start of works on site | | |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes<br><br>*(Air Pollution) and Visual Blight due to excavation* | ▪ Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>▪ Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>▪ PPEs to be used by workers<br>▪ Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU/ULB |
| 6 | Material sourcing, transport, and stacking of construction materials<br><br>*(Occupational Health and Safety issues and Air noise pollution)* | ▪ Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>▪ Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>▪ Materials shall be sourced only from approved quarries<br>▪ Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>▪ The driver should be with required license and follow speed regulations<br>▪ Materials shall be transported preferably through well-surfaced roads. If road is kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>▪ Material transport and unloading activities should not result in noise disturbance to locals and should be during day time<br>▪ Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>▪ Provide vehicle wheel wash area on site<br>▪ Workers to be provided with Personnel Protection Equipment (PPE) including | Contractor | SPMU/DPMU/ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | safety boots, jackets, ear muffs, gloves.<br>▪ Proper rest area on site shall be provided with water, first aid, toilets | | |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | ▪ Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>▪ Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>▪ Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>▪ It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with land owners wherever the labour is accommodated<br>▪ Camp must not be provided in an area prone to Hazards<br>▪ Camp should be adequately at higher plinth levels to prevent water intrusion<br>▪ Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>▪ Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>▪ The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>[Refer ECOP section 06 and section 11 of EMF for KSWMP] | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. especially in case of providing support facilities<br>*(Impacts on Fauna /* | ▪ Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in biomining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>▪ Identify appropriate government site to avoid land acquisition and resettlement impacts<br>▪ Covered and well-marked storage area with cut off drains & odor /fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the | Contractor | SPMU/DPMU/ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *Flora)* | same are to be arranged with due consideration to nearby residences | | |
| 9 | Contamination of groundwater due to leaching. Leachate parameters; BOD, COD, TDS, Ecoli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | ▪ During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>▪ Depending on the contractors plan for biomining of the capped area on site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ULB |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke – burning, trampling/machinery | ▪ Movement routes of vehicles to be planned to avoid key fauna/flora on site such as *Haliaeetus leucogaster(white bellied sea eagle),Ailanthus sp.*(Tree) &*Funambulus tristriatus* ( Jungle Palm Squirrel)<br>▪ Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU/ULB |
| 11 | Nuisance hazards to neighboring areas | ▪ Ensure proper design and adequate compound wall; high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements<br>▪ In case of waste mound and site edges are sliding or unsafe; provide engineered retention walls. | Contractor | SPMU/DPMU/ULB |
| 12 | Treatment & Disposal of wastes and rejects | ▪ Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & inert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventoried and quantified, including Biocarth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertilizer Control Order 1985 and | | |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>▪ Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, water bodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| **B** | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| **Implementation of biomining of the dumpsite** | | | | |
| 1 | Impact due to the vehicular movement<br><br>*(Air and noise environment & Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | ▪ Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>▪ All vehicles and machinery should obtain Pollution Under Control Certificates<br>▪ HORN PROHIBITION signpost to be erected.<br>▪ Rumble strips/speed breaker to be provided on access roads.<br>▪ Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed.<br>▪ Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>▪ Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>▪ Avoid heavy vehicle movement through Kasaragod roads during peak hours 7 a.m to 10 a.m – mention: school hrs / peak hrs; and during important period / festivals when people use the road to access temple<br>▪ Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | Contractor, ULB | SPMU/DPMU/ULB |
| 2 | Impact due to the use of heavy vehicle and equipment<br><br>*(Air and Noise environment)* | ▪ Mixing equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>▪ Equipment Operators & laborers should wear dust masks, ear protection, and hard hats.<br>▪ Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>▪ Labor to be provided masks / PPEs. | Contractor | SPMU/DPMU/ULB |

Copyright © 2023. KSWMP| All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • Construction / Biomining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighboring sensitive land uses<br>• Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>  ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>  ▪ Using modern, well-maintained and regularly serviced vehicles.<br>  ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>  ▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>• Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>• As Thalipadappu dumpsite has sensitive receptors and settlement areas within 150m of it, noisy works shall be stopped from 22:00 to 06:00.<br>• Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>• Avoid noisy activities/machines near south west side of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near south west side of the dumpsite<br>• Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities<br>*(water environment)* | • Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>• Vehicle washing or maintenance near water bodies are to be avoided.<br>• Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ULB |
| 4 | Leachate and Runoff from biomining | • Provide site cut off drain around the site to divert off storm water from entering the site, and to prevent contaminating downstream resources with runoff from the | Contractor | SPMU/DPMU/UL |

Copyright © 2023. KSWMP| All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | activities<br><br>*(Soil contamination and groundwater contamination)* | dumpsite<br>• Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>• Ensure storm water drains will lead to drain outlets (along the north east boundary of the site) on roads adjoining the dump yard<br>• Provide leachate drains – lined – from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area preferably to the north east of the site<br>• Provide proper treatment of leachate and storm water that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by biomining activities like excavation and waste segregation and stabilization<br>• The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB.<br>• The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>• Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>• Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>• Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>• Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide | | B |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | for emergency containment additionally | | |
| 5 | Soil decontamination from accumulated waste levels<br><br>*(Impact on leachate, odor)* | • Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bioculture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>• Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>• Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU/ULB |
| 6 | Excavation of waste from the waste mound<br><br>*(Health and safety impacts)* | ▪ The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided.<br>▪ Machinery operated for excavation should be operated by skilled operators at all times.<br>▪ Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>▪ Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>▪ In case of the waste mound and site edges are sliding or unsafe, provide engineered retention walls or string boundaries.<br>▪ When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | Contractor | SPMU/DPMU/ULB |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open | ▪ All vehicles shall carry only approved load of weight<br>▪ Regular cleaning of roads & drains and removal of spills if any.<br>▪ All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>▪ Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical | Contractor | SPMU/DPMU/ULB |

|---|---|---|---|---|
| | during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | where workers are not exposed to contaminated, hazardous or noxious substances.<br>▪ First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>▪ Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>▪ Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>▪ Measures such as deferred timings and stretch break to be adopted<br>▪ Secure all installations from unauthorized intrusion and accident risks;<br>▪ Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every days start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipments, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>▪ EHS specialist with adequate experience & third party supervision are important for biomining activity<br>▪ Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>▪ Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible<br>▪ Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas; | | |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>▪ Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br>▪ Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near those. In close proximity to this location, there is a transformer. to be marked well & safe kept before activity start near those<br>▪ Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>▪ All workers shall be registered as per prevalent labor laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>▪ Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractor's person/insurance agent<br>▪ While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>▪ While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>▪ Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>▪ A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>▪ No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor | | |

Copyright © 2023. KSWMP| All rights reserved

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • All works related to working at heights will be undertaken only during the daytime when sufficient sunlight is available;<br>• Use of temporary fall protection measures and outer edges of any elevated work surfaces, such as handrails and toe boards to prevent materials from being dislodged will be done;<br>• All excavation activities to be conducted in supervision of the site contractor;<br>• Proper signage and lights to be provided in all work or activity areas & work permit system to be ensured.<br>• All records on emergencies, accidents, workers & their duty schedule, important site events, waste storage & disposal etc shall be maintained on site. All accidents including Indicative, Serious and Severe accidents to be recorded. All severe & serious accidents to be reported to the Bank & procedures followed for root cause analysis & Corrective Action Plans prepared and implemented, as per Banks Incident Reporting Tool | | |
| 10 | Risk of fire due to conditions leading to spontaneous combustion<br><br>*(Air environment, disturbance to communities and workers, health impacts, safety issues)* | • Follow CPCB Directions (May 26, 2022) Directions under Section 5 of EP Act (1986) – for implementation of SWM Rules 2016 – regdg Fire Incidents at MSW Dumpsites (https://cpcb.nic.in/openpdffile.php?id=UHVblGl0YXBpb25GaWxlLzQyNDRfMTY1NDE2Mzk3N19tZWRpYXBob3RvNzYxMGwZGY=. ), LSGD Kerala Government GO on Fire Safety of MRF, MCFs (for the MRF on site if used for storage of wastes)and other Regulations, guidelines applicable<br>• Divide the site & plan for work in each area/quadrant as per work plan & prepare fire safety plan & emergency response plan in line with EIA Annexure 3; and National/State regulations & WB EHS<br>• Examine the site everyday by experienced Fire Safety / OHS personnel for any smokes<br>• Avoid conditions that can lead to spontaneous combustion such as:<br>○ Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard<br>○ Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.<br>• Design the facility for access by firefighting equipment, including clear aisles among waste heaps or work areas and access to adequate water supply. | Contractor, ULB | SPMU/DPMU |

### 6.3 Emergency & Disaster Management Plan

**Hazards Associated with Dumpsite Activities**

The Disaster Management Act, 2005 mandates every Government Department to prepare, review and update Disaster Management Plan

#### 6.3.1 Identified Emergency Situations

*Table 17 Hazards associated with Dumpsite Biomining & Bio remediation*

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| **As per World Bank EHS Guidelines** | |
| **Waste Storage** | **Regular visual inspection of all waste storage collection and storage areas for evidence of accidental releases** |
| **Waste Segregation** | **Regular audits of segregation of Bio mined wastes.** |
| **Monitoring records for hazardous waste collected,stored, or shipped should include** | **1. Material Identification:**<br>- Name and identification number of the hazardous material(s) present in the waste.<br><br>**2. Physical State:**<br>- Indicates whether the waste is in a solid, liquid, gaseous form, or a combination of these.<br><br>**3. Quantity:**<br>- Specify the amount of hazardous waste, and biomedical waste retrieved from site typically measured in kilograms or liters, or by the number of containers. All such waste shall be staked in appropriate places/containers for disposal; duly marked & records kept<br><br>**4. Waste Shipment Tracking:** |

Copyright © 2023 KSWMP| All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| | - Documentation tracking details include:<br>- Quantity and type of hazardous waste.<br>- Dates of dispatch, transportation, and receipt.<br>- Records of the originator, receiver, and transporter involved in the waste shipment.<br><br>**5. Handling and Treatment:**<br>- Describes the method and date of various actions taken with the retrieved waste, such as storing, repacking, treating, or disposing it.<br>- Cross-referenced with specific manifest document numbers relevant to the hazardous waste.<br><br>**6. Location within Facility:**<br>- Specifies the specific locations within the facility where – various types shall be stored or processed.<br>- Includes information about the quantity of waste at each location. |
| **Falls and Slips at the dumpsite**<br>**Slippery surfaces or uneven surfaces and poor access to work areas climbing on and off the facility, equipments/machinery or the waste segregation/other facilities set up.** | Tidy workplace by maintaining good housekeeping. Handholds wherever necessary and clear/ safe access to work areas with proper PPE to the persons working at the site. |
| **Fire Hazard**<br>**Fire risk may occur due to the following**<br>**Storage of flammable liquids / Gas like LPG, Diesel**<br>**Any combustible materials**<br>**Sparks**<br>**Open flames** | Combustible/flammable materials should be properly managed and stored/used. Fire extinguishers and Fire hydrant Network with reserve water (As per NFPA Code) should be made available. Emergency Plan in case of fire. |

Copyright © 2023 KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| **Absence of Fire hydrant network may increase the risks in case of major fire accident** | |
| **Absence of Personal Protective Equipment**<br>**Lack of adequate footwear, Helmets, hearing/ eye protection, gloves & goggles may lead to injuries and death.** | Proper footwear, Helmets, hearing/ eye protection, gloves & goggles should be given to the workers at the dumpsite. Proper training should be given to the workers on the use of PPE. |
| **Electrical Hazard**<br>**Electric wires if any damaged**<br>**Poorly insulated**<br>**During temporary repairs**<br>**Circuits overloaded may lead to major accident** | Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit. |
| **Ladders**<br>**Risk may occur due to the following**<br>**Not secured against dislodgement**<br>**Defective ladders**<br>**Not sufficient length**<br>**Incorrectly placed** | Ladder risk can be mitigated by the following<br>Secured against movement or footed<br>Ladders in good condition<br>Regular inspection<br>Ladder should be extended one (1 m) meter above platform to avoid injuries |
| **Excavations**<br>**Risk may occur due to the following**<br>**Trench collapse**<br>**Gas emission** | Risk can be mitigated by the following<br>Soil stability should be known before excavation<br>No water accumulation<br>V500 mask should be used at the in order to counter the gas emission.<br>Emergency Plan |
| **Defective or wrong Hand Tools**<br>Wrong/defective tool may end up with injuries to the workers using the tool | Right tool for the job should be used properly and it should be in good condition |

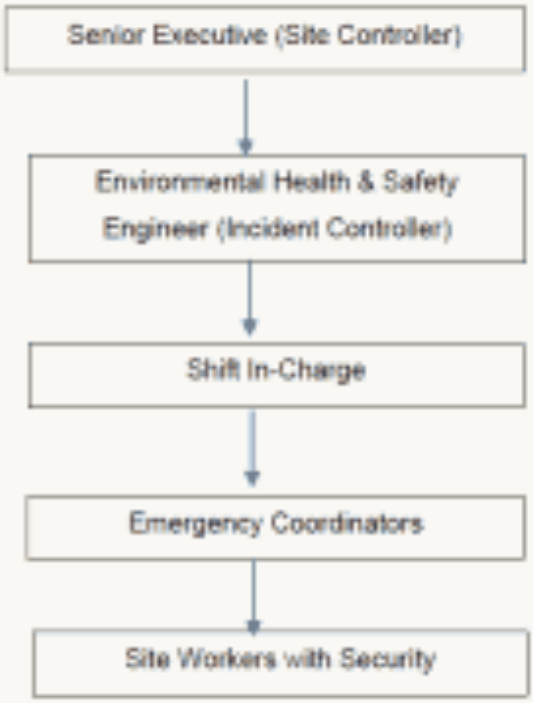
Copyright © 2023. KSWMP | All rights reserved

| Hazards Associated with Dumpsite Activities | Control / Mitigation Measures |
|---|---|
| **Accidents due to vehicular movement**<br><br>**Vehicle movement inside the site** | Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents |
| **Noise Hazard**<br>**Noise levels over 85 decibels would cause trouble to the people working at the site** | Noise Levels should be maintained below 85 decibels and with proper protection |
| **Falling Material**<br>**Fall during carrying/Lifting of waste and materials from overhead work areas.** | Risk can be mitigated by preventing the falls by barriers, training, strengthening the materials used for works and the following<br>Use of hard hats.<br>Person operating the Jcb/machine must be provided with walkie talkie/hand signals to know about the clearance |
| **Visitors Presence at site**<br>**Insufficient fencing may lead to attract pedestrians to enter the site.** | Fencing and barricades with proper signage boards indicating trespassers not allowed |

### 6.3.2. Proposed Organizational Structure for Disaster Management

The Organizational structure for the Disaster management contains the following team members.

**Emergency Response Team:**



A response team needs to be set in assistance with a senior executive (Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

Incident controller would be reporting to the Site Controller. Incident Controller organizes a team responsible for controlling the incidents with the personnel under his control.

Shift In-charge would be the reporting officer, who would bring the incidence to the notice of the Incidence Controller and Site Controller.

Copyright © 2023 KSWMP| All rights reserved

Emergency Coordinators would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.

**Organizational structure for the Disaster Management Team**

### 6.3.3 Emergency Response Facilities

Emergency Control Center – with access for emergency shutdown procedures, duties and contact details of key personnel and government agencies, emergency equipment, etc.

- Assembly Point – with minimum facilities for safety and rescue
- Emergency Power Supply – connected with diesel generator, flame proof emergency lamps, etc.
- Fire Fighting Facilities – first aid fire-fighting equipment, fire alarms, etc.
- Location of Wind Stock – located at appropriate location to indicate the direction of wind for emergency escape
- Emergency Medical Facilities – Stretchers, gas masks, general first aid, emergency control room, breathing apparatus, other emergency medical equipment, ambulance

Copyright © 2023 KSWMP| All rights reserved

the medical centre should display poster for treating burns and first aid. Some medicines and facilities to be kept in the medical centre are suggested.

**Health and Safety Measure for the workers**

All workmen employed in working conditions will be provided with adequate personal safety equipment as applicable to the work including (but not limited to):

- Safety shoes/boots
- Safety Helmets
- Hand gloves
- Ear muffs

**Monitoring Plan**

The considerations in an emergency planning include the following:

- Identification and assessment of hazards and risks
- Hazard consequences analysis
- Alarm and communication procedures
- Identification and equipping emergency control centre identify assembly, rescue points, medical facilities
- Emergency preparedness plan, procedure, steps to be taken before during and after emergency
- Formulation of plan and emergency sources
- Training rehearsal, evaluation and updating the plan
- Machinery should be examined regularly
- Medical examination for every employee shall be examined by doctors at least 3 months in a calendar. Health register should be maintained by the individual industry coming in the project site

**Emergency Action Plan for Fire**

In case of Fire the immediate plan of action will be "RACE" that stands:

Copyright © 2023. KSWMP| All rights reserved

R - Rescue: When you discover a fire, rescue people in immediate danger if you can do so without endangering yourself.

A - Alarm: Sound the alarm by pulling a fire pull station and call fire station, from a safe distance, notify security of precise location of fire

C - Confine: if possible

E - Evacuate: Evacuate the place

Immediately informed the response team on site and local fire brigade Response team moves to the point of fire and take all necessary steps to stop the fire. Fire brigade to join at the earliest. If the fire is not controllable and spreads then the manager in charge should inform the district authorities and call for additional external help. Complete an Incident/Accident Report within 24 hours.

Firefighting system is proposed to prevent and control fire outbreaks .The firefighting system will consist of portable fire extinguishers, hose reel, wet riser, yard hydrant, automatic sprinkler system, and manual fire alarm system. In case of dumpsite biomining it is also important to shave fire lines in the biomining area & also in the storage area where material retrieved is stored.

**Emergency Action Plan for Electric Fire**

- Disconnect the affected areas electric supply
- If fire is small scale than $NAHCO_3$ or Sand will be effective.
- Attempt to extinguish fire with the help of $CO_2$ based extinguisher
- Seek support of Fire Brigade

Action Plan of on-site Emergency Plan

- The action plan considered is given as follows:
- To constitute Disaster Management Committee under senior officer not below the rank of General Manager
- To identify potential hazards areas in the layout map
- To predict degree of burns and distance of the risk zone by using model

Copyright © 2023 KSWMP| All rights reserved

- To evacuate the area within risk zone
- To localize the emergency and if possible eliminate it
- To minimize the effects of accidents on people and property
- To take remedial measures in the quickest possible time to contain the incident and control it with minimum damage
- To mobilize the internal resource and utilize them in the most effective way
- To get help from the local community and government official to supplement internal manpower and resources
- To minimize the damage in other sections
- To keep the required emergency equipment in stock at right places and ensure that they are in working condition
- To keep the concerned personnel fully trained in the use of emergency equipment
- To give immediate warning to the surrounding localities in case of emergency situation arising
- To mobilize transport and medical treatment of the injured
- To educate the public in the surrounding village regarding hazards
- To arrange treatment of causalities
- To safe guard the people
- To identify the causalities and communicate to persons known to them
- To render necessary help to concerned
- To rehabilitate area affected

**Urban Floods:**

Floods are extreme events, usually triggered by extreme precipitation (river/inland floods) and/or storms (coastal floods). If these rainfalls exceed the retention capacity of the basins, drainage speed and volume, it causes floods.

**Different Types of Flooding:**

1) Localized flooding due to inadequate drainage;
2) Flooding due to overflows from River/Channels/drains, where the dumpsite is on or near flood plains or when flood plains are occupied by various settlements & other infrastructure without space for water to flow.

Copyright © 2023. KSWMP| All rights reserved

**Stakeholders in Disaster Management:**

The policy also systematizes a frame work of operation for the following set of stakeholders that play key roles in disaster management.

- Kerala State Disaster Management Authority
- State and Central Government Departments and Disaster response forces
- District Disaster Management Authorities
- Local authorities including Municipal Corporations/Municipalities, District/Block/Grama Panchayats, Taluk/Village Officers etc.
- Voluntary and Civil Society Organizations
- Red Cross, multilateral aid agencies and U.N agencies
- Community – Village Disaster Management Committees / Task Forces
- Public sector Undertakings
- Private sector undertakings
- Army, Navy, Air Force, and Coast guard, Airport Authority, National Disaster Response Force etc.
- District disaster teams shall be informed of the proposed activity and its schedule

### 6.4 Proposed Environmental Monitoring Plan

Monitoring at a dumpsite site is carried out in four physical zones as follows:

i. On and within the dumpsite
ii. In the unsaturated subsurface zone beneath and around the dumpsite
iii. In the groundwater (saturated) zone beneath and around the dumpsite
iv. In the atmosphere/local air above and around the dumpsite

The Environmental Monitoring Program involves the following:

- Conducting survey and sampling program.
- Analysis of samples and data / information collected, and interpretation of data and information.
- Preparation of reports for submitting to management and statutory authorities.

Copyright © 2023. KSWMP| All rights reserved

- Environmental monitoring is carried throughout the project operation to detect changes in the key environment quality parameters, which can be attributed to the project.

The results of the monitoring program used to evaluate the following.

- Extent and severity of the environmental impacts against the predicted impacts
- Performance of the environmental protection measures or compliance with pertinent rules and regulations.

### 6.4.1 Air Environment

The potential sources of air pollution from the dumpsite include vehicular movement emission of dust from biomining activities & wastes retrieved and stacked and passive leakage of landfill gas from the disposal site. Other important contributor is odor emissions from the existing legacy site disturbed. Monitoring of the air environment will be carried out during the operational phase in and around the project site.

### 6.4.2 Noise Environment

The operations shall induce noise due to operations of transport trucks, (men & material) JCB loaders and other types of machinery required at the dumpsite. For moving wastes, screening, stacking, turning etc. and the biomining activity per schedule. Monitoring of ambient noise levels and also the exposure of the workers to that environment is essential.

### 6.4.3 Water Environment

Water quality to be monitored during the operational phase. The monitoring frequency needs to be increased if higher concentrations are expected. Both groundwater regime and surface water domain is anticipated to be most-affected, through leachate contamination. Therefore surface & ground water will be periodically monitored for the parameters particularly increase in BOD, heavy metals and the hazardous chemicals

### 6.4.4 Land Environment

The soil in the dumpsite &neighboring areas will be analyzed for the relevant parameters.

The details of Environmental Monitoring Programs are given below:

Copyright © 2023. KSWMP| All rights reserved

*Table 18 Environmental Monitoring Parameters*

| Environmental components | Locations | Frequency | Parameters |
|---|---|---|---|
| Ambient Air quality | Nearby habitations and downwind locations | Quarterly [1 sample] | $PM_{10}$, $PM_{2.5}$, $NO_X$, $CH_4$, CO, Ammonia |
| Noise | Outside the site – towards residential area. | Monthly | Noise levels |
| Ground and Surface water | Ground water from the nearest well, drain upstream & downstream of where leachate is disposed, and Thodu upstream were the drain joins. | Quarterly | IS 10500:2012 drinking water parameter if for ground water wells, Class D,E for drain & Thodu (if these are not used as drinking water source) |
| Accidental release | Chemical, oil and fuel spills | Daily | Near Chemical, oil storage areas incident reports |
| Health safety Hazards | Medical records, documentation of injuries and accidents, Health and safety assessments | As and when accident/injury occurs | Incident reports |
| Leachate | 1 point per leachate pond | Weekly during bio mining activity | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite) |

Copyright © 2023 KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| | | | • Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins |
| | | | • |
| | | | |

In case of any deviation from FR, this would be updated and mitigation monitoring measures would be revisited. Currently the location of disposal of biomined material, or type of transport of biomined material is unknown & hence, these impacts & mitigation, monitoring requirements will be updated & implemented by the Contractor. This aspect should be made a Bid condition.

Copyright © 2023. KSWMP| All rights reserved

### 6.5 Environmental& Social Safeguard Budget

The details of Environmental Budget for Implementation and Supervision of Environmental Management Plan (EMP) are given below:

*Table 19 Detailed Cost Breakup*

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| | **Environmental Safeguards** | | | | |
| 1 | Deodorizer equipment (power sprayer) | Only Once | [redacted] | [redacted] | [redacted] |
| 2 | Green Net ( Approx., 300 m Length – Height – 3 m) and installation charges | Based on requirement | [redacted] | [redacted] | [redacted] |
| 3 | Spillage Kit | Only Once | [redacted] | [redacted] | [redacted] |
| 4 | Monitoring of Environmental parameters [Air, Ground water, Surface water, Noise, Soil and Leachate] Actual Noise abatement, odor management, dust management measures to be included in DPR cost | Quarterly, first six months by contractor and next two years by ULB | [redacted] | [redacted] | [redacted] |
| 5 | Gas monitoring to check the gas accumulation at the dumpsite | Gas monitoring should be conducted at least twice a day for about 7 consecutive days | [redacted] | [redacted] | [redacted] |
| 6 | Personal protective equipment | Entire Process | [redacted] | [redacted] | [redacted] |
| 7 | Training on capacity building | Entire Process | [redacted] | [redacted] | [redacted] |

Copyright © 2023. KSWMP| All rights reserved

| S. No. | Description | Frequency | Unit Price | Qty | Amount in Rs |
|---|---|---|---|---|---|
| | **Environmental Safeguards** | | | | |
| 8 | Leachate Management (Full costs included in DPR. This is only for incidental mitigation of odur, leaks, spillage, flies etc. ) | Entire Process | [redacted] | [redacted] | [redacted] |
| 9 | Access Road Improvisation | Only Once | [redacted] | [redacted] | [redacted] |
| | **Social Safeguards** | | | | |
| 10 | Overall Budget for Social Safeguards | Entire Process | [redacted] | [redacted] | [redacted] |
| **TOTAL (actual costs for works involved for mitigation measures are to be included by the contractor in DPR costs based on his work method. This is only indicative cost for incidental mitigation & management measures. EIIS in Labour camp also not included here; but shall be included by the contractor based on his work plan as this is combined with multiple other dumpsite biomining works)** | | | | | [redacted] |

## 7. INSTITUTIONAL ARRANGEMENTS

### 7.1 Proposed Institutional Arrangements

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organization will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances.

Copyright © 2023. KSWMP| All rights reserved

The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU

### 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components.
- Training for ULB officials, Councilors and Ward convener
- Training for Political and trade union leaders
- Training for workers of Municipal Sanitary workers

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

### 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email –https://kswmp.org/grievances/grmkswmp@gmail.com/ Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

Copyright © 2023. KSWMP| All rights reserved

## 8. PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

"Public Consultation" refers to the process by which the concerns of local affected persons and others who have plausible stake in the environmental impacts of the project or activity are ascertained with a view to taking into account all the material concerns in the project or activity design as appropriate.

Initially the public opposed the dumping of waste at Kasaragod dumpsite and the same has been inactive from year 2010. Now this proposal is to remediate the existing site in order to protect the environment and human health of the nearby area. The summary of the document will be made available in the website, which will also be featured in a newspaper advertisement in Malayalam language for public disclosure.

### 8.1 Public Consultation

In connection with the dumpsite remediation, a consultation meeting was conducted on 02.02.2023 at Kelugudde, the place where the dumpsite was located. Stakeholders from different groups including head load workers, employees of grocery shops and tea shops participated in the meeting followed by a transect walk. Local municipal ward councilor (Aswani. K), Clean City Manager, PIU Engineer, Kudumbashree CDS member, ADS Secretary, NHG member, local politicians and public along with KSWMP officials participated.

### 8.2 Outcome of the meeting

A transect walk was followed by the meeting with the participation of local residents. The local community, after the meeting and interactions, decided to extend wholehearted support for the dumpsite remediation activity, provided there should be an assurance from the wauthority that the land would not further be used for the same dumping purposes. The meeting also discussed various aspects of dumpsite remediation in detail including the possible social and environmental issues that may affect their routine life as well as the free movement during the time of operation

### 8.3 Information, Education and Communication (IEC) Plan

| IEC Plan for Kasaragod dumpsite remediation | | | | |
|---|---|---|---|---|
| **Programme** | **Methodology** | **Topic** | **Responsibility** | **Monitoring** |
| **Sensitization/ Awareness programme** | Meeting with all concerned Stakeholder's with prior notification to discuss about the process and remediation methods | Process of dumpsite remediation Developing as a Recreational park | Contractor | TSC/DPMU/ DPMC |
| **Pamphlet** | Distribute to all households within the limits in connection with the dumpsite remediation programme. | Awareness through community participation Different locations in the neighboring area | Contractor | TSC/DPMU/ DPMC |
| **Informative standees in all** | Visible places near the dumpsite | Protocol to the public who reside nearby areas and also trespassers. | Contractor | TSC/DPMU/ DPMC |
| **Announcement vehicle** | All across places near the dumpsite | Health and hygiene protocols during the dumpsite remediation process | Contractor | TSC/DPMU/ DPMC |

Copyright © 2023. KSWMP| All rights reserved

| IEC Plan for Kasaragod dumpsite remediation | | | | |
|---|---|---|---|---|
| **Programme** | **Methodology** | **Topic** | **Responsibility** | **Monitoring** |
| **Digital campaign (Social media)** | Areas near to the dump site. In and around the concerned ward area.<br>(in Malayalam and Kannada Languages) | Short video presentations tocommunicate through different digital platforms like WhatsApp pertaining to the existing scenario and proposal of Recreational Park with self-explanation | Contractor | TSC/DPMU/ DPMC |
| **Cautionary notification boards** | About vehicle movement and the transit of waste | precautionary measures should the general public take. | Contractor | TSC/DPMU/ DPMC |

**Conclusion**

The dumpsite remediation activity at Kasargod involves substantial social and health risks. However, a set of risk mitigation activities are proposed in the social management plan to overcome the identified risks and its negative impacts on the people residing near to the site. Formation and regular meeting of GRM & stakeholders committee, capacity building, awareness generation, regulated working hours, controlled operation at office working hours, counseling for the aggrieved parties, gender sensitization, legal awareness, providing safety are the major mitigation measures. This proposal is made to reduce the social risk associated with dumpsite remediation and to minimize the negative social impacts.

ANNEXURES

## Annexure 1 – Environmental Screening

**Environmental Screening**

**Sub Project Details**

| Name of Subproject: | Dumpsite Remediation |
|---|---|
| Sub project Components: | Dumpsite Remediation |
| Subproject Location (City / Town/ Village with ward numbers): | Kasaragod ULB, Ward 4Thalipadupppu, Kasaragod District. |

**Stage 1: Exclusion List**

| Sl.No | Non-permissible Activities |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016 (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible) |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |
| The project does not fall under the above conditions as mentioned under exclusion list | |

**Stage 2: Environmental Screening Checklist**

| Sl.No | Components | Details |
|---|---|---|
| 1 | Project Components | Dumpsite Remediation |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste | This proposed project involves biomining of existing dumpsite.<br>This remediation process |

Copyright © 2023 KSWMP | All rights reserved

| | | |
|---|---|---|
| | management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities / associated facilities) | involves<br><br>**Pre-processing of legacy waste**<br><br>1. Clearing and grubbing of site<br><br>2. Windrow formation for stabilizing the excavated waste<br><br>3. Windrow turning, tilling and cone formation<br><br>**Machinery erection**<br><br>1. Site leveling for Plant erection on the site and commissioning of machineries.<br><br>2. Operation of plant for processing the waste.<br><br>3. Office set up and fire safety measures<br><br>The byproducts of the process are<br><br>1. Bio earth and coarse fraction soil – will be used within the site<br><br>2. RDF – will be send to nearby waste to energy plants like cement plant and power plant which further processing it will be used as fuel<br><br>3. Recyclables – will be send to the authorized recycling agency |

| | | |
|---|---|---|
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project: including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination) Site Survey No:/s (attach map) with ownership details. Geographical co-ordinates of the site location (including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | Latitude: 12°30'59.0"N, Longitude 74°59'10.3"E<br><br>Land ownership: Kasaragod Municipality<br><br>Land use: Public<br><br>Disaster Zone: It falls under Zone III (Moderate) |
| 4 | Land Area proposed to be used: Location wise (in sq. km / sq. m) | It is remediation of land and hence no land required |
| 5 | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | Operational phase – 0.5 KL/day<br>Domestic use – 1.0 KL/day |
| 6 | Power Required and Source of Power | Demand load for the proposed equipment during the remediation process is available and additional power required will be made available by DG sets |

**Baseline Environmental Conditions**

| S.No | Environmental Aspects | Yes | No | Details |
|---|---|---|---|---|
| 1<br><br>(i) | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers)<br><br>Critically Vulnerable Coastal Areas (CVCAs), Eco sensitive Areas (ESAs) | | No | The project site is not located near any Critically Vulnerable Coastal Areas (CVCAs), Eco sensitive Areas (ESAs) |

Copyright © 2023 KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| (ii) | Cultural Heritage site, protected monuments - listed by ASI/State | | No | The project site is not located near any cultural Heritage or protected monuments as listed by ASI/state |
| (iii) | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species? If yes, which is the area? | | No | The project site is not located near Natural Forests / Protected Areas / Bio-Reserves |
| (iv) | Other Wetlands/ Mangrove/ Estuarine Region | | No | The project site is not located near any Wetlands/ Mangrove/ Estuarine Region |
| (v) | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas: areas with natural features like waterfalls, sacred groves | | No | The project site is not located near any Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas: areas with natural features like waterfalls, sacred groves |
| (vi) | Other Sensitive Environmental Components listed in EMF | | No | No other sensitive environmental components listed in EMF exist nearby the project site |
| (vii) | Drinking water source, upstream and downstream users of rivers, etc | | No | No river source is resorted for drinking water use. Downstream the ground water source is available |
| (viii) | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | No | The sea is located 1.86 km (Aerial Distance) from the project site. |

Copyright © 2023. KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| | | | | There won't be any influence of tidal influence |
| (ix) | Sensitive Receptors – a) Habitations / Households / Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | Yes | | a. **Nearest Habitation**- 6Houses are located at an Aerial distance of 40 m<br>b. **Religious Place**- Ayyappa Bajana Mandhir Temple is located at an aerial distance of 210 m<br>c. **School** -Adkathbail GUP School is located at an aerial distance of 750m.<br>d. **Tourist Places** – Kanha Beach is located 3 km from the proposed project site. |
| 2 | Is the site in Critical / Over Exploited Ground Water Block. Provide the level of the groundwater table | | No | Semi critical |
| 3 | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | | No | The site does not fall under major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion.<br>There may be chance of fire due to<br>1. Fire breaking due to high temperature<br>2. Electrical short circuit due to poor maintenance. |

Copyright © 2023. KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| | | | | 3. Smoking in the premises near the waste storage.<br>4. Burning of the waste by unauthorized persons<br>5. Keeping highly flammable materials like, cooking gas, kerosene, match boxes, etc.<br>6. Not having provision for proper fire/smoke detecting system. |
| 4 | Describe the type of soil and vegetation on site | Yes | | Hard laterite soil with few trees present in the site |
| 5 | Is the site present in the flood plains as recorded in the last 100 years. Provide the HFL level of the site/region | | No | The sea is located 1.86km (Aerial Distance) from the project site.<br>The 2018 peak flood experienced minimal problems or issues. |
| 6 | Existing pollution/contamination or degradation on site | Yes | | Dumpsite located in Kasaragod ULB is the existing contamination and detailed under section 3.11 |
| 7 | Any other remark on baseline condition | Yes | | Based on the test result of environmental baseline for Kasaragod dumpsite certain parameters exceeds the permissible limits and test report are |

Copyright © 2023 KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| | | | | given under section 3.11 |

**Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils**

| S.No | Impacts on Land / Soil Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Total extend of land to be covered/built | Yes | | 1.1 acres |
| 2 | Total extend of land where the waste will be dumped openly / or expected to get contaminated by waste or leachate/material storage | Yes | | Due to open dumped area |
| 3 | Extend of Land to be remediated | Yes | | 1.1 acres |
| 4 | Extend of land expected to be under green belt | Yes | | Will be under the scope of contractor |
| | proposed project cause the following on Land / Soil: | | | |
| (i) | Impact on Surrounding Environmental Conditions including Occupation on Low lying lands/flood plains | | No | There will be no major impact other than the operational phase as this project is remediation project. During operational phase the anticipated impacts are identified and mitigation measures are provided |
| (ii) | Substantial removal of Top Soil (mention area in sqm) | | No | Nil |
| (iii) | Any degradation of land / eco-systems expected due to the project? | | No | There will be no Land degradation instead it will be a remediation of land from further contamination |
| (iv) | Loss or impacts on Cultural/heritage areas/properties | | No | There will be no loss or impacts on |

Copyright © 2023 KSWMP| All rights reserved

| | | | | |
|---|---|---|---|---|
| | | | | Cultural/heritage areas /properties |
| (v) | Does the project activity involve cutting and filling/ blasting etc? | | No | The project does not involve cutting and filling/ blasting as the building is existing. |
| (vi) | Will the project cause physical changes in the project area (e.g., changes to the topography) due to excavation, earthwork, or any other activity? | | No | The project will have change in a positive way by clearing the waste dumped into vacant land |
| (vii) | Will the project involve any quarrying/ mining etc? | | No | The project does not involve any quarrying/ mining |
| (viii) | Will the project / any of its component contaminate or pollute the Land? | | No | Presently there is contamination and due to the project activity the further contamination shall be eliminated and natural system shall be restored |
| (ix) | Will the project contribute to any long term significant adverse (negative), large scale, irreversible, sensitive impact at a regional scale or area broader than the project sites? | | No | There will be no negative impact due to the proposed project |
| (x) | Will the Project or related activities cause negative impacts on the land in combination with other anticipated / existing projects in the region? | | No | There will be no negative impact due to the proposed project |

Copyright © 2023 [illegible] All rights reserved

| Sl.No | Impacts on Air and Noise Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project cause or increase air pollution due to dust and / or vehicle emissions? | Yes | | It will be minimal and adequate mitigation measures will be taken to reduce the impact. |
| 2 | Will the project cause or increase pollution due to GHG emissions? | | No | Nil |
| 3 | Will the project cause or increase odor nuisance? | Yes | | The Biomining project will be create odor nuisance but it is temporary and once the process is completed there will be no odor nuisance. |
| 4 | Is there a potential for release of toxic gases or accident risks (eg: potential fire outbreaks) | Yes | | There may be chance for any release of toxic gases or potential fire outbreaks which will be mitigated through proper mitigation plan by adopting gas collection system. |
| 5 | Will the project generate or increase noise levels which will impact surrounding biodiversity or communities? | Yes | | The Biomining project will create increase in noise level but it is temporary and once the process is completed there will be no noise. |

| Sl.No | Impacts on Water Environment | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the activities proposed at the site(s) impact water quality (surface | | No | The leachate generated will be properly |

Copyright © 2023. KSWMP | All rights reserved

| | | | | |
|---|---|---|---|---|
| | or ground) – leachate, runoff, wastes deposition, erosion? | | | collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 2 | Will the activities proposed at the site(s) impact water resource availability and use – leachate, runoff, wastes deposition, erosion? | | No | The leachate generated will be properly collected in leachate collection tank and thus avoiding the impact with the surface or ground water |
| 3 | Chances of Pollution of Water bodies / groundwater wells, nearby or downstream | | No | This remediation project will transform the existing polluted area into a healthier and improved environment. Hence there will not be any chance of pollution of water bodies / groundwater wells, nearby or downstream |
| 4 | Will the activities proposed at the site(s) hinder natural drainage | | No | As the existing dumpsite will hinder the natural drainage pattern. The proposed activity once completed will improve the natural pathway without any obstacles. |
| 5 | Will the activities proposed at the site(s) decrease permeability /rainwater percolation | | No | The activities proposed at the site will not decrease permeability /rainwater percolation |

Copyright © 2023 KSWMP | All rights reserved

| Sl.No | Impacts on Bio diversity & Host Communities | Yes | No | Remarks |
|---|---|---|---|---|
| 1 | Will the project necessitates cutting of Trees /Loss of Vegetation | | No | There will be no cutting of Trees. But there will be Loss of Vegetation due to this project |
| 2 | Will the project necessitate substantial removal of Top Soil (mention area in sqm) | | No | There will be no Substantial removal of Top Soil. |
| 3 | Any degradation of land / eco-systems expected due to the project? | | No | There will be no degradation of land / eco-systems expected due to the project activity.<br>Also, the proposed activity will protect the land from further contamination |
| 4 | Will the project result in Health & Safety Risks in the neighborhood including the release of toxic gases, leachate, accident risks | Yes | | There may be chance of accidental risks due to leachate and toxic gases, which will mitigated by proper lined leachate drain and PPE kits |
| 5 | Potential Noise, Light Pollution/movements causing disturbance to nearby habitats/communities | | No | There will be no major impact.<br>During operational phase there will be noise pollution due to movement of vehicles which will be curtailed by adopting mitigation measures. |
| 6 | Potential disruption to common property, accessibility, traffic | | No | There will be no major impact. |

Copyright © 2023 [illegible] All rights reserved

| | | | |
|---|---|---|---|
| | disruptions, conflicts, or disruption to the local community within the subproject area? | | During operational phase there will be slight increase in traffic due to movement of vehicles which will be mitigated by adopting movement of vehicles during off peak hours. |

**Project Categorization and Need for Safeguards Instruments**

| Project category | ☐ E1 ☑ E2 ☐ E3 |
|---|---|
| Key Reasons | During screening, it has found that the proposed subproject is moderately causing impact to the base line environment, land/ soil / water /noise environment, biodiversity or to the community. Site is not close to any Environmental Sensitive Receptor. Moreover, Project results positive impacts on Environment. The Environmental Baseline analysis reveals that dumpsite not having any Heavy metal contamination. Hence it is categorized as E2. |
| Safeguards Instruments Required | a) E1: Project-specific EIA (impact assessment considering the project details & location) by Independent Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>b) E2: Project-specific EIA by DPR Consultant (with signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities)<br>c) E3: signed/sealed Screening Form, Consultations, EMP, Budget, Responsibilities |

Copyright © 2023. KSWMP | All rights reserved

| Status | Agency / Official | Name, Signature with Date and Seal |
|---|---|---|
| Prepared by | PIU or ULB (project in charge) | |
| | Environmental Engineer | |
| Checked, categorized as __ (E1, E2, E3) & ToR issued by: | DESDU / SESDU | |
| | Environmental Specialist | |

**Annexure 2 – Fire and Risk Assessment**

A fire and risk assessment is a systematic evaluation of potential fire hazards and associated risks within a particular environment or premises. The assessment aims to identify potential fire hazards, assess the level of risk they pose, and recommend measures to mitigate or manage those risks effectively. Fire and risk assessments are essential for ensuring the safety of the workers, protecting property, and complying with fire safety regulations.

The existing legacy waste dumpsite, occupying about 1.1 acres in ward 4Thalipaduppu, aims to fully reclaim the land for future development. Bio-mining, a technique chosen after careful evaluation will be used to recover the land and ensure sustainable and environmentally friendly treatment of the waste. The process will yield various by-products, which require immediate attention to prevent fire hazards.

The by-products as follows:

1. The bio earth (10057.50 cu.m)& C&D (4224.15 cu.m)waste.
2. Retrieved plastics, rags, paper& other combustibles that cannot be recycled,but may be used as Refused derived fuel (RDF) of 5239.96 cu.m.
3. Recyclables of 593.39 cu.m will be sold to authorized recyclers

The retrieved plastics, rags etc that cannot be recycled and the recyclables if stored on site, poses a potential fire risk and requires proper handling. To mitigate the risk, a storage and disposal process spanning 3 to 4 months shall be devised by the contractor in line with his work plan During this period, the contractor shall implement various protective measures to prevent the possibility of a fire outbreak.These following measures are important for preventing fires, ensuring the safety of workers and nearby communities, and minimizing risks to the environment and property.

**Pre-Construction/Planning Stage:**

1. Fire Safety and Emergency Plan: Develop a comprehensive fire safety plan and emergency response plan to address potential fire incidents.
2. Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard.
3. Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.
4. Fire Equipment: Ensure that the site is equipped with fire extinguishers.

**Storage of Waste & RDF:**

**Fire Standards and Facilities:** Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.

Copyright © 2023. KSWMP| All rights reserved

Below equipment and their required quantities should be strategically positioned according to the site's specifications.

- Fire extinguisher (A, B, C powder): It will be used to immediately put off fire caused by wood, Paper and textiles, flammable liquids and flammable gases. Commonly can be placed anywhere inside the site
- Fire extinguisher (Foam spray): Mainly used to put off the fire caused by flammable liquids. It should be placed in diesel storage area, lubricant storage area and DG sets.
- Fire extinguisher ($Co_2$): Mainly used to put off the fire caused by Electrical short circuit. It should be placed near the control panel room/operation room.
- Fire bucket filled with sand: It should be placed near the diesel storage area

To ensure rapid response in case of a fire, it's essential to have a water tanker filled with water, equipped with a fire-fighting hose, readily accessible along with the portable motor. The presence of this equipped water tanker ensures timely and effective action during fire emergencies. All requirements in line with National/State regulations and as advised the local Brigade Shall be arranged & followed.

The following points to be considered for assessing the fire risk and procedure to mitigate it.

1. **Identification of Fire Hazards:** The first step involves identifying potential fire hazards in the premises. These hazards could include sources of ignition (e.g., electrical equipment), combustible materials (e.g., flammable liquids, paper, cardboard), and other factors that could contribute to the outbreak of a fire.
2. **Assessment of Risk:** Once the hazards are identified, the next step is to assess the level of risk associated with each hazard. This involves evaluating the likelihood of a fire occurring and the potential consequences if a fire were to break out.
3. **Escape Routes**: Since operational phase occurs in an open environment, the need for conventional escape routes in the event of a fire emergency may not be required.
4. **Fire Safety Measures:** The assessment reviews existing fire safety measures in place, such as fire alarms, fire fighting equipment, and fire suppression systems. Proper assembly point is required in case of fire break out
5. **Emergency Procedures:** The assessment evaluates the effectiveness of emergency procedures and evacuation plans in the event of a fire, ensuring that workers can safely evacuate the premises.
6. **Fire Training and Awareness:** The assessment considers the level of fire safety training provided to workers and the awareness of fire hazards and evacuation procedures.
7. **Record-Keeping:** Detailed records of the assessment process, findings, and recommended actions are maintained for future reference and regulatory compliance.

Copyright © 2023. KSWMP| All rights reserved

8. **Recommendations:** Based on the assessment, the fire risk assessor provides recommendations for improving fire safety, which may include installing additional fire safety equipment, conducting training programmes, or implementing any changes to reduce fire risks.
9. **Review and Updates:** Fire and risk assessments should be regularly reviewed and updated to account for any changes in the premises or regulations.

Fire and risk assessments play a crucial role in preventing fires and minimizing their impact if they occur. They are particularly important for dumpsites and other places with a higher risk of fire hazards to ensure the safety and well-being of workers.

NOTE : The major assessments had been referred based on the EMF Vol-II Part A – Indicative EMP in the Impact assessment.

## Annexure 3 – Dumpsite screening checklist

Checklist for screening of dumpsites for potential landfill/ processing facility

| Name of the contact person from ULB-Phone number and email Address | Kasaragod |
|---|---|

| S.No. | Item | Norm | Information |
|---|---|---|---|
| 1 | Land ownership (including that required for approach road) (in line with revenue records) (supporting data to be provided as annex) | | Kasaragod, Municipality |
| 2 | Name of the location of site and Map of the site (include as an annex) | | Thalipaduppu, Kasaragod |
| 3 | GPS coordinates of site | | Latitude: 12°30'59.0"N, Longitude 74°59'10.3"E |
| 4 | Is there a Pollution Control Board permit for dumping/SWM activity? | | Yes |
| 5 | Is there a notified no development zone or buffer or green belt around the dump? | | No |
| 6 | Possible area to be kept as buffer green belt around (within / outside the site for purchase) | | Not available |
| | Site Selection Criteria - give distances, wherever applicable | | |
| 7 | Groundwater (m below liner bottom) | 2m | Pre-monsoon-13.22m Postmonsoon-11.02m |
| 8 | Private water sources (well etc.)-distance from site boundary (to be | 100 m (river) | Chandragiri puzha (south)river is |

Copyright © 2023 KSWMP| All rights reserved

| | | | |
|---|---|---|---|
| | adjudged based on approx. distances during screening exercise) | | located at a radial distance of 2 km from the site |
| | | 200 m (Pond) | Pond is located at an aerial distance of 1.00 km from the site |
| | | 30 m (Local Canal) | 300m from the dumpsite. (Shankarankuzhi Thodu) |
| 9 | Env. Sensitive Areas/ Wetlands | Not Permitted | No |
| 10 | Site having Rare and Endangered Species | Not Permitted | No |
| 11 | Site should not be within Protected/ Reserve Forests | Not Permitted | Site is Not within the Protected/ Reserve Forests |
| 12 | Residential Development within prescribed buffer zone of 200 m | Not Permitted | Yes. Local Residents nearby Dumpsite within 200 m |
| 13 | Perennial Stream within site | Not Permitted | No |
| 14 | Airport | 20 Km | No |

| S.No | Item | Norm | Information |
|---|---|---|---|
| 15 | Distance to the nearest village in the predominant wind (m)direction | | 50m |
| 16 | Flood prone site | | No |
| 17 | Accessibility - Road access for heavy vehicles | | 5 m wide Approach road. Partly Concrete and partly bituminized. |
| | i. Starting point of the access road | | Adkathbail |

Copyright © 2023. KSWMP | All rights reserved

| | | | |
|---|---|---|---|
| | ii. length and width of the access road | | 5 m wide |
| | iii. Current condition of the access road (visual assessment) | | Tarring Road with good condition. |

| S.No. | Site Description | | |
|---|---|---|---|
| 18 | Is the site flat/stopping to nearby uses | | Flat |
| 19 | Soil base-soft soil/murrum,soft rock etc | | Hard Laterite soil |
| 20 | Direction of Leachate flow out of the site, if any | | No. The biodegradable waste dumping stopped since 2010 |
| 21 | Other uses within the dumpsite(recycling yard, compost pad etc) | | Nil |
| 22 | Boundary conditions-walls/fence/what land uses along boundary | | Compound wall |
| 23 | Year since the dump site is existing | | 1970 |
| 24 | Is the dumping Operation Ongoing | | Stopped the Biodegradable waste since 2010 |
| 25 | Any underground utilty/gas line etc near the site | | No |
| 26 | Existing power supply, water supply, electric poles going through/over/in the site etc. | | Yes. Nearby Transformer |
| 27 | Are there pools of leachate ,rat and fly infestations, domestic animals roaming freely, odor s,dust, vermin and birds,waste being burnt at | | No |

## Annexure 4 - Occupational Health and Safety

Occupational Health and Safety Risk Assessment for Dumpsite Remediation is as follows

**1. Introduction:**

The purpose of this Occupational Health and Safety (OHS) Risk Assessment is to identify, assess, and mitigate potential hazards and risks associated with the implementation of a Biomining project for dumpsite remediation. Biomining is a sustainable and environmentally friendly method used for the disposal of dumped waste and reclamation of land.

**2. Scope:**

This risk assessment focuses on the occupational health and safety aspects of the Biomining process for dumpsite remediation. It covers the potential hazards and risks that workers may encounter during site preparation, Biomining operations, and waste disposal activities. The assessment will also outline control measures to minimize or eliminate these risks.

**3. Hazard Identification:**

Biomining process identifies potential hazards, which include but are not limited to:

a. Chemical Hazards: Exposure to hazardous chemicals present in the dumpsite waste and chemicals used in the Biomining process.

b. Biological Hazards: Potential health risks associated with the presence of pathogens, disease-causing microorganisms, and vectors within the waste. These hazards can arise from the decomposition of organic matter, the presence of infectious materials, and the attraction of disease-carrying organisms such as rodents, insects, and other vermin.

c. Physical Hazards: Potential for slips, trips, and falls on uneven terrain or during equipment operation.

d. Mechanical Hazards: Risks associated with operating and maintaining heavy machinery.

e. Ergonomic Hazards: Strain and injuries related to improper handling of equipment or materials.

f. Environmental Hazards: Adverse effects on air and water quality during the Biomining process.

**4. Risk Assessment:** The risk assessment will categorize the identified hazards based on their severity and likelihood of occurrence. Each hazard will be evaluated using a risk matrix to determine the level of risk and priority for mitigation.

Copyright © 2023. KSWMP| All rights reserved

**5. Risk Mitigation Measures:**

To ensure the safety of personnel involved in the Biomining project, the following risk mitigation measures will be implemented:

a. Engineering Controls:

- Regular maintenance and inspection of machinery to prevent mechanical failures.

- Providing appropriate personal protective equipment (PPE) to workers.

b. Administrative Controls:

- Developing standard operating procedures (SOPs) for Biomining operations.

- Implementing a comprehensive training program for all personnel involved in the project.

- Scheduling regular breaks and rotation of tasks to minimize fatigue.

c. Environmental Monitoring:

- Regular monitoring of air and water quality to ensure compliance with safety standards.

- Establishing emergency response protocols in case of any unexpected environmental events.

d. Emergency Preparedness:

- Developing and practicing emergency response plans for potential accidents or incidents.

- Providing workers with first-aid training and easily accessible medical facilities.

e. Personal Protective Equipment (PPE):

- Mandating the use of appropriate PPE, such as respirators, gloves, safety goggles, and protective clothing.

**6. Worker Health Surveillance:**

Implementing a health surveillance program to regularly monitor the health of workers involved in the Biomining project. This may include medical examinations and assessments to detect any health issues related to exposure during the remediation process.

The work site to be equipped with first aid and the contractor must have tie-up with nearest primary health center/ medical facility for the welfare of the labors.

**7. Training and Education:**

Copyright © 2023. KSWMP| All rights reserved

Conducting comprehensive training and educational programs for workers and supervisors to raise awareness of potential hazards, proper handling of equipment, and the correct use of PPE.

**8. Conclusion:**

By proactively identifying potential hazards, assessing risks, and implementing appropriate control measures, this Occupational Health and Safety Risk Assessment aims to ensure the safe and successful execution of the dumpsite remediation Project through Biomining. Continuous monitoring and improvement will be essential throughout the project to maintain a safe work environment.

## EXECUTIVE SUMMARY

Kasaragod is a Municipality in Kasaragod District, of Kerala State. Even though the ULB has an excellent practice of waste management, the primary environmental issue currently faced by municipal authorities revolves around a longstanding existing legacy waste dumpsite. Despite discontinuing waste dumping activities, these dumpsites remain as the remnants of a time when waste disposal methods were not as advanced or environmentally conscious as they are today. As a consequence, these sites pose significant environmental, social, and economic challenges for the communities and ecosystems surrounding them. The SWM Rules 2016 directs all local bodies to identify the legacy dumpsites and to scientifically remediate it in order to ensure a safe and healthy environment. In acknowledgment of this imperative, the Government of Kerala has undertaken the endeavor through the Kerala State Solid Waste Management Project (KSWMP) to address the issue of remediating legacy waste dumpsites across all Urban Local Bodies (ULBs). As a component of the project's first phase, the remediation of the existing dumpsite located in Thalipaduppu, Kasaragod, has been proposed.

The Kasargod municipality has an area of 16.69 sq.km with 38 wards. The municipality intend to remediate the existing legacy waste dumpsite at ward 04 (Thalipaduppu) Kellugudde and recovery land 100% for development of recreational park for the public. The Kellugudde (Thalipaduppu) dumpsite is used for dumping of solid waste from the year 1970 to year 2010. The dumping of the solid waste was stopped due to protest from the local residents for addressing the issues of the problems created by odour and leachate from dumpsite and local residents are in demand to remediate the legacy dumpsite and to utilize the remediated land for social cause. The total quantity of legacy waste is estimated to be approximately 16735.685 Tons. Since the cessation of dumping activities in 2010. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes.

To assess the quantity & composition of the legacy waste & also evaluate the environmental baseline of the dumpsite, the samples from the strategic locations were collected and analyzed for various parameters viz., physical and chemical analysis of Legacy waste, Soil, Air, Noise, leachate, Ground Water and Surface Water. As part of the study, detailed site investigations were carried out as follows – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Chemical, Environmental Analysis by M/s Poluchem Laboratories. From the results of the investigations, it was found that the waste was found to depth of 4.5 m. The total estimated quantity of legacy waste was found to be around 20115 m3 (16735.685 T)

As per the SWM Rules 2016, selection of the applicable method/type or technique for dumpsite remediation needs to be arrived from the Feasibility study carried out and based on the results, remediation can be done by a) Capping without land recovery, b) Bio-mining – reclamation/recovery of land 100 %) capping with partial land recovery. The selection of technology shall also depend on the available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for 100% land recovery and forward linkages/utilization of processed aggregates/by-products. Based on the detailed assessment of the selection parameters, Bio-mining –

Copyright © 2023. KSWMP | All rights reserved.

reclamation/recovery of land 100% is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and 100% land recovery/remediation legacy waste dumpsite.

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land 100 %) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by-products as per the requirements of the utilization/forward linkage. Based on the detailed assessment of the selection parameters, mobile/compact screening is the machineries are which shall be the optimum screening machineries the for processing the stabilized legacy waste of 20115 m3 within the stipulated timeline of 31st March 2024 by NGT for remediation of legacy waste dumpsite.

Environmental & Social safeguards: The project attracts E2 Environmental category based on the project activities and status of the environment baseline. The project is categorized as possessing a moderate level of social risk, as determined through social mapping and a transect walk. This involves engaging with the local community residing near the prospective project site to evaluate the challenges posed by the existing legacy waste dumpsite and the potential ramifications during the project's implementation.

By-products utilization/forward linkages/Usage

1. The bio earth & inerts quantity 10057.50 m3 & 4224.15 m3 and waste will be utilized for development of the reclaimed legacy waste dumpsite as recreational park/facility.
2. Refused derived fuel (RDF) of 5239.96 m3 will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the processes
3. Recyclables of 593.39 m3 will be sold to authorized recyclers and will be collected from the dumpsite.

The activities of the bio-mining will be commenced from the Dec 2023 and end by Mar 2024. An expanse of 1.1 Acre is designated for reclamation, aiming to transform it into a facility like potential public-access green park etc., The project is projected to incur a total expenditure of [redacted]/-. The expense linked to the processing and disposal of legacy waste per cubic meter amounts to [redacted]/-.

## 1. INTRODUCTION

Kasaragod Municipality stands as a swiftly advancing urban local body within the Kasaragod district. While demonstrating commendable waste management practices, the principal environmental concern confronting the municipal authorities pertains to an enduring legacy waste dumpsite. Despite ceasing waste disposal operations, these residual dumpsites persist from an era when waste disposal practices were less sophisticated and ecologically attuned compared to the present standards. Consequently, these sites present substantial environmental, societal, and economic complexities for the neighboring communities and ecosystems.

As the SWM Rules 2016, all local bodies to identify the legacy dumpsites and to scientifically remediate it in order to ensure a safe and healthy environment. Recognizing this necessity, KSWMP has initiated the project of remediation of legacy waste dumpsites in all the ULBs. As part of the project, in phase -1 the existing dumpsite of Thalipaduppu, Kasaragod is proposed to remediated.

The legacy waste dumpsite remediation needs to be arrived from the feasibility study outlining the technical, economic, and social factors which will have implication of the process of remediation of legacy waste dumpsite. Based on the detailed field investigations & assessment and market sounding, the method proposed for remediation of legacy waste dumpsite will ensure long term sustainability and environmentally sound treatment which will be technically feasible, economically viable, and socially acceptable. `

## 2. GENERAL DESCRIPTION ABOUT PROJECT

The Kasargod municipality has an area of 16.69 sq.km with 38 wards. Solid waste generated from 11586 households and 3189 institutions including commercial establishments is 9.79 TPD. The municipality intend to strengthen and enhance the existing treatment facilities of the bio degradable & non – degradable waste system at household, institutional and community level for effective management of the solid waste generated and also remediation of existing legacy waste dumpsite

The Thalipaduppu dumpsite was used for dumping of solid waste from the year 1970 to 2010. The legacy waste is spread in an area of 1.1 acres with approximate height of 4.5 m and a portion of the dumpsite is capped as part of the remediation. Almost entire area is filled with legacy waste on dumpsite. The legacy waste at the site mainly consists of organic material, stones, plastic, and rags/clothes. The municipality intend to remediate the existing legacy waste dumpsite at Thalipaduppu, Kasaragod and recovery land 100% for development of recreational park for the public. The details of the legacy waste dumpsite are provided below:

*Table 1 Dumpsite Details*

| Name of ULB | Kasaragod |
|---|---|
| District | Kasaragod |
| Taluk | Kasaragod |
| Location | Thalipaduppu, Kasaragod |
| GPS Co-ordinate of the Site | Latitude: 12° 30'59.01"and Longitude: 74° 59'11.099" |
| Total dumpsite area (in acres) | 1.1 Acre |
| Legacy waste spread (in acres) | 1.1 Acre (Complete area occupied by legacy waste) |
| Ownership of Land | ULB |

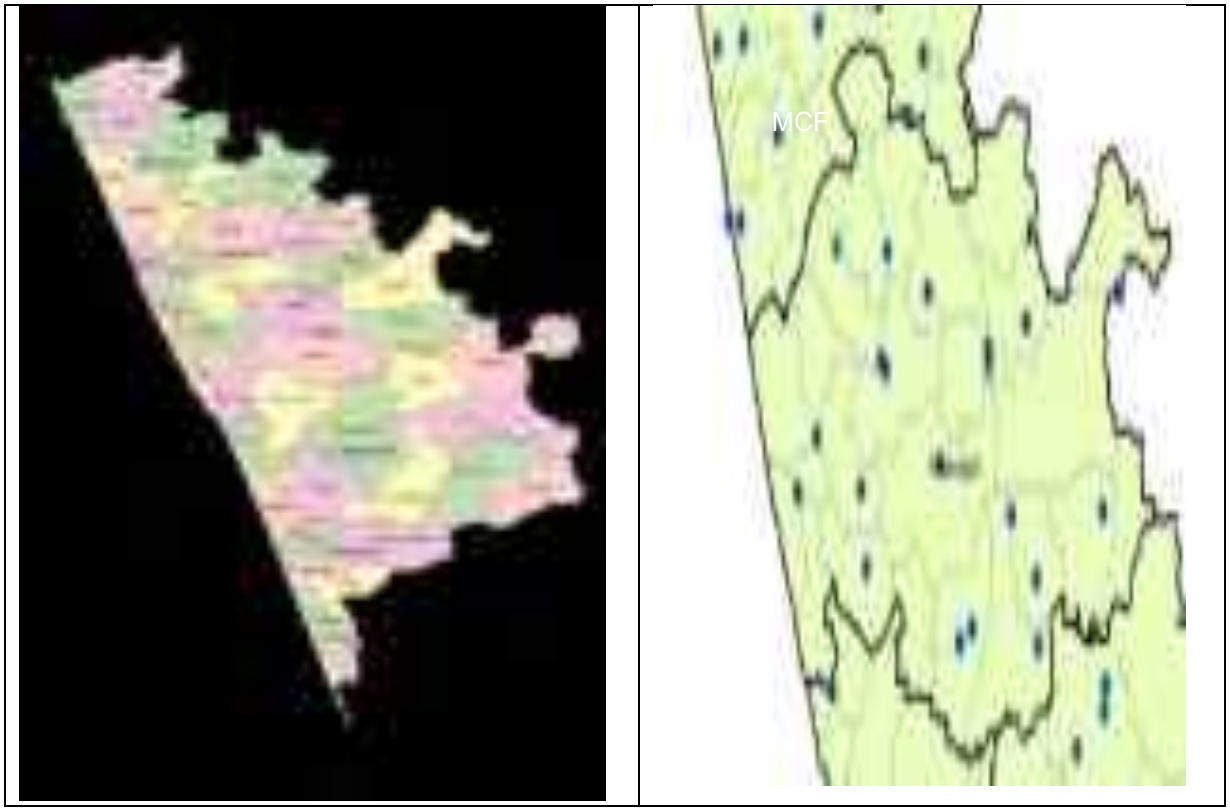
## 3. LOCATION, DEMOGRAPHY, ACCESS, LAND-USE, WATER TABLE AND CLIMATE OF THE ULB

### 3.1 LOCATION

Kasargod is a Municipality in the state of Kerala, India and is located at Latitude: 12° 30'59.01" and Longitude: 74° 59'11.099" with an area square Kilometer 16.7 and has an average elevation of 19 m. It is Located 581 KM South towards State capital Thiruvananthapuram. Kasaragod District population is 13, 02,600. It is 11th largest district in the State by population. Kasaragod District is sharing border with Dakshin Kannad District of Karnataka to the North, Kannur District to the South, Lakshadweep Sea in the west. Kasaragod is about 581 KM by road to Thiruvananthapuram (Capital of Kerala). Major rail way stations in district are Kasaragod, Kanhangad and Nileshwar. The Key map of Kasargod Municipality is given below.



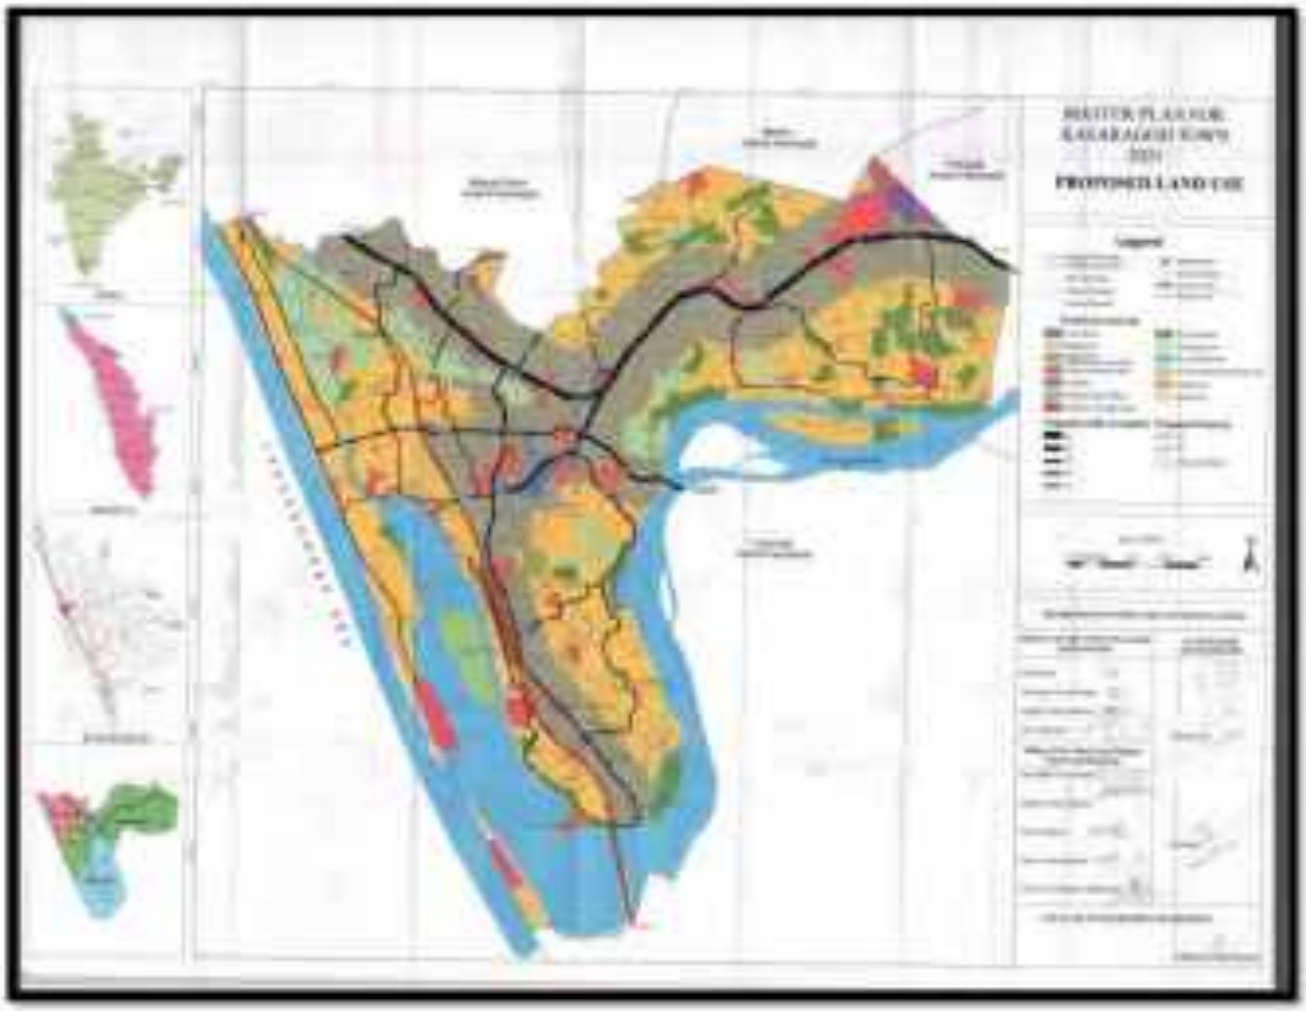


*Figure 2 Map for Kasaragod Municipality*

### 3.2 POPULATION, DENSITY AND LITERACY RATE

Kasaragod Municipality population is 57005, among them about 28,000 (49 %) are male and about 29,000 (51 %) are female. As of 2011 census there are 1054 females per 1000 male in the city. The Kasaragod Municipality was formed on 1964, as per the survey present population is 57,005.

The literacy rate of Kasargod city is 94.76 % higher than state average of 94.00 %. In Kasargod, Male literacy is around 96.53 % while female literacy rate is 93.12%.

Source: Master Plan for Kasaragod town 2031(draft)

*Figure 3 Land Use Map of Kasaragod Municipality*

### 3.3 LAND USE

The Kasargod municipality has a total area of 16.69 Sq. km. The land use indices of Kasargod municipality are shown in below figure:

1. The predominant land use in the area is residential.

2. There is a nearby KSEB Substation Godown of civil supplies located approximately 20 meters away.

3. Kudumbashree Community Hall adjacent to dumpsite.

The land use indices of Kasaragod municipality are shown in below figure.

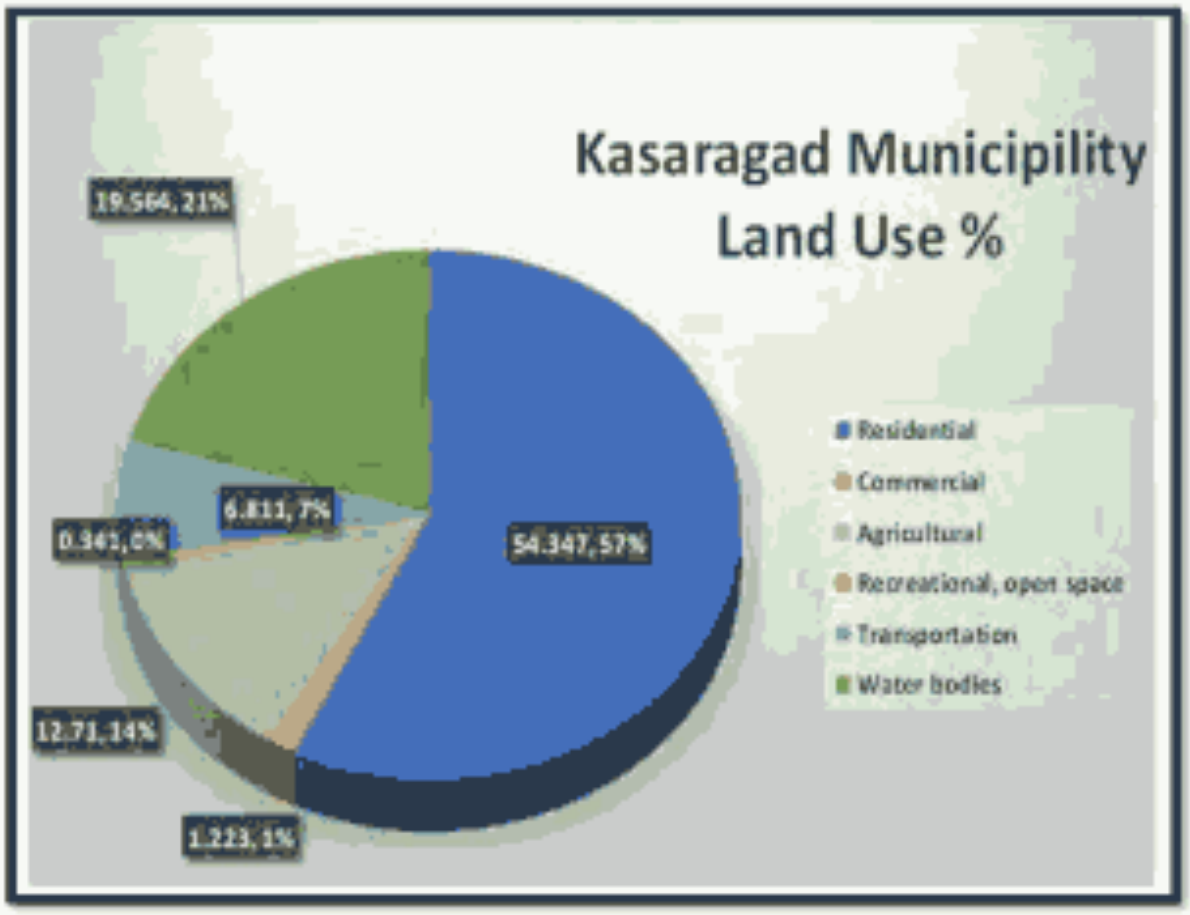

Table 2 Land use indices

| Description | Area (in sq.km.) | Land Use % |
|---|---|---|
| Residential | 9.064 | 54.347 |
| Commercial | 0.204 | 1.223 |
| Agricultural | 2.12 | 12.71 |

Copyright © 2023. KSWMP | All rights reserved.

| Description | Area (in sq.km.) | Land Use % |
|---|---|---|
| Recreational, open space | 0.057 | 0.341 |
| Transportation | 1.136 | 6.811 |
| Water bodies | 3.263 | 19.564 |
| **Other** | **0.834** | **5.00** |
| **Total** | **16.7** | **100** |

*Figure 4 Land Use of Kasaragod*

## 3.4 TRANSPORTATION CORRIDOR

*Table 3 Transportation corridor details*

| Mode | Details |
|---|---|
| **Road** | Kasargod has a good road network. National Highway 17 (NH17) leading to Mangalore passes through Kasargod town, the state highway through Kasargod are SH-31, SH-55, SH-56 & SH-57. The town is well connected with major urban centres in the state by rail and roads. S.H-32 to Kalladukka leads to Badiadukka, Perla Vitla and further to Karnataka State. The Jalsoor road passes through Muliyar and leads to Sulliyahas |

Copyright © 2023. KSWMP | All rights reserved.

| | |
|---|---|
| Train | Kasargod Railway Station is one of India's model railway stations, and is located in the Mangalore Shornur railway line of southern railway. A major thrust on the rail transport network happened with the opening of Konkan Railway, providing direct access from this region to Bombay. The Shornur-Mangalore broad gauge Railway line connects 12 Panchayats and three Municipalities of the District covering a distance of 81km through the coastal belt of the District. There are 10 railway stations and one halt station in the district. The new Konkan Railway link reduces the distance to Mumbai by 800 kms and makes this the shortest route for Keralalites to Mumbai, the Commercial hub of India. The Shornur-Mangalore broad gauge line adds to the regional linkage of the town. It directly links Kasaragod with Mangalore in the north and Kannur in the south. The rail to South passes along the Bekal Tourism Development Project area. |
| Air | The nearest international airports are situated at Mangalore (65 km away) and Kannur (110 km away). |

### 3.5 TOPOGRAPHY

Kasaragod has an average elevation of 19 m (62 ft). Based on altitude, land could be classified into three; low land, mid land and high land.

*Table 4 Topography*

| Altitude | Details |
|---|---|
| Lowland | The coastal plains, the midlands and the eastern highland regions. The coastal plains with an elevation of less than 10m occur as narrow belt of alluvial deposits parallel to the coast. To the east of coastal belt is the midland region with altitude ranging from 10 to 300 m amsl. |
| Midland | The midland area is characterised by rugged topography formed by small hillocks separated by deep cut valleys. The midland regions show a general slope towards the western coast. To its east is the high land region. The midland and hill ranges of the district present a rugged and rolling topography with hills and valleys. |
| Highland | The district is the northernmost district of the State of Kerala. Kasaragod is located at Latitude: 12° 30'59.01" and Longitude: 74°59'11.099". It has an average elevation of 19 metres (62 feet). Ranipuram or Madathunala (1016m) peak is the highest peak in the Kasargod district of Kerala. It is located in the Ranipuram Wildlife Sanctuary. |

### 3.6 CLIMATIC CONDITION

#### 3.6.1 TEMPERATURE & RAINFALL

Kasargod Municipality falls within the tropical to sub- tropical climatic region. The maximum temperature in the region varies almost between 32 °C to 37 °C and minimum temperature ranges from 21.6 °C to 32.6 °C .

Kasargod Municipality falls within the tropical to sub- tropical climatic region and dominant feature is the monsoon. The major source of rainfall is southwest monsoon from June to September which contributes nearly 85.3% of the total rainfall of the year. The northeast monsoon contributes nearly 8.9% and balance of 5.8% is received during the month of January to May as

Copyright © 2023. KSWMP | All rights reserved.

pre monsoon showers. Out of the 106 rainy days in a year, 87 rainy days occur during south west monsoon season.

*Table 5 Temperature & Rainfall Data*

| Month | Climatic Conditions of Kasargod Municipality | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec |
| Average High Temp. °C | 31.4 | 31.5 | 32.2 | 32.7 | 32.2 | 29.3 | 28.2 | 28.4 | 28.8 | 30 | 31 | 31.5 |
| Average Low Temp. °C | 21.7 | 22.8 | 24.3 | 25.9 | 25.7 | 23.9 | 23.4 | 23.6 | 23.5 | 23.8 | 23.1 | 22 |
| Average Precipation mm | 1 | 1 | 5 | 55 | 262 | 1002 | 1190 | 647 | 338 | 229 | 77 | 18 |

*Source: Climate-Data.org*

According to the Rainfall Data, the most favorable working period spans from December to March due to the lower precipitation levels.

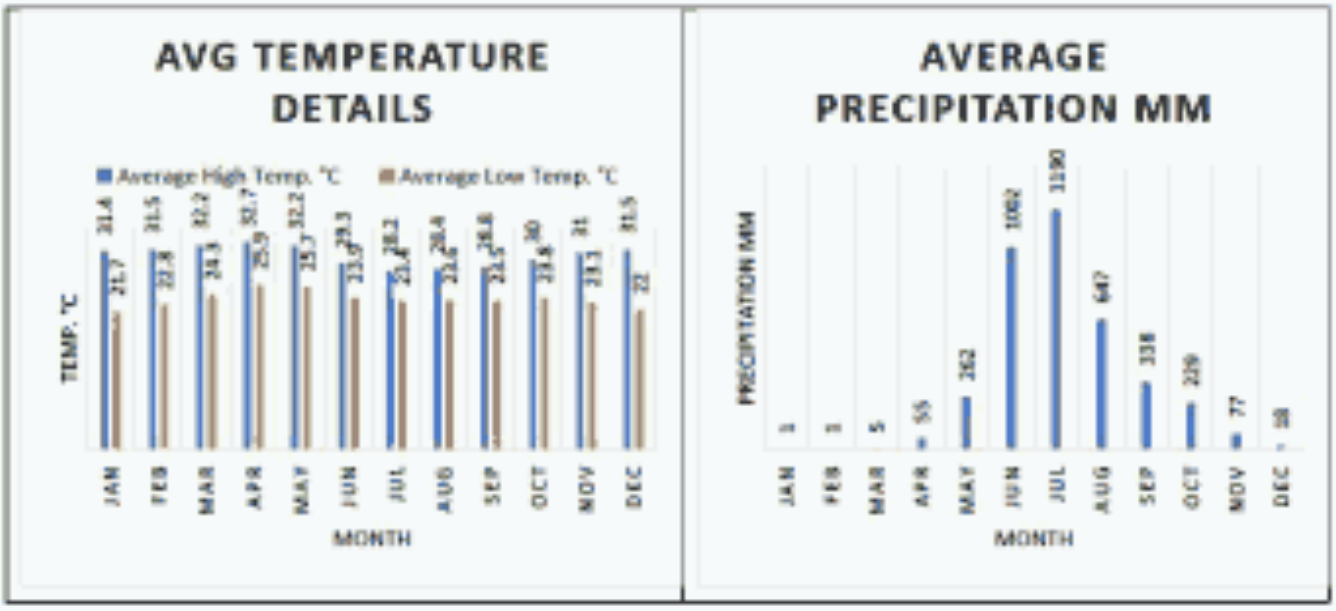

*Figure 5 Monthly Variation of Climate and Rainfall for Kasaragod Town*

### 3.7 FLOOD ZONE

According to the 2022 Flood Probability Report published by the Kerala State Disaster Management Authority, the Kasargad municipality as shown in below.

Copyright © 2023. KSWMP | All rights reserved.

*Table 6 Flood zone details*

| DESCRIPTION | BASE YEAR | 1 in 10 YEAR (CC RCP 8.5) | | 1 in 25 YEAR (CC RCP 8.5) | | 1 in 50 YEAR (CC RCP 8.5) | | 1 in 100 YEAR (CC – RCP 8.5) | |
|---|---|---|---|---|---|---|---|---|---|
| Kasargod Municipality | 2011 | Flood Inundation Area (Km2) | Max. Flood Level (m) | Flood Inundation Area (Km2) | Max. Flood Level (m) | Flood Inundation Area (Km2) | Max. Flood Level (m) | Flood Inundation Area (Km2) | Max. Flood Level (m) |
| | | 3.46 | 7.31 | 3.54 | 7.7 | 3.91 | 8.91 | 4.05 | 9.35 |

*Source: Kerala State Disaster Management Authority CC=Climate Change RCP= Representative Concentration Pathway*

### 3.8 EARTHQUAKE ZONE

The Bureau of Indian Standards (BIS) has grouped the country into four seismic zones viz. zones II, III, IV and V as detailed in the Map below. The Kerala state falls under Seismic Zone 3.

### 3.9 COASTAL REGULATION ZONE

As per the Coastal Regulation Zone (CRZ) notification 2011 and further amendment in CRZ notification 2019, the Kasaragod legacy dumpsite does not fall under the CRZ zone. The dumpsite located in the ward 4, Thalipaduppu which is around 1.3 km away from the Coastal Regulation Zone

### 3.10 GROUND WATER LEVEL

The details of groundwater level during pre-monsoon and post-monsoon, and the average fluctuation is provided in the table below.

*Table 7 Details of Ground Water level*

| Pre-monsoon (m) | Post monsoon (m) | Avg. Fluctuation (m) |
|---|---|---|
| 20 | 0.1 to 10 | 0-2 |

## 4. DETAILED DESCRIPTION OF THE DUMPSITE

### 4.1 PHYSICAL FEATURE OF THE SITE

The total expanse of the dumpsite measures approximately 1 acre 10.45 cents, with a 100 % portion occupied by legacy waste. The average elevation of this legacy dumpsite is 4.5 meters. This historical waste repository is situated at geographical coordinates Lat: 12° 30'59.01'' N, Long: 74°59'11.099'' E in the region known as Thalipaduppu (ward-4), within the Kasargad Municipality.

At present, the Municipality's solitary dumpsite is located within the Thalipaduppu Area of Kasargad Municipality. Specifically positioned within ward No. 4, this site encompasses non of MCF, RRF or any other waste activity processing unit. The complete site are filled with legacy waste only.

The dumpsite is enclosed by a well-constructed compound wall initially. But now its one side is damaged partially. The two side of compound wall have 2m average height compound wall and the fourth side have retaining wall of laterite stone.

*Figure 6 Site Access Roads – Kasaragod Dumpsite*

Copyright © 2023. KSWMP | All rights reserved.

## 4.2 INFORMATION ON SITE MANAGEMENT

The Thalipaduppu dumpsite has served as a repository for solid waste disposal since 1970, spanning a period of over 40 years. This site was closed in 2010.

## 4.3 SITE HISTORY INCLUDING PUBLIC PROTEST

The Thalipaduppu dumpsite is used for dumping of solid waste from the year 1970 to year 2010. The dumping of the solid waste (bio degradable waste) was stopped due to protest from the local residents for addressing the issues of the problems created by odour and leachate from dumpsite and local residents are in demand to remediate the legacy dumpsite and to utilize the remediated land for social cause.

## 4.4 DIRECTIONS FROM AUTHORITIES LIKE NGT, PCB, ETC.

### 4.4.1 NGT DIRECTIONS & ORDERS

The National Green Tribunal (NGT) has set norms and guidelines (O.A. No. 606/2018) to address legacy waste accumulated at long-operating dumpsites, to mitigate environmental and health hazards. The norms focus on closure and remediation of dumpsites, waste segregation and treatment using appropriate technologies, conducting Environmental Impact Assessments (EIAs), implementing land use planning and zoning regulations, monitoring and compliance measures, and promoting public participation and awareness regarding legacy waste management. These guidelines aim to stabilize dumpsites, prevent further pollution, and involve communities in decision-making and risk education.

### 4.4.2 LOCAL SELF GOVERNMENT DEPARTMENT - GUIDELINES

The remediation of dumpsites is further directed by Honorable NGT in its order OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. Remediation of Legacy Waste Dumpsites through Bioremediation - G.O.(Rt)No.2629/2022/LSGD Dated, Thiruvananthapuram, 29-10- 2022

### 4.4.3 KSPCB - GUIDELINES FOR DUMPSITE REMEDIATION

The Kerala State Pollution Control Board (KSPCB) has established guidelines (PCB/HO/SEE2/Model City/Kozhikode corporation/2019 dated 09/09/2021) for dumpsite remediation to address the environmental and health impacts of waste disposal. The recommended steps include conducting a site assessment, developing a remediation plan based on risk assessment, selecting appropriate remediation technologies, implementing remediation activities under supervision, verifying the success of remediation, and ensuring long-term management and monitoring of the site. By following these guidelines, the KSPCB aims to mitigate the adverse effects of waste disposal, protect the environment, and safeguard public health.

### 4.4.4 CPCB GUIDELINES

Hon'ble NGT warned that due to incremental growth of Municipal Solid Waste (MSW), these MSW dumps are converting into virtual mountains. Hon'ble NGT further directed that every city/town should adhere to clause 'J' of Schedule–I (capping is not the first option for environmentally safe legacy waste management) of SWM Rules, 2016. Finally, Hon'ble NGT directed CPCB to propose Standard Operating Procedure (SOP) for implementation of Bio-mining and Bioremediation of legacy solid waste.

Copyright © 2023. KSWMP | All rights reserved.

### 4.4.5 SWACHH BHARAT MISSION (SBM) ADVISORY

The advisory on dumpsite bioremediation addresses the challenges of legacy waste and promotes sustainable waste management practices and emphasizes the importance of dumpsite bioremediation as a sustainable solution for managing legacy waste. By adopting these guidelines, municipalities can address the environmental and health risks associated with dumpsites and promote a cleaner and healthier living environment for communities.

### 4.4.6 CENTRAL PUBLIC HEALTH AND ENVIRONMENTAL ENGINEERING ORGANIZATION (CPHEEO) GUIDELINES

The guidelines aim to provide a comprehensive approach to remediate dumpsites in a safe and environmentally sustainable manner. Key points from the guidelines include conducting site assessments, segregating waste, and implementing engineering and biological measures to control contamination, treating leachate to prevent groundwater contamination, and conducting post-remediation monitoring. These guidelines are crucial to ensure effective and environmentally sound dumpsite remediation that protects public health and the environment.

# 5 SCOPE OF WORK

Preparation of feasibility report for the assessment of a technically feasible & financially viable solution for the remediation of legacy dumpsite located at Kasaragod includes the following steps.

- Conducting detailed field investigations – 1. Geotechnical Investigation by M/s Matter Material testing & Research Laboratory (P) Ltd. and 2. Waste Analysis - Physical & Chemical, and Environmental Baseline Analysis by M/s Poluchem Laboratories.
- Assessment & Analysis of detailed investigation report submitted by the Laboratories.
- Waste quantification by conducting survey (total station/ drone survey) & assessment of composition of legacy waste based on the Physical & Chemical characteristics and Leachate.
- Quantification of by-products viz; Bio earth, RDF, Recyclables, Inert, etc., based on the Physical & Chemical characteristics and exploring the options for optimum utilization of the By-products.
- Market sounding/service provider's consultation to explore the available successful options of technologies/machineries.
- Optional Analysis – Types of remediation (land recovery – Biomining, Capping partially Biomining & Capping), Methods/Technologies (Stationary & Mobile- compact), Implementation mode, Forward linkages (Utilization/Management of By-products) and Environmental & Social categorization as per the Environmental Management Framework – Vol II Part A.
- Assessment of System Requirements – Machineries & Vehicles and auxiliary items with indicative specifications, Manpower & consumables etc.,
- Environmental Safeguards- Baseline assessment, impact & risk assessment, mitigations measures and Environmental Management & monitoring plan and its budget.
- Social Safeguards - Social Mapping, transect walk, Focus group discussion, Sensitive mapping.
- Preparation of Action Plan (Gender, Livelihood, RAP, Tribal etc.,), Social Management & monitoring plan.
- Project cost – Establishment and Operation & Maintenance cost, Disposal costs incl. transport, Environmental and social monitoring costs, Revenue from the project, Funding for project
- Project Implementation plan –contractual models and timelines.

## 5.1 OBJECTIVES:

- To remediate the legacy waste dumpsite of approximately 16735.68 Tons by 31st March 2024.
- To reclaim the legacy waste dump area and to develop recreational park facilities, thereby eliminating the chances of dump fires, leachate generation, and foul odor.
- To reduce greenhouse gas emissions, soil pollution, and groundwater contamination.
- To increase nearby real estate/social value and benefit the citizens.

# 6 COMPOSITION, CHARACTERISTICS OF LEGACY WASTE AND ITS IMPACTS

## 6.1 DETAILED INVESTIGATION STRATEGY

To understand the nature and composition of the legacy waste and the existing baseline environmental conditions, samples from waste, surface and groundwater, leachate, soil, air, and noise were collected as per the requirements given in the Project Implementation Manual, considering the state and national guidelines. Samples were collected as mentioned below;

- ✓ Bore hole upto a depth of 9 m and collection of 3 (nos) samples from the soil at interval of 1.5 m.
- ✓ Waste analysis viz., leachate sample from 1 (nos) locations and physical analysis from 2 (nos) location, and chemical analysis from 1 (nos) location.
- ✓ Environmental baseline analysis surface water 1 (nos) location and ground water samples from 3 (nos) location (Well Water Samples -1 up gradient, 2 down gradient) and Air sampling from 2 (nos) locations and noise sampling from 1 (nos) location

## 6.2 DETAILED INVESTIGATIONS

The detailed investigations carried out for the legacy waste dumpsite is given in the table below:

*Table 8 Investigation details*

| S.No | Parameters | Sampling Nos. |
|---|---|---|
| I | Geotechnical Investigation | |
| A | Boreholes up to 10m depth (as per CPHEEO Manual) | 1 |
| B | Permeability test- (as per CPHEEO Manual) standard penetration test SPT and collection of undisturbed samples - Soil Investigation - Classification, gradation, Atterberg's limit, Bulk density, dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coefficient of permeability, strength, compressibility (vertically-3 samples per borehole) | 1 |
| 2 | Waste & Environmental Analysis | |
| A | Leachate Analysis (TCLP usepa 1311) (SCHEDULE II of SWM rules, 2016), Suspended solids, Dissolved solids (inorganic),pH, Ammonical nitrogen (as N), Total Kjeldahl nitrogen (as N), BOD, COD, Arsenic (as As), Mercury, Lead, Cadmium, Copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds | 3 |
| B | Physical Analysis of waste (As per CPHEEO manual) including Density, Bulk Density, Moisture Content, Size of waste Constituents, Calorific Value | 2 |
| C | Chemical Analysis of waste/soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), total Carbon, C/N ratio, calorific value, Bio-chemical - biodegradable factor | 1 |
| D | Ground Water (Well Water Samples -1 up gradient, 2 down gradient) - (shallow and deep wells): pH, Colour, EC, Turbidity, SS, TDS, TOC, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, | 3 |

Copyright © 2023. KSWMP | All rights reserved

| | | |
|---|---|---|
| | TKN, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total Coliforms (IS 10500 – 2012) | |
| E | Surface Water (pH, Colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, TKN, Total Alkalinity, Total hardness, Ecoli and Total Coliforms (IS 10500 – 2012) | 1 |
| F | Ambient Air Quality (Sulphur Dioxide (So2), Nitrogen Dioxide (No2), Particulate Matter 2.5, Particulate Matter 10, Ozone (O3), Lead (Pb), Carbon Monoxide (CO), Ammonia (NH3), Benzene (C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | 2 |
| G | Ambient Noise Level (E(p)Rules) for 24 hours | 1 |
| Note: Detailed Technical Investigations conducted as per PIM | | |

## 6.3 METHODOLOGY OF SAMPLING

To assess the quantity & composition/characteristics of the legacy waste & also environmental baseline conditions in the vicinity of the dumpsite, a detailed sampling methodology including identification of sampling locations, distance from the sensitive components, quantity & number of samples, and location (Lat/Long) were considered. The following table shows the strategic location details of samples selected for the detailed investigation.

*Table 9 Details of sampling location*

| S.No | Description | Sampling location | Justification |
|---|---|---|---|
| 1 | Air sampling (2 Locations) | Within the dumpsite<br>Dumpsite entry point | As per the wind direction and speed of the wind are determined and based on the existing wind-rose data the air sampling location fixed at two locations |
| 2 | Noise (1 Location) | Within the dumpsite | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 3 | Surface water (1 Location) | Surface water near to the dumpsite [stream] | Considering the sites geographical features, it is situated in a predominantly flat terrain. Nearby surface water available at the distance of 250 m in the Northe East Direction. |
| 4 | Ground water (3 Locations) | 3 wells identified near the dumpsite area | Considering the sites geographical features, it is situated in a predominantly flat terrain. Based on the possible infiltration and slope direction, two ground water samples are collected in the east direction and one of the west direction |
| 5 | Bore Hole (1 Location) | Within the dumpsite area | As per the site location, the noise levels are taken at the entry point which is abutting the access road resulting in huge noise impact due to movement of vehicles. |
| 6 | Legacy Waste | Within the dumpsite area | Not Applicable |

Copyright © 2023. KSWMP | All rights reserved

*Table 10 Direction and Distance of the sampling location*

| S.No | Description | Direction | From Dumpsite (m) | From Boundary (m) |
|---|---|---|---|---|
| 1 | Surface Water | North East | 251 | 230 |
| 2 | Ground water-1 | South West | 93 | 60 |
| 3 | Ground water-2 | East | 92 | 63 |
| 4 | Ground water-3 | South West | 189 | 115 |
| **Note: Air and Noise Monitoring are monitored inside the dumpsite** | | | | |

*Table 11 Quantity of sampling & location*

| S. No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 12°30'58.224" E -74°59'09.455"<br>Location -2: N- 12°30'56.597" E -74°59'12.52" |
| 2 | Surface Water | 1.5 Litres | Location -1:N- 12°31'06.571" E -74°59'12.616" |
| 3 | Ground Water | 1.5 litres | Location -1:N- 12°30'55.788"E -74°59'11.213"<br>Location -2:N- 12°31'0.402"E -74°59'12.516"<br>Location -3:N- 12°30'57.964"E -74°57'16.399" |
| 4 | Leachate | 1.5 litres | Location -1:N- 12°30'58.110" E -74°59'09.272" |
| 5 | Ambient Air Quality | 2 Nos | Location -1:N- 12°30'59.01" E -74°59'11.099"<br>Location -2:N- 12°30'58.032" E -74°59'09.533" |
| 6 | Ambient Noise Quality | 1 Nos | Location -1:N- 12°30'58.146" E -74°59'10.283" |

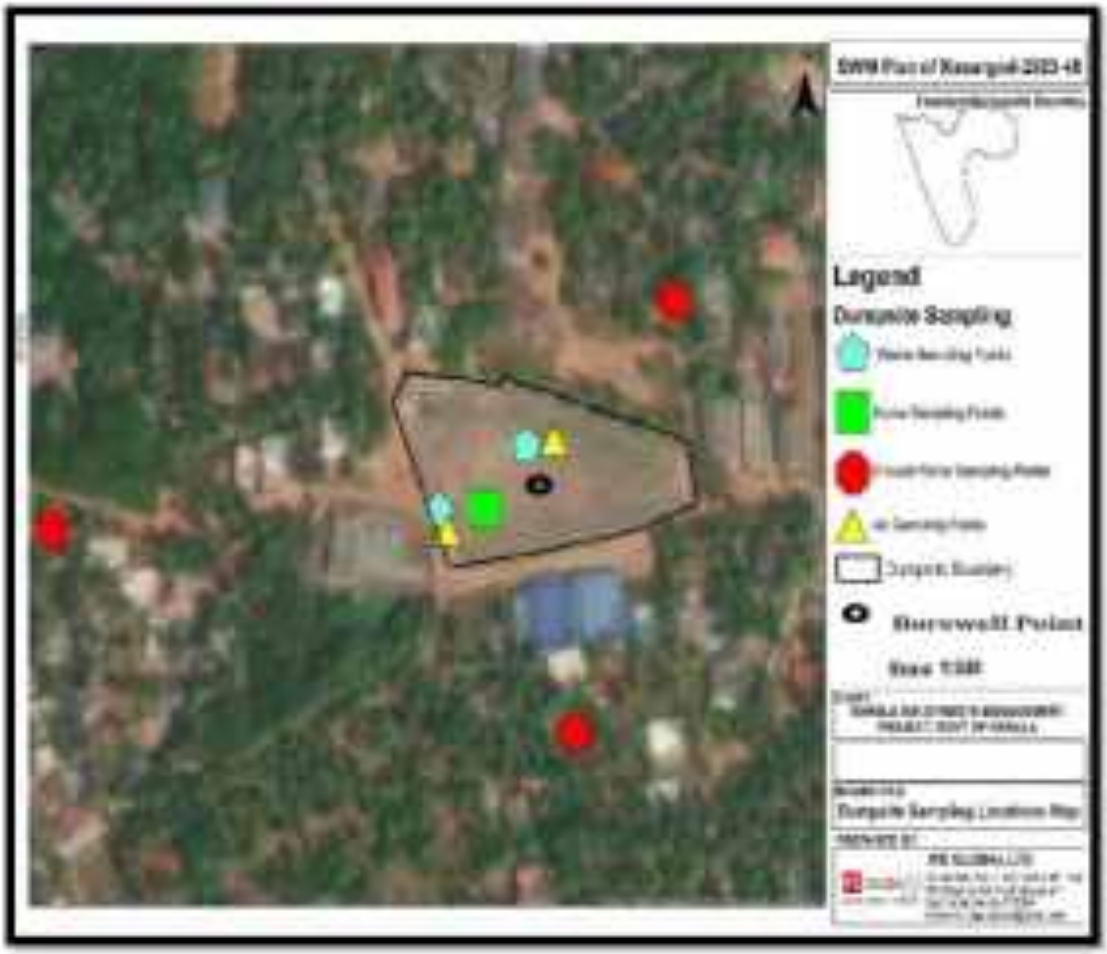

*Figure 7 Sampling Locations – Borehole & legacy waste sample*

### 6.4 ANALYSIS AND INTERPRETATION OF EXPLORATORY DATA

As part of the feasibility study, Technical Support Consultants (IPE Global Ltd) has entrusted the geotechnical investigation & Environmental baseline assessment to M/s Matter Material Testing & Research Laboratory (P) Ltd and M/s Polluchem Laboratories (P) Ltd respectively.

The initial site visit was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd on 20th May 2023 along with the experts of TSC and PIUs. Field Geotechnical investigation to collect the soil samples after drilling through the legacy waste was started on 09th June 2023 and was completed on 20th June 2023. Positioning of Air samplers & Noise monitoring equipment, sampling of surface/groundwater, leachate, and legacy waste were done on 12th June 2023 by M/s Polluchem Laboratories (P) Ltd. The lab analysis reports were submitted by the investigation agencies to TSC. The lab analysis reports are provided in Annexures – A & B

#### 6.4.1 GEOTECHNICAL EXPLORATORY DETAILS

For assessing the depth of legacy waste and contamination of the soil below the legacy waste, bore hole samples were collected using rotary drill. The exploratory data of the bore hole revealed a maximum depth of 4.50 m for waste and 4.50 m for the soil. Lateritic rock was encountered below the soil stratum. The Geotechnical investigation was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. The details of the exploratory data of the bore hole is provided below.

Copyright © 2023. KSWMP | All rights reserved.

*Table 12 Exploratory Data of Bore Log*

| S. No | Borehole location | Total Depth of the Borehole (m) | Depth of Soil (m) | Depth of Legacy Waste (m) | Remarks |
|---|---|---|---|---|---|
| 1 | N- 11°35'38.862"<br>E -75°36'20.735" | 9 | 4.5 | 4.5 | Lab Analysis Report provided in Annexure A |
| Note: Bore hole terminated at the depth of 4.5 m below ground level due to Laterite rock. | | | | | |

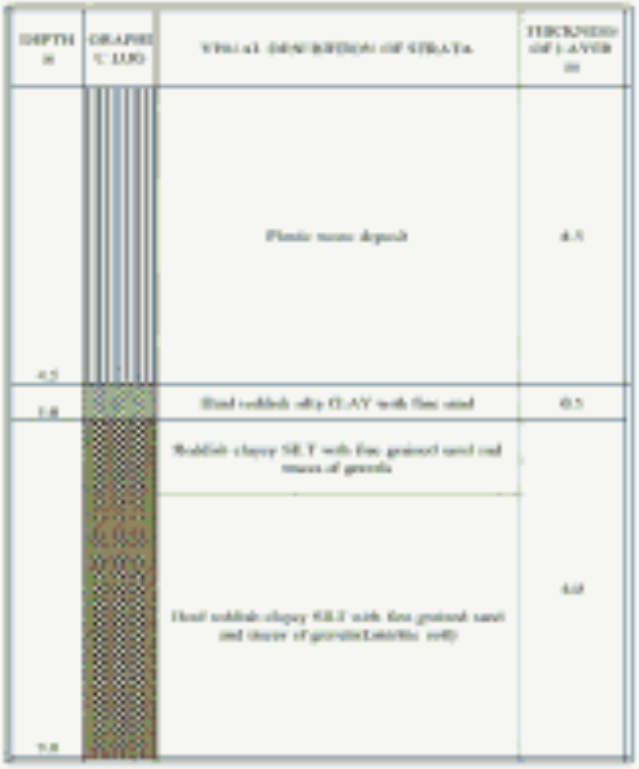

*Figure 8 Soil Profile & Geotechnical Investigation*

### 6.4.2 ESTIMATED TOTAL QUANTITY OF WASTE

The total quantity of waste is estimated based on the contour/topography survey profile of the waste over the ground level and exploratory data of the bore log (Geotechnical investigations). The details of the estimated total quantity of waste is provided below:

*Table 13 Quantity of waste below ground level*

| Level | Volume of Legacy Waste (m3) | Density of Waste (t/m3) | Total Quantity of Waste (T) | Remark |
|---|---|---|---|---|
| Below & Above | 20115 | 0.832 | 16735.68 | *As per the Contour Survey Report by ULB + Below Ground quantity ( approx – 9000 cu.m) |

### 6.4.3 LEGACY WASTE CHARACTERIZATION

The characteristics of the legacy waste were assessed by collecting e samples of 25 kg from 2 (nos) locations within the dumpsite. The legacy waste samples were collected on 06th June 2023 by M/s Polluchem Laboratories (P) Ltd. The assessment of waste characteristics. was done based on the results of the analysis. The details of the characteristics viz., composition, physical & chemical characteristics, heavy metals, and estimated quantity of by-products are provided in the tables below:

| S. No | Items | Quantity of sample collected | Location |
|---|---|---|---|
| 1 | Solid Waste | 25 kg | Location -1: N- 12°30'58.224" E -74°59'09.455"<br>Location -2: N- 12°30'56.597" E -74°59'12.52" |

**Physical Composition:**

### 6.4.4 ENVIRONMENTAL BASELINE

The environmental baseline was assessed from the analytical results of air, surface & groundwater, noise and leachate from the location as mentioned in the section 6.3. The samples were collected on 06th June 2023 by M/s Polluchem Laboratories (P) Ltd. The Environmental baseline was analyzed with reference to the lab analysis reports. The details of analysis & inferences are provided in the tables below:

**Surface Water Analysis:**

| Location | Inference | | | |
| 1 | The analysis reveals that all the parameter within the acceptable limit except it is slightly acidic. Color also not in permissible limit means either water have some organic material in dissolved form or suspended particles and the dissolved oxygen content is less than prescribed limit, so also the BOD3 is greater than the allowable limit. Indicating that the water is containing biodegradable waste | | | |

**Note:** The sampling location and its respective distance from the dumpsite have been incorporated into Table 10. The stream is not use for any public use.

## 6.5 RISK ASSESSMENT

**Surface Water:** Dumpsites can release pollutants into nearby surface water bodies through leachate, which is generated when rainwater or other liquids come into contact with the waste. Leachate can contain various contaminants such as heavy metals, organic compounds, and pathogens. Proper containment and management of leachate are essential to prevent water pollution.

In Kasaragod dumpsite, the analysis of surface water reveals that all the parameter are within the acceptable limit, except BoD, pH and colour value slightly surpasses the permissible limit and does not have any effect.

*Table 25 Risk Assessment- surface water*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite – BoD content & pH[Slightly surpassing the limit] |
| **Pathway** | Water / Run off |
| **Receptor** | Humans, Animals, Aquatic life and flora & fauna |
| **Risk** | No effect on receptor |

**Groundwater:** Pollutants from dumpsites can infiltrate into the underlying groundwater, particularly if the dumpsite is not adequately lined or if waste disposal practices have caused contamination of the soil. Once pollutants enter the groundwater, they can spread over a wide area, affecting drinking water sources and ecosystems. Remediation techniques often focus on preventing or minimizing further groundwater contamination.

In Kasaragod dumpsite, the analysis of ground water samples at three different locations reveals that except pH, turbidity, colour and presence of coliform and E coil all other parameters are within the limit The pH values slightly acidic in range. This acidic water creates irritation in nose and being corrosive in nature it corrodes pipelines.

*Table 26 Risk Assessment - Ground water*

| **Risk Assessment** | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite – pH, turbidity, coliform and E coli [Slightly surpassing the limit] |
| **Pathway** | Water, Soil |
| **Receptor** | Humans, Animals and flora & fauna |

| | |
|---|---|
| **Risk** | Negligible impact on the receptor is anticipated, and following the remediation of the site, the associated value is expected to decrease. |

**Air**: Dumpsites may emit pollutants into the air through processes such as open burning of waste or the release of gases from decomposing organic materials. Airborne pollutants can include particulate matter, volatile organic compounds (VOCs), dioxins, and other hazardous substances. These pollutants can have adverse effects on air quality and human health.

In Kasaragod dumpsite, the analysis of Air samples at two different locations reveals that the air is not polluted.

*Table 27 Risk Assessment - air*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Nil |
| **Pathway** | Air |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | Nil |

**Soil**: Dumpsites can contaminate the surrounding soil with a wide range of pollutants. Hazardous chemicals, heavy metals, and organic compounds can leach from the waste and accumulate in the soil, potentially posing risks to plants, animals, and humans.

*Table 28 Risk Assessment - soil*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Heavy metals etc. |
| **Pathway** | Soil |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | **Possible risks to Human health**<br>Soils if contain substances such as heavy metals, which may be toxic to humans, can pass those substances on to humans through crop uptake, leading to unsafe foods.<br>**Possible risks to Animals**<br>When farm animals consume the plants grown from contaminated soil it affects the health of animals in later stage.<br>**Possible risks to flora** |

Copyright © 2023. KSWMP | All rights reserved.

| Risk Assessment | |
|---|---|
| | Soil pollution may alter plant metabolism and reduce crop yields and cause trees and plants that may absorb soil contaminants to pass them up the food chain. |

**Bioaccumulation in Biota**: Pollutants from dumpsites can enter the food chain and bio accumulate in plants and animals. Contaminated soil or water can be taken up by plants, and these plants may then be consumed by animals. As pollutants move up the food chain, their concentrations can increase, leading to potential health risks for humans and wildlife.

*Table 29 Risk Assessment - Bioaccumulation in Biota*

| Risk Assessment | |
|---|---|
| **Source** | Legacy Waste Dumpsite |
| **Pollutant** | Leachate from Dumpsite –, BoD, zinc, lead and pH [Slightly surpassing the limit] |
| **Pathway** | Air, water and soil |
| **Receptor** | Humans, Animals and flora & fauna |
| **Risk** | Negligible impact on the receptor is anticipated, and following the remediation of the site, the associated value is expected to decrease. |

# 7 EVALUATION OF REMEDIATION TECHNIQUES

Although the term "legacy waste" has not been defined in any official government document in India, it typically refers to aged municipal solid waste in landfills or dumpsites. These legacy dumpsites are creating various irreversible environmental/health/livelihood hazards. The major sources of pollution are:

- ✓ Puddles of leachate flowing through the adjacent area and reaching the water table long-term issues of greenhouse gas emissions
- ✓ Surface water and groundwater pollution due to erosion and seepage
- ✓ Dumpsite fires
- ✓ Due to the faster urban development and increased waste generation per capita and mismanagement of generated waste.

The dumpsites have emerged as pollution hubs, especially those situated in human settlements, as cities have grown over the decades. It has, therefore, become a necessity for the city authorities to remediate the existing dumpsites in an environmentally sound and economically viable manner.

**Remediation of legacy waste dumpsite**

Remediation is a scientific process in which contaminants are removed or neutralized scientifically so that pollution to the environment can be controlled or reduced and eventually reclaiming the land for public use. The remediation of dumpsites leads to the following advantages:

1. Uplift of the environment- reduction in greenhouse gas emissions, soil pollution, ground water contamination, significant reduction in air pollution of the entire area and elimination of dump fires and leachate generation.
2. Enhancement of social aspects - Elimination of foul odour to benefit the citizen living nearby, decline in vector borne diseases arising out of the dumpsite and increase in nearby real state value and rental values.
3. Land - Dumpsite land becomes available for public use or for setting up SWM facility on the reclaimed land.
4. Utilization of bio products/aggregates - the aggregates generated from the process like refuse-derived fuel can be reused, recycled, or repurposed, thus exerting less pressure on the economy to use virgin natural resources like fossil fuels.

For assessment of site-specific remediation type/methodology of legacy waste dumpsite, the following activities shall be carried out:

- ✓ A total station survey for assessment of volumetric quantity of legacy waste above the ground level.
- ✓ Detailed investigations 1. Geotechnical Investigation and 2. Waste Analysis - Chemical, Environmental baseline Analysis.
- ✓ History of the site, Physical features of site, as –is/current situation and compositional analysis of waste.
- ✓ Baseline study of heavy metals in surface;

Copyright © 2023. KSWMP | All rights reserved.

- ✓ water, rainfall, soil type, surface hydrology, topography, wind direction etc. shall be studied before and after bioremediation.
- ✓ Periodic study should also be carried out after completion of bioremediation to check for any adverse effects in the surrounding area.

The details of the remediation techniques for the remediation of the legacy waste dumpsite remediation are as follows

## 7.1 BIO-MINING – RECLAMATION/RECOVERY OF LAND

Bio- mining is the scientific technique to extract materials of economic interest from legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) and followed by sustainable management through recycling, co-processing, road construction etc.

*Table 30 Phases of Bio-mining*

| Phases of Bio-mining | |
|---|---|
| Phase 1: Stabilization | The legacy waste is formed into equal-sized windrows, and which are turned frequently, bio-culture is added and de-odourizer (an odour-controlling agent) sprayed. This phase removes stench, reduces moisture and eliminates pathogens. |
| Phase 2: Sorting & Segregation | In this phase, stabilized legacy waste is sorted/segregated into bio earth, recyclables, refused derived fuel (RDF) and C&D through series of various sizes of Trommels/circular rotatory sieves and manpower. |
| Phase 3: Disposal & Utilization | In this phase, the non-combustible fractions such as soil and stones are disposed of for further processing into finer aggregates or for earth filling. The combustible fractions are called refuse-derived fuel (RDF) are sent for co-processing in cement industries. |

| | |
|---|---|
| Salient Aspects | land recovery, increase in value of land and available for public use/habitation with immediate effect.<br>Ensures long-term sustainability and environmentally sound treatment of legacy waste and present lucrative revenue-generating opportunities.<br>Bio products/aggregates generated from the process can be used as alternative construction material, fuel and recyclables.<br>Compliance to SWM Rules and NGT orders.<br>Improvement in aesthetics and quality of life & health. |
| Applicability | The ownership is well defined.<br>Working space is available in the dumpsite.<br>Linkage for utilization by-products is available |

## 7.2 CAPPING WITHOUT LAND RECOVERY

Copyright © 2023. KSWMP | All rights reserved.

Capping is a scientific process of profiling legacy waste and covering with barrier layers consisting of soil, high density polyethylene (HDPE) liner, gas collection system surface drainage system, and a vegetative cover to minimize the percolation of rainwater into the legacy waste.

| | |
|---|---|
| Salient Aspects | The capped area becomes a green space and can be developed into parks/recreational areas.<br>Capped area will be equipped with environmental monitoring systems for post-closure maintenance to monitor pollution levels in groundwater and surface-water sources and air (especially methane emissions) at least 15 years.<br>Capped area needs to be inspected periodically for settlement due to physical, chemical and biological transformation, leachate generation, erosion and naturally occurring invasion by deep-rooted vegetation. Recurring expenditure will be incurred for regular maintenance.<br>On July 17, 2019, the National Green Tribunal passed an order directing that capping of legacy waste would lead to huge environmental and health consequences. The tribunal suggested bio-mining as environmentally safe and the most preferable approaches to dumpsite remediation.<br>SWM rules do not permit habitation over it for at least 15 years because of the danger posed by toxic gases release by the waste. |
| Applicability | Capping could be a solution for legacy waste where bio-mining is not possible because of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for utilization/ disposal of segregated components<br>Lack of working space & resources |

## 7.3 CAPPING WITH PARTIAL LAND RECOVERY

Capping with partial land recovery is process of combination of capping and bio-mining, legacy waste through bio-remediation i.e. exposure of all the legacy waste (formation of windrows) to air along with use of composting bio-cultures, to stabilize of the waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.). The useful fractions derived from this process can linked to relevant buyers and the inert material will be capped to prevent further degradation of the environment.

| | |
|---|---|
| Salient Aspects | The capped area becomes a green space and can be developed into parks/recreational areas and partial land recovered can be available for public use/habitation with immediate effect.<br>Ensures short -term sustainability and environmentally sound treatment of legacy waste.<br>Salient Aspects are of Capping and Bio-mining are applicable for the respective capped area and recovered area |
| Applicability | Legacy waste dumpsite area partial of steep terrain, inaccessible ravines and narrow valleys.<br>Lack of linkage for disposal of inert<br>Recovery land for public use is not a priority |

Copyright © 2023. KSWMP | All rights reserved.

## 7.4 SELECTION OF REMEDIATION OPTION

Selection of the applicable method/type or technique is based on the factors like., salient aspects & applicability of remediation types viz., Capping without land recovery, Bio-mining – reclamation/recovery of land & capping with partial land recovery and also available resources viz., manpower, machineries, money and physical site conditions including quantity & characteristics of legacy waste, baseline environment, social issues & demands, compliances to regulatory (KSPCB/NGT) requirements, need for land recovery and forward linkages/utilization of processed aggregates/by-products.

Based on the detailed assessment of the selection parameters, Bio-mining – reclamation/recovery of land is the method/type or technique, which shall ensure long-term sustainability and environmentally sound treatment of legacy waste and land recovery/remediation legacy waste dumpsite. It may be noted that the bio-earth and C&D material which will be recovered by remediation is proposed to be used for development of the reclaimed legacy waste dumpsite as recreational park/facility (for site development work/ profiling). The bio-earth and C&D material recovered will be subjected to bi-weekly sampling and conform to the parameters mentioned in Schedule II of SWM Rules 2016 before using the material. Considering the same, there won't be any leachate generation using this material. There won't be any capping done and hence the question of erosion etc. doesn't arise.

**Salient parameters for opting the Bio-mining – reclamation/recovery of land.**

1. Based on the assessment from the chemical analysis report from the M/s. Polluchem, all the heavy metals are within the permissible limits as prescribed by the regulatory authorities Soil is free of contamination viz., heavy metals, chemical and other toxic substances.
2. Land recovery, increase in value of land and available for public use/setting of SWM facility with immediate effect. An area of 1.1 acres will be reclaimed through bio-mining
3. Adequate downstream linkages for the management/disposal waste viz., Bio-earth and C&D waste will be utilized for development of the reclaimed legacy dumpsite as recreational park/facility, recyclables will be sold to the authorized recyclers & will be collected from the project site and RDF will be sent to Cement industries for co-processing viz., as supplement to the conventional fuel.
4. By products/aggregates generated from the process can be used as alternative construction material (after processing), fuel and recyclables.
5. The Solid Waste Management Rules, 2016 and several National Green Tribunal (NGT) directives have mandated that urban local bodies opt for bio-mining over capping.

Copyright © 2023. KSWMP | All rights reserved.

# 8 TECHNICAL DESCRIPTION OF THE SELECTED OPTION

## 8.1 METHODOLOGY

The legacy waste dumpsite reclamation through bio-mining with recovery of land involves Phase 1: stabilization, Phase 2: sorting & segregation and Phase 3: disposal & utilization

The type of machinery, capacity and type of screens to stabilize of the legacy waste followed by screening/sorting of the stabilized waste to recover all valuable resources viz., bio-earth/organic fines, bricks, stones, plastics, rubber, glass, metals, clothes, rags etc.) will depend on the physical site conditions including quantity & characteristics of legacy waste and utilization of the aggregates/by-products/recovered material.

The type machinery available for the bio mining are as follows:

1. Stationary screening machinery and
2. Mobile/compact machinery.

### 8.1.1 STATIONARY SCREENING MACHINERY

A Stationary trommel is a specialized piece of equipment used in legacy waste bioremediation processes to separate and classify solid waste materials. It is designed to efficiently screen and sort different components of the waste based on size and other characteristics. Technical description of a Stationary Trommel used in legacy waste bioremediation are as follows:

- ✓ Structure: The Stationary trommel consists of a frame made of steel or other durable materials. It is designed to withstand the harsh conditions of waste treatment facilities. The frame supports a cylindrical drum that is inclined at an angle for optimal material flow.
- ✓ Drum: The drum is the main component of the Stationary Trommel and is typically made of perforated metal or mesh. It is cylindrical in shape and rotates on its axis using a motorized drive system. The drum's 3- 5 mtr diameter and 10 mtr length can vary depending on the specific requirements of the waste treatment process.
- ✓ Motor and Drive System: The Stationary Trommel is equipped with a motor and drive system that powers the rotation of the drum. The motor is typically electrically powered and is connected to the drum through a gearbox or direct drive mechanism. The rotational speed of the drum can be adjusted to optimize the screening process.
- ✓ Inlet and Outlet: The Stationary Trommel has an inlet where the legacy waste is fed into the drum for processing. The waste material enters the drum at one end, typically assisted by a conveyor or loader. The screened waste material is discharged from the opposite end of the drum through an outlet.

Copyright © 2023. KSWMP | All rights reserved.

- ✓ Screening Mechanism: As the drum rotates, the legacy waste inside it is subjected to a combination of tumbling and rolling actions. The perforated drum allows smaller-sized particles and materials to pass through, while larger items such as bulky waste, debris, and contaminants are retained inside the drum. The drum's perforation size can be customized to achieve the desired separation efficiency.
- ✓ Waste Sorting: The Stationary Trommel facilitates the separation of different components within the legacy waste. It effectively segregates organic waste, inert materials, recyclables, and other categories based on their size and physical properties. This sorting process prepares the waste for further treatment or disposal.

Source: DCC Infra., Gurugram Site

*Figure 11 Stationary Trommel Machine*

Salient Features of Stationary Screening Machinery:

- Land requirement high for setting of machinery and processing area.
- Erection, Installation and Commissioning is time consuming
- Cost Intensive – CAPEX & OPEX high
- Electrical Power Intensive and Consumption is high
- Breakdown of the Machinery is high, onsite technicians should be available.
- Manpower – skilled & unskilled Intensive

  Suitable for quantity more than 2,00,000 ton of legacy waste.
- Less suitability for reuse of the machinery/screenings for more than one site/location.

### 8.1.2 MOBILE/COMPACT SCREENING MACHINERY

The Mobile Trommel is a technical apparatus utilized in legacy waste bioremediation processes. Its primary function is to separate and sort various types of waste materials, such as solid waste and organic matter, for effective bioremediation.

**Structure:** The trommel consists of a cylindrical drum, typically made of heavy-duty metal, which is inclined at a slight angle. The drum is supported by a framework and set in motion by a motor

Copyright © 2023. KSWMP | All rights reserved.

or engine, causing it to rotate slowly. The rotation of the drum allows the waste materials to be fed into the trommel at one end, while simultaneously moving the materials along its length. Large screening area (9.5 sq m). Helps in good quality segregation & high productivity.

**Screening Mechanism:** The Mobile Trommel incorporates various mechanical features to facilitate waste separation. As the waste enters the drum, it encounters a series of screens or perforations arranged along the length of the drum. These screens have different mesh sizes, which allow for the separation of different-sized particles. The smaller particles, such as sand or fine soil, pass through the screens and fall through openings at the bottom of the trommel, while larger materials, such as plastics or larger debris, are retained and carried along by the rotation of the drum.

**Separation System:** Additionally, the Mobile Trommel may be equipped with paddles or lifters mounted inside the drum. These paddles help to agitate and tumble the waste materials, assisting in the separation process by ensuring proper contact between the waste and the screens. They also help to break up clumps or aggregates, aiding in the release of trapped organic matter. Four different screen inclination angles for operations between 20°-35° are available for selection provides flexibility.

**Treatment Process:** In the context of legacy waste bioremediation, the Mobile Trommel plays a crucial role in preparing the waste for subsequent treatment steps. By separating the waste into different fractions based on particle size, it allows for targeted bioremediation processes. For example, the fine fraction may be subjected to aerobic or anaerobic composting, while the larger fraction can undergo mechanical or physical treatments.

**Transport:** Quick and easy folding of conveyor helps in quick setup time.

**Discharge height:** Wider conveyor and higher discharge heights help in making bigger stockpile and eliminates the frequent loader usages.

*Source: Kleemann Mobile Screens (Piranna, Ahamadabad Site)*

***Figure 12 Compact Screening Machinery***

Copyright © 2023. KSWMP | All rights reserved.

**Salient Features of Mobile/Compact Screening Machinery:**

- Full Mobility: Plants are fully mobile like excavator. Plants can be moved across the most difficult of surfaces and terrain and can accommodate the most inaccessible locations.
- Quick Set up time: Track-Mobile plants can normally be set-up within 1 hour, as it normally does not require additional conveyors, feed hopper to link separate machines, thus increasing machine utilization.
- Versatility: Track-Mobile plants can be operated independently or in combination of two or three stage screening depending upon user requirements.
- No Civil works required: Plants do not require any civil works, can be erected & shifted quickly. Thus offer quicker return on investment.
- Manpower requirement is less.

## 8.2 SELECTION OF MACHINERIES

Selection of machineries for screening of the stabilized legacy waste is based on the parameters viz., salient features of the screening machineries, remediation type (Bio-mining – reclamation/recovery of land) and also compliances to regulatory (KSPCB/NGT) requirements (legacy waste dumpsite remediation by 31st March 2024), physical site conditions including quantity & characteristics of legacy waste and sorting/segregation of stabilized legacy waste into aggregates/by- products as per the requirements of the utilization/forward linkage.

Based on the detailed assessment of the selection parameters listed above, the site conditions, legacy waste characteristics, statutory requirements etc, mobile / compact screening shall be the optimum screening machinery for the Kasaragod Dumpsite. The 16735.68 tons legacy waste can be remediated within the stipulated time by NGT i.e. 31st March 2024

**Salient parameters for opting the Mobile/Compact screeners.**

1. Sorting/segregation of the stabilized legacy waste of 20115 $m^3$/ 16735.68 Tons within the stipulated timeline of 31st March 2024.
2. The remediation process will be guided by National, State Regulations & EIA/EMP in line with KSWMP ESMF.
3. Salient Features of Mobile/Compact Screening Machinery – details are in the section 8.1.2

## 8.3 SYSTEM REQUIREMENTS

### 8.3.1 CAPACITY SIZING OF MOBILE COMPACT SCREENER

The capacity of the Mobile compact screener is assessed as **100 TPH.** The calculation shown is only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and standards. The details of plant capacity sizing are provided in the table below:

*Table 31 Capacity sizing of Mobile Compact Screener*

| Description | Quantity |
|---|---|
| Quantity of waste (Tons) | 16735.68 |
| Mobilization and site preparation (days) | 60 |
| Weekends & Holidays | 20 |

Copyright © 2023. KSWMP | All rights reserved.

| Description | Quantity |
|---|---|
| Rainy Days | 20 |
| Break downs (Days) | 15 |
| No of days (Dec 2023 - Mar 2024) | 60 |
| Effective processing days | 30 |
| Processing per day (16735/30) (Tons) | 557 |
| Capacity of the Plant - Considering working 8 hrs/day | 70 |
| Proposed Capacity of plant TPH | 100 |

### 8.3.2 MACHINERIES & VEHICLES

Detailed assessment of quantity (nos) of machinery, vehicles, auxiliary items required for effective processing of the legacy waste are provided in the Annexure – E. The summary of machineries and vehicles requirements are provided in the table below:

*Table 32 Machineries & Vehicles*

| S. No. | Description | Quantity(Nos) | Remarks |
|---|---|---|---|
| 1 | Mobile Trommel @ 100TPH | 1 | Detailed Specifications are provided at Annexure –F |
| 2 | Baling Machine @ 50TPD | 1 | |
| 3 | Ballistic Separator @ 30TPH | 1 | |
| 4 | Magnetic Separator | 1 | |
| 5 | Front End Loader @ Bucket Capacity 1Cum | 2 | |
| 6 | Chain Mounted Excavator @ Bucket Capacity 1.1 Cum | 2 | |
| 7 | Weighing bridge - 40 Ton | 1 | |
| 8 | Tipper @ 8 Cum | 5 | |
| 9 | Truck @ 22 Cum ( For RDF) | 2 | |
| 10 | Tractor - Trolley shift of Materials | 1 | |
| 12 | Tractor -Trolley Water Tanker | 1 | |
| 13 | Mechanical Sprayer | 2 | |
| 14 | Office - Portable cabin (1 Nos) | 1 | |
| 15 | GPS (5 Nos) & Tracking System (1 Nos) | 5 | |
| 16 | CCTV System (Cameras 5 Nos) | 5 | |
| 17 | Fire Safety System - Fire Extinguisher ABC type 4 Kg/cm2 | 10 | |

Note: Considering the size of the site, it is required that the contractor liaisons with the Fire Department and deploys a fire tender at the site during the period of the contract works to manage any fire incident as part of Fire Safety Plan.

Copyright © 2025. KSWMP | All rights reserved.

## 8.4 OPERATIONS AND MAINTENANCE

### 8.4.1 MANPOWER:

Detailed assessment manpower required for effective processing of the legacy waste are provided in the Annexure – I. The summary of manpower required are provided in the table below:

*Table 33 Manpower details*

| S. No | Manpower | Nos |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental, Social and Health & Safety (ESHS) Officer | 1 |
| 3 | Security (3 X 8 Hrs) | 3 |
| 4 | Operations Supervisor & Accountant | 2 |
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 2 |
| 8 | Labors near Screening machinery | 4 |
| 9 | Labors at Baling facility | 2 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 11 |

### 8.4.2 ELECTRICAL POWER:

*Table 34 Electrical Power details*

| Machineries | Required Electrical Load (KW) | Working Hr. | Total Units (KW-Hr) |
|---|---|---|---|
| Bailing Machine | 5 | 4 | 20 |
| Ballistic Separator | 15 | 6 | 90 |
| Magnetic Separator | 5 | 6 | 30 |
| Weigh bridge | 5 | 6 | 30 |
| **Total** | **30** | | **170** |

Copyright © 2025. KSWMP | All rights reserved.

### 8.4.3 FUEL/DIESEL FOR VEHICLES:

*Table 35 Fuel/Diesel for Vehicles*

| Description | Liters per Day |
|---|---|
| Fuel - Diesel Mobile Trommel (12 liters/hour) | 96 |

### 8.4.4 WATER REQUIREMENTS:

*Table 36 Water Requirements*

| Description | Liters per Day |
|---|---|
| Water Requirements For Workers and Other uses | 5000 |
| (Source – Municipality water Supply – At site, no provision for water supply.) | |

Note: The calculation shown above is only indicative and the contractor is required to propose own design and capacity to complete the works in the stipulated time and guidelines as per tender. The responsibility of availing necessary power and water connection shall be with the contractor as condition precedent before starting the work.

Further, considering the size of the site, it is required that the contractor liaisons with the Fire Department and deploys a fire tender team at the site during the period of the contract works to manage any fire incident as part of Fire Safety Plan. Alternatively, general SOPs for fire safety detailed herewith are to be followed:

a) Fire Fighting System including fire hydrant, pressure pumps, 5000 Ltr (min) water storage, adequate hose reel and fire extinguishers to be provided at site.
b) Alternate source of power (DG)
c) Manual Fire Alarm System with evacuation plan
d) Regular check, maintenance of equipment's for firefighting (before initiating work and then at interval of 1 months thereof)
e) Training to all men. (Before initiating work and then at interval of 3 months thereof).
f) Maintaining fire line while storage of material (RDF). RDF to not exceed 10% of total estimated waste at site at any given time.
g) Any other requirement in consultation with local Fire & Rescue Services office.

Copyright © 2023. KSWMP | All rights reserved.

# 9 SCOPE OF DISPOSAL INCLUDING LOCATION OF DISPOSAL FOR RDF, BIO SOILS, C & D WASTE, AND OTHERS AS PER LOCAL DEMANDS

## 9.1 UTILIZATION OF BY PRODUCTS

The details of the utilization of aggregates/by-products screened out by processing of the stabilized legacy waste are provided in the table below

*Table 37 Utilization RDF, bio soils, C & D waste*

| S.No | Component | Quantity (Cu.m) | Utilization/Linkage/Usage |
|---|---|---|---|
| 1 | Bio earth and C&D Waste | 14281.65 | The bio earth and C&D from waste will be utilized for development of the reclaimed legacy waste dumpsite as recreational park/facility. |
| 2 | RDF | 5239.96 | RDF will be sent to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel. Currently the indicative nearest location for the RDF disposal is at Dalmia Cements, Trichy which has the necessary infrastructure for co-processing of RDF. |
| 3 | Recyclables & others | 593.39 | Recyclables will be sold to CKCL/recyclers authorized by KSPCB/CPCB. |
| Note: The contractors engaged in biomining will be responsible for ensuring this disposal of Bio Earth, RDF, recyclables, and others. | | | |

Copyright © 2023. KSWMP | All rights reserved.

## 10 ESTIMATED PROJECT COST

The details of the estimated cost for bio-mining - recovery of land by remediating legacy waste dumpsite is provided in the table below:

*Table 38 Details of Estimated Project Cost*

| Estimate for Dumpsite remediation considering Forward Linkage | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Sr. No. | Activity | Details | Rate/ m3 | Cost Index @ 1.35 * A | COP @ 1.15 * C | % weightage consideration | Round off (INR) | Quantity (m3) | Amount (Rs) |
| | | | A | B | D | | | | |
| 1 | Remediation/ Biomining | Rate adopted from Calculation from Suchitwa Mission (DSR 2018 including baling) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 2 | Transportation of RDF | The average distance to cement factories works out to be 400 km. [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 3 | Disposal of recyclable | Considering that the recyclable will be sold at rate of [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 4 | Disposal of Inert | Considering the disposal cost of [redacted] (market rate) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| 5 | Disposal of Compost / Soil enricher | Considering the disposal cost of [redacted] (market rate) | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] | [redacted] |
| | | | | | | | | | [redacted] |
| | Environmental & Social Safeguard estimated amount for the implementation and monitoring | | | | | | | | [redacted] |
| | Grand Total | | | | | | | | [redacted] |

## 10.1 REVENUE FROM THE PROJECT

The anticipated sources of revenue from the processing of the legacy waste dumpsite viz., by sale Bio earth & C&D waste, organic compost, RDF and recyclables. But due to the following reasons mentioned below no revenue from the project is considered

- Bio earth & C&D waste will be utilized within the remediated dumpsite as filler material for development of recreational park.
- RDF is utilized as fuel (co – processing) in the cement industries, presently most cement industries are only accepting the RDF at no cost whereas transportation cost is required to be borne by the contractor sending the RDF to the cement factory/ WtE facility.
- The uncertainty of quantity and quality of the recyclables from legacy dumpsite due to burnt or crushed or disintegrated, rusted and additional money is required for cleaning of the recyclables for saleable.

## 10.2 FUNDING FOR PROJECT

The estimated cost of [redacted]/- for the project Dumpsite Remediation which equals to [redacted]/- per $m^3$. The sources and funding pattern is given below:

*Table 39 Funding for the project*

| Item | External (70%) Rs. | State Govt.(30%) Rs. | Total cost Rs |
|---|---|---|---|
| Bioremediation | [redacted] | [redacted] | [redacted] |

Copyright © 2023. KSWMP | All rights reserved.

# 11 PROJECT IMPLEMENTATION PLAN

## 11.1 PROPOSED OPERATIONAL PLAN

The bioremediation of Kasaragod dumpsite will be done with the land recovery and will be executed through an outsourcing model. The proposed operational plan is provided at the Annexure - I

## 11.2 TIMELINE

In compliance with the National Green Tribunal (NGT) orders, it is mandatory to remediate all dumpsites in Kerala by March 2024. To ensure timely completion and compliance with the deadline, timeline for the implementation of project is provided below.

| S No | Description | Indicative Time frame |
|---|---|---|

## 11.3 CONTRACT MODEL

**Execution Method:**

- Item Rate Contract and disposal/Management of by-products/aggregates with land recovery and redevelopment of the site with inert/ soil enricher. The work shall be carried out in compliance with SWM Rules 2016 and CPCB Guidelines for the disposal of legacy waste 2019.

**Working Model:**

- 100% work to outsourced to selected private contractor
- Technical Support Consultants (TSC) will assess the quantity of waste and the ULB will hand over the land for setting up the plant to the Contractor.
- Cost of Electricity connection to be provided by ULB for the plant.
- Electricity charges for the usage of the plant to be paid by contractor
- Contractor is responsible for disposal of RDF, recyclables, and aggregates

## 12 BENEFITS OF THE PROJECT

Remediation of legacy waste dumpsite in the Kasaragod leads to the following anticipated benefits:

- **Reclamation of Land**: An area of 1.1 acres will be reclaimed and will be developed into a recreational park for public use. A contamination assessment is to be carried out before any public use project is taken up at the location.
- **Environmental Protection**: The primary benefit of dumpsite remediation is the protection and restoration of the environment. By cleaning up contaminated sites, the project helps prevent the release of pollutants into the soil, groundwater, and air, thereby safeguarding ecosystems and biodiversity. The project shall arrest GHG emissions from the legacy dumpsite.
- **Health Improvement**: Remediation projects reduce these risks, leading to improved public health outcomes and a reduction in waterborne and airborne diseases.
- **Enhanced Water Quality**: Remediation activities prevent further contamination of surface and ground water resources and contribute to the restoration of water quality, benefiting both aquatic ecosystems and local communities' access to the safe drinking water.
- **Aesthetic and Social Benefits**: Remediation of legacy waste dumpsite can significantly improve the aesthetics of the surrounding areas. Reclaimed sites are more visually appealing, enhancing the overall quality of life for nearby residents. Uncontrolled waste dumping will be stopped.
- **Operational & Life cycle Aspects**

  Further dumping of untreated waste will be stopped completely. The project will extract utilizable components from the legacy waste through bio-mining process.
- **Employment**

  During remediation & post- remediation period, requirement of un-skilled labor will be fulfilled by s local sourcing.

Copyright © 2023. KSWMP | All rights reserved.

# 13 CONCLUSION

- The activities of the bio-mining will be commenced from Dec 2023 to Mar 2024. An area of 1.1 acres will be reclaimed and will be developed into a recreational park for public use after contamination assessment.
- Through the process of bio mining the dumpsite, complete land reclamation and recovery, while prioritizing environmental safeguards. This means that the land will be reclaimed and put to use.
- Considering site conditions and quantum, screening of the 20115 $m^3$ of legacy waste, mobile / compact screening machinery will be preferred.
- Favorable site conditions for bio-mining:
    1. Optimum width (5 m) of the road is available for movement of the vehicles.
    2. Electrical power infrastructure viz., power lines & electrical transformer is available adjacent to the boundary of the dumpsite.
    3. At the dumpsite plot, a vacant land parcel of approx. 0.20 acres is available for the installation of auxiliary infrastructures, supporting conditions movement of processing machinery and vehicles.
- The project activity requires to obtained "Site Authorization, Consent to Establish and Consent to Operate" from KSPCB
- By-products utilization/forward linkages/Usage
    1. The bio earth & C&D quantity of 10057.50 m3 & 4224.15 m3 respectively is proposed to be utilized after testing for the contamination for development of the reclaimed land as recreational park/facility. The contraction shall level the site in consultation with the PIU/TSC/DPMU.
    2. Refused derived fuel (RDF) of 5239.96 m3 will be to cement factories for co-processing i.e., for utilizing as alternative fuel, supplementing the conventional fuel in the processes. The indicative location of cement plant is Dalmia Cements, Trichy.
    3. Recyclables of 593.39 m3 will be sold to CKCL /Private recyclers authorized by KSPCB/CPCB
- The implementation/execution of the project activities shall be conforming to SWM Rules 2016, NGT orders, KSPCB norms, CPCB guidelines and KSWMP ESMF and other regulatory rules & norms.
- Environmental & Social safeguards:
    1. The project attracts E2 Environmental category based on the Environmental Screening and Exclusions mentioned in the Environmental and Social Framework Guidelines.
    2. Site specific Environmental Assessment and Environmental Management Plan has been developed.
    3. The project attracts moderate risk social category based on the social mapping & transect walk to understand the settlements/habitations/establishments etc., and consultation with the people living around the proposed project site to assess the problems faced by the legacy waste dumpsite and impact during the execution of the project.
- Total cost of the project is Rs. [redacted]/- (INR [redacted]). The cost per $m^3$ for processing and disposal of the legacy waste is [redacted]/- per $m^3$.

# 1 INTRODUCTION

Matter Material Testing and Research Laboratory Pvt. Ltd has been set-up as a result of increased demand locally from various industries for a multidisciplinary testing, materials consultancy & investigation facility in alignment with global standards and technology advancements. MatterLab is an independent professional and technical services provider to all who are concerned with quality and performance of materials & products.

IPE Global Ltd. which provides technical support consultancy services to the Urban local bodies in different municipalities for the Kerala State Waste Management Project (KSWMP) has entrusted the geotechnical investigative works as part of their DPR study for the remediation of dumpsite in Kelugudde, Kasaragod, Kasaragod district to M/s Matter Material Testing & Research Laboratory (P) Ltd. A single borehole was bored using a rotary drill. The initial site visit was done on 20th May 2023. The field geotechnical investigation to collect the soil samples of the ground after drilling through the legacy waste was started on 09th June 2023 and was completed on 20th June 2023. Standard Penetration test (SPT) was conducted within the borehole as required. Representative and undisturbed soil samples were collected to conduct relevant laboratory tests to acquire the necessary parameters. This report presents results of the geotechnical investigation of the ground encountered after drilling through the waste at the dumpsite.

# 2 SCOPE OF WORK

The scope of this work comprises of:

- Preliminary site visit by the geotechnical team to access the site conditions and selecting an appropriate point for geotechnical investigation.
- Drilling of a single borehole at the proposed borehole location as per the direction of the Client.
- Collection of soil samples and performing necessary laboratory tests on the collected samples to obtain the desired parameters of the ground profile.
- Preparation of report with laboratory test results.

# 3 OBSERVATIONS FROM SITE VISIT

Matterlab has deputed a team from our geotechnical department along Mr. Kamal Kishore Jha of IPE Global during the third week of May 2023, in order to collect the information regarding the site prior to mobilizing the equipment for drilling.

**Figure 1** : Location of the borehole drilled at the dumpsite.

## 4 GEOTECHNICAL INVESTIGATIONS

### 4.1 Rotary drilling

Rotary drilling technique was adopted for advancing and clearing out through legacy waste and soil between sample intervals. Standard penetration test (SPT) is conducted at every 1.50m interval after drilling was done through waste at the dumpsite.

### 4.2 Drilling equipment

Mechanical rigs of rotary drilling machine were used for the purpose. The rigs are well suited for the required work. The rigs are new and well-maintained.

Soil Boring: The boring was advanced by rotating drill string connected by series of drill rods. The borehole of 150mm diameter was formed using a drag bit (Soil Cutter) in soil. The drag bit cuts the subsoil at the bottom of the borehole and the soil fragments were removed by drilling mud (bentonite) which is under circulation. Bentonite slurry is used for stabilizing the borehole.

Bentonite slurry deposits as a thin film on the wall of the borehole during circulation and stability of borehole is derived from its thixotropic property and the hydro static head of the suspension. Bentonite having liquid limit greater than 400% is used for preparing bentonite slurry.

### 4.3 Observation during drilling

**Sampling**

The samples collected from the SPT sampler are treated as representative samples. Immediately after collection of sample from the sampler, the sample was transferred to a double walled polythene bag. A sample label is attached and the bag is tied tightly with thread to avoid any loss of moisture.

**Standard Penetration Test (SPT)**

These tests were conducted in the boreholes at regular intervals or the change of strata; it was carried out by standard sampler (a split-spoon sampler) of standard design and dimension (50 mm OD and 35 mm ID, with minimum length of 450 mm). The sampler was driven by a 63.5 kg drive weight (monkey) as per guidelines laid in IS: 2131. As per the IS code of practice for this test, the monkey was allowed to fall on the top of the drill rod from a height of 750 mm several times until the sample penetrates about 150 mm into the soil as a seating drive. The number of blows required to drive the spoon from 150 mm to 450 mm i.e., beyond the seating drive, were recorded and this number of blows is called 'N' value or Standard Penetration Test (SPT) value of the sub-soil at that particular depth. Where the test has been carried out on completion of a test, the split spoon sampler was brought out of the borehole and opened the same. The collected soil sample from the split spoon sampler was preserved in air tight polythene packets for classification purpose. The samples were labeled properly with the project name, borehole and the depth of sampling.

**Preparation of Bore Logs:**

On completion of each borehole, the soil samples were examined and logged. The final log is prepared on the basis of visual examination of soil samples and laboratory testing data. The following are observed and recorded in the bore log the commencement and completion date, location of borehole, elevation of top and bottom of boring, ground water table, boundaries of each soil layer that encountered, classification and description of the deposit, blow count values obtained from SPT tests, collection of soil samples etc.

The borelog is attached as **Appendix-I.**

## 5 LABORATORY ANALYSIS

The laboratory tests were conducted as per the relevant Standard Codes. A summary of laboratory tests carried out is shown below in **Table 1** and the complete results of laboratory testing are presented in **Appendix II**.

**Figure 2 :** Laboratory tests performed at MatterLab.

**Table 1: Details of various laboratory tests and relevant codes followed**

| Sl No. | Type of sample | Description | Relevant Codes |
|---|---|---|---|
| 1 | Soil | Grain-Size Analysis | IS: 2720(Part-4)-1985 |
| 2 | | Atterberg's Limit | IS: 2720(Part-5)-1976 |
| 3 | | Moisture Content | IS 2720(Part 2)-1973 |

## 6 SUMMARY

The geotechnical examination on the soil samples collected after boring through the waste at the dumpsite at Kelugudde, Kasaragod, Kasaragod district was carried out by M/s Matter Material Testing & Research Laboratory (P) Ltd. As per the work instructions of the client, a single borehole was bored using a rotary drilling method. The maximum depth of investigation was 9.0 m (4.5 m in waste and 4.5 m in the ground). SPT and collection of undisturbed samples were carried out at regular intervals. Various laboratory tests were carried out on the SPT and undisturbed soil samples.

Based on the investigations carried out, it was observed that the original ground below the waste comprises of a 2.5m thick sandy layer underlain by a 2.0 m thick clayey layer until the depth of termination. The tests mentioned in the above table were performed on the samples in the laboratory following the respective codes to obtain the necessary parameters. The laboratory results on samples obtained from the site are appended in **Appendix II**.

## TEST REPORT

Ref.No: PL/RT/GW/1446/2023
(ULR NO TC698220000001446F)

Date of Issue: 22/06/2023

Name & address of customer : M/s. Program Manager
IPE Global Ltd
Kavanatt,Building Kakkanad
Ernakulam
(TSC Package D, KSWMP )

Sample drawn by : Poluchem Laboratory Sample Collector
Sampling Method : IS 3025 Part 1 1987- Reaffirmed 2014
Sample Description : Ground water-3
Sample Location : Kasarngod- Kelugudde
Gps Reading : N- 12°30'57.964"
E -74°57'16.399"

Sample code : P/1446/2023
Date of Sample Collected : 12/06/2023
Date of receipt of sample : 14/06/2023
Date of analysis started : 14/06/2023
Date of completion of analysis : 22/06/2023

| Parameters tested | Test method | Results | Acceptable Limit As per IS – 10500 - 2012 |
|---|---|---|---|
| pH | IS 3025 (P) 11 –1983RA2017 | 6.60 | 6.5 – 8.5 |
| Color | IS 3025 (P) 04 –1983RA2017 | 25 Hazen Unit | 5 Hazen Unit |
| Turbidity | IS 3025 (P) 10 – 1984RA2017 | 19.5 NTU | 1 NTU |
| Electrical Conductivity | IS 3025 (P) 14 – 1984RA2013 | 300 µS/cm | — |
| Total Dissolved Solids | IS 3025 (P) 16 – 1984RA2017 | 187 mg/l | 500 mg/l |
| Total Suspended Solids | IS 3025 (P) 15 – 1984RA2017 | 16 mg/l | — |
| Total Hardness as $CaCO_3$ | IS 3025 (P) 21 – 1983RA2014 | 96 mg/l | 200 mg/l |
| Total Alkalinity as $CaCO_3$ | IS 3025 (P) 23 – 1986RA2014 | 104 mg/l | 200 mg/l |
| Chloride as Cl | IS 3025 (P) 32 – 1988RA2014 | 17.1 mg/l | 250 mg/l |
| Sulphate as $SO_4$ | IS 3025 (P) 24 – 1986RA2014 | 12.7 mg/l | 200 mg/l |
| Iron as Fe | IS 3025 (P) 53 – 2003RA2014 | 2.54 mg/l | 1.0 mg/l |
| Nitrate as $NO_3$ | IS 3025 (P)34 – 1988RA2014 | 4.67 mg/l | 45 mg/l |
| Fluoride as F | IS 3025 (P) 60 -2008RA2014 | 0.28 mg/l | 1.0 mg/l |

Annexure-I

# PROPOSED OPERATIONAL PLAN

## Proposed Operational Plan

The project of the Bio-mining with land recovery will be implemented through 100% outsourcing model. The detailed operations of land recovery is provided below:

1. **Project Kick-off**

The existing legacy waste dumpsite should be visited jointly by representative of implementation agency, officials ULB and experts of PMU/PMC & TSC for the following

- ✓ For assessment of ***As –Is Situation*** of local settings viz., human settlement & environmental settings etc.,
- ✓ For validation of profile, quantity & physical characterization of legacy waste.
- ✓ Available services viz., electrical power, source of water and access road etc.,
- ✓ For ground truthing the sampling locations of baseline environmental parameter, locations where monitoring will conduct during operation phase and post reclamation phase
- ✓ For sensitizing/awareness of the upcoming the project activity to the stakeholders within the vicinity of the dumpsite.
- ✓ For understanding the sensitive of environmental & social aspects/social considerations viz., educational institutions, religious places and settlements settings.
- ✓ For ensuring that the implementation agency understands and to complies with all local and national regulations related to project activities.

2. **Site Management Plan**

The position of the machineries and other auxiliary machineries/equipment's in-line with the defined process of bio-mining with land recovery play imperative role in effective implementation of the project activities.

A detailed site management plan is prepared including the details of excavation & pre stabilization area in phases (1 to 4), machineries, weigh bridge, area allocation for by-products storage, vehicle parking area and position of CCTV cameras. The detailed site Management plan is provided as Annexure E.

3. **Site Preparation**

The portion of the legacy waste dumpsite will be clear vegetation and levelling the area to create a stable & level platform for positioning of bio-mining machineries/equipment's and for processing of legacy waste.

4. **Procurement of Machinery & Vehicles and Equipment's**

An indicative list of Machineries &Vehicles and equipment's are proposed to for effective processing the quantity of existing legacy waste in-tune to the timeline of NGT orders. The indicative list of the Machinery & Vehicles and equipment's are provided in the Section 8.3.2

5. **Mobilization of Manpower**

For effective management of the project activities, an indicative list Manpower provided in the Section 8.4.1 shall be mobilize required.

6. **Statutory Approvals**

The implementation agency is responsible for obtaining all required permission/consent/approvals from the competent authorities. The ULB/DPMU/DPMC will only facilities implementation agency in obtaining the approvals etc. The indicative list of statutory approvals required for the project is provided below.

a. Site Authorization from KSPCB in conforming to SWM Rules 2016 and Consent to Establish/Operate KSPCB.
b. Dept. of mining and geology
c. Necessary permission for storage of process materials and chemicals
d. NOC from Dept. of Fire and Rescue
e. Segregated Hazardous waste disposal arrangement (eg: KEIL Ambalmedu, Kochi)
f. NOC from Heritage/Archeology if the site is in regulated zone of heritage/protected building
g. Any other statutory approvals/ permissions

### 7. Establishment of forward linkages

The By-products from the bio-mining process/operations viz., Bio earth/ C&D waste (Inert), RDF and Recyclables will be stored in the designated place (as indicated in the site management plan) within the dumpsite. The contractor is responsible for management/establishment of forward linkages. Utilization of Bio earth/C&D (inert) may be finalized in consultation with ULB. An indicative forward linkage is provided in the Section 9.1. The compost should conform to Schedule II of SWM Rules 2016, and RDF should conform to the Guidelines on Usage of RDF in various Industries issued by MoHUA. Bi-weekly sampling will be carried out to confirm the same.

**Bio-mining operations**

- Step-1 – Waste Stabilization

The initial step involves the use of a front-end loader to excavate the legacy waste, allowing for the leachate to dry out through exposure to solar radiation and for the removal of trapped methane from the heap. To ensure the decomposition of biodegradable waste such as discarded food, fruits, flowers, and garden waste, proper aeration is necessary to prevent the generation of leachate and odors. The top layer of the legacy waste, approximately 150 mm in depth, is repeatedly loosened using the front-end loader. Additionally, the waste is lightly mist-sprayed with bio-cultures to manage odors and disperse decomposing microbes throughout the waste. The loosened legacy waste forms windrows.

- Step-2 – Windrow Formation

The second step involves creating windrows of the legacy waste using backhoe. Composting bio-cultures are added to accelerate decomposition and generate biological heat within the waste, aiding in drying it out and reducing its volume. These windrows are turned every 3 days to ensure proper biological treatment and moisture loss. After 1-2weeks, when the heaps have reached a suitable consistency for screening, the material is weighed and transferred to a Mobile Trommel, which consists of rotating cylinders with different-sized perforations.

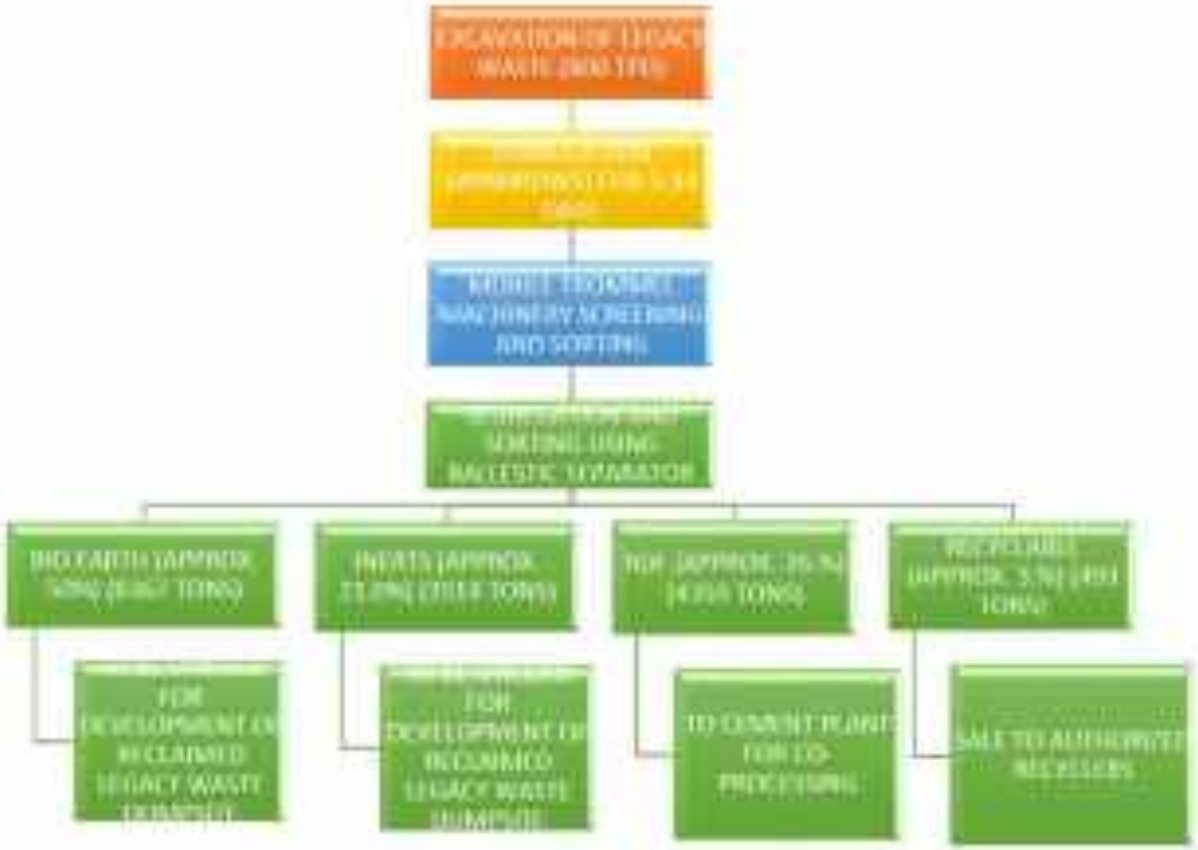
- Step-3 – Sorting and Segregation by Mobile Trommel

The third step is to move stabilized waste to mobile trommel to get 3 different sizes of fractions

✓ Fraction 1 – (minus 30 mm) – Bio Soil/earth -Used for side development/ filling.
✓ Fraction 2 – (30-80) mm – Mixed fraction – Plastics with C&D (send to Ballistic Separator)

- ✓ Fraction 3 – (80 +) mm – Mixed fraction – (send to Ballistic Separator)

The Fraction-2 & Fraction-3 (30-80) mm & (80 +) mm is required to move for further separation process through ballistic separator.



- Step-4 – By - products – C&D materials

In the fourth step, the fraction-2 and fraction-3 are sorted into three types based on their shape and weight: heavy and rolling fraction (referred to as 3D) - C&D Material, light fraction (referred to as 2D) - RDF, and the sieved fraction (or under-screen fine fraction) - Plastic.

- Step-5 - Byproducts – RDF

In the fifth step, the RDF sorted by the ballistic separator (30TPH) is moved to the baling machine (50TPH) for packaging the RDF fractions. The baled RDF is then transported to Cement plants via a weigh bridge (30Tons), where a co-processing facility is available.

## 8. Monitoring & Supervising Mechanism

Supervision and monitoring during dumpsite remediation by TSC/PIU/DPMU

## 9. Record keeping and Reporting

i. The Implementation agency shall maintain a record of the daily processed legacy waste and also keep proper record of all the recovered and disposed of materials.

ii. The Implementation agency shall maintain authorized weigh bridge records at the point of receipt by end designated agency. A consolidated weigh bridge records certified by the Plant Manager/competent authority of the authorized Cement plant/ WtE or such units certifying the total RDF received from the Project is a valid proof of compliance.

iii. The Implementation agency shall maintain all the statutory records, as per SWM Rules, 2016, and also conditions stipulated in Site Authorization/Consent to Establish/Operate by KSPCB if any, KSWMP/WB requirements and other project relevance statutory requirements.

iv. The site shall be operated in CCTV surveillance with data storage of entire contract period. For CCTV surveillance High-Definition IP based cameras in adequate numbers. As per the requirement of the ULB/KSWMP link with mobile compatibility may be provided for online monitoring of the project activities.

v. The vehicles engaged for the project activities shall be equipped with Vehicles Tracking System (VTS) by equipping with GPS and online monitoring system.

vi. The agency is required to maintain loading and unloading weighbridge slips, e-way bill, LR copy, RDF receipt acknowledgement letter from the cement factory/ WtE facility for complete traceability of the recovered fractions.

## 10. Land recovery/project closure

Land shall be reclaimed i.e. all the legacy waste will be removed till it reaches the surface of the earth/ soil. The Machinery & Vehicles of the implementation agency shall be vacated within 14 days from date completion of bio mining of legacy waste. The encumbrance free reclaimed land shall be handed over to ULB after filling the inert/ soil enricher at the site with proper compaction and appropriate profiling for an aesthetic appearance. The material must be stabilized and is expected to be within the allowable limits for landfill, however the profiling will be done with appropriate drainage system. The contractor is required to provide the design for the profiling ensuring stability, compaction, drainage etc in the technical bid. It will be the responsibility of the bidder to ensure proper slope stability, compaction, and surface run-off drainage. The inert and soil enricher recovered will be subjected to bi-weekly sampling to check the parameters mentioned in schedule II of SWM Rules 2016 before using the material at site

Annexure-J

# LSGD GUIDELINES FOR REMEDIATION OF LEGACY WASTE DUMPSITES THROUGH BIOREMEDIATION

# GOVERNMENT OF KERALA

## Abstract

Local Self Government Department - Guidelines for Remediation of Legacy Waste Dumpsites through Bio Remediation - orders issued.

## DEPARTMENT

G.O.(Rt)No.2629/2022/LSGD Dated,Thiruvananthapuram, 29-10-2022

Read 1 Letter No. 2683/C2/2022/SM dated 16.09.2022 from Executive Director Suchitwa Mission.

## ORDER

As per the letter read above, Executive Director, Suchitwa Mission had submitted draft guidelines for implementation of project for remediation of Legacy Waste Dumpsites through Bio Remediation.

2) Government have examined the matter in detail and are pleased to approve the guidelines enclosed herewith for implementation of project for reclamation of legacy waste dumpsites through bio remediation.

(By order of the Governor)
SHIBI ABRAHAM
DEPUTY SECRETARY

To:

Principal Director Local Self Government Department

Director Local Self Government(Urban) Department

Director, Local Self Government (Rural) Department

Executive Director, Suchitwa Mission

Principal Accountant General (A&E/Audit-I/Audit-II)Kerala, Thiruvananthapuram.

Executive Director, Information Kerala Mission.

**ലെഗസി മാ**ലിന്യ **നിർമ്മാർ**ജന പദ്ധതികളു**ടെ നിർവ്വഹ**ണ ഉദ്യോഗ**സ്ഥ**ൻ

- ലെഗസി മാലിന്യ നിർമാർജന പദ്ധതികളുടെ നിർവ്വഹണ ഉദ്യോഗസ്ഥൻ തദ്ദേശ സ്വയംഭരണ സ്ഥാപനത്തിന്റെ എഞ്ചിനീയർ ആയിരിക്കും

നിർമ്മാർജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യ നിക്ഷേപങ്ങളുടെ അളവ തിട്ടപ്പെടുത്തൽ

- പൊതുവായി, നിർമ്മാർജ്ജനം ചെയ്യേണ്ട ലെഗസി മാലിന്യത്തിന്റെ അളവ (ക്യൂബിക മീറ്ററിൽ) ടോട്ടൽ സ്റ്റേഷൻ സർവേയിലൂടെ കണ്ടെത്താവുന്നതാണ. എന്നാൽ ടോട്ടൽ സ്റ്റേഷൻ സർവേ സാധ്യമല്ലാത്ത സാഹചര്യത്തിൽ, ഒരു ലക്ഷം ക്യൂബിക മീറ്റർ വ്യാപ്തിയിൽ കൂടുതലുള്ള വലിയ ഡംപസൈറ്റുകളുടെ കാര്യത്തിൽ ഡ്രോൺ സർവ്വേ രീതി സ്വീകരിക്കാവുന്നതാണ.

- ആവശ്യമുള്ള പക്ഷം, പുറമെയുള്ള സർവേ ഏജൻസികളെ നിശ്ചിത നടപടിക്രമങ്ങൾ പാലിച്ച ഇതിനായി ഏർപ്പെടുത്താവുന്നതും, അതിനുള്ള ചെലവ ലഭ്യമായ ഫണ്ടിൽ നിന്ന തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം വഹിക്കേണ്ടതുമാണ.

- സൈറ്റിന്റെ കോണ്ടൂർ മാപ്പ തയ്യാറാക്കേണ്ടതും ആയത തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ പരിശോധിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

എസ്റ്റിമേറ്റ തയ്യാറാക്കലും പദ്ധതി രൂപീകരണവും

- സൈറ്റിന്റെ നിലവിലെ അവസ്ഥ, മാലിന്യത്തിന്റെ സ്വഭാവം/തരം, മാലിന്യ നിക്ഷേപത്തിന്റെ കാലയളവ, മറ്റ അടിസ്ഥാന വിശദാംശങ്ങൾ എന്നിവയെക്കുറിച്ചുള്ള വിശദമായ റിപ്പോർട്ട അനുബന്ധം- I ൽ നൽകിയിരിക്കുന്ന പ്രൊഫോർമയിൽ തയ്യാറാക്കേണ്ടതാണ

- അനുബന്ധം-II ൽ നൽകിയിരിക്കുന്ന സ്പെസിഫിക്കേഷനും ഡാറ്റയും അനുസരിച്ച ബയോമൈനിംഗ മുഖേന പ്രവൃത്തി നടപ്പിലാക്കുന്നതിന എസ്റ്റിമേറ്റ തയ്യാറാക്കേണ്ടതാണ.

- പ്രൊപ്പോസൽ തയ്യാറാക്കുന്നതിന്റെ ഭാഗമായി പ്രസ്തുത പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള എല്ലാത്തരം ചെലവുകളും പരിഗണിക്കേണ്ടതാണ.

- വാർഷിക പദ്ധതിയുടെ ഭാഗമായി പ്രോജക്ട ഏറ്റെടുക്കേണ്ടതും ലഭ്യമായ സ്രോതസ്സുകളിൽ നിന്നും ഫണ്ട വകയിരുത്തേണ്ടതുമാണ.

സാങ്കേതിക അനുമതി

നിലവിലുള്ള സാമ്പത്തിക അധികാരങ്ങൾ അനുസരിച്ച തദ്ദേശ സ്വയംഭരണ വകുപ്പ(ലോക്കൽ ഇൻഫ്രാസ്ട്രക്ച്ചർ & എഞ്ചിനീയറിംഗ വിങ) ലെ ബന്ധപ്പെട്ട എഞ്ചിനീയർ പ്രോജക്ടിന സാങ്കേതിക അനുമതി നൽകുകയും മാനദണ്ഡങ്ങൾ പാലിക്കുന്നതിനായി ചീഫ ടെക്നിക്കൽ എക്സാമിനർക്ക (ഫിനാൻസ വിംഗ) ആവശ്യമായ റിപ്പോർട്ടിംഗ ഉറപ്പാക്കുകയും ചെയ്യേണ്ടതാണ.

തദ്ദേശ സ്വയംഭരണ സ്ഥാപനങ്ങൾ ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ/ഭൂമികൾ വീണ്ടെക്കുന്നതിനുള്ള പദ്ധതി നിർവ്വഹണം നടത്തുന്നതിനുള്ള നടപടി ക്രമങ്ങൾ

ടെൻഡറിംഗ

- ലെഗസി മാലിന്യ നിക്ഷേപ സൈറ്റുകൾ വീണ്ടെടുക്കുന്നതിനുള്ള പ്രവൃത്തിയുടെ വിശദമായ സ്കോപ്പ ഓഫ വർക്ക, നിബന്ധനകളും വ്യവസ്ഥകളും മുതലായവ വ്യക്തമായി പരാമർശിക്കുന്ന 'ടു കവർ ബിഡ്സ താല്പര്യപത്രം'(Request for Proposa - wo Cover Bd) തയ്യാറാക്കേണ്ടതും ആയത നടപടിക്രമങ്ങൾ പാലിച്ച പ്രസിദ്ധീകരിക്കുകയും ചെയ്യേണ്ടതാണ.

- കേന്ദ്ര പാർപ്പിട-നഗരകാര്യ മന്ത്രാലയവും (MoHUA) സെൻട്രൽ പബ്ലിക ഹെൽത്ത & എൻവയോൺമെന്റൽ എഞ്ചിനീയറിംഗ ഓർഗനൈസേഷനും (CPHEEO) ചേർന്ന പ്രസിദ്ധീകരിച്ച "സ്വച്ഛ ഭാരത മിഷൻ (അർബൻ)-അഡ്വൈസറി ഓൺ ലാൻഡ്ഫിൽ റിക്ലമേഷൻ" ൽ നൽകിയിരിക്കുന്ന മാർഗ്ഗനിർദ്ദേശങ്ങളെ

അടിസ്ഥാനമാക്കി RFP-യിലെ വ്യവസ്ഥകൾ/യോഗ്യതാ മാനദണ്ഡങ്ങൾ നിശ്ചയിക്കാവുന്നതാണ.

- കേന്ദ്ര മലിനീകരണ നിയന്ത്രണ ബോർഡ പുറപ്പെടുവിച്ച "ഗൈഡലൈൻസ ഫോർ ഡിസ്പോസൽ ഓഫ ലെഗസി വേസ്റ്റ (ഓൾഡ മുനിസിപ്പൽ സോളിഡ വേസ്റ്റ) " പ്രകാരം ലെഗസി മാലിന്യ നിക്ഷേപങ്ങൾ നിർമ്മാർജ്ജനം ചെയ്യേണ്ടതാണെന്ന നിബന്ധന പ്രവൃത്തിയുടെ 'സ്കോപ്പ ഓഫ വർക്കിൽ' ഉൾപ്പെടുത്തുന്നുണ്ടെന്ന ഉറപ്പ വരുത്തേണ്ടതാണ.

- ലഭ്യമാകുന്ന ടെക്നിക്കൽ ബിഡ്സുകൾ പരിശോധിച്ച വിലയിരുത്തേണ്ടതും സാങ്കേതിക യോഗ്യത നേടുന്ന ബിഡ്ഡർമാരെ ബിഡ/ടെൻഡർ അംഗീകാരത്തിന്റെ തുടർ ഘട്ടത്തിനായി ഷോർട്ടലിസ്റ്റ ചെയ്യേണ്ടതുമാണ. ടെക്നിക്കൽ ബിഡ്സുകളുടെ മൂല്യനിർണ്ണയം നടത്തുന്നതിനായി താഴെപ്പറയുന്ന അംഗങ്ങളെ ഉൾപ്പെടുത്തി തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതിക സമിതി രൂപീകരിക്കേണ്ടതാണ;

    - സെക്രട്ടറി
    - LSGD (LID & EW) എഞ്ചിനീയർ
    - ഹെൽത്ത വിഭാഗം ഉദ്യോഗസ്ഥൻ (നഗര തദ്ദേശ സ്ഥാപനങ്ങളുടെ കാര്യത്തിൽ)
    - ജില്ലാ ശുചിത്വ മിഷനിൽ നിന്നുള്ള സാങ്കേതിക വിദഗ്ധൻ
    - ജില്ലാ മലിനീകരണ നിയന്ത്രണ ബോർഡിന്റെ പ്രതിനിധി
    - അക്കാദമിക സ്ഥാപനങ്ങളിൽ നിന്നുള്ള മറ്റ വിദഗ്ധർ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ സാങ്കേതികമായി ഷോർട്ടലിസ്റ്റ ചെയ്ത ബിഡഡർമാരുടെ ഫിനാൻഷ്യൽ ബിഡ്സുകൾ തുറക്കേണ്ടതും നടപടിക്രമങ്ങളും മാനദണ്ഡങ്ങളും പാലിച്ച അംഗീകരിക്കേണ്ടതുമാണ.

- തിരഞ്ഞെടുത്ത കരാറുകാരന/ഏജൻസിക്ക ലെറ്റർ ഓഫ അവാർഡ (L O A) നൽകുകയും കരാറിൽ ഏർപ്പെടേണ്ടതുമാണ.

നിർവ്വഹണം, മേൽനോട്ടം, ബില്ലുകൾ തയ്യാറാക്കൽ

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന തലത്തിൽ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയറും മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങളുടെ നിരീക്ഷണ ചുമതലയുള്ള ഉദ്യോഗസ്ഥനും അടങ്ങുന്ന ഒരു മേൽനോട്ട സമിതി (Superv s on Commttee) രൂപീകരിക്കേണ്ടതാണ

- R F P ഡോകുമെന്റിലും കരാറിലും ഉൾപ്പെടുത്തിയിട്ടുള്ള 'സ്കോപ്പ ഓഫ വർക്ക' കരാറുകാരൻ കൃത്യമായി പാലിക്കുന്നുണ്ടോ എന്ന നിരീക്ഷിക്കുന്നതിനായി തദ്ദേശ സ്വയംഭരണ സ്ഥാപനം മേൽനോട്ട സമിതിയെ ചുമതലപ്പെടുത്തേണ്ടതാണ.

- പ്രസ്തുത പ്രവൃത്തി 'സ്കോപ്പ ഓഫ വർക്കിൽ' നിഷ്കർഷിക്കുന്ന പ്രകാരമാണോ നടപ്പിലാക്കുന്നതെന്ന മേൽനോട്ട സമിതി കൃത്യമായും പരിശോധിക്കുകയും നിരീക്ഷിക്കുകയും ചെയ്യേണ്ടതാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ കരാറുകാരന/ ഏജൻസിയ്ക്ക സൈറ്റ ഹാൻഡ ഓവർ ചെയ്ത നൽകേണ്ടതും പ്രവൃത്തി നടപ്പിലാക്കുന്നതിനുള്ള/ നിർവഹിക്കുന്നതിനുള്ള പിന്തുണ നൽകുകയും ചെയ്യേണ്ടതാണ.

- മാലിന്യ പരിപാലന പ്രവർത്തനങ്ങൾ നിരീക്ഷിക്കുന്നതിന്റെ ചുമതലയുള്ള ഉദ്യോഗസ്ഥൻ പ്രസ്തുത പ്രവൃത്തിയിൽ ഉൾപ്പെടുന്ന മാലിന്യ പരിപാലനവുമായി ബന്ധപ്പെട്ട പ്രവർത്തനങ്ങളായ വിൻട്രോ ഫോർമേഷൻ, മാലിന്യം

തരംതിരിക്കൽ, മലിനീകരണ നിയന്ത്രണ മുൻകരുതലുകളും ആരോഗ്യപരമായ കാര്യങ്ങളും ഉറപ്പുവരുത്തൽ എന്നിവയ്ക്ക മേൽനോട്ടം വഹിക്കേണ്ടതും കരാറുകാരന/ഏജൻസിക്ക മേൽനോട്ട സമിതി മുഖേന ആവശ്യമായ നിർദ്ദേശങ്ങൾ നൽകേണ്ടതുമാണ.

- തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ എംബുക്കിൽ 'ഇനിഷ്യൽ', 'ഇന്റർമീഡിയറ്റ്', 'ഫൈനൽ' ലെവലുകൾ എന്നിവ എടുത്ത അളവുകൾ രേഖപ്പെടുത്തേണ്ടതും, തദ്ദേശ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- കരാറിൽ വിശദമാക്കിയിട്ടുള്ള ജോലിയുടെ വിവിധ ഘട്ടങ്ങൾ പൂർത്തിയാക്കിയ ശേഷം കരാറുകാരൻ/ഏജൻസി ക്ലെയിം ചെയ്യുന്ന പ്രവൃത്തിയുടെ വർക്ക ബില്ലുകൾ തദ്ദേശ സ്വയംഭരണ സ്ഥാപന എഞ്ചിനീയർ തയ്യാറാക്കേണ്ടതും തദ്ദേശ സ്വയംഭരണ സ്വയംഭരണ വകുപ്പിന ബാധകമായ അധികാരമനുസരിച്ച ബന്ധപ്പെട്ട തദ്ദേശ സ്വയംഭരണ വകുപ്പ (എൽ.ഐ.ഡി & ഇ.ഡബ്ല്യു) എഞ്ചിനീയർ ചെക്ക മെഷർമെൻറ നടത്തുകയും ചെയ്യേണ്ടതാണ.

- <u>GUIDELINES FOR IMPLEMENTATION OF PROJECTS FOR RECLAMATION OF LEGACY WASTE DUMPSITES THROUGH BIO REMEDIATION (BIO MINING AND MANAGEMENT OF RECOVERABLES AND REJECTS)</u>

As per the provisions of Solid Waste Management Rules 2016, local bodies are mandated to remediate legacy waste dumpsites and reclaim the land based on the guidelines issued by CPCB. Remediation of legacy dumpsites involves various activities such as assessment of the nature and quantity of waste to be remediated, excavation works to open the dumps, screening and sorting to segregate the waste fractions, reuse and sale/marketing of recovered materials, scientific disposal of rejects as per the norms. The remediation of dumpsites is further directed by Honorable NGT in its order on OA 519/2019 dated 17.07.2019. Subsequent to this, the Government of Kerala approved the Implementation Strategy for legacy waste remediation including demarcating the responsibility of various stakeholders for remediation of historical dumpsites through bio mining vide G.O (Rt) No.702/2020/LSGD dated 22.03.2020. However, the progress of implementation of such projects has not been satisfactory so far. One of the main reasons is that there is a lack of clarity in the procedures to be followed for legacy waste remediation projects right from the approval of the project to the mode of execution (including sale and disposal of recovered materials) by LSGIs since the nature of such projects is not similar to the general public construction/civil works. Also, the nature, quality and quantity of material that can be recovered from an existing legacy dumpsite cannot be accurately predetermined without opening up such dumpsites and hence it is not practical to prepare a workable estimate for the same like other public works . In order to tackle these issues, Swachh Bharat Mission(Urban) and CPHEEO have issued an "Advisory on Landfill reclamation", and suitable provisions of this advisory can be adopted for the State of Kerala. In these circumstances, the Government has examined this matter in detail, and the following guidelines are issued for the implementation of projects for remediation of legacy dumpsites by Local Self Government Institutions.

**<u>Standards, guidelines and advisories to be followed</u>**

- "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" issued by Central Pollution Control Board
- "SBM-U Advisory on Landfill Reclamation" published by MoHUA and

CPHEEO

- Guidelines issued by Government of Kerala in this regard from time to time

**Models for implementing legacy waste dumpsite remediation by LSGI's**

- 100% outsourced model (As per "SBM -U Advisory on Landfill Reclamation" published byMoHUA and CPHEEO)

**Implementing officer for legacy waste dumpsite remediation projects**

The implementing officer for legacy waste remediation shall be the Engineer of the LSGI

**Quantification of legacy waste to be remediated**

- The volume of legacy waste (in m3) to be remediated shall be generally assessed through Total Station Survey. If a total station survey is not feasible, a drone survey may be adopted for large dumpsites having a volume of more than 1 (One) Lakh m3.
- If required, external survey agencies may be engaged following laid down procedures and the cost for the same shall be met by LSGI from available funds.
- Contour mapping of the site shall be prepared and approved by the Engineer of the LSG

**Project Cost Estimation and Formulation by LSGI**

- Detailed report regarding the site conditions, nature of dump, history of dumping and other basic details shall be prepared in the format given in **Annexure - I**
- The estimate for biomining shall be prepared as per the specification and data given in
  - **Annexure -II**
- The overall cost for the implementation of the project shall be considered as part of the proposal.
- Project shall be taken up as per annual projects and funds from available sources shall be ear marked

**Technical Sanction**

- Technical sanction for the project shall be issued by the concerned Engineer in LSGD (LID & EW) as per the existing financial powers and necessary reporting to the Chief Technical Examiner (Finance Wing) may be ensured for compliance as per norms

**Implementation steps for remediation of legacy waste dumpsites by LSGIs**

**Tendering**

- Request for Proposals (RFPs-Two cover bid) clearly mentioning the scope of work, terms and conditions for reclamation of legacy waste dump sites shall be prepared and published as per laid down procedures.
- Conditions/eligibility criteria in the RFP shall be fixed based on the guidelines given in"**SBM-U Advisory on Landfill Reclamation"** published by MoHUA and CPHEEO
- It shall be ensured to mention in the scope of work that remediation of legacy waste dumpsites shall be undertaken as per the **"Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)"** issued by Central Pollution Control Board.
- The technical proposals received should be evaluated and technically qualified bidders shortlisted for further stage of bid approval. A Technical committee shall be formed at LSGI level for evaluation of the technical bids with the following members;
    - Secretary
    - LSGD (LID & EW) Engineer
    - Health Official (in the case of Urban local bodies)
    - Technical expert from District Suchitwa Mission
    - Representative from District Pollution Control Board
    - Other experts from academic institutions if any
- Financial bids of the technically shortlisted firms should be opened at LSGI level and approved as per procedures and norms
- Letter of Award (LoA) is to be issued to the selected contractor/agency and agreement executed.

**Execution, Supervision and preparation of bills**

- LSGI shall constitute a supervision committee consisting of LSGI Engineer and the officer in charge of monitoring waste management activity
    - LSGI shall authorise the supervision committee to monitor that the contractor correctly follows the scope of work included in the RFP document and agreement.
- The supervision committee shall inspect and monitor that the work is being carried out as per the scope defined.
- LSGI Engineer shall hand over the site and provide support for execution of work at the site by the contractor/agency
- The officer in charge of monitoring waste management shall oversee the waste management related activities such as formation of windrows, segregation of waste into various streams,ensuring pollution control measures and health matters involved in the project and shall give direction to the contractor/agency through the supervision committee.

- LSGI Engineer shall measure, record quantities by taking initial, intermediate and final levels in M-book and Check measurements shall be done by the officials of LSGD (LID & EW) as per the powers vested with in the Local Self Government Department.
- LSGI Engineer shall prepare the work bills claimed by the contractor/agency after completing stages of work detailed in the agreement and check measurement shall be made by the officials of LSGD (LID & EW) as per the powers vested within Local Self Government Department.

# 1. Introduction

Dumpsite remediation refers to the process of mitigating the adverse effects of existing dumpsites and restoring them to a safe and environmentally sustainable state. The emphasis during the remediation of dump sites is primarily on social safeguard aspects, with a key focus on meaningful engagement with stakeholders, comprehension of stakeholders' risk perceptions, and the restoration of sites to a safe and environmentally sustainable condition. This involves a sequence of systematic social actions, encompassing social inclusion, efficient labor management, prevention of gender violence throughout the process, successive rehabilitation of affected individuals, and the reduction of health risks for the host community. The World Bank-supported KSWM Project has incorporated the bio-mining process for the Kelugudde dumpsite of Kasargod municipality.

## 1.1 Profile of ULB

The Kasaragod municipality is an Urban Local Body (ULB) in the Kasaragod district of Kerala, covering an area of 16.7 square kilometers (sq.m) and divided into 38 administrative wards. This municipality generates 35.60 tons per day (TPD) of solid waste. However, Kasaragod ULB does not possess adequate solid waste treatment and disposal facilities as mandated by the Solid Waste Management (SWM) Rules of 2016. Consequently, unsegregated waste was disposed of in an unscientific manner;essentially dumped at the ULBs trenching ground (where feceas/night soil used to be dumped from pit latrines) at Kelugudde in ward 4.

Socio-Economic profile of ULB is presented below in the table

| Socio Economic Profile Data | |
|---|---|
| **District Name** | Kasargod |
| **Town Name** | Kasargod |
| **Total Population of Town** | 61253 |
| **Total Male Population of Town** | 29615 |
| **Total Female Population of Town** | 31798 |
| **Total Scheduled Castes Population of Town** | 1729 |

| | |
|---|---|
| **Total Scheduled Castes Male Population of Town** | 819 |
| **Total Scheduled Castes Female Population of Town** | 910 |
| **Total Scheduled Tribes Population of Town** | 141 |
| **Total Scheduled Tribes Male Population of Town** | 77 |
| **Total Scheduled Tribes Female Population of Town** | 64 |

### 1.2 Profile of Dumpsite

The Biomining and Bioremediation at the Kasaragod ULB dumpsite is proposed as part of the Kerala Solid Waste Management Project (KSWMP) in collaboration with funding from the World Bank and the Asian Infrastructure Investment Bank. The dumpsite situated in Ward 4, Kasaragod, covers a total area of 1.16 acres and contains a legacy waste quantity of 16,736 tons. The waste at the site is approximately 50 years old, with dumping activities started in 1970 and stopped in 2010. Initially, the dumpsite served as a trenching ground for the disposal of sewage from pit latrines. The total volume of waste accumulated is approximately 20,115 cubic meters, and the dumpsite spans across an area of 1.16 acres. Over the years of past 50 years, Kelugudde dumpsite saw various types of wastes dumped there. In order to promote a healthy and sustainable environment, it is imperative to undertake the remediation of the dumpsite.

### 1.3 Socio economic baseline of Host community

The dump site is in land owned by ULB and shares a border with Madhur Grama Panchayath. It was a waste dumping site of Kasaragod Municipality from 1970 till 2010. When the composition of BDW and NBDW in the site became a menace to the public residing near the area, the public protest arose. The typical dumpsite impacts such as foul smell, flies, rodents, leachate etc were present in the dump site. Dumping was stopped in 2010 due to public protests and the site has been closed since then. Thus, the evident impact on habitation is being minimized and the dumped wastes are now covered with soil and vegetation.

The site is located 700 meters from National Highway 66. The access road to the site is of four - meter width. Mixed types of families of different socio-economic groups such as High-Income Groups (HIG), Middle-Income Groups (MIG), and Low-Income Group (LIG) reside within 200m radius making a cross section of the society. The main source of income are daily wage labour, working in gulf countries, nearby cashew factory etc Malayalam, Kannada, Konkani and Tulu languages are commonly used by the residents.

There are about 100 households residing within a 200-meter radius of this dumpsite. There are six families residing within 50 meters and 26 families within 100 meters near to the site. A Civil supplies warehouse (20m), KSEB substation (within 20m), Community Hall (50m), shops (100m) etc are also functioning near this dumpsite.

**1.4 Vulnerability mapping of Host community**

There are no scheduled tribes, rag pickers living near the dumpsite. The dumpsite is in close proximity to 6 households which are the people at high risk. An SC colony of 5 houses with 18 people belonging to Nalkattaya community is at 150ms.

| Sl.No | Particulars | Number |
|---|---|---|
| 1 | Number of Senior citizen residing Near dumpsite | 11 |
| 2 | Number of single women staying near the dumpsite | 6 |
| 3 | Number of persons with disabilities | 4 |
| 4 | Number of person with severe disease | 3 |
| 5 | Number of persons with respiratory issues | 7 |
| 6 | Number of Kids | 9 |

## 2. Output from Social Screening

### 2.1 Social Screening Checklist

Social screening of the dumpsite remediation, by a joint team of DPMU, DPMC, TSC and PIU, was carried out on 2.2.2023 with the screening checklist. Social screening was done to identify the potential social risks anticipated during dumpsite remediation. Major findings during the screening process are shown below.

- There are 100 households within 200 m radius of the dumpsite.
- The major institutions within 200ms are KSEB Substation, Civil supplies warehouse, firecracker store, grocery shop, two tea shops, tile godown, furniture shop and steel fabrication works.
- There is proper access to the dumpsite with a 4ms width road of 700meters from the National Highway. The major institution in the access road is a worship area, Shree Ayyappa Bhajana Mandiram which is at a distance of 210 meters from the dumpsite.
- No permanent or temporary loss of access to facilities, services, or natural resources during the sub project activity.
- There is no Loss of Land or livelihood due to the sub project activity.
- No rag pickers in the site and no ST community within 200ms.
- The site/location does not have any archaeological/historical importance
- There is a history of public protest and the site was closed in 2010 due to the protest.

### 2.2 Transect walk

To understand the social dynamics, demographic profile, livelihood patterns, social dynamics of the community and to understand the needs, concerns, and aspirations of the community, a transect walk was carried out on 02.02.2023, which was crucial for developing effective dumpsite remediation strategies that align with their priorities.

- A Scheduled Cast community Colony of 5 houses with 18 people belonging to Nalkattaya community was located and visited during the transect walk.
- A cracker storage store for wholesale was located. Its only for storage and wholesale of crackers. No production or retail sale is done there.
- A cashew factory is located beyond 200ms. The no. of employees varies from 120 to 150 based on season.
- Around 20 people living near the site, work in the cashew factory.
- 2 incidents of fire have reported in the site.

### 2.3 Key Informant Interview

A key informant interview was conducted with 5 persons. A predefined schedule was used to gather information. Open ended questions with sub questions were used to get maximum information and clarifications given. The interview was productive. The history and emergence of the dumpsite, people's protest, social and health issues and public views on the dumpsite were gathered as part of data collection. The major concerns and their expectations were delivered during the interview.

- The dumpsite was active from 1970 till 2010.
- The natives suffered lot of environmental and health issues when the site was active.
- There were several protests to close the dump site and as a result it was closed in 2010.
- 3 of the informants interviewed were suspicious about the future use of site.

### 2.4 Stakeholder Consultation

A Consultation Meeting was conducted on 10.11.2023, 10.30 am with the host community where around 50 people participated. There were 10 participants representing people living within 50ms. Employees of Civil Supplies warehouse and KSEB substation also participated which are the two major institutions within 50ms. Other participants were the tea shop owner, representation of SC colony, Kudumbsharee CDS, ADS, NHG representatives, local public etc. Three group discussions were carried out as part of identification of risks. Sri. PV Sureshkumar, (Environmental Expert) and Sri. Sreejith TM (Social Development Expert) of TSC explained about the bio mining process and its outcomes in detail.

- Group members concerned about foul smell, emission of gasses, dust during the bio-mining process.
- The group was suspicious about the reuse of remediated land again for waste management activities.
- They also suspected the further dumping of waste after the dumpsite remediation process.
- The group believes that the bio-mining would bring a positive impression and impact over the lives of local communities.
- The workers of Civil supply warehouse informed that about 10 -15 loads of food grains are handled by them in a single day.

- The demanded, the trucks coming with loads of food grains should not be stopped during the dumpsite remediation.
- The Necessary traffic arrangements may be made in this regard as the approach road is narrow by 4-meter width.
- KSEB staff also raised concern about the presence of foul smell & dust and chances of illness.
- Most of the households around use water connection. Open wells are not in used in many houses.

**Focus Group Discussion**

A focus group discussion was conducted on 10.11.2023 followed by the consultation meeting specifically for the SC colony residents. Twelve people from the colony participated in the FGD. The colony is located at a distance of 150ms. Sri.Suresh Kumar, Environmental Expert ,TSC Sri. Sreejith TM, Social Development Expert, TSC, moderated the discussion. The moderator explained about the proposed dump site remediation activities with a positive note on how the remediation activities are beneficial to the local community.

- The colony people belong to Nalkattaya community which is a Scheduled Cast.
- There are 5 houses in the colony with 18 people.
- Their mother tongue is Tulu.
- The participants asked questions regarding the process, duration, number of labors to be engaged at the time of operation and the type of machinery to be used.
- They believe that the lifelong negative image of the 'trenching ground' would get eliminated once the remediation is over.
- The participants were also concerned about the further usage of the land for dumping of waste even after the dumpsite remediation process got over.

## 2.5 Findings of Social Screening

Considering the facts and figures consolidated using social screening checklist and transect walk, the dumpsite is categorized as having a moderate social risk. The recent bio-mining conducted by the ULB at the dumpsite revealed no reported health issues, odor problems, or concerns about vehicle movements by stakeholders residing near the dumpsite. The dumpsite has sufficient road access through a side road, ensuring no disruption to public properties and commercial establishments near the site. There are no scheduled tribes, rag pickers, or other vulnerable

communities living near the dumpsite. Bio remediation activity required temporary installation of machineries, water supply system and separate toilets (if required). As the area has a high density of population with 100 households, 3 shops and 7 institutions within 200ms, the dumpsite can be categorized into "Substantial Risk".

| S.No | Social risks | Findings and Recommendations |
|---|---|---|
| 1 | Presence of 100 families, institutions, shops, establishments, and other public utilities near (200m) the dumpsite. | • Free movement of the residents needs to be ensured<br>• The livelihoods of the workers attached to these facilities should not be affected if the working hours of public utilities including shops and establishments are restricted, at any cost |
| 2 | Sound pollution, health issues and foul smell most affects 6 families residing very close to the site (50m). | SIA and SMP will consider the detailed impact and proper mitigation measures |
| 3 | Health risk of vulnerable groups residing near to the site (especially 6 families) which includes patients with breathing issues, pregnant women, children below the age of two and elderly above the age of seventy-five. | Health issues may aggravate during work operations.<br>These factors should strongly be considered especially for all vulnerable groups |

### 2.6 General Observations:

- The local residents are very supportive of the initial process of the proposed dump site remediation.
- All concerns related to the health care of the vulnerable communities residing near to the dumpsite need to be taken care of properly.

- Free movement of the residents needs to be considered while preparing the project. There should be adequate provision for necessary traffic regulations / arrangements to manage the movements of vehicles as well as machineries.
- The local residents requested an assurance from the municipal authorities that the remediated dumpsite should not be used for any kind of waste management activities.

### 2.7 Expected positive impacts on host community after remediation:

**Enhanced quality of life**

The remediation can restore the aesthetics of the area, reducing visual blights, foul odour and improving air and water quality. According to the opinion of people residing nearby the dumpsite, the project can contribute to an improved sense of well-being. Also it results to a clean and hygienic work environment for the workers engaged in MCF and RRF.

**Livelihood and employment of vulnerable community**

It is identified that no rag pickers are currently engaged in collecting waste from the dumpsite or making a living from it. Therefore, the proposed dumpsite rehabilitation project will have no impact on housing or livelihood of any rag pickers.

**Economic opportunities**

After remediating the site, the Municipality is planning to enhance the capacity of the MCF and RRF to process more non bio degradable waste and to set up a centralized waste management unit to process the bio degradable waste. These projects will create more job opportunities to the people who are looking for employment in waste management sector. Remediation creates new opportunities for economic development in the area. The cleaned-up land can potentially be used for new construction, commercial development, or recreational activities. Remediation process will help to increase property values for surrounding residents.

**Access to service**

It is observed that the project will not affect access to any facilities, services, or natural resources as there is enough space/land available in the existing site.

**Land availability**

The dumpsite is situated near the residential area. Living near a waste dump site can significantly impact the quality of life for residents. The removal of these sites can improve the aesthetics of the area and increase property values for surrounding residents.

## 3. Stakeholder Analysis

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| Service Providers | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like PCB,KSEB,KWA etc | To deliver necessary approvals and provide necessary services for remediation purpose |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | DPMU | Monitoring and Evaluation |
| 5 | TSC/PMC | Technical support and consultation |
| 6 | Contractor | Execution of the Remediation process |
| 7 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| Community | | |
| 8 | Members of 100 HHs in the 200 m radius of the dumpsite | Support and cooperation for the remediation process |
| 9 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |

| | | |
|---|---|---|
| 10 | Rag Pickers | Participation in informal collection to strengthen the collection process to prevent further dumping |
| 11 | Waste Generator in Municipality | Compliance with the rules and policies of the ULB related to waste management to avoid the formation of such dumping yards in future |
| 12 | Institutions, offices and shops near the site and the personnel involved | Cooperating with the remediation process |
| 13 | Scrap dealers | Informal participation in NBD waste management to prevent further dumping after remediation |
| 14 | End recyclers | Process the inert and legacy waste safely after remediation |

## 4. Required Action plans

All the social risks were identified through the social screening and Transect walk conducted at site. Since there are families and institutions in the close proximity of the dumpsite, below shown action plans have been formulated to be followed at site

- **Labour Management Plan**

Maximum of 15 labours are expected to be engaged in remediation process at a time. A detailed labour Management plan has been prepared and attached as Annexure.

- **Labour Influx Management Plan**

Since 27 families are residing in 200 m Households there are chances of influx issues. A detailed labour Influx Management plan has been prepared and attached as Annexure.

- **Preventive GBV Action plan**

Since an MCF, RRF and Bio waste processing units are functioning inside the dumpsite and close proximity to households there are high chance of occurrence GBV incidents. A detailed GBV action plan has been prepared and attached as Annexure.

- **Citizen Engagement Plan**

Being a socially sensitive area with past protest history, public protest might have happened during the execution period of the project. A detailed citizen engagement plan has been prepared and attached as Annexure.

The assessment of potential social risk during the remediation process and the identification from social screening with screening checklist, transect walk and focus group discussion indicates that there will not be any impact on the livelihood of the community and service providers.

It is identified that land acquisition is not required as sufficient land is available.

## 5. Conclusion

The report on Social Screening, Transect walk and Consultation Meeting covers a comprehensive analysis on existing conditions and potential social impacts that may arise during the remediation of the Kelugudde dumpsite in Kasargod Municipality. The vulnerabilities identified, the risks to be mitigated, observations and suggestions raised during screening and transect walk are elaborated in this report. The dumpsite has proper road access, thus there will not be any disruption to the public properties and commercial establishments nearby the site. The assessment of social screening indicates that the dumpsite remediation can create a positive impact in the living conditions of the host community. As the area has a high density of population with 100 households, 3 shops and 7 institutions within 200ms a strong community engagement need to be ensured at each step and so the dumpsite can be categorized into “Substantial Risk”.

# LABOUR MANAGEMENT PLAN

## 1. INTRODUCTION

### 1.1 PROJECT TITLE:

Project for the remediation of dumpsite at ward 4 owned by Kasargod Municipality

### 1.2 PROJECT AREA

The Dumpsite of Kasargod Municipality is situated in ward 4 of the municipality, covering an area of 1.16 acres.

## 2. SCOPE AND STRUCTURE OF THE LABOUR MANAGEMENT PLAN

The scope of the LMP shall be as outlined in the World Bank's ESMF. The engagement will be planned as an integral part of the project's social assessment and project design and implementation. This document has 10 chapters. This chapter viz., chapter 1 served as introduction. Scope and structure of LMP is provided in chapter 2. An overview of labour use in the project is presented in chapter 3. Key potential labour risks are listed in chapter 4. Legislative framework governing labour employment in India/Kerala is discussed in chapter 5. Implementation Arrangements, policies and procedures follow in the subsequent chapter. Grievance redressal mechanism, contractor management are presented in the last chapters.

## 3. OVERVIEW OF LABOUR USE ON THE PROJECT

### 3.1 Details of Labours

The proposed remediation process requires following category and number labors

| S. No | Manpower | Nos |
|---|---|---|
| 1 | Site In-charge/Head | 1 |
| 2 | Environmental Health & Safety Engineer | 3 |
| 3 | Security (3 X 8 Hrs) | 2 |
| 4 | Operations Supervisor & Accountant | 2 |

| | | |
|---|---|---|
| 5 | Machine Operator, Mechanic & Electrician | 2 |
| 6 | Labors for stone removal | 2 |
| 7 | Labors for spraying Bio culture | 4 |
| 8 | Labors near Screening machinery | 2 |
| 9 | Labors at Baling facility | 6 |
| 10 | Drivers for tipper trucks, excavators, backhoe loaders and tractors | 1 |
| | **Total** | **25** |

## 4. ASSESSMENT OF KEY POTENTIAL LABOUR RISKS

### 4.1 Project Activities:

The bioremediation of the dumpsite includes the following activities.

- Mobilization of plant and machinery for bio-mining
- Waste excavation and forming of windrow
- Spraying with inoculum and waste stabilization
- Waste segregation and refinement
- Sorting materials into recyclable, RDF, compost and inert
- Transport to the authorized recyclers and end users

### 4.2 Key Labour Risks

It is assessed that key labour risks would be associated with health and safety risks related to the construction activities such as exposure to physical hazards during construction activities such as: use of heavy equipment, exposure to noise and dust, falling objects, exposure to hazardous materials and exposure to electrical hazards from the use of tools and machinery, lack of proper sanitation facilities, availability of separate toilet for women workers. As the construction activities will involve hazardous work, persons under the age of 18 will not be employed by the Project. Many workers will be exposed to occupational health and safety hazards, primarily including but not limited to.

- Injuries/accidents/ fatalities leading to even death, while at work.

- Inadequate accommodation facilities at work force camps, including inadequate sanitation and health facilities.
- Non-payment of wages by Employer.
- Non-payment of benefits (compensation, bonus, maternity benefits etc.) by Employer
- Discrimination in Employment (e.g., abrupt termination from employment, working conditions, wages or benefits etc.)
- Engagement of child labour.
- Sexual harassment at work sites.
- Forced labour or trafficking.
- Security of women workforce.
- Inadequate facilities for pregnant women and lactating mothers.
- Inadequate facilities for the children of the workforce at workforce camp sites
- Possibility of Gender based violence as the work is mostly carried out within the premises of the existing facilities like MCFs/ RRFs etc where female SWM workers are engaged.
- Absence or inadequate or in accessible emergency response system for rescue of labour/workforce.
- Health risks of labour relating to HIV/AIDS and other sexually transmitted diseases.
- Unclear terms and conditions of employment.
- Discrimination and denial of equal opportunity in hiring and promotions/incentives/training opportunities.
- Denial for workers' rights to form workers organizations, etc.
- Absence of a grievance redressal mechanism for labour to seek redressal of their grievances/issues.

## 5. BRIEF OVERVIEW OF LABOUR LEGISLATION: TERMS AND CONDITIONS

| Sl No | Applicable Acts | Details |
|---|---|---|
| 1. | Employees Compensation Act 1923: | The Act provides for compensation in case of injury, disease or death arising out of and during employment |
| 2. | Contract Labour (Regulation & Abolition) Act 1970 | The Act provides for certain welfare measures to be provided by the Contractor to contract labour and in case the Contractor fails to provide, the same are required to be provided, by the Principal Employer by law. The Principal Employer is required to take Certificate of Registration and the Contractor is required to take license from the designated Officer. The Act is applicable to the establishments or Contractor of Principal Employer if they employ 20 or more contract labour. |

| | | |
|---|---|---|
| 3. | Minimum Wages Act 1948: | The Employer is supposed to pay not less than the Minimum Wages fixed by appropriate Government as per provisions of the Act if the employment is a scheduled employment. Construction of Buildings, Roads, Runways are scheduled employments. |
| 4. | Payment of Wages Act 1936: | It lays down the mode, manner and by what date the wages are to be paid, what deductions can be made from the wages of the workers. |
| 5. | Equal Remuneration Act 1976: | The Act provides for payment of equal wages for work of equal nature to male and female workers and for not making discrimination against Female employees in the matters of transfers, training, and promotions etc. |
| 6. | Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979: | The Act is applicable to an establishment which employs 5 or more inter-state migrant workmen through an intermediary (who has recruited workmen in one state for employment in the establishment situated in another state). The Inter-State migrant workmen, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home up to the establishment and back, etc. |
| 7. | Child Labour (Prohibition & Regulation) Act 1986: | The Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of Child Labour is prohibited in the Building and Construction Industry. |
| 8. | Employees State Insurance Act 1948: | The Act provides for certain benefits to insured employees and their families in case of sickness, maternity and disablement arising out of an employment injury. The Act applies to all employees in factories (as defined) or establishments which may be so notified by the appropriate Government. The Act provides for the setting up of an Employees' State Insurance Fund, which is to be administered by the Employees State Insurance Corporation. Contributions to the Fund are paid by the employer and the employee at rates as prescribed by the |

| | | |
|---|---|---|
| | | Central Government. The Act also provides for benefits to dependents of insured persons in case of death because of an employment injury. |
| 9. | Sexual Harassment of Women at the Workplace (Prevention, Prohibition and Redressal) Act, 2013: | This Act defines sexual harassment in the workplace, provides for an enquiry procedure in case of complaints and mandates the setting up of an Internal Complaints Committee or a Local Complaints Committee |
| 10. | Industrial Disputes Act 1947: | the Act lays down the machinery and procedure for resolution of Industrial disputes, in what situations, a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing the establishment. |
| 11. | Trade Unions Act 1926: | The Act lays down the procedure for registration of trade unions of workmen and employers. The Trade Unions registered under the Act have been given certain immunities from civil and criminal liabilities. |

## 6. RESPONSIBILITY MAPPING

The ULB (Urban Local Body) will award the proposed work to the contractor through competitive bids. The contractor will be responsible for hiring laborers for both civil and skilled work. In the recruitment process, the contractor is obligated to provide opportunities to members of the host community who possess the necessary skills and willingness to engage in the activities available at the dumpsite for remediation.

The contractor is required to adhere to existing labour laws in the state of Kerala while employing laborers, ensuring compliance with all applicable welfare measures mandated by the relevant labour legislation and rules. Additionally, the contractor is responsible for implementing measures to protect and assist vulnerable groups of workers, including individuals with

disabilities, migrant workers, and women workers. These protective measures should be explicitly outlined in the work agreement.

Furthermore, the contractor must prioritize occupational health and safety measures for the laborers. The ULB will actively monitor the contractor's compliance with legal and welfare requirements. The ULB will also organize training sessions for the workers and establish a forum at the ULB level to address any grievances raised by the workers.

It is a prerequisite for the contractor to possess a valid Labor License, and all laborers working on the site must be registered with the appropriate authorities. This comprehensive approach ensures the well-being and fair treatment of workers throughout the remediation project.

## 8. CODE OF CONDUCT

A code of conduct needs to be incorporated with the contract under the project. The contractor should conduct continuous awareness generation and training activities to ensure that the workers abide by the code of conduct. While preparing the code of conduct, following aspects should be ensured.

- Compliance with applicable laws, rules, and regulations of the jurisdiction
- Compliance with applicable health and safety requirements (including wearing prescribed personal protective equipment (PPE), preventing avoidable accidents and a duty to report conditions or practices that pose a safety hazard or threaten the environment)
- The use of illegal substances
- Non-Discrimination (for example based on family status, ethnicity, race, gender, religion, language, marital status, birth, age, disability, or political conviction)
- Interactions with community members (for example to convey an attitude of respect and non-discrimination)
- Sexual harassment (for example to prohibit use of language or behavior, towards women or children, that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate)
- Violence or exploitation (for example the prohibition of the exchange of money, employment, goods, or services for sex, including sexual favors or other forms of humiliating, degrading or exploitative behavior)
- Protection of children (including prohibitions against abuse, defilement, or otherwise unacceptable behavior with children, limiting interactions with children, and ensuring their safety in project areas)

- Sanitation requirements (for example, to ensure workers use specified sanitary facilities provided by their employer and not open areas)
- Avoidance of conflicts of interest (such that benefits, contracts, or employment, or any sort of preferential treatment or favors, are not provided to any person with whom there is a financial, family, or personal connection)
- Respecting reasonable work instructions (including regarding environmental and social norms)
- Protection and proper use of property (for example, to prohibit theft, carelessness, or waste)
- Duty to report violations of this Code
- No retaliation against workers who report violations of the Code, if that report is made in good faith.

## 9. SYSTEMATIZING THE CODE OF CONDUCT

Awareness raising: The Contractor is required to conduct ongoing awareness-raising and training activities to ensure that workers consistently adhere to the Code of Conduct. Additionally, the Contractor must take measures to ensure that local communities are well-informed about the Code of Conduct, enabling them to report any concerns or instances of non-compliance. This proactive approach aims to foster a shared understanding of ethical standards and accountability within both the workforce and the surrounding communities.

## 10. TRANSPARENCY IN CONTRACT SPECIFIC TERMS AND CONDITIONS

All contracts must contain

- Wages: Specific wages and payment modality, timeline
- Working Hours: hours of work, maximum number of hours that can be worked on the project, overtime, compensation
- Leaves: rest per week, annual leave, maternity leave, sick leave
- Benefits: medical treatments in case of accidents or otherwise
- Notice of termination of employment and details of severance payments in a timely manner
- Collective agreements that apply to the project, other specific terms, and conditions
- Details of the grievance redressal mechanism.

## LABOUR MANAGEMENT PLAN MATRIX

| Activities | Target | Timeline | Means of verification | Responsibility |
|---|---|---|---|---|
| To complete the registration by the Principal Employer, the ULB, as per the provisions of the Contract Labour (Regulation & Abolition) Act 1970 (CL Act), Inter-State Migrant workmen's (Regulation of Employment & Conditions of Service) Act 1979 (ISML Act) and The Building and Other Construction Workers (Regulation of Employment and Conditions of Service) Act 1996 (BOCW Act) and procure certificate to that effect. | 3 Registration Certificates to be procured by the ULB under CL Act, ISML Act and BOCW Act respectively.<br><br>3 registrations of ULB secretaries | Before Awarding works | Registration Certificate issued by District Labour Officer under CL Act, ISML Act and BOCW Act | ULB |

| | | | | |
|---|---|---|---|---|
| To Procure license under CL Act, ISML Act and registration under BOCW Act by the contractor | The contractor must take the licenses.<br><br>2 Licenses and One registration under CL Act, ISML Act and BOCW Act respectively. | Before commencing the work at site | License and registration certificate issued by the competent Authority. | Contractor |
| To procure Workmen Compensation insurance policy proportionate to the number of labour force deployed. (By the Contractor) | One insurance policy. | Before commencing work at site | Copy of insurance policy | Contractor |
| To display a copy of the certificate of registration at the conspicuous place at the premises where the building and other construction work is being carried on. | One notice board | As soon as the work is started. | Photographs of the notice board where the license is displayed. | Contractor |

| | | | | |
|---|---|---|---|---|
| To establish a labour information signboard at camp site by including following details like, date of payment of wages, working hours, holidays, wages rates for different categories of labours and name and contact details of local labour inspector and his/ her office and emergency contact numbers. | One notice board | Do | do | |
| To conduct pre- employment medical examination (as per the provisions of BOCW Act)- to ensure medical fitness of the employee. | All workers must be examined | No of workers employed by the contractor | Pre-Medical Examination certificate issues as per Rule 223(C) of BOCW Act (Form No. IX) by the Registered Medical Practitioner. | Contractor |
| To conduct Periodical Medical Check-ups (once in every six months) | All workers must be examined. | No of workers employed by the contractor | Medical Examination certificate issued by a registered medical practitioner. | Contractor |

| | | | | |
|---|---|---|---|---|
| To provide safe drinking water- the contractor must provide safe drinking water at worksite as well as camp site* (Guideline is provided along with this document) | As per requirement | During the entire contact period | Photographs of supply of potable water, Bill of water purchase. | Contractor |
| To arrange first Aid facility at work site as well as camp site (Specifications and items to be maintained in the box is mentioned in this document) | As per requirement | During the entire contract period | First Aid Register, Bill of purchase, photographs of First Aid kit | Contractor |
| To arrange separate First Aid room at work site | Allot one specified room( according to the nature of work) | To be made available during the construction period | Photographs of the facility | Contractor |
| To provide first Aid training to selected labourers or staff members through an authorized agency. | One training with authorized agency | Within one month of commencement of the work | Training records & Photographs | Contractor |

| | | | | |
|---|---|---|---|---|
| To establish linkage with local hospitals/ health care institutions for emergency medical assistance | Tie up with at least one hospital | Within one month of the commencement of the work | Letters issued by the hospital or correspondence and agreement with the hospital. | Contractor |
| To establish rest room at work site or camp site | ( according to the nature of work) | Before the commencement of the work | Photographs of the rest room | Contractor |
| To establish Canteen facility for labours if the contractor engages more than 250 labours | ( according to the nature of work) | Before the commencement of the work | Photographs of the facility, canteen register etc | Contractor |
| To maintain essential registers and records like Form A (Registration of employees), Attendance Register, Wages Register, and other registers like incidents registers including Accident register, Harassment complaints, recovery register, Maternity leave, Termination etc | | As and when the work starts | Copy of registers. | Contractor |

| | | | | |
|---|---|---|---|---|
| Constitute GRC for labours (maximum members to be six. Number of members from employer and employee to be equal. Female members should be minimum 50%. ) | Project grievance mechanism can be used | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | ULB |
| Constitution of ICC (minimum members to be four. The presiding member should be a senior female employee) | Constitution of ICC | As and when work starts | Copy of register and minutes of meeting. Complaint box etc | ULB |
| To publish the abstract of labour laws within the premises of the labour camp.<br>1. The Payment of Wages Act<br>2. The Employee compensation Act<br>3. The Building and Other Construction Workers (RECS) Act<br>4. The Contract Labour (A&R) Act | Abstract of Six acts | As and when the camp is established | Photos of the notices published. | Contractor |

| | | | | |
|---|---|---|---|---|
| 5. The Child and Adolescent Labour (P&R) Act<br>6. The Maternity Benefit Act | | | | |
| To establish code of conduct and provide induction trainings | | As and when new employees are joined | Training reports and other documents | Contractor |
| Conduct HIV/AIDS awareness programs | As per requirement | Once in six months | Reports, photographs etc | Contractor |
| All the Drivers should possess effective and valid Driving License | Drivers should be selected after verification of DL | As and when drivers are appointed | Photocopy of license ids to be collected | PIU |
| All the vehicles involved in the project shall be insured to cover the third-party risk | Vehicle must be allowed to be plied in the project only after procurement of third-party insurance to the vehicle | As and when vehicles are plied in the project | Photocopy of insurance is to be collected | PIU |

## CITIZEN ENGAGEMENT PLAN

### 1. Stakeholder identification

As part of social safeguard initiatives for the Bioremediation of dumpsite at Kasargod, the social experts of TSC, DPMC and DPMU conducted brainstorming exercises with locals and functionaries of Kasargod Municipality. A detailed list of primary and secondary stakeholders is prepared on the basis of these exercises.

#### 1.1 Waste Generators

The dumpsite is located in Kelugudde specifically in Ward 4 . It covers an area of 1.16 acres.

| Sl.No | Waste Generators | Nos |
|---|---|---|
| 1 | General Households | 100 |
| 2 | Shops | 3 |
| 3 | Institutions | 7 |

Table 5: Waste Generators

#### 1.2 Service Providers

The identified service providers of the dumpsite are as follows:

| SL No | Stakeholders | Roles of the stakeholders w.r.t remediation process |
|---|---|---|
| Service Providers | | |
| 1 | ULB Council | Providing ground support to the remediation process |
| 2 | Govt institutions like District administration and line departments, PCB,KSEB,KWA, | To deliver necessary approvals and provide necessary services. |

| | | |
|---|---|---|
| | Fire&Safety, Police and Geology Dept. | |
| 3 | ULB Officials | Support and Monitoring of the process |
| 4 | Contractor | Execution of the Remediation process |
| 5 | Service providers/HKS | Proper collection and waste segregation to prevent further dumping after remediation |
| 6 | Labours of contractor/Agency at site | Execution of work by strictly following Labour Management plan and Preventive GBV Action plan |

## 2. Need of the plan

Citizen engagement as part of the proposed bioremediation of the Kelugude dumpsite in Kasargod municipality aims to facilitate two-way communication between the project and its stakeholders in order to make better informed decisions. Such an engagement will certainly pave the way for better implementation of the project, and it will ensure public participation in trouble shooting at all the stages of the implementation of the project.

## 3. Objective of the plan

The citizen engagement plan for the proposed dump site remediation is prepared with following objectives;

- To create a conducive environment for the smooth implementation of the proposed bioremediation of the dumpsite by promoting constructive dialogues between the project and its stakeholders.
- To ensure stakeholder participation in the planning, implementation, and monitoring of the sub-project.
- To suggest appropriate activities with a monitoring plan and an expected budget for engaging the stakeholders with the motive of enhancing their ownership in the project through increased participation.

## 4. Stakeholder concern

### 4.1 Waste Generators

- Concerns on foul smell, dust, noise and leachate during the remediation process.
- Concerns on community health impacts during the remediation process.

- Concerns related to the further usage of the dumpsite for waste dumping purposes.

**4.2 Service Providers**

Major concerns of the service providers which has to be addressed by the citizen's engagement plan can be summarized as follows.

- Lack of proper awareness on the remediation activities.

**5. Activities proposed**

**5.1 Community/citizen Awareness**

- Sensitization of host community
- Periodic FGD to assess the community concerns on remediation activities.
- Sensitization programs to nearby institutions
- Formation of GRM committee
- IEC display board on remediation process and merits.

**5.2 Awareness to Service providers**

- Sensitization on the bio-remediation activity for the elected representatives and officials prior to the commencement of the bioremediation process.
- Meeting with Contractor to understand their plan of operations/No labors involvement/timeline etc.
- Sensitization meetings to the district administration, line departments, PCB, KSEB, KWA, Fire & Safety, Police and Geology Dept.

**6. Citizen Engagement Plan**

| S. No | Engagement Challenge | Impacts on Community/Citizen | Proposed activities | Implementing Responsibility |
|---|---|---|---|---|
| 1 | Lack of Awareness on Project activities | Non co-operation of Community/stakeholders | Awareness campaigns /IEC material/ sensitization programs to the stakeholders | Contractor |

| | | | | |
|---|---|---|---|---|
| 2 | Delay in decision making and timely support from the ULB | To establish transparency and building confidence in the project commitments to ULB elected members and officials | Sensitization on the bio-remediation activity for the elected representatives and officials prior to the commencement. | Contractor |
| 3 | Lack of proper GRM system | Delay in the execution of remediation work | Constitution of GRM Committee to take-up social issues raised at site level | Contractor |
| 4 | Lack of conducive environment for bioremediation activity | Delay in the execution of remediation work | Sensitisation meetings to various departments | Contractor |

**7.Monitoring Plan**

| S. No | Activity | Means of Communications | Monitoring Indicator | Monitoring Responsibility |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activities for the Municipal Council and officials | Presentation and group discussion | No of councilors and officials attended | TSC |

| | | | | |
|---|---|---|---|---|
| 2 | Sensitization meeting to host community | Presentation and group discussion | No of persons attended. | TSC |
| 3 | Formation of GRM committee | Meeting and presentation | Office order/ proceedings | TSC |
| 4 | One to one meeting district administration, line departments, PCB, KSEB, KWA, Fire & Safety and Police | Presentation | No of one to one meeting conducted / no of officials attended | TSC |
| 6 | IEC display board | IEC boards | No of IEC developed and displayed | TSC |

**8.Budget**

| S. No | Activity | Specification | Quantity / events | Cost |
|---|---|---|---|---|
| 1 | Sensitization on the bio-remediation activities for the Municipal Council and officials prior to the commencement of the work | Half day Programme for Councilors and municipal officials | 1 | [redacted] |
| 2 | Sensitization meeting s and FGD with host community | Half day Programme by incorporating all host community members | 3 | [redacted] |
| 3 | Formation of GRM committee at local level to take up any issue | Committee formation | 1 | [redacted] |

| | | | | |
|---|---|---|---|---|
| | raised at site level and help to resolve an emergency. | | | |
| 4 | Meeting with Contractor to get an understanding of their plan of operations/No labors involvement/timeline etc. | One to one interaction | As required | [redacted] |
| 5 | Issue based one to one meeting district administration, line departments, PCB, KSEB, KWA, Fire & Safety, Police and Geology | One to one | As required | [redacted] |
| 6 | IEC display board for information dissemination | IEC display in the site | 1 | [redacted] |
| **Total** | | | | [redacted] |

| RISK | MITIGATION MEASURES | IMPLEMENTATION RESPONSIBILITY | MONITORING INDICATORS | MONITORING RESPONSIBILITY |

# SUMMARY

**INTRODUCTION:** Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio mining of multiple Legacy Waste Dumpsites in various districts. The selected dumpsite is Murukkumood which is located in Ward no 22 Kayamkulam municipality, Alappuzha District.

**RATIONALE FOR THE PROPOSED SUB-PROJECT:** Kayamkulam ULB proposes bio mining and bioremediation of the Murukkumood legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

**PROPOSED SUB-PROJECT DETAILS:** Kayamkulam dumpsite is located at a distance of 2.5 km from the centre of Kayamkulam town in western side and encompasses a total area of 1 acres of land. The geographical coordinates of the dumpsite are 9.173379° N & 76.521623° E. The volume of legacy waste to be remediated in the dumpsite is 10261.02 Cu.m. The legacy waste is presented about 1.2 m below and 3.3 m above the ground level respectively. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts.

**APPLICABLE NATIONAL, STATE LEGISLATIONS AND TECHNICAL GUIDELINES:** To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed.

**THE WORLD BANK SAFEGUARDS POLICIES, AND KSWMP ESMF**: The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are ensured.

**SUB-PROJECT SCREENING AND ITS CATEGORIZATION:** As per indicative categorization for dumpsite bio mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (1 acres) and waste spread (0.70 acres) and environmentally sensitive features around this subproject is individually considered as E2 and EIA is prepared accordingly.

**ENVIRONMENTAL BASELINE:** Physio graphically, Kayamkulam in and around topographical features falls under relatively flat and low lying areas which includes the paddy land. The favourable time for remediation is between October-2023 to March-2024 non-monsoon period. As per Wind rose, the predominant wind directions are blowing from West direction to East throughout the year. As per the geotechnical investigation, the subgrade soil was encountered at 1.2m below the waste depth of the dumpsite and the predominant soil is silty sand. The dumpsite is surrounded by predominantly of Dry cultivation land use and the same will act as odour attenuation during remediation. The cultural heritage zone near dumpsites is Krishnapuram Palace at a distance of 3.0 Km in SW direction. Hence, no significant physical impact to the heritages sites is envisaged during remediation. As per the district disaster management plan-2015 the site is not in the flood prone area.

**DESCRIPTION OF ENVIRONMENTAL PARAMETERS:** The analysed air pollution data indicates that the levels are within acceptable limits of NAAQs for all the parameters. The ambient Noise levels Leq are above the National Ambient Noise standards for Residential Area both day and night time. The noise levels are influenced by the population within the vicinity, within the dumpsite there is an MCF and RRF facility. the groundwater sample taken from the downstream side (Sample 2) is contaminated, while the other two samples are not contaminated and the dumpsite has not caused any major increase in the contamination of ground water. Similarly, the surface water sample shows Exceeding limits of BOD and COD limits, impacting water quality and aquatic ecosystems. High iron levels can lead to the formation of precipitates, affecting ecosystem health. Elevated color and turbidity can impact aquatic ecosystems by influencing sunlight penetration, affecting plant growth. Electrical conductivity levels suggest some dissolved ions but generally remain within acceptable ranges for agriculture and certain industrial processes. The leachate monitoring data indicates, TDS is about 5395 mg/l while the suspended solids is about 57mg/l respectively.

**ANALYSIS OF ALTERNATIVES:** After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

**ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS:** Environment: During operational phase (bio-remediation), the main potential nuisances caused by a dump site are fugitive dust, odour, foul gases, smoke from the site (in case of fire), and leachate generation. Birds, vermin, and rodents, littering, noises both from machineries operating at the site and waste collection vehicles. Social: No specific social risk is identified for initiating the remediation process except the occupational hazards to the workers engaged in the remediation process. It can be overcome by using adequate protective measures properly. In connection with the dumpsite three family is residing in an aerial distance of 15 m. Hence sensitivity of receptors will not affect much to the bio-remediation process of the dump site

and can be categorized as Medium Vulnerable receptor capacity to absorb proposed changes or/and moderate opportunities for mitigation.

**ENVIRONMENTAL MANAGEMENT AND MONITORING PLAN:** The management plan proposed are for pre-remediation as well as during remediation stage. The mitigation measures are recommended for impacts from air, noise, water, leachate, health and safety, OH&S aspects. The proposed monitoring plan includes leachate, surface and ground water monitoring for a period of once in three months. The cost of [redacted] is required for implementation and supervision of EMP.

**EMERGENCY PREPAREDNESS PLAN:** The identified emergency situations which may arise from remediation activities are fire risk in summer, occupational health and safety related risks. The Kayamkulam police station at 2.7 km, Kayamkulam Govt. Taluk hospital at 3.3 km, Kayamkulam Fire station at 3.8 km are the nearest emergency services. Periodic Compliance monitoring system will be done by the contractor during remediation.

**PUBLIC CONSULTATION AND INFORMATION DISCLOSURE: A** Transect walk was carried out on 22.02.2023 covering the surrounding area of the dump site. Effective IEC drive to be initiated to engage with the community to build support as the activity will create positive impact. Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the process at the site. Site control measures should be enforced to prevent unauthorized personnel into the work site.

***Note: All the references to Social Impact Assessment and Social Management Plan may be referred to Part B- Social Impact Assessment which is a separate document attached along with this document.***

# CHAPTER 1 INTRODUCTION

## 1.1 Project Background

The Government of Kerala (GoK) utilizes financial support from the World Bank and Asian Infrastructure Investment Bank (AIIB) for KSWMP which aims to strengthen the institutional and service delivery systems for Waste Management services in urban areas in Kerala. The project is jointly co-financed by the World Bank and AIIB (105m$ each). The AIIB has agreed to apply the environmental and social services of the World Bank described in Co-Financing Framework agreement and as agreed Project Co-Lenders Agreement. The project will improve SWM service delivery of all Urban Local Bodies (ULBs) in Kerala in addition to supporting the development of regional Biomedical Wastes (BMW), and Construction and Demolition (C&D) Waste Management facilities. The proposed geographical coverage for SWM at this stage includes all (93) ULBs. The identified ULBs for SWM constitute approximately 65 percent of the urban population (approximately 10 million people) spread across the 14 districts of the State; and the overall project influence area is the entire State for Regional SWM, Construction and Demolition (C&D) Wastes and Biomedical Wastes (BMW) management facilities.

Under Component 2 of the KSWMP Project, the Government of Kerala intends to undertake bio-mining of multiple Legacy Waste Dumpsites in various districts. There are 19 dumpsites identified for remediation under the Kerala Solid Waste Management Project. Several others have been taken up for remediation directly by the ULBs. Currently, 7 dumpsites considered within the three districts, which are (Ernakulum, Alappuzha and Idukki) falling under Package B are selected by Kerala Solid Waste Management Project (KSWMP) for remediation under the project. One of the selected dumpsite is Murukkumood is located near Ward no 22 Kayamkulam municipality, Ernakulum District.

## 1.2 The Rationale for the Proposed Sub-Project:

Murukkumood dumpsite in Kayamkulam ULB at ward no.22 has a total waste quantity of 10261.02 cum, spreading over 0.70 acres. The site is located between Lat - 9.173379° N and Long - 76.521623° E and has an elevation of MSL +25 (m), with a gentle slope towards the South West part. During the monsoon season, due to the geography of the site, runoff from waste flows toward the southwest side of the site, reaching the nullah situated 25 m to the south of the dumpsite. ULB proposes bio-mining and bioremediation of the Murukkumood legacy waste dumpsite site under KSWMP supported by the World Bank, for which the present Feasibility Report has been prepared. Considering the environmental and social impacts associated with legacy dumpsite bio-mining and bioremediation, it is proposed to undertake an Environmental Impact Assessment and Social Impact Assessment in line with the ESMF for KSWMP.

The proposed remediation of Murukkumood dumpsite, Kayamkulam Municipality Alappuzha District. The presence of these dumps encourages further dumping at these sites,

even though they are filled beyond capacity to take any more waste. The need for remediation of these dumpsites is directed by **NGT Order in OA 519/2019 dated 17/7/2019** on Remediation, the observation being the following,

## 1.3 Proposed Sub-Project Details

Murukkumood dumpsite is located at a distance of 2.5 km from the centre of Kayamkulam town in western side and encompasses an area of approximately 1 acre of land and waste spread over an area of 0.70 acres. The dumps site is not very far from human settlement. The coordinates of the dumpsite are 9.173379° N & 76.521623° E. It is located in ward no. 22 of the municipality. Kayamkulam municipality holds the ownership of the dumpsite. The highway is about 1.50 km from the dumpsite and the railway station is at a distance of 1320 m. North-eastern side of the dumpsite is vacant land. A small nallah flows North-eastern side of the dump site within the distance of 25 m. The exact date for start of the dumpsite was not available with municipality; however approximately it had started around 85 years ago, the information has been gathered during field visit.

Currently, the quantity of waste dumped at this site is about 10261.02 cum as estimated by the topo survey done as part of the pre-feasibility study conducted by KSMWP. As of now 70 % of the area is covered with solid waste. Average height of the waste heap is 3.30 m above and below 1.2m from the existing ground level. Hence bioremediation of the dumpsite is essential to mitigate the environmental impacts. Dumpsite reclamation involves excavation, screening, and separation of material from dumpsites into various components such as soil, recyclable materials, and residues.

## 1.4 Objectives and Scope of the EIA & SIA:

As per indicative categorization for dumpsite bio-mining and bioremediation, this subproject is categorized as E1. Considering the residual positive impacts of dumpsite remediation, small extent of the dumpsite (1 acre) and waste spread (0.70 acres) and absence of environmentally sensitive features around, this subproject is individually considered as E2, and EIA is prepared accordingly.

The EIA & SIA process involves the identification of the potential environmental issues in the project and trying to address them during design interventions. The EIA further carries out impact prediction and evaluation of residual environmental and social issues of a Project. It then goes on to outline the proposed mitigation measures for residual impacts and enhancement measures for positive impacts which the Project will implement.

## 1.5 Structure of the Report:

The Consolidated EIA & SIA report has been structured into the following Chapters:

- Introduction and Project Description.

- Policy, Legal and Administrative Framework presents a review of the existing Institutions and legislation relevant to the project at the National and the State levels;

- Environmental Assessment Methodology discusses sequence of tasks carried Out in preparing EIA;

- Existing Environmental Scenario presents a consolidated picture of the existing Environmental setting of the project;

- Assessment of Potential Impacts identifies and quantifies the potential impacts on each of the environmental components due to the proposed project development;

- Analysis of Alternatives discusses the criteria for analysis of alternatives of technology for remediation.

- Mitigation Measures presents an elaborate listing of the nature of impacts on each of the environmental components and the avoidance and mitigation measures suggested.

- Public Consultation details the stages and types of public consultations carried out during the project preparation stage and people's perceptions of the project benefits and the Potential impacts;

# CHAPTER 2 POLICY AND REGULATORY FRAMEWORK

## 2.1 Applicable National, State Legislations and Technical Guidelines

**National Environmental Rules and Regulations: -**

To understand the extent of the environmental and social assessment for the proposed sub-project works, applicable laws, legislation, and policies have been reviewed. A summary of environmental legislation/regulations relevant to project is furnished in the following **Table-2.1**.

Table 2.1 Summary of Environmental Legislation/ Regulations

| Sl. No. | Act / Rules | Purpose | Applicable (Yes / No) | Reason for Applicability | Authority |
|---|---|---|---|---|---|
| 1 | Environment Protection Act, 1986 | To protect and improve the overall environment. This is an umbrella Act. | Yes | As all environmental notifications, rules and schedules are issued under this act. | MoEF &CC, CPCB, SPCB |
| 2 | Solid Waste Management Rules, 2016 | To manage collection, transportation, Segregation, Treatment, and disposal of solid wastes (other than Hazardous waste, Plastic Waste, Bio Medical waste) | Yes | Dumpsite remediation/site raising | MoEF &CC, CPCB, SPCB |
| 3 | Air (Prevention and Control of Pollution) Act, 1981 | To control air pollution by controlling emission of air pollutants as per the prescribed standards. | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 21 of Air (Prevention and control of Pollution) Act 1981. | State Pollution Control Board, Kerala |
| 4 | Water Prevention and Control of Pollution) Act, 1974 | To control water pollution by controlling discharge of pollutants as per the prescribed standards. | No | No, Consent to Establish (CTE) and Consent to Operate (CTO) are required to be obtained from SPCB under section 25 of this Act. | State Pollution Control Board, Kerala |
| 5 | The Noise Pollution (Regulation and Control) Rules, 2000 & amendments | The standards for noise for day and night have been promulgated by the MoEF&CC for various activities. | Yes | This act will be applicable for all construction equipment deployed at worksite and in operation. | State Pollution Control Board, Kerala |
| 6 | Public Liability and Insurance Act, 1991 | Protection from accidents. | Yes | This act will be applicable for providing immediate relief to the persons affected by accident occurring during work. | State Pollution Control Board, Kerala |

| | | | | | |
|---|---|---|---|---|---|
| 7 | Central Motor Vehicle Act 1988 | To check vehicular air and noise pollution. | Yes | This rule will be applicable to vehicles deployed for construction activities and construction Machinery. | Motor Vehicle Department |
| 8 | The Plastic Waste Management Rules, 2016 | For the storage and disposal of plastic wastes through authorized vendors. | Yes | This act will be applicable for the storage and disposal of all the plastic wastes. | State Pollution Control Board, Kerala |
| Other applicable Rules | | | | | |
| 9 | Construction & Demolition Waste Management Rules, 2016 | | | | |
| 10 | Batteries (Management and Handling) Rules, 2001 | | | | |
| 11 | E-Waste (Management) Rules, 2016 | | | | |
| 12 | Kerala Municipality Act, 1994 & Rules | | | | |
| 13 | Hazardous & Other Wastes (Management And Transboundary Movement) Rules, 2016 | | | | |
| 14 | Bio-medical Waste (Management & Handling) Rules, 1998 | | | | |

**Applicable Social and Other Legislation**

**Other Legislations applicable to Construction activities under the project**

- Workmen's Compensation Act 1923 (the Act provides for compensation in case of injury by accident arising out of and during the course of employment);
- Payment of Gratuity Act, 1972 (gratuity is payable to an employee under the Act on satisfaction of certain conditions on separation if an employee has completed 5 years);
- Employees PF and Miscellaneous Provision Act 1952 (the Act provides for monthly contributions by the employer plus workers);
- Maternity Benefit Act, 1951 (the Act provides for leave and some other benefits to women employees in case of confinement or miscarriage, etc.);
- The Sexual Harassment of Women at Workplace (Prevention, Prohibition and Redressal) Act, 2013 is introduced to prevent and provide redressal of complaints of sexual harassment.
- The Protection of Women from Domestic Violence Act, 2005 defines domestic violence, describes the powers and duties of protection officers, service providers and lists the procedures for obtaining reliefs.
- Contract Labor (Regulation and Abolition) Act, 1970 (the Act provides for certain welfare measures to be provided by the contractor to contract labour);
- Minimum Wages Act, 1948 (the employer is supposed to pay not less than the Minimum Wages fixed by the Government as per provisions of the Act);
- Payment of Wages Act, 1936 (it lays down as to by what date the wages are to be paid, when it will be paid and what deductions can be made from the wages of the workers);
- Equal Remuneration Act, 1979 (the Act provides for payment of equal wages for work of equal nature to Male and Female workers and not for making discrimination against Female employees);

- Payment of Bonus Act, 1965 (the Act provides for payments of annual bonus subject to a minimum of 83.3% of wages and maximum of 20% of wages);
- Industrial Disputes Act, 1947 (the Act lays down the machinery and procedure for resolution of industrial disputes, in what situations a strike or lock-out becomes illegal and what are the requirements for laying off or retrenching the employees or closing down the establishment);
- Industrial Employment (Standing Orders) Act; 1946 (the Act provides for laying down rules governing the conditions of employment);
- Trade Unions Act, 1926 (the Act lays down the procedure for registration of trade unions of workers and employers. The trade unions registered under the Act have been given certain immunities from civil and criminal liabilities);
- Child Labour (Prohibition and Regulation) Act, 1986 (the Act prohibits employment of children below 14 years of age in certain occupations and processes and provides for regulation of employment of children in all other occupations and processes. Employment of child labour is prohibited in Building and Construction Industry);
- Inter-State Migrant Workmen's (Regulation of Employment and Conditions of Service) Act, 1979 (the inter-state migrant workers, in an establishment to which this Act becomes applicable, are required to be provided certain facilities such as housing, medical aid, travelling expenses from home to the establishment and back, etc.);
- The Building and Other Construction Workers Act (BOCW), 1996 is a social welfare legislation that aims to benefit workers engaged in building and Other Constructions Works.

## 2.2 The World Bank Safeguards Policies, and KSWMP ESMF

The World Bank policies and directives on environmental and social safeguards have been adhered to the proposed dump site remediation. The applicability of the relevant policies of the dumpsite remediation that are undergoing remediation are summarized in the following table.

**Environmental Codes of Practices (ECoP):** The ECoPs provide guidelines for environmental management of biomining and bioremediation activities which are seen to be of limited extent of impacts/risk, temporary and reversible, and readily managed with good practices during the implementation. The following key points should be considered.

**Key Points of ECop to be considered:**

- The bio-mining activities and preparatory activities shall follow the "Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste)" published by CPCB in February 2019.

- Bio-mining methods include Tractor Tiller, Trench method, Cone Method, windrow, Thin Layer Method, etc. More appropriate may be the Cone method for legacy waste and window for relatively fresh waste.

- Leachate channelization and treatment facility shall be set up before starting the bio-mining works. Works shall take place only during the non-monsoon period; and there shall be suitable precautions to prevent any rainwater disturbing the operations (like seasonal unexpected rains, storm water, runoffs from other sources).

- Ballistic separator and trommel may be used for screening. Screened fractions into which waste is segregated include RDF, inert, Compost, and C&D wastes.

**Applicable World Bank Operational policies**

OP 4.01 Environmental Assessment Help to ensure the environmental and social soundness and sustainability of investment projects. Support integration of environmental and social aspects of projects in the decision-making process

OP 4.04 Natural Habitats Promote environmentally sustainable development by supporting the protection, conservation, maintenance, and rehabilitation of natural habitats and their functions.

OP 4.09 Pest Management includes training to prevent risk to human beings or animals from Bio-culture, enzymes, insecticides and such formulations used for remediation.

OP 4.11 Physical Cultural Resources (PCR) includes resources of archaeological, paleontological, historical, architectural, religious (including graveyards and burial sites), aesthetic, or other cultural significance. Assist in preserving PCR and in avoiding their destruction or damage. PCR

WB General EHS Guidelines Recommendations of these guidelines would be incorporated in the ESMP and Bidding document for this sub-project.

The Environmental Management Framework (EMF) has been prepared to assist in the screening, assessment, and management of environmental risks of all solid waste management projects at an early stage during the planning and integration, mitigation hierarchy during the subproject design, implementation, and operation. The framework helps provide specific guidance on the policies and procedures to be followed for environmental assessment along with the roles and responsibilities of the implementing agencies.

# CHAPTER 3 ENVIRONMENTAL AND SOCIAL BASELINE

## 3.1 Project Location of the site

Murukkumood dumpsite is located at a distance of 2.5 km from the center of Kayamkulam town in western side and encompasses a total area of approximately 1 acres of land. Out of this, 0.70 acres of land is covered with solid waste. The coordinates of the dumpsite are 9.173379° N and 76.521623° E. It is located in ward no. 22 of the municipality. Kayamkulam Punaloor road is at a distance of 340m from the dumpsite from north-western directions. In the surrounding area of the dumpsite around 25 Households are residing within 100m radius. The railway station is at a distance of 1320m. North-eastern side of the dumpsite is vacant land. A small nallah flows North-eastern side of the dump site within the distance of 25 m. Govt Homeo & Ayurvedic Hospital-558m, Kandalasseril Temple-162m, Holy Trinity school-518m away from the project location. The google map image showing the location of Murukkumood dumpsite is shown below in **Figure: 3.1.**

*Figure 3.1 Murukkumood Dumpsite Location Map*

## 3.2 Methodology for Environmental Baseline Studies

The baseline appraisal should consider all aspects of the environment that may be altered by the proposed project. These can be categorized as physical, biological or socioeconomic attributes. The baseline should be based upon the findings of the screening and scoping studies. Surface water and sediments, groundwater, air quality, noise, soils and land use Biodiversity Socio-economic (social), cultural heritage, traffic and transport Physical Biological Socio-economic. The scope of the baseline study, including attributes that will be appraised, and the geographical extent of the analysis, will typically have been agreed with the relevant decision makers as an outcome of the scoping phase. It is important to re-emphasize that the scope (and detail) of the baseline study should be commensurate with the size and scale of the project and hence the potential changes that the project may have upon the environment and society. The baseline study will typically be developed in three stages:

**Desktop study:** Office-based exercise during which readily available existing information (i.e. that can be used to describe the existing environment) is collected and reviewed to ensure its appropriateness for use within the EIA & SIA;

**Field study:** The stage within which additional data is captured in the field, with the intent of addressing any gaps that have been identified in the existing knowledge base; and

**Reporting stage**: Collation of the captured information into the baseline report.

The below table indicates the environmental attributes and location of monitoring.

*Table 3. 1 Environmental Attributes*

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 1 | Air sampling (2 Locations) | Sulphur dioxide SO2, Nitrogen Dioxide NO2, Particulate Matters 2.5, Particulate Matters 10, Ozone, Lead Pb, Carbon Monoxide (Co), Ammonia (NH3), Benzene(C6H6), Benzo pyrene (BaP), Arsenic (As), Nickel (Ni) for 24 hrs | The sample locations (2 Nos) were taken within the dumpsite in North and South – East side. | As per the windrose, Prominent wind is in West and WSW. However, during an on-site observation, soil particles held in hand were noted to be carried in the air, revealing that the actual wind flow at the site occurs from the north to the southeast direction. |
| 2 | Noise (1 Location) | Ambient Noise level [E(P)] for 24 hours | At the Entrance of the dumpsite. | Most vulnerable point in the site in regards of Noise |

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | | | quality is due to entry and exit of the waste loading and unloading vehicle. Please note that the site is devoid of proximity to any sensitive receptors within a 200 m radial circle . |
| 3 | Surface water (1 Location) | pH, colour, EC, Turbidity, SS, TDS, TOC, DO, BOD, COD, Heavy metals (such as (Pb, Cd, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness, Ecoli and Total coliforms (IS 10500-2012). | A nearby nullah is taken for water quality monitoring which is at a distance of 179m from the dumpsite in the North East direction. | Surface water sample was collected from one locations ie near the periphery of the dumpsite during monsoon period (July 2023). The nullah is at a distance of 25m and it is not using for any drinking purpose. |
| 4 | Ground water<br><br>(3 Locations) | Ph, colour, EC, Turbidity, SS, TDS, TOC, COD, Heavy metals (such as Pb, Cd, Cu, Zn, Cr, Hg, Ni), Fe, C/N, F, As and Mn, Cl, NO3, SO4, Total Alkalinity, Total hardness and Total Pesticides, Ecoli and Total coliform (IS 10500-2012). | GW1:Groundwater sampling location at a distance of 400m from the dumpsite in the North West direction.<br>GW2:Groundwater sampling location at a distance of 470m from the dumpsite in the South East direction<br>GW3:Groundwater sampling location at a distance of 60m from the dumpsite in the South East direction. | The results indicate that the groundwater sample taken from the downstream side (GW2) is contaminated, while the other two samples are not contaminated and the dumpsite has not caused any major increase in the contamination of ground water. |

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| 5 | Bore Hole (1 location) | Permeability test-1No/2 hectares (as per CPHEEO Manual) standard penetration test SPT and collection of UDS-Soil investigation – classification, gradation, Atterberg limit, Bulk density, Dry density, water content, cohesion, angle of internal friction, Proctor density, Optimum moisture content, coeff of permeability, Strength compressibility (vertically-3 samples per borehole). | Centre of the dumpsite | Volume of legacy wastes were found to be higher in the center part of the dumpsite during investigation. So the bore hole test was performed in the center. |
| 6 | Waste & Environmental Analysis | Leachate Analysis (TCLP USEPA 1311) (schedule II of SWM,2016), Suspended solids, Dissolved solids(inorganic) Ph, Ammonical nitrogen (asN), TKN (as N), BOD, COD, Arsenic (as As), Mercury, Lead, cadmium, copper, Zinc, Nickel, Cyanide, Chloride, Fluoride, Phenolic compounds. | Northern side of the dumpsite. | The data indicates that the TDS is about 5395 mg/l while the suspended solids is about 57mg/l. The chlorides are high at 1429 mg/l. The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from the waste. |
| | | Physical Analysis of waste (As per CPHEEO Manual) including Density, Bulk Density, Moisture content, size of waste constituents. | Within the dumpsite at 2 locations. | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. So the two locations were |

| Sl. No | Description | Parameters Tested | Sampling location | Justification |
|---|---|---|---|---|
| | | | | considered for sampling. |
| | | Chemical Analysis of waste soil for heavy metals, pH, Nitrogen, Phosphorus and Potassium (N-P-K), Total carbon, C/N ratio, calorific value, Bio-chemical and Biodegradable factor | 1sampling location | The legacy waste was found to be older and no access to the vehicular movement, when compared to other parts of the dumpsite. |

## 3.3 Environmental Audit of the Existing Facilities

There are functional MCF and RRF for dry waste within the Murukkumood dumpsite.

There are MCF and RRF within the dumpsite, which are not supported under KSWMP under this subproject. However, an environmental audit of the facility is important as this may be used as an associated facility to which some recyclables may be channelized to and is situated at the same site and might be impacted during the bio-mining activities.

*Table 3. 2 Environmental Audit of Existing facilities*

| Sl. No. | Aspects | Remarks |
|---|---|---|
| 1 | Structural Characteristics | **1. MCF**<br>Area - approx. 56 (in Sq. m)<br>Buffer/setback around the MCF – 3 ft<br>Distance from waste pile of dumpsite- 2 m.<br>Proposed in Year 1 Track 1 proposal for maintenance.<br>Doors & windows: Not Available, dust emission and odor can impact the MCF facility.<br>**2. RCF**<br>Area - approx. 28 (in Sq. m)<br>Buffer/setback around the RRF – 3 ft<br>Distance from waste pile of dumpsite- 2 m.<br>Proposed in Year 1 Track 1 proposal for maintenance.<br>Doors & windows: Not Available, dust emission and odor can impact the MCF facility. |
| 2 | Functional Characteristics | Activities in the MCF, RRF: Functional<br>Materials and condition of stacking: NIL<br>Activities spilling out onto the dumpsite: Yes |

| | | |
|---|---|---|
| | | Access: Common access for MCF, RRF & Dumpsite. All are in the same premises.<br>Total No: of workers – 34 |
| 3 | Facilities | Parking area- NIL<br>Loading/unloading Area- NIL<br>Storage room & area: Yes<br>Worker snack/rest areas: Yes<br>Worker / other washrooms & sewerage: Yes<br>Water supply for Cleaning, Washroom: Yes<br>Greenbelt: NIL |

## 3.4 Physiography and Climate

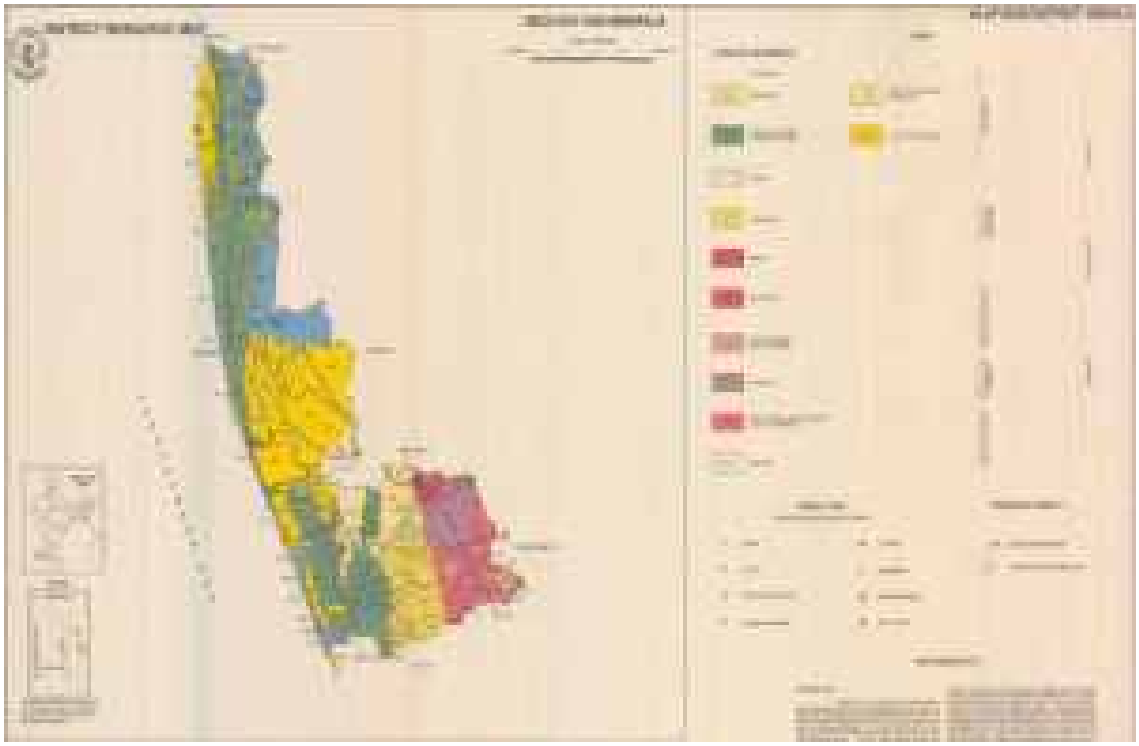
### Physiography

The land in and around the dumpsite is relatively flat and low lying areas which includes the paddy land.

### Climate

Kayamkulam is a coastal town located in the Alappuzha district of the Indian state of Kerala. It experiences a tropical climate characterized by high humidity, warm temperatures, and significant rainfall. As per Climate-Data.org, the mean yearly temperature observed in Kayamkulam is recorded to be 26.4 °C. The month of August registers the most frigid temperatures throughout the year, with an average low temperature of 25.4 °C. The month of maximum warmth in a year is March, during this period the temperature reaches up to 28.0 °C. The highest amount of precipitation occurs during the month of June, with an average quantity reaching up to 435 mm. So, the favorable time for remediation is between October-2023 to March-2024 non-monsoon period. As per wind rose diagram, the most predominant wind directions are blowing from West and WSW direction. The wind rose diagram for Alappuzha is shown in **Figure: 3.2**.

*Figure 3.2 Wind rose diagram*



## 3.5 Hydrology, Hydrogeology, and Soil

### Hydrogeology

The project site is surrounded by the community. From monitoring wells dispersed across the state, the depth to water level is observed in the months of April, August, November, and January in 2021–2022. According to information published by the CGWB, the Government of India, the water level in Kayamkulam, fluctuates from 2-5 mbgl in the year 2021–2022. (Source: Annual Report 2021-2022, CGWB)

### Geology

The geology comprises the formations and structures existing in the area. Kayamkulam town is in the midland region. The topography of the project location is almost flat. Vegetable cultivation is being carried out adjacent to the location. This type of land is well suitable for food grain crops. The geology map of Alappuzha District is shown in **Figure: 3.3.**

*Source https //dmg.kerala.gov.in/wp-content/uploads/2020/01/dsr_ala.pdf*

*Figure 3.3 Geology Map of Alappuzha District*

### Soil

As per the geotechnical investigation, the soil was encountered at 1.20 m below the waste depth of the dumpsite and the predominant soil is silty sand. The detailed geotechnical investigation report is enclosure in the FR.

## 3.6 Land Use & Land Cover

The land use survey of 2010 revealed that the predominant land use of Kayamkulam Municipality is residential. 67.55% of the total area is under residential use. Existing land use analysis shows following breakups as shown in table. The details of analysis of the land use survey and the resultant findings of existing land use are given hereunder. The glaring aspect of existing land use of Kayamkulam municipality is blessed with potential resources such as agriculture land and water bodies.

The highest percent of land use falls under the category residential/agricultural mix, which include mainly dry agriculture lands where residential developments are co- existent. Cashew and rice is the principal crop followed by coconut, Banana, Pulses.

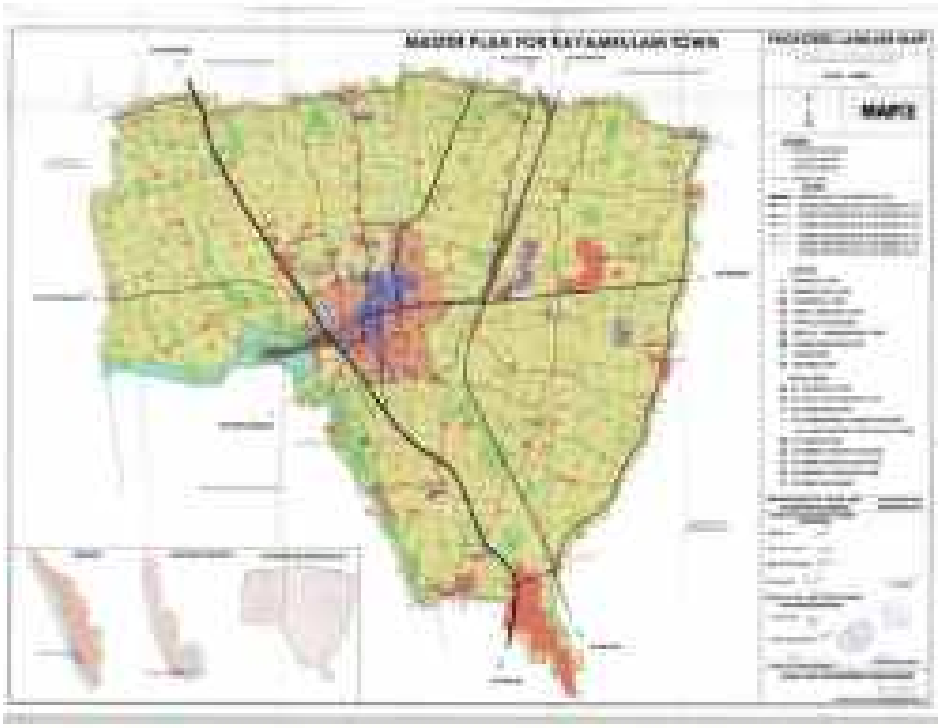


*Figure 3. 4 Landuse and Landcover Mao of Kayamkulam Municipality*

## 3.7 Cultural Heritage

The Krishnapuram Palace, built in the 18th century, now functions as a museum. Constructed in typical Kerala-style architecture, it has the largest mural painting in Kerala. The palace museum houses the Kayamkulam double-edged sword. Pathiramanal the picturesque island of vembanad lake is the first local biodiversity heritage in Alappuzha

## 3.8 Ecology and Biodiversity

The wild faunal species present are, mainly dogs, rodents and flies are seen near dumpsite. Also, crow, egrets, and other birds are seen feeding on the wastes. The flora species are shrubs, trees

The soil in the region is high with annual rainfall, this will result in good vegetative cover. During the visits to the site, there were no birds noticed in the dumpsite area. However, as the bio mining process will proceed, it is expected that the site will attract several types of birds that will come to the site to look for food**.** Due to the sandy nature of soil the coconut palm trees can see near to the site and the paddy crops.

## 3.9 Traffic Assessment

The proposed development will attract and generate the additional trips as an add-on to the existing traffic during its remediation period. In order to analyze the traffic conditions during the remediation and throughout the project lifespan, a traffic impact assessment is performed. The traffic impact assessment (TIA) is a technical analysis of traffic problems and issues relating to the specific development. The chief objective of the TIA is to identify whether a particular development project will have an impact on the safety and efficiency of adjacent roads.

The Dumpsite is at an aerial distance of 340m from the Kayamkulam - Punaloor PWD road. And there are two entrance in which the heavy vehicles can enter the premises. The approach roads to the dumpsite are municipality roads and the width of the roads are 5m. During the bio-mining process the following concepts to be incorporated.

1. It should be imperative that the ingress and egress points are staffed all the time to facilitate smooth traffic movement.

2. To provide adequate parking provision within the site premises during the construction phase for staff as well as visitors.

3. To schedule heavy vehicles to flow on the road during non-peak traffic hours to avoid congestions.

4. Traffic signage within the premises to be maintained, wherever required.

## 3.10 Natural Disasters

The area where the dumpsite is situated has a history of being prone to flooding, as observed in 2018 flood. The Murukkumood dumpsite is marked in the flood prone KML file which is shown in the **Figure 3.6** shown below. But as per the disaster management plan the site is not in the flood prone area.

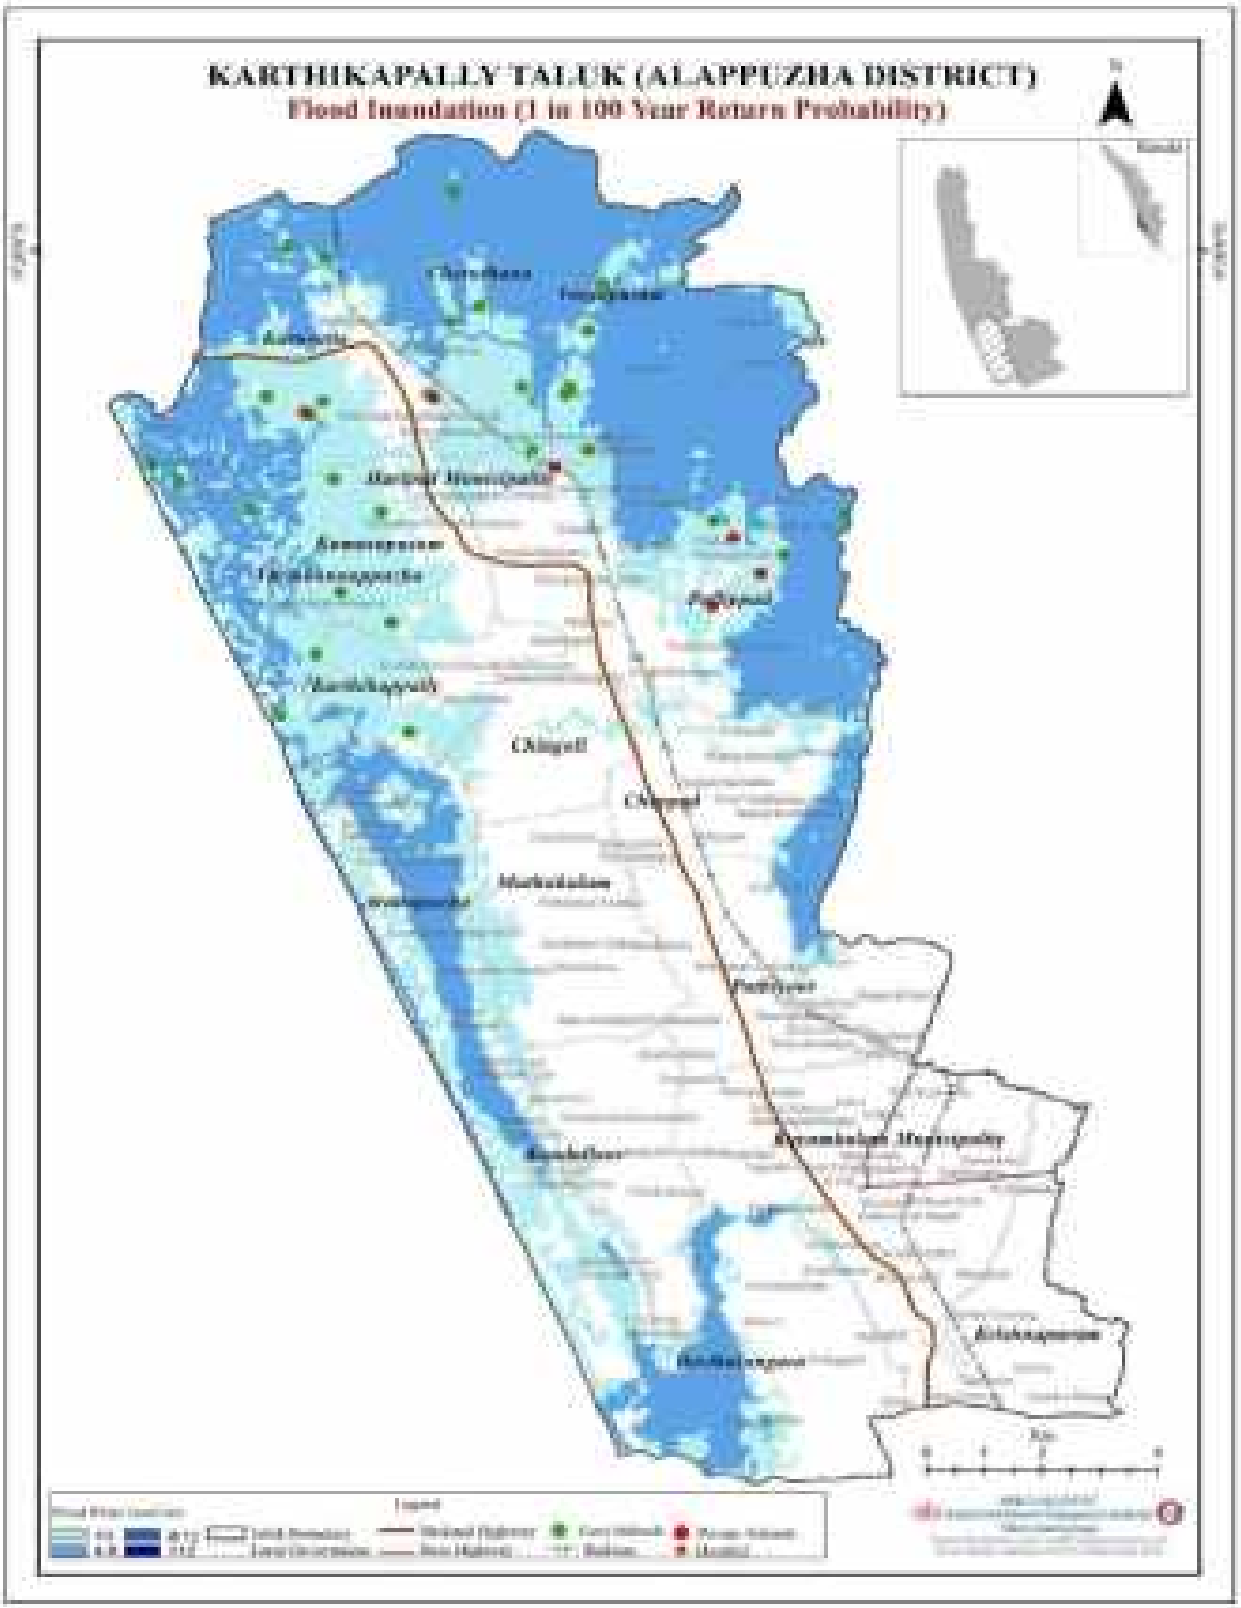

*Figure 3. 5 Fload Inundation Map of Karthikapally Taluk, Alappuzha District*

*Source-Flood KML file*

*Figure 3. 6 Flood Prone Map of the Murukkumood Dumpsite*

## 3.11 Description of Environmental Parameters

*Table- 3.3 Description of Environmental Baseline Parameters*

| Sl. No. | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| 1 | Water Supply<br>a) Surface water<br>b) Ground Water | A) Surface water: nullah is 25 m from the site in South direction and Surface water sample was collected and the test results showed – all parameters are well within limits except Turbidity, Iron, Colour, COD, TDS and Electrical Conductivity.<br>B) Ground Water collected from 3 different locations (1. Open well at a distance of 400m from the dumpsite in the North West direction, 2. Open well at a distance of 470m from the dumpsite in the South East direction and 3. Open well at a distance of 60m from the dumpsite in the South East direction.)<br>– all parameters are well within limits except for Turbidity, colour, Iron, BOD and Electrical Conductivity | Surface water: Exceeding limits of BOD and COD limits, impacting water quality and aquatic ecosystems. High iron levels can lead to the formation of precipitates, affecting ecosystem health. Elevated color and turbidity can impact aquatic ecosystems by influencing sunlight penetration, affecting plant growth. Electrical conductivity levels suggest some dissolved ions but generally remain within acceptable ranges for agriculture and certain industrial processes. |

| Sl. No. | Environmental Aspect | Discussion on Baseline Scenario | Remarks on Demand Supply Gaps (Availability, Quality) & Aspects to be addressed in the Subproject |
|---|---|---|---|
| | | | Ground water: The results indicate that the groundwater sample taken from the downstream side (Sample 2) is contaminated, while the other two samples are not contaminated and the dumpsite has not caused any major increase in the contamination of ground water.<br><br>Site Drainage & leachate Impacts due to bio-mining activity (esp during any seasonal rain) is important as far as the nearby soil & water environment are concerned. |
| .2 | Leachate | The data indicates that the TDS is about 5395 mg/l while the suspended solids is about 57mg/l. The chlorides are high at 1429 mg/l. The heavy metals are found to be low, hence the soil is unlikely to be contaminated by heavy metals from the waste. | |
| .3 | Air Quality | Air samples were collected from 2 locations within the dumpsite and results found to be well within the permissible limits. | The concentration levels of the exploration are compared with the appropriate standards for the interpretation. The air pollution data indicates that the levels are within acceptable NAAQs. The air quality index is within the range of 51-100 which is moderate and is no significant contribution from the dumpsite. |
| .4 | Noise Level | Noise Level monitoring samples collected at entrance of the dumpsite. The ambient Noise levels Leq are above the National Ambient Noise standards for Residential Area both day and night time. The noise levels are influenced by the population within the vicinity, within the dumpsite there is an MCF and RRF facility. | Proper remedial measures for increased noise level shall be ensured by the contractor while bio mining activity. |

# CHAPTER 4 ANALYSIS OF ALTERNATIVES

## 4.1 Alternative 1: Zero or No Project Alternative (without Dumpsite Remediation)

The proposed Bioremediation aims to develop an effective and scientific method for the removal of waste and prevent further contamination of the site.

If the waste remains unattended (without project scenario) it may lead to degrade the baseline quality and unfavorable environmental conditions as follows.

1. Foul Odor Emission: Accumulated waste can produce foul odors due to the decomposition of organic matter. This can negatively impact the quality of life for nearby residents and create an unpleasant living environment.

2. Disease Spread: Unattended waste sites can become breeding grounds for disease-carrying organisms like flies, rats, and other pests. These vectors can spread diseases to nearby communities, posing a significant health risk.

3. Air, Soil, and Water Pollution: The waste may release harmful chemicals and pollutants into the air, soil, and water of the surrounding area. This pollution can have long-lasting negative effects on the environment and human health.

4. Environmental Degradation: The pollution resulting from unattended waste can lead to degradation of the surrounding environment, disrupting natural habitats and causing long-term ecological imbalances.

5. Aesthetic and Economic Impact: Unsightly waste piles can reduce property values and economic development in the area.

## 4.2 Alternative 2: Mode of Execution / Management Alternative

Kayamkulam Municipality intends to complete the remediation project as earlier. However, considering the time required for mobilization, installation, sieving and handling recoverable etc., a time frame of about six months will be considered. The broad timeline chart for the execution of this project is given below **Table – 4.1.**

*Table 4.1 Timeline Chart for Execution*

| TIMELINE CHART FOR EXECUTION | | | | | | | |
|---|---|---|---|---|---|---|---|
| **S. No.** | **Task Name** | **M 1** | **M 2** | **M 3** | **M 4** | **M 5** | **M 6** |
| 1 | Planning & Mobilization | ■ | | | | | |
| 2 | Site Clearance & Development for accessibility within the site & fencing works | | ■ | | | | |
| 3 | Foundation & Civil Works (Cover Shed installation) for machineries | | | ■ | | | |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 4 | Site Development for Windrows & Leachate Collection | | | | | | |
| 5 | Electrical Works | | | | | | |
| 6 | Hiring & Installation of Machineries | | | | | | |
| 7 | Excavation of Legacy Waste | | | | | | |
| 8 | Windrow Formation & Spraying of Bio culture | | | | | | |
| 9 | Sieving Operations | | | | | | |
| 10 | Handling Outputs (RDF, Bio-soil, Inert, C&D waste, Recyclables, etc.) | | | | | | |
| 9 | Project Closure Activities:<br>• Leveling of Reclaimed Land using Bio-soil<br>• Handover the available infrastructure at site to the ULB<br>• Closure Report Submission to ULB. | | | | | | |
| 10 | Buffer Period (Rainy Season) | | | | | | |

### 4.3 Alternative 3: Technology Alternatives

The selection of the appropriate method or technique for remediation is determined by considering several parameters. These include the significant aspects and suitability of remediation types such as

1. Capping without land recovery.
2. Bio-mining – reclamation/recovery of 100% land
3. Capping with partial land recovery.

Additionally, factors like available resources such as manpower, machinery, finances, and physical site conditions, including the quantity and characteristics of legacy waste, Environmental baseline, social concerns, regulatory compliance (KSPCB/NGT), the need for complete land recovery, and opportunities for utilization of processed aggregates/by-products are taken into account.

After a comprehensive assessment of these selection parameters, it has been determined that Bio-mining – reclamation/recovery of 100% land is the most suitable method. This approach ensures long-term sustainability and environmentally sound treatment of the legacy waste, leading to complete remediation and recovery of the dumpsite.

# CHAPTER 5 ASSESSMENT OF ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS

Bio mining and bioremediation of existing legacy dumpsites brings in overall environmental improvement and positive impacts on the health of the communities around. Other benefits include more man-days at work, overall improvement in socio-economic (upliftment in social status) aspects and land value increase. The access road improvement will reduce dust/pollution related to traffic and result in better access to communities. However, bio-mining activity would result in temporary impacts on the environment during the process. In addition, disposal of retrieved waste fractions is important rather than allowing to pile on land. Else this would continue to pollute the environment and create health impacts for a longer term. Impact on air, water, land/soil, and fauna/flora and communities (incl. noise and vibration) are important in this case. In addition to the below mentioned,

(i) Drainage and leachate flow into regional waterbodies (& esp. used as sources of supply/use by people, animals) or ecologically important areas from multiple dumpsites during usual days and during emergencies,
(ii) Pollution on land/soil, dust and odour nuisance and fire risk to communities, flora & fauna due to recovered materials at multiple sites due to poorly planned forward linkages, during emergencies, and extended storage considering climate risks,
(iii) Noise/vibration impacts of heavy vehicle movement, traffic on main roads in the region, and
(iv) Pollution possibilities due to dumping/storage & use of recovered fractions at various recyclers, WTE facilities for reuse/disposal. Some of these impacts and risks are identifiable at this stage, while some would be known only based on the project details that would be known from the work plan of the contactor once on board.

## 5.1 Impact Assessment Methodology

Impacts are assessed based on Magnitude, Duration, and Significance of the impacts and sensitivity of the receptors present within the 500 m aerial distance of Murukkumood dumpsite.

### 5.1.1 Magnitude and Duration of Impacts

The assessment of magnitude is undertaken in two steps. Firstly, the key issues associated with the Dumpsite Bio-mining are categorized as beneficial or adverse. Secondly, potential impacts shall be categorized as High, Average, Low, or negligible based on consideration of the parameters such as:

- Temporal extent (duration) and the likelihood of the potential impact;
- The spatial extent of the potential impact;
- Reversibility of the Impact;

- Legal standards and established criteria.
- Likelihood of the impacts

The magnitude of the potential impacts of dumpsite under KSWMP is identified according to the categories outlined in Table Aspects for Determining the Magnitude of Impacts. Magnitude is assessed as medium, considering shorter duration of the activity. However, magnitude of cumulative impacts of various dumpsite remediation might be High.

Table 5.1: Aspects for Determining the Magnitude of Impacts

| Aspects | Large | Medium | Small | Negligible |
|---|---|---|---|---|
| **Duration of the potential impact** | Long term (more than 20 years) | Medium Term Lifespan of the Program (5 years) | 1 to 2 years or Less than the lifespan of the program | Temporary with no detectable potential impact |
| **Spatial extent of the potential impact** | Regional – much beyond project boundaries | Beyond immediate Program components, site boundaries or local area | Within program boundary (but cumulative impact of various dumpsite biomining activities will be on larger extent) | A specific location within program component or site boundaries with no detectable potential impact |
| **Reversibility of potential impacts** | Potential impact (including positive impact) is effectively permanent, requiring considerable intervention to return to baseline | Potential impact requires a year or so with some interventions to return to baseline | Baseline returns Naturally or with limited intervention within a few months | Baseline remains constant |
| **Legal standards and established professional criteria** | Against national/approved standards and or international guidelines/obligations | Complies with limits given in national standards but not confirming to international lender guidelines in one or more parameters | Meets minimum national standard limits or international guidelines | Not applicable |
| **Likelihood of potential impacts occurring** | Commonly occurs under typical operating or construction conditions (Certain) | Usually seen occurring under most situations (Likely) | Occurs under abnormal, exceptional or emergency conditions | Unlikely to occur |

| | | | | |
|---|---|---|---|---|
| | | | (Occasional) | |

NOTE: Anticipated Project Duration - 5 to 6 months

### 5.1.2 Sensitivity of Receptor

The sensitivity of a receptor shall be determined based on a review of the population (including proximity/ numbers/ vulnerability) and the presence of features on the site or the surrounding area.

In the surrounding area of dumpsite around 25 Households are residing within 100m radius (with 3 houses within 15m). A Govt. Homeo & Ayurvedic Hospital at a distance of 558m, Kandalasseril Temple at a distance of 162m, Holy Trinity school at a distance of 518m. But there are no many habitats and project affected people and families. Hence sensitivity of receptors will not affect much to the bio-remediation process of the dump site and can be categorized as Medium Vulnerable receptor capacity to absorb proposed changes or/and moderate opportunities for mitigation.

### 5.1.3 Significance of the impact

The significance of the project impact is tabulated below: -

| Project Details | Sensitivity | Vulnerability of Resource | Importance of Resource |
|---|---|---|---|
| No project Impacts | Medium | Medium | Medium |
| Project with Bio Remediation (Biomining) | Medium | Low | Low |

Overall, Bio mining will have a medium impact, with more of a positive Impact on the Environment and Human health in longer term.

**Source-Pathway-Receptor Analysis**

A) **Source**: The source of contamination is the legacy waste remaining and being deposited at the Murukkumummod closed dumpsite, more specifically the landfill gas and leachate generated from it. The waste type, age and volume determine the quality and quantity of the leachate and landfill gas. In this case the waste is +20 years old, as dumping had started in year 1995 (Non-functional). The total waste volume is 10261.02 cu. m with the dumpsite spread over 0.70 acres and the legacy waste is presented about 3.30 m above and 1.20 m below from the existing ground level. In addition to the landfill gas and leachate, windblown dust and litter are also considered as sources of contamination.

B) **Pathways**: The following pathways for migration of contaminants have been identified: Wind- The main pathway for litter and dust dispersion is the wind. As long as the waste

is kept uncovered, the dust and litter will continue to be blown off the dumpsite to the surroundings. In addition to the dust and litter, the wind also causes spreading of landfill gases from the dumpsite. Rainwater runoff through the dumpsite acts as a pathway for transport of leachate to the soil and groundwater. The rainwater flowing off the dumpsite along the slope towards South west direction acts as a pathway for the uncovered waste to flow along the boundary of the dumpsite, which is enclosed with boundary wall. Since, the dumpsite is enclosed by boundary, runoff to the nearby river is not possible unless there is any leakage or due to heavy rainfall.

The leachate flows with groundwater and acts as the pathway. Surface water contaminants like run-off from the dumpsite, leachate and windblown dust and litter that reach nearby surface water bodies like canals and rivers are further transported by surface waters and in this case the surface water acts as the pathway.

C) **Receptors:** Receptors are air, surface water (drain passing through residential areas) and ground water. For drinking purpose, they mainly use municipal water supply (30 nearby Households within 200 m and 3 households at 15m distance), soil, flora, fauna and humans. In the case of remediated dumpsite, the most prominent group of receptors are the nearby residences. As the dump is not contaminated by hazardous wastes, remediation would improve the pollution scenario provided the bio-earth used is pollution free and of good quality. However, other impacts are expected on the final destinations of the retrieve waste fractions – such as WTE plants/Cement Plants and MCF/MRFs in the region. Depending on the locations of end use of fractions retrieved from bio-mining, the contractor shall assess the impacts on communities and workers on site & nearby; and near locations of end-use. Key impacts may result from direct contact of communities, workers, flora & fauna with contaminants (waste, soil, sediment, leachate and surface water); during and after bio-mining activity, activities in bio-mined dumpsite, Inhalation of dust and gases emanating from the dumpsite and stored wastes if any, during and post biomining activity.

## 5.2 Impacts on Air Environment

- Key impacts on air include:
- Emission of Methane and other Greenhouse gases; and its impacts on scavengers, workers on site/other facilities on site (MCF and RRF in this case), nearby communities of Ward 22.
- In case of accidental or deliberate burning of wastes (esp. plastics), it releases smoke and gaseous contaminants. These contain particulates, carbon monoxide and other contaminant gases including dioxins; all emitting noxious odour, hazardous to health. Another direct hazard may be expected from the generation of hydrogen sulphide due to disposal of certain types of waste, or the development of anaerobic conditions in the wastes.

## 5.3 Impacts on Water Environment

**Ground water**

- Borehole data indicates waste depth is of 1.2 m with silty sand strata after that. Hence it is expected that the ground percolation of leachate from existing dump may not contribute to large scale pollution of the ground water resources. Nevertheless, leachate and runoff through the legacy waste dump are important contributors to poor water quality. With the slope of the dumpsite, this tends to get accumulated at low-lying gradients and flows into drain up to the nullah that flows at a distance of 25 m from the dumpsite in the southern side. Oozing & pooling of leachate & it draining to nearby areas during rains would be an important aspect to be managed during bio-mining to prevent ground water contamination
- Leachate samples: BOD, COD, TDS exceeding limits may impact the ground water quality in nearby residences, wells, and long term soil pollution.
- Borehole data: Dump below water table may impact water resources and wells nearby.
- Ground beneath the dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. There are no parameters exceeding the permissible limits for heavy metals.

**Surface water**

- The dumpsite experienced flooding during 2018 floods and the site is not vulnerable to flooding as per KSDMA but the dumpsite location is within the flood prone area in the KML Map for Flood prone area. The site is not in CRZ zone, and hence activities would not impact sensitive coastal areas. Nullah is at a distance of 25 m and coast is at a distance of 8.6 Km from the dumpsite.
- Gentle slope is in the South West Direction. The dumpsite is surrounded by residential households and dry vegetation. It is important to contain and treat leachate from the proposed bio-mining activities on site. Treated leachate may be recirculated or used for other purposes.

## 5.4 Impact due to Odour

Dumpsite of organic, or partly organic waste, always results in anaerobic degradation of the waste and consequently, the production of landfill gas, consisting mainly of methane, $H_2S$, Ammonia, and carbon dioxide. If not properly managed the gas can cause odor problems in the neighborhood and since landfill gas is a highly potent greenhouse gas it will also contribute to the increased level of greenhouse gases (GHG) in the atmosphere. Dumpsite gas may also increase the risk of fires or explosions at the landfill site and surroundings.

## 5.5 Impact on Noise

A potential nuisance is a noise from transport of vehicle and machinery operating during remediation phase of the Dumpsite and transports of waste to the Dumpsite. The topography is favorable to attenuate noise to the surroundings. The distance to nearby residential areas is at 15m with 3 households. Hence, the impact will be higher during remediation to the residents.

## 5.6 Impacts on Soil

- Historic land use assessment and Contamination Assessment of the waste, land/soil is an important pre-project activity. If the site has hazardous waste contamination, it shall be excluded from the site as bio-mining, or bioremediation would not help improve such sites. Such subprojects are hence included in the exclusion list of KSWMP ESMF, also considering the capacities and purview of the project.

- Spillover of activities to nearby road and land would result in pollution of all types on these areas. Hence it is important to restrict all activities to the site for legacy waste bio-mining. If the waste is transferred and stored for any other use, that shall be after assessment of the quality of materials so transported / proposed to be used. The process and result shall be discussed with Pollution Control Board and the user agency and there shall be testing, discussions and written certification of acceptance by the user agency to determine if the retrieved material would meet the requirements for end use and is devoid of pollution to ensure no harm to the environment. Communities if the site of end use shall be consulted on such end use as applicable and determined by the SMP/SEP.

- Ground beneath dump remain polluted if heavy metal/other parameters exceed limits in leachate, soil, water. In Murukkumood, all heavy- metals are falling within the limit as per Fertilizers Control Order 1985 and its amendments. Murukkumood does not figure in the CPCB list of contaminated sites of Kerala. In case hazardous waste (including legacy asbestos), e-waste or biomedical waste is found while bio-mining, same shall be retrieved, transported, treated and disposed as per specific waste guideline of the Central Pollution Control Board, Guidelines for Disposal of Legacy Waste (Old Municipal Solid Waste), Feb 2019) and World Bank EHS Guidelines. A plan shall be prepared to auditing of all wastes, management, eliminating pollution & OHS risks; and monitoring of such wastes, cleared and implemented. The site shall have a register maintained on quantities and movement of all retrieved fractions including these.

## 5.7 Other impacts on Biodiversity - Fauna/Flora

- Since the project involves transport of wastes, it is important to consider the impact beyond the project boundaries. Within 50 Km from the site, there is a Konni Reserve Forest and Coastal region at 8.6 Km from the dumpsite.
- Fauna: impacted by direct consumption of the solid wastes, sharps, entanglement, or by consumption of plants and/or animals contaminated by wastes, or as a result of leachate effects on groundwater and surface water.
- Flora: Plants near open dumpsites can be impacted directly by the waste, dust or smoke from burning. Disturbance to vegetation due to machinery, trampling by foot, vehicle or animals, or contamination by waste or leachate, the migration of landfill gas, or as a result of burning or smoke.

- Disturbance to other fauna and flora on site: onsite activities including those related to MCF and RRF may also impact fauna/flora through high noise levels of pre-construction / construction activities.
- Biodiversity of existing site: Available biodiversity of existing site is mentioned in the Environmental Baseline session and there is no key species identified which are listed by IUCN.

## 5.8 Other Impacts on existing or proposed activities on site/s

- There may be approvals from various agencies for bio-mining activities and associated facilities; depending on utilities and uses on site & associated activities. These permits shall be obtained prior to initiating activities on site.
- Impacts of bio-mining on existing facilities on site such as the MCF and RRF, etc. (disturbance to activities & people due to dust, leachate, noise, odour; additional load of wastes to these facilities, vibration impacts & structural damage, etc).
- Post bio-mining impacts: retention of contaminants on site if bioremediation was not well implemented, emission of gas, leachate, visual blight of stored wastes, fire risks and pests on stored waste if not disposed on time, are the impacts post mining which shall be mitigated.
- Impact on forward/backward linkages: Wastes brought normally to site shall be stopped, or if this is dumped elsewhere or not processed, it will lead to health and environmental issues. This alternate location, being associated facility need mitigation measures to avoid/minimize pollution, Health & Safety impacts on workers, communities. Also, forward linkages are considered as associated facilities/linked activities. Impacts of transportation of these fractions (traffic increase, odor, leachate, dust), impacts during rains & emergencies, handling, storage at the identified locations, reuse etc. shall be mitigated.

# CHAPTER 6 ENVIRONMENTAL AND SOCIAL MANAGEMENT AND MONITORING PLAN

## 6.1 Proposed Environmental and Social Management Plan

*Table 6. 1 Proposed Environmental Management Plan*

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| *A* | **Planning and Pre-Construction Stage** | | | |
| *1* | | *Planning for biomining facility* | | |
| 1 | Bio-mining & Bioremediation Plan & Capacities | • Contractor to update the EIA, EMP & EMoP before start of any activity on site, based on his work plan and disposal plan for retrieved / bio-mined material. This shall be made a bid condition. The EMP shall also include mitigation, management & monitoring measures for the location of reuse/disposal of these bio-mined material in line with the agreements with such facility owners and National, State regulations and WB EHS<br>• Contractor to prepare & follow Disaster/Emergency Response Plan, a detailed Fire Safety Plan, Pests/Flies, Odour and Leachate Management Plan.<br>• The contractor to have qualified & experienced environmental health & safety personal during all days to manage EHS aspects including EMP, EMoP, reporting and training of workers.<br>• Contractor to get all required licenses & permits before start of any activity on site | Contractor | SPMU/DPMU/ ULB |
| 2 | Site Access Closure | • The total cessation of dumping in the site will be implemented before any works.<br>• All public access to the site, including waste pickers and scavengers should be prohibited via adequate fencing/compound wall, manned security, information to communities around and signage which prohibit public access completely, to avoid risk to the public.<br>• The site will be fully closed to any SWM operation and appropriate signage must be established at the site entrance to indicate that the waste dump has been closed from the operation.<br>• To avoid land disturbance and movement, the fence/compound wall shall generally follow the contour of the ground.<br>• Grading shall be performed where necessary to provide a neat appearance | ULB or Contractor as per Bidding mechanism | SPMU/DPMU/ ULB |
| 3 | Site assessments including soil boring, auger and test pit, or standard penetration tests for assessing the contamination of the waste – *impact on air quality, odor, water contamination due to leachate,* | • Carry out site assessments as per Guidelines for Bio mining of Legacy Waste Dumpsites of CPCB<br>• Consider safe bio-mining & gas / leachate generation from existing capped portion of the site<br>• Assess the depth of contamination or the depth to which the site need remediation (to minimize impacts due to legacy waste and leachate) and type of remediation required by conducting bore and auger test and test pit, or standard penetration tests or other suitable means<br>• Provision of appropriate PPE's to the team undertaking the site assessments | TSC, ULB, Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *health and safety impacts of the people working in the site assessment* | ▪ Ensure that waste samples are taken in a manner that does not greatly disturb the matrix of the existing waste mound. Ensure proper barricades while working on the pit and proper backfilling of test pits<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound.<br>▪ Plan for machinery operated which will be operated by skilled operators at all times.<br>▪ Arrange adequate PPEs full-body suits, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures.<br>▪ Excavation work shall be planned and scheduled with information to concerned authorities and host communities – to follow a sequenced manner, to avoid ad-hoc exposed areas of the waste mound | | |
| 4 | Absence / Delay in Permissions for Developing the biomining facility and associated works as per National regulations | ▪ Required permissions for undertaking biomining at the existing dumpsite and assessments conducted for undertaking biomining as per existing Laws, Regulations; including for associated infrastructure, DG Sets, Consent to Establish; and other licenses including those as per Labor Laws, before the start of works on site | Contractor, ULB | SPMU/DPMU/ ULB |
| 5 | Dust impacts due to Site works, screening & stacking of retrieved wastes<br>*(Air Pollution) and Visual Blight due to excavation* | ▪ Plan to Provide temporary high screen, buffers around the site before the start of work to curtail dust emissions<br>▪ Arrange a green belt as early as possible on the area of the site with no / less dump. Schedule use of bioremediation soil/compost from site to grow the green belt (preferably fast-growing thick canopies of indigenous trees, shrubs in layers)<br>▪ PPEs to be used by workers<br>▪ Awareness to communities & suggest to use PPEs | Contractor and or ULB depending on agreement on bidding mechanism/DPR | SPMU/DPMU/ ULB |
| 6 | Material sourcing, transport, and stacking of construction materials<br>*(Occupational Health and Safety issues and Air noise pollution)* | ▪ Prior intimation to neighbors on proposed construction activities, timings, emergency contacts, grievance mechanism<br>▪ Prior intimation to nearby Primary Health Centre on work activities need for medical support, emergency support needs, type of laborers on-site and labor camp if any<br>▪ Materials shall be sourced only from approved quarries<br>▪ Material shall be transported only in closed trucks with PUC certificates, with water sprinkling if required to curtail dust emissions.<br>▪ The driver should be with required license and follow speed regulations<br>▪ Materials shall be transported preferably through well-surfaced roads. If road it kuchcha, water sprinkling shall be done to prevent dust emission before and after truck passes<br>▪ Material transport and unloading activities should not result in noise disturbance to locals and should be during daytime<br>▪ Materials shall not be spread around on site. It shall be properly stored/stacked following good housekeeping practices (labeling, properly arranged); in covered sheds to prevent loss of strength and loss of material. Material storage shall not result in any harm to workers or visitors.<br>▪ Provide vehicle wheel wash area on site<br>▪ Workers to be provided with Personnel Protection Equipment (PPE) including safety boots, jackets, ear muffs, gloves. | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ Proper rest area on site shall be provided with water, first aid, toilets | | |
| 7 | The layout of Labour camp *(Impacts on Air, Water, Land, Fauna/Flora, Socio-economic)* | ▪ Labour camp layout, design and material/fire safety plan shall be approved by site engineer before start of construction of the camp<br>▪ Nearby health center shall be informed about the labor camp & appropriate medical checkup shall be arranged periodically<br>▪ Materials used for the camp shall be safe (from corrosion, fire/flood/other manmade and natural disasters)<br>▪ It should not be provided in the waste dumping yard compound. There shall be proper permission & written agreement with landowners wherever the labour is accommodated<br>▪ Camp must not be provided in an area prone to Hazards<br>▪ Camp should be adequately at higher plinth levels to prevent water intrusion<br>▪ Rooms shall be of appropriate sizes with adequate ventilation and livable temperature/other conditions and facilities like proper beds, storage areas, common kitchen where wood or unsafe fuels are not used (better to use LPG)<br>▪ Proper facilities shall be provided at the camp including food and common entertainment facilities, crèche (in case of female labourers- as in regulations), toilets with proper septic tanks, washing area, wastewater, and waste collection/management systems, etc.<br>▪ The camp shall be planned / designed to be maintained in good clean hygienic conditions and shall have outdoor seating areas, greenery, security<br>(Refer ECOP section 06 and section 11 of EMF for KSWMP) | Contractor | Site engineer of SPMU, Labour Commissioner, PCB |
| 8 | Nearness/disturbance to sensitive areas such as forests, wildlife habitations, etc. especially in case of providing support facilities<br>*(Impacts on Fauna / Flora)* | ▪ Ensure site selection for any support facilities or activities (such as vehicle storage etc. if no in biomining site) based on the screening checklist and the master plan of the region, to avoid sensitive areas. Follow mitigation hierarchy – Avoid, Minimize, Mitigate, Reduce. Obtain requisite permissions from respective authorities such as Pollution Control Board, ULB etc.<br>▪ Identify appropriate government site to avoid land acquisition and resettlement impacts<br>▪ Covered and well-marked storage area with cut off drains & odour/fly/dust/ fire prevention shall be ensured for excavated wastes and washing, segregation of the same are to be arranged with due consideration to nearby residences, slope and other landuses | Contractor | SPMU/DPMU/ ULB |
| 9 | Contamination of groundwater due to leaching. Leachate parameters; BOD, COD, TDS, Ecoli, Heavy metals exceeding limits & impacts on ground water quality in nearby schools, residences, wells; long term soil pollution | ▪ During the excavation, ensure appropriate design provisions (based on hydrogeological aspects as well) are made for liners, lined drains for leachate collection and leachate treatment facilities to prevent percolation of leachate. Wherever excavated material is stored, it shall be kept on the platform with garland drain to collect leachate and direct it to the treatment plant<br>▪ Depending on the contractors plan for bio-mining of the site, adopt plans to manage leachate | Contractor | SPMU/DPMU/ ULB |
| 10 | Impacts on flora, fauna" consumption of wastes, leachate impacts, dust smoke burning, trampling/machinery | ▪ Movement routes of vehicles to be planned to avoid key fauna/flora on site<br>▪ Leachate collection & storage/treatment and recirculation shall be planned to avoid impacts on flora, fauna | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| I1 | Nuisance hazards to neighboring areas | • Ensure proper design and adequate compound wall, high screen during construction in consultation with communities, buffer zones and thick green belt to comply with SWM Rules, 2016 and other PCB requirements<br>• In case of waste mound and site edges are sliding or unsafe, provide engineered retention walls. | Contractor | SPMU/DPMU/ ULB |
| I2 | Treatment & Disposal of wastes and rejects | • Contractor to Plan treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste. Retrieved Legacy Waste, reject & inert disposal plan shall be prepared, submitted to the Engineer for approval. All retrieved material shall be inventorised and quantified, including Biosenth, rejects, inerts. These shall be tested and disposed in line with applicable regulations including Hazardous Waste Management Rules 2016, Biomedical Waste Management Rules 2016, SWM Rules, 2016, C&D waste Rules 206, Plastic Waste Management Rules 2016, Fertiliser Control Order 1985 and their amendments. Asbestos Management Plan shall be prepared for management if Asbestos wastes retrieved if any<br>• Further storage, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc) in such a way that no material is allowed to remain on site after contract period. | | |
| **B** | **Implementation or Biomining & Bioremediation stage and Construction of ancillary facilities such as access road improvements, compound walls, greenbelts, drainage etc.** | | | |
| | **Implementation of bio-mining of the dumpsite** | | | |
| 1 | Impact due to the vehicular movement<br>*(Air and noise environment & Vehicular - Vehicular & Vehicular - Pedestrian Conflicts)* | • Vehicles and machinery are to be maintained so that emission conforms to National Ambient air quality standards.<br>• All vehicles and machinery should obtain Pollution Under Control Certificates.<br>• HORN PROHIBITION signpost to be erected.<br>• Rumble strips/speed breaker to be provided on access roads.<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emission standards prescribed.<br>• Vehicle movement shall be well planned. Ensure surfacing the site access & sprinkling of water to suppress dust before and after the movement of the vehicle<br>• Adopt required measures as per CPCB guidelines, and site & proposed work plan/schedule specific safety requirements.<br>• Avoid heavy vehicle movement through access roads to the Marakkannoor dumpsite during peak hours 7 a.m to 10 a.m mention: school hrs / peak hrs; and during important period / festivals when people use the road to access temple<br>• Vehicle should move at control speed inside the dumpsite and reverse horn must be installed in every vehicle to avoid the accidents. | Contractor, ULB | SPMU/DPMU/ ULB |
| 2 | Impact due to the use of heavy vehicle and equipment<br>*(Air and Noise environment)* | • Moving equipment (in case of construction of ancillary facilities) should be well sealed and be equipped with a dust-removal device.<br>• Equipment Operators & labourers should wear dust masks, ear protection, and hard hats.<br>• Vehicles delivering materials should be covered appropriately to reduce spills and dust blowing off the load.<br>• Labor to be provided masks / PPEs. | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ Construction / Bio-mining dump site prone to dust generation shall have fencing (of suitable material & height in consultation with communities) to arrest dust spreading into neighboring sensitive land uses<br>▪ Noise standards at operation machines are to be strictly monitored to prevent exceeding of GOI noise standards.<br>  ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines.<br>  ▪ Using modern, well-maintained and regularly serviced vehicles.<br>  ▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>  ▪ Provision of earmuffs and ear protection to workers and employees in high noise areas.<br>▪ Workers in the vicinity of strong noise to wear protectors and their working time should be limited as a safety measure.<br>▪ As Murukkumood dumpsite has sensitive receptors and settlement areas within 200m (3 houses within 15 m radius) of it, noisy works shall be stopped from 22:00 to 06:00.<br>▪ Machinery and vehicles should be maintained well in good condition to keep their noise to a minimum.<br>▪ Avoid noisy activities/machines near South side of the site where settlement exist within 50m. Noise barrier shall be provided at all noise-sensitive locations / for noise generating equipment such as DG sets, mixers (for ancillary facilities) especially near South side of the dumpsite<br>▪ Adopt required measures as per CPCB guidelines, and site & work specific safety requirements | | |
| 3 | Impact during the construction activities<br>*(water environment)* | ▪ Labour camps if any (depending on Contractors work plan & arrangements) are to be located away from water bodies.<br>▪ Vehicle washing or maintenance near water bodies are to be avoided.<br>▪ Contaminated water from construction / biomining activities carrying soil, cement wash, etc shall not be allowed to flow out of the site. It shall be contained and treated on site. | Contractor | SPMU/DPMU/ ULB |
| 4 | Leachate and Runoff from biomining activities<br>*(Soil contamination and groundwater contamination)* | ▪ Provide site cut off drain around the site to divert off storm water from entering the site, and to prevent contaminating downstream resources with run off from the dumpsite<br>▪ Depending on the contractors plan for biomining of the capped area on site, implement leachate management to cause no harm to communities & environment<br>▪ Ensure storm water drains will lead to drain outlets<br>▪ Provide leachate drains lined from probable leachate pool areas (based on site geography or slope) and carry it to the leachate treatment area<br>▪ Provide proper treatment of leachate and storm water that unavoidably flows through dump or wastes in a tank, constructed wetland in the site or other such arrangements. Treated water/leachate shall be stored for reuse in greenery or for wash purposes (Initiate green belt development on-site parts which will not be impacted by bio-mining activities like excavation and waste segregation and stabilization<br>▪ The quality parameters for recycling and reuse applications must be as per SWM Rules, 2016 or other applicable standards. The treated water quality needs to be tested at prescribed regular intervals – once a week. The treated leachate water quality needs to comply with the latest standards prescribed by the KSPCB/CPCB. | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ The storage areas of the facility should have a leachate barrier system that forms a secure barrier between the groundwater, soil, and substrata<br>▪ Design and maintain the slope and orientation of leachate drains such that free drainage of leachate to a collection drain is facilitated and ponding of leachate is avoided; shape the piles and windrows to maximize runoff and hence reduce infiltration<br>▪ Provide channels to collect leachate around heaped waste windrows (for air contact or enhancing natural drying) and provide cut off drain around all work areas with collection facility for leachate at the lower gradient and channelizing to the leachate treatment or recirculation mechanism<br>▪ Plan the works on-site only during non-rainy seasons and to complete the works before rains<br>▪ Store leachate preferably in aboveground storage tanks or such arrangements to minimize contamination and impacts of submergence/flooding/rains, and provide for emergency containment additionally | | |
| 5 | Soil decontamination from accumulated waste levels<br>*(Impact on leachate, odor)* | ▪ Decontaminate the soil / stabilized layers remaining after sieving out wastes using windrow and bioculture of appropriate quality in line with standards / regulations or appropriate means as per CPCB Guidelines<br>▪ Vegetative layer using contaminant absorptive root varieties like Vetiver may be tried on soil and along the edge of the green belt or floating wetlands may be deployed in water channels nearby to maximize absorption of leachate in the soil by root-zone phytoremediation<br>▪ Soil and water testing shall be done and changes in contamination shall be noted. | Contractor | SPMU/DPMU/ ULB |
| 6 | Excavation of waste from the waste mound<br>*(Health and safety impacts)* | ▪ The contractor will ensure that waste excavation is conducted in a manner that does not greatly disturb the matrix of the existing waste mound.<br>▪ Care should be maintained, especially when working on the slopes to ensure further failures do not occur due to the height of the mound. Slips of waste / stored heap and worker shall be avoided<br>▪ Machinery operated for excavation should be operated by skilled operators at all times.<br>▪ Workers working on machinery and site during excavation should be geared with full-body suits preferably of fluorescent color, masks helmets, boots and gloves, and heat protection equipment to avoid exposure with raw decomposing waste material, which can be at higher temperatures. Proper harness and toes shall be used considering slipping possibility on wastes.<br>▪ Excavation work shall be carried out in a sequenced manner, to avoid ad-hoc exposed areas on the waste mound<br>▪ In case of the waste mound and site edges are sliding or unsafe; provide engineered retention walls or string boundaries.<br>▪ When stockpiled, wastes mined out should be covered and with garland drain to collect leachate and channelize it to the leachate collection & treatment mechanism. | Contractor | SPMU/DPMU/ ULB |
| 7 | Transportation of wastes or retrieved or other material in overloaded and open vehicles<br>*(Air, Odour nuisances; spills and littering impacts on Air, Water, Land)* | ▪ All vehicles shall carry only approved load of weight<br>▪ Regular cleaning of roads & drains and removal of spills if any.<br>▪ All waste transport vehicles shall be covered and movement shall be during non-peak hours.<br>▪ Ensure provisions of SWM Rules 2016 & other relevant rules such as Biomedical Waste Management Rules or Hazardous Waste Management Rules 2016 or others as applicable for all waste / retrieved material Transportation activities.<br>▪ Adopt required measures as per CPCB guidelines, and site specific safety requirements. | Contractor | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 8 | Occupational health and safety impacts of the workers during the biomining & construction of support facilities:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage of chemicals/other materials, biocultures or wastes etc; by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | ▪ Avoid direct & double handling of wastes through avoidance measures (suitable planning & equipment), engineering controls & use PPEs<br>▪ Work area & Labour camps shall be provided with First Aid and other related activities.<br>▪ Emergency Preparedness plans shall be prepared and implemented for all manpower working centers and its field extension centers.<br>▪ An Environment Health & Safety policy shall be prepared and implemented<br>▪ Adequate manpower shall be provided & manager & staff shall listen and act upon the manpower related grievances.<br>▪ Workers will be provided with PPE such as face mask, gloves, shoes, nose masks & goggles<br>▪ Provide / cull out non-slippery work areas as much is feasible; or provide with safe strong holding bars, harness, strings any other appropriate safety equipment to ensure that the activities are performed without slip, trip, fall especially on waste, leachate or trenches<br>▪ Proper training will be provided regarding the maintenance of health<br>▪ Workers shall be provided with scrubbing facilities / wash areas; rest areas, toilet facilities (may be mobile toilets with septic tanks & water supply), food, and water in a hygienic environment (with proper hand wash). Provide clean eating areas where workers are not exposed to contaminated, hazardous or noxious substances.<br>▪ First aid facilities will be available at accessible places. More than one first aid station if the site is large or work schedule requires thus<br>▪ Tie-up with the local hospital / Family, Primary or Community Health Centre and ASHA worker to be arranged through responsible Health Inspector of ULB or HC to be arranged to provide an ambulance to handle emergency cases and for regular health checkups. Arrange daily health checkup for workers working on waste heaps<br>▪ Routine inspections, housekeeping, and maintenance of vehicles, site to be carried out at regular intervals.<br>▪ Measures such as deferred timings and stretch break to be adopted<br>▪ Secure all installations from unauthorized intrusion and accident risks;<br>▪ Undertake hazard assessment & prepare site and activity specific mitigation plan at the start of any subproject activity. Also undertake hazard assessment, safety briefing & tool box talks during every day start of works / activities. Key hazards would be (but not limited to) are flammability, work on ground which may be soggy & have leachate pools, fire hazards, gas and leachate from existing capped area on site, electric shocks, works with heavy machines & equipment, slips of men & material (retrieved) stacked, biohazards, explosion of existing batteries/other materials, infections, infectious/hazardous wastes etc.<br>▪ EHS specialist with adequate experience & third party supervision are important for bio-mining activity<br>▪ Provide H and S orientation training to all new workers to ensure that they are apprised of the basic site rules of work at the site, personal protective protection, and preventing injury to fellow workers. Safety flashes may be prepared for exchange with new works (migrants) or other sites<br>▪ Provide visitor orientation if visitors to the site need to gain access to areas where hazardous conditions or substances or stored materials may be present. Ensure also that visitor/s do not enter such areas unescorted. Communities esp. school children shall be advised to avoid work/vehicle movement areas as much possible | Contractor, ULB | SPMU/DPMU/ ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | ▪ Ensure the visibility of workers through their use of high visibility vests when working in or walking through heavy equipment operating areas;<br>▪ Ensure moving equipment is outfitted with audible back -up alarms & flag men with whistles or speakers;<br>▪ Electrical wires should be properly insulated and earthed, no exposed wires and no overloading thus it will reduce the accidents due to electrical short circuit.<br>▪ Mark and provide signboards for hazardous areas such as energized electrical devices and lines, service rooms housing high voltage equipment, and areas for storage and disposal. Signage shall follow international standards and be well known to, and easily understood by workers, visitors, and the general public as appropriate. Any electric wires, or appurtenance to be marked well & safe kept before activity start near those In close proximity to this location, there is a transformer. Disallow worker exposure to noise level greater than 85 dBA for more than 8 hours a day without hearing protection<br>▪ All workers shall be registered as per prevalent labor laws (including a workforce of subcontractors) and provided insurance cover & others as per existing acts/laws<br>▪ Workers and their kith and kin shall be suitably informed about the registration, other details of workers, and insurance details and provide contact details of contractor's person/insurance agent<br>▪ While using heavy machinery like JCB, cranes, etc, inform workers on possible dangers and prevent going near operating / movement areas. Flagmen should be arranged on-site with a whistle.<br>▪ While using heavy machinery like JCB, cranes, etc, inform communities to prevent children and others from going near operating / movement areas including roads.<br>▪ Flagmen shall be arranged if work is near schools, hospitals, major roads, and traffic control is required with the support of police. Traffic management plan to be prepared, got approved & followed as required. Communities esp. school children to be advised to use alternate roads if possible<br>▪ A work permit system will be implemented for all works related to working at heights (typically when working over 2m and above – for example in case of any activity on heaped wastes) and for hot jobs;<br>▪ No worker shall enter site in intoxicated condition & suitable checks shall be adopted by the contractor<br>▪ All works related to working at heights will be undertaken only during the daytime when sufficient sunlight is available;<br>▪ Use of temporary fall protection measures and outer edges of any elevated work surfaces, such as handrails and toe boards to prevent materials from being dislodged will be done;<br>▪ All excavation activities to be conducted in supervision of the site contractor;<br>▪ Proper signage and lights to be provided in all work or activity areas & work permit system to be ensured.<br>▪ All records on emergencies, accidents, workers & their duty schedule, important site events, waste storage & disposal etc shall be maintained on site. All accidents including Indicative, Serious and Severe accidents to be recorded. All severe & serious accidents to be reported to the Bank & procedures followed for root cause analysis & Corrective Action Plans prepared and implemented, as per Banks Incident Reporting Tool | | |
| 9 | Risk of fire due to conditions leading to spontaneous combustion | ▪ Follow CPCB Directions (May 26, 2022) Directions under Section 5 of EP Act (1986) – for Implementation of SWM Rules 2016 – regdg Fire Incidents at MSW Dumpsites (https://cpcb.nic.in/openpdffile.php?id=UHVibGljYXRpb25GaWxlLzQyNDRfMTY1NDE2Mzk3N19tZWRpYXBob3RvNzYxMi5wZGY= ), LSGD Kerala Government GO on Fire Safety of MRF, MCFs (for the | Contractor, ULB | SPMU/DPMU |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | *(Air environment, disturbance to communities and workers, health impacts, safety issues)* | MRF on site if used for storage of wastes)and other Regulations, guidelines applicable<br>▪ Divide the site & plan for work in each area/quadrant as per work plan & prepare fire safety plan & emergency response plan in line with EIA Annexure 3; and National/State regulations & WB EHS<br>▪ Examine the site everyday by experienced Fire Safety / OHS personnel for any smokes<br>▪ Avoid conditions that can lead to spontaneous combustion such as:<br>o Smoking Ban: Prohibit smoking in all areas of the dumpsite facility to eliminate a common fire hazard<br>o Preventing Fires: Strictly forbid activities like intentionally setting fire to materials in the landfill.<br>▪ Design the facility for access by firefighting equipment, including clear aisles among waste heaps or work areas and access to adequate water supply.<br>▪ Ensure workers are briefed of fire hazard & its management<br>▪ No unauthorized entry shall be permitted to the site; including of workers during holidays, nighttime, or hours other than normal work hours under the supervision of site engineer / supervisor. Fencing and barricades with proper signage boards indicating "trespassers not allowed"<br>▪ The following activities should be implemented to prevent fires from occurring at the facility<br>o adequate fire-fighting equipment should be made available on-site and stored in an accessible manner,<br>o all operating staff should be trained and able to manage fire outbreaks at any part of the facility.<br>o clear signage should be established to inform workers and the public that flammable liquids are not permitted on the site. This should be reinforced by advice to customers at the gatehouse and inspection of loads at the organic reception area.<br>o Approved quantities of combustible contaminants that have been separated (such as tires and plastic bottles) should be stockpiled in small piles or windrows.<br>o all fuels or flammable solvents for operational use should be stored in an appropriately ventilated and secure store (at appropriate height). This store should be located away from the bio mining, storage, and processing areas.<br>o all flammable liquids should be stored within a bund that can hold 110% of the volume of the flammable liquids stored there so that any release of raw or burning fuel cannot cause a fire in the combustible organics present on the site or have an impact on contaminating storm water.<br>▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented throughout the bio mining activity in line with National State regulations, guidelines and international good practices<br>▪ Ensure that appropriate fire safety standards, facilities, equipment are in place for storage and transportation stages. Fire mock drills to be conducted monthly once.<br>▪ Contain all local smokes/small fires inside the dump asap. Fire brigade help shall be sought on all smokes/fires outside the dump<br>▪ Ash from fires to be contained at the earliest within the site using bunds or screens, rather than allowing to disturb nearby receptors. Early clearing and disposal of such ash at TSDF to be ensured.<br>▪ Provide contact details of Fire Department & ambulance other essential emergency services on site & ensure training to the workers by such service providers | | |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| 10 | Construction of new facilities in retrieved land | ▪ The excavated site shall be protected from any dumping during or after the bio mining activity and shall be reserved for SWM activities in line with SWM Rules 2016<br>▪ Any new facility under KSWMP to be constructed on the retrieved land, shall follow EMF procedures & National State regulations | ULB | SPMU/DPMU |
| 11 | Pest / Vermin Control & Visual impacts (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted; preferably in coordination with Health section of ULB & local Health Center<br>▪ Communities around shall be made aware of possible pest menace & ULB shall support those in need with required pest management measures and offered health checkups<br>▪ Bio-pesticides / biological control shall be followed. However, bio-pesticides, or bio cultures used shall be tested to ensure the presence of no banned chemicals or hazardous materials<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used<br>▪ Visual blight to be curtailed by screens, proper lighting, housekeeping, leachate management | Contractor, ULB | DPMU, SPMU |
| 12 | Odour nuisance | ▪ Waste with a strong odor to be covered immediately they are emptied from vehicles.<br>▪ Control and manage leachate treatment to minimize odor.<br>▪ Provide buffers screens to curtail odor from reaching surrounding communities especially to North side of site.<br>▪ Using natural deodorizers such as lemongrass, eucalyptus etc. and planting fragrant flowering plants around the site to mask odor. | Contractor, ULB | DPMU, SPMU |
| 13 | Storage, Collection, Transport, Treatment & Disposal of wastes and rejects | ▪ Storage, Collection, Treatment, treatment & disposal mechanisms for retrieved wastes & rejects/inerts in line with applicable regulations for each type of waste<br>▪ Storage, Collection, Transport, treatment or disposal of retrieved legacy wastes or rejects/inerts shall not be in a manner that disturbs any sensitive receptor or area (communities, waterbodies, air, soil, biodiversity etc); & adequate protection shall be made to prevent such impacts even during rains / disasters<br>▪ Waste handling shall be inline with existing regulations & guidelines & avoid health & safety impacts<br>▪ No material is allowed to remain on site after the contract period<br>▪ Adequate fire safety arrangements & awareness & training to workers shall be ensured on site & at disposal / treatment areas for wastes in discussion with Local Fire Brigade to prevent any fire on legacy waste site or retrieved & stored wastes or that is transported<br>▪ Vehicles movement shall be tracked by ULB to ensure disposal of material/rejects/inserts in designated or agreed area & are in line with schedule; using GPS.<br>▪ Given that the access road is used by the public, it is imperative to implement the required safety precautions and environmental protection measures when transporting the waste. | Contractor, ULB | DPMU, SPMU |
| 14 | Other activities | ▪ No activity other than bio mining shall take place on site & any activity shall cause no adverse impacts on the environment or people<br>▪ If existing MCF shall be used for storing bio mining wastes, its safety shall be ensured in terms of fire & structural safety before starting to use the facility. Further usage of the MCF after bio mining works shall be after proper cleaning / washing & disposal of all rejects/inserts & tools to ensure good housekeeping & no H&S impacts | | |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |
|---|---|---|---|---|
| | | • If existing MCF shall be used by the ULB for storing dry wastes from Town, during bio mining period, alternate access shall be arranged & workers shall be adequately protected against any health & safety impacts | | |
| 15 | Energy Efficiency & Water Use efficiency | • All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & bio mining / construction techniques<br>• Landscaping & green belts to use local / indigenous plants & trees<br>• Waste water and Leachate to be treated & recycled/reused | Contractor | ULB |
| C | **Future Site Usage (EMP shall be updated in line with EMF & used if future site usage is proposed under KSWMP). This section is not the responsibility of the Contractor for Bio mining, but of the future facility operator & ULB** | | | |
| 1 | Future use of the bio mined site: Green Park, MCF, MRF, RRF, Treatment plants, landfill cell or any other, preferably for SWM | • ULB to ensure that the site will not be used for future dumping.<br>• Activities at existing MCF to be upgraded to ensure that no waste (even dry wastes) gets dumped around<br>• ULB shall plan the future use of the site shall be in consultation with the communities<br>• Phase 1 Environmental Assessment to be carried out, EA for existing facilities & EIA for proposed development in line with EMF in case this is proposed to be developed under KSWMP<br>• All applicable clearances, permits shall be arranged in line with applicable regulations for the proposed new use of the site, and appropriate designs/plans to be prepared & implemented | Future Facility Developer/ Operator & ULB | ULB (SPMU in case it is under KSWMP) |
| 2 | Vehicle movement for new activities: MCF/MRF, RRFs, Treatment plants, landfill cell<br><br>*(Air, water environment, a nuisance to biodiversity, communities, Health impacts)* | • The movement route shall be scheduled for each vehicle<br>• Enforce speed limits applicable and make drivers aware of this<br>• Vehicles movement shall be tracked by Health Supervisors to ensure keeping up to schedule, preferably using GPS<br>• Any adulterated fuel shall be avoided. There shall be periodic emission tests for vehicles<br>• Provision of Personal Protective Equipment such as face mask, gloves, nose masks & goggles to all workers in C&T vehicles, Maintenance yards<br>• Proper lubrication shall be provided to minimize squeaking noise due to friction<br>• Honking shall be minimized to eliminate any possible discomfort to the nearby people.<br>• The most optimum route is planned with minimum no. of vehicles with the help of GIS mapping and apps for the general public<br>• Traffic will be managed at the site by providing adequate space for parking of vehicles<br>• Timely transfer and disposal of retrieved material shall be carried out by vehicles and should transfer materials only to designated areas as per design<br>• No waste or material shall be disposed in any place other than the designated area, including water bodies, coasts/forests, or sensitive areas. | Future Facility operator | ULB |
| 3 | Exhaust emissions<br>*(Air impacts)* | • No idling of vehicles on site<br>• Regular maintenance of heavy equipment used at the site and waste hauling vehicles to ensure their exhaust emissions meet the emissions standards prescribed | Future Facility operator | ULB |
| 4 | Plying of vehicles through kutcha / unsurfaced roads and idling | • Vehicle movement shall be well planned – through topped roads. In case of necessity to move through Kutcha roads, ensure sprinkling of water to suppress dust before and after the movement of the vehicle | Future Facility operator | ULB |

| S No | Probable Negative Impacts | Mitigation Measures | Implementation Responsibility | Monitoring Responsibility |

| | *(Air pollution SPM, CO, CO2)* | | | |
| 5 | Impact on the ambient noise quality during the operations *(Noise, nuisance to sensitive receptors, health impacts)* | ▪ Strictly adhering to designated working hours (day time); Sensitizing construction truck drivers and equipment operators to switch off idle engines;<br>▪ Using modern, well-maintained and regularly serviced vehicles;<br>▪ Ensuring that all generators and heavy-duty equipment be insulated or placed in enclosures to minimize ambient noise levels.<br>▪ Provision of earmuffs and ear protection to workers and employees in high noise areas | Future Facility operator | ULB |
| 6 | Occupational health and safety impacts of the workers:<br>• Health impacts of exposure to a variety of harmful materials of waste-related pollutants.<br>• Accidental spillage by moving vehicles.<br>• Cut & Bruises during handling of materials/rejects<br>• Allergies from pathogen and airborne dust<br>*(Air environment, Health impacts)* | ▪ All OHS and CHS measures to be followed in line with applicable regulations, guidance<br>▪ Workers & communities shall be made aware of OHS, CHS risks and impacts & mitigation measures adopted<br>▪ Emergency management plan to be prepared & followed<br>▪ Workers shall be appropriately trained or OHS during construction & Operation of all future facilities | Future Facility operator | ULB |
| 7 | Pest / Vermin Control (Odour, flies, rodent / other pest menaces) | ▪ Regular cleaning and approved pest control measures to be adopted<br>▪ Biopesticides / biological control shall be followed.<br>▪ Banned pesticides/insecticides shall not be used.<br>▪ Workers shall be made aware of storage and use of pest control measures and PPEs to be used | Future Facility operator | ULB |
| 8 | Fire Safety | ▪ The local fire brigade shall be informed of the activity, and fire safety plan shall be submitted for their comments/feedback & implemented in line with National State regulations, guidelines and international good practices | Future Facility Operator | ULB |
| 9 | Energy Efficiency & Water Use efficiency | ▪ All activities to consider energy efficient & clean fuels; and use of energy efficient equipment & construction techniques<br>▪ Landscaping & green belts to use local / indigenous plants & trees<br>▪ Waste water to be treated & recycled/reused | Future Facility Operator | ULB |

### 6.1.1 Disposal phase of By-products from Bio-mining process:

The bio-earth and coarse fraction soil recovered from dumpsite will be used for filling low lying areas. The RDF material recovered from dumpsite will be transported to nearby cement factory and recyclable material will be handed over to the authorized recycling agency. If the by-products are not removed from the site within a three-month period, penalties will be imposed on the contractor.

## 6.2 Disaster Management and Emergency Preparedness

A disaster is a catastrophic situation in which suddenly, people are plunged into helplessness and suffering and, as a result, need protection, clothing, shelter, medical and social care, and other necessities of life. In the case of Dumpsite remediation, Disaster Management Plan is aimed to ensure the safety of life, protection of the Environment, protection of installation, restoration of the remediation process, and salvage operations in this order of priorities.

For effective implementation of the Disaster Management Plan, it should be widely circulated and personnel training is to be provided through rehearsals/drills. The disaster management Plan consists of Onsite Emergency Plan and an offsite Site Emergency plan, which is outlined here for Emergency Preparedness. The list of emergency helpline services is mentioned in the Table below.

*Table 6. 2 List of Emergency Helpline Services*

| Sl. No. | Emergency Services | Distance from the dumpsite |
|---|---|---|
| 1 | Kayamkulam Police Station | 2.7 Km |
| 2 | Fire station Kayamkulam | 3.8 Km |
| 3 | Kayamkulam Government Taluk Hospital | 3.3 Km |

### 6.2.1 Approach to Disaster Management Plan (DMP)

The objective and approach of the Disaster Management Plan is to make use of the combined resources of the plant and the outside services to achieve the following:

- Effect the rescue and medical treatment of casualties;
- Safeguard other people;
- Minimize damage to property and the environment;
- Initially contain and ultimately bring the incident under control;
- Identify any dead;
- Provide for the needs of relatives;
- Provide authoritative information to the news media;
- Secure the safe rehabilitation of the affected area;

- Preserve relevant records and equipment for the subsequent inquiry into the cause and circumstances of the emergency.

In effect, it is to optimize operational efficiency to rescue rehabilitation and render medical help and to restore normalcy. Disaster Management Plan should include Emergency Preparedness Plan, Emergency Response Team, Emergency Communication, Emergency Responsibilities, Emergency Facilities, and Emergency Actions.

#### 6.2.1.1 Identified Emergency Situations

Major disasters which can affect the remediation process are as follows:

- Floods due to heavy rainfall
- Fire risk in summer
- Occupational and health risks during the remediation process
- Safety-related accidents during the remediation process

#### 6.2.1.2 Proposed Organizational Structure for Disaster Management Plan

**Response team:** Setup an Emergency Organization. Emergency Organization includes the senior executive (head of EO as a Site controller), Manager Safety (Incident controller), Shift in charge, and Emergency Coordinators.

- All Incident control would be reported to the Site Controller. Each Incident Controller organizes a team responsible for controlling the incident with the personnel under his control.
- **Shift In-charge** would be the reporting officer, who would bring the incident to the notice of the Incidence Controller and Site Controller.
- **Emergency Coordinators** would be appointed who would undertake the responsibilities like firefighting, rescue, rehabilitation, transport and provide essential and support services. For this purpose, security in-charge, personnel department, essential services personnel would be engaged. All these personnel would be designated as key personnel.
- In each shift, the electrical supervisor, in charge, and other maintenance staff would be drafted for emergency operations. In the event of power or communication system failure, some of the staff members in the office/facility would be drafted and their services would be utilized as messengers for quick passing of communications. All these personnel would be declared as essential personnel.

## 6.3 Proposed Monitoring Plan

The proposed monitoring plan is presented in table below,

*Table 6. 3 Proposed Monitoring Plan And Frequency*

| Monitoring media/parameters | Items and parameters | Frequency | Location |
|---|---|---|---|
| **Ambient Air Quality** | PM10, PM2.5, NOx, CH4, CO, Ammonia | Quarterly (1 sample) | 2 point |
| **Noise** | Leq Day and Night | Monthly | 2 point |
| **Health safety Hazards** | Medical records, documentation of injuries and accidents, Health and safety assessments | As and when accident/injury occurs | Incident reports |
| **Leachate** | • pH<br>• Biological Oxygen Demand- BOD<br>• Chemical Oxygen Demand-COD<br>• Nitrogen (Ammonia, Nitrate, Nitrite)<br>• Oxidation-Reduction Potential- ORP<br>• Electrical Conductivity-EC<br>• Total Organic Carbon (TOC) Dioxins<br>• Heavy Metals (As per the schedule II of SWM rules 2016) | Quarterly | 2 point |
| **Groundwater quality** | Parameters will be defined and sampling, preservation, and analysis of water will be carried out following those stipulated in the subsections below and Standards Methods for Testing Water and wastewater, 21st edition, published by American Public Health Association (2005). | Quarterly | 8 points |
| **Surface water quality** | | Quarterly | 6 points. 2 upstream and 4 downstream |

## 6.4 Estimated Budget for Implementation and Supervision of EMP

The estimated capital cost of [redacted] is required for budget provision for implementation and supervision of EMP. The remediation will be only during shorter time duration and hence the recurring cost won't be incurred. The estimated budget for implementation & supervision of EMP is shown in the table below.

*Table 6. 4 Estimated Budget for EMP*

| Sl. No | Particulars | Capital cost(lakhs) |
|---|---|---|
| 1 | Dust Mitigation measures including site green mat enclosure, Water sprinkling and wheel washing | [redacted] |
| 2 | Mobile toilet, Pest Control, Disinfectant | [redacted] |
| 3 | Medical cum First aid facility | [redacted] |
| 4 | PPE workers & welfare , Firefighting equipment | [redacted] |
| 5 | Monitoring & Testing (Air, Noise, Water, Soil, Leachate) | [redacted] |
| | **Total** | [redacted] |

# CHAPTER 7 INSTITUTIONAL ARRANGEMENTS

## 7.1 Proposed Institutional Arrangement

Technical support for preparation and implementation of safeguards instruments at the ULB level will be provided by district-level TSCs hired by each DPMU, which will include environmental engineers (preferably with qualifications and experience in SWM), natural habitat/biodiversity specialists for projects near Natural Habitats, social cum communication experts (preferably with experience in SWM). The Terms of Reference for TSCs will include the scope of work to ensure compliance with ESMF, and to support screening and categorization of the subprojects using the screening tools presented in the ESMF. The results of the screening will be forwarded to the DESDU for confirmation on the categorization and issuance of ToR for the preparation of safeguard instruments. In the case of subprojects that may impact Natural Habitats, the Biodiversity Management Committee of the ULB will review the screening and guide the ToR preparation. The Support Organisation will be overall responsible for various IEC activities for sensitizing the communities and undertaking consultations as part of the citizen engagement plan for wider acceptance of the proposed investments. They will facilitate the integration of community needs, carry out Free Prior Informed Consultation required to prepare the DPRs and Safeguard Instruments. Safeguard documents pertaining to E1 category investments will be prepared by independent consultants other than the TSC who is in charge of DPR preparation. For E2 projects TSC will prepare the ESIAs as part of DPR preparation. For E3 projects, TSC will compile the filled-in screening Formats and applicable Indicative ESMP and will submit to DESDU for approval and records. ESIAs of E1 and E2 subprojects will be sent to S-ESDU after reviewing by D-ESDU. ESIAs of E2 projects will be cleared by S-ESDU; while those of E1 category projects or any special projects/under any special circumstances will be sent to the World Bank for review and clearance after reviewing by S-ESDU. Each contractor / DBOT operator will have an environmental / EHS expert who will supervise the implementation of ESMP at sub-project level. The PIU Engineers, Health officer, and support organization will directly supervise the contractor / DBOT operator and guide the implementation of ESMPs with TSC support. The PIUs will support and co-ordinate for government approvals and statutory clearances. The PIU will submit the compliance reports on clearances, permits, and environmental and social safeguards to D-ESDU.

## 7.2 Capacity Building

- Sensitize and orient different stakeholders of the project with adequate communication of benchmark standards on various project components. Ensure up gradation of awareness generation at different levels. Special focus: Health Hygiene and sanitation Sub Activity

- Training program for HKS (Health & Hygiene, source level waste segregation and source level treatment, Fire and Safety)
- Training program for ULB Councilors and Ward convener (Proposed SWM project plan of KSWMP)
- Training program for Political and trade union leaders (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for Residence Association leaders (Health, Hygiene different composting methods and source level waste segregation, littering of waste, Public Health, Fire and Safety)
- Training program for workers of Municipal Sanitary workers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for school / college students (Health, Hygiene and source level waste segregation, Fire and Safety)
- Training program for ULB officials (Proposed SWM project plan of KSWMP, proposed policies, existing policies etc... to improve the existing pattern into zero waste concept of the municipality)
- Training program for School children, Parents and Teachers (Health, Hygiene and source level waste segregation, Fire and Safety)
- Massive awareness campaign on 5R (Reuse, Recycle, Repurpose, Reduce and Refuse)

**Importance of Capacity Building**

Capacity building is defined as the "process of developing and strengthening the skills, instincts, abilities, processes and resources that organizations and communities need to survive, adapt, and thrive in the fast- changing world. It is the development of knowledge, skills and attitudes in individuals and groups of people relevant in the design, development and maintenance of institutional and operational infrastructures and processes that are locally meaningful. It is generally defined 'capacity building' as the creation of an enabling environment with appropriate policy and legal frameworks, institutional development, including community participation, human resources development and strengthening of managerial systems. It is a long-term, continuing process, in which all stakeholders participate. The main aim of capacity building under solid waste management is to build a basic understanding regarding the solid waste management project at each step of value chain (waste generation, segregation & storage at source, primary collection, secondary collection, transportation, processing and disposal) and importance of their work and develop a sense of belonging towards the work.

## 7.3 Grievance Redressal Mechanism

All grievances relating to the Project and SWM services will be resolved within the legal framework of the State. A robust GRM system will be functioning at ULB level and state level. Citizen can lodge complaint either directly to ULBs, toll free number or through digital platforms (website/email – grmkswmp@gmail.com / Toll free number-18004250238). The complaint will automatically be recorded in login of ward level official of ULB and an escalation system is constituted according to the category of each complaint to close the complaint in time. The complainer can close the complaint through a feedback form according to their satisfaction.

# CHAPTER 8 PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

## 8.1 Approach to Public Consultation

KSWMP has developed a detailed strategy and installed various inclusive mechanisms in the different stages of the remediation process considering the project affected persons, families, and commercial establishments.

As the initial step, a **Transect walk** was carried out on **22/2/2023** covering the surrounding area of the dump site. The aim of the transect walk was to assess the site and gather information about its location, potential social risks, existing infrastructure and the impact on surrounding communities. The group exercise that entails walking between two points to intentionally cross or transect a community. The group explores environmental and social resources, conditions and systems by observing, asking, listening, looking and producing a transect diagram. Information collected can be used to reveal land use practices, hazards and vulnerabilities to inform disaster mitigation and water management.

**Ward level Consultation Meetings** will be conducted during the planning stage in the chairmanship leadership of ward councilor by engaging the representatives from different resident's associations, commercial establishments and other institutions in the ward for explaining about the remediation process and thereby to gain public support and cooperation.

## 8.2 Information Disclosure

Warning sign boards and project information boards with full details of grievance redressal mechanism along with all related contact details will be installed at site during the remediation process at the site. Site control measures should be enforced to prevent unauthorized personnel from entering the work site. Work zones should be delineated around specific bore holes, excavations and other areas that may pose the risk of potential exposure to the hazards

# ANNEXURE I

## INITIAL ENVIRONMENTAL EXAMINATION

Checklist to be followed for Environmental Screening during the Initial Environmental Assessment Stage has been provided below:

**Subproject Details**

| | |
|---|---|
| **Name of Subproject:** | Murukkumood Solid Waste Dumpsite Reclamation by Biomining. |
| **Subproject Components:** | Biomining, Leachate Treatment, Site development, green belt etc. |
| **Subproject Location (City / Town/ Village with ward numbers):** | Murukkumood / Kayamkulam / Ward 22 |

**Stage 1: Exclusion List**

**Is the Project Excluded from Consideration due to the following:**

| Sl No | Non-permissible Activities |
|---|---|
| 1 | Projects in sites/locations which should be excluded as per prevailing Rules / Laws, near Natural Habitats and Forests: (i) any construction in demarcated Forest areas or protected areas or their buffers, (ii) landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). |
| 2 | Projects which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas |
| 3 | Projects involving (i) any impact on or due to Dams or embankments or (ii) purchase, storage and use of Banned Pesticides |

This dumpsite remediation project involves 1. (i) no construction in demarcated Forest areas or protected areas or their buffers, (ii) no construction of landfills, not confirming to siting criteria as per SWM Rules 2016, or (iii) no treatment facilities for Solid Waste, Biomedical Wastes and C&D Wastes not conforming to Pollution Control Boards siting criteria for specific industry (various types of treatment plants) types (where mitigation measures are not possible). 2. NO activities which would involve decontamination of hazardous waste dumpsites or those would potentially result in further pollution of sensitive areas, 3. No activities with (i) any impact on or due to Dams or embankments (ii) and project will not purchase, store and use Banned Pesticides.

Hence, not excluded
Proceeding to Stage 2 Screening

**Stage 2: Environmental Screening Checklist**

| Project Details | | |
|---|---|---|
| **Sl.No** | **Components** | **Details** |
| 1 | Project components | Murukkumood Solid Waste Dumpsite Reclamation by Biomining |
| 2 | Details of Components (main components including collection and transportation, decentralized household solid waste management, community-level solid waste management, centralized non-biodegradable waste management facilities, centralized biodegradable waste management facilities, sanitary landfills, biomining of dumpsites, including for Linked activities / associated facilities) | Proposed project includes Bio-Mining of Legacy Waste Quantity of 10261.02 $m^3$,The Objective of the project is to dispose the old dumped waste and the formation of a windrow of legacy waste, followed by waste stabilization through bio-remediation (i.e. exposing all waste to air and using composting bio-cultures), i.e. screening of the stabilised waste to recover all valuable resources (such as organic fines, bricks, stones, plastics, metals, clothes, rags, and so on), and finally its long-term disposal. |
| 3 | Location of the Project Sites & Current Land use (Provide information for all sites involved in the project; including for Linked activities / associated facilities), any historic land use (related to heritage, or contamination)<br>Site Survey No (attach map) with ownership details, Geographical co-ordinates of the site location [including any off-site sub-components (attach map)<br><br>Also, mention disaster zones? (Earthquake, Cyclone, etc.) | Location of Project site: (Lat. 9.17352049,<br><br>Long 76.52148736 in ward 22.<br><br>Current land use: For the last +20 years, Kayamkulam Municipality's solid waste has been deposited in the dumping yard at Murukkumood . Later One Material Collection Facility has been set up adjacent to Murukkumood Dumping Yard to collect and process the Non-bio degradable waste from the Kayamkulam Municipality. But around 1.50 tons per day of biodegradable wastes from daily street cleaning, shops, vegetable market etc. is collected by the sanitation workers of the municipality and delivered to Murukkumood dumping Yard. Based on the preliminary survey conducted, it is estimated that 10261.02 m3 of Solid Waste has been deposited so far. The dumpsite is covered with compound wall with gate.<br><br>Site Survey No:1956<br>Historic land use: MSW dumpsite since 1995, land owned by Municipality.<br><br>Linked / Associated facilities / off site components: MCF & RRF<br><br>Earthquake zone: III (IS 1893-2022) |

| | | |
|---|---|---|
| **4** | Land Area proposed to be used: Location wise (in sq km / sq m) | 2832.79 sq. m at existing MSW dumpyard. |
| **5** | Quantity of Water Required for Construction and Annual Operations with Details of Source/s | During the segregation process-2 KL/Day<br>Source-KWA |
| **6** | Power Required and Source of Power | No DG set requirement for this sub-project. Electricity connection is available within the site.<br>Source of Power - Existing KSEB line near to the dumpsite. |

**Baseline Environmental Conditions**

| **Sl. No** | **Environmental Aspects** | **Yes** | **No** | **Details(include distance in Km, info on its importance)** |
|---|---|---|---|---|
| 1 | Is the project site located on or adjacent to any of the following (Provide Distance to these features in meters/kilometers) | | | |
| (i) | Critically Vulnerable Coastal Areas (CVCAs), Eco-sensitive Areas (ESAs) | | ✓ | Azheekal Beach-7.70km |
| (ii) | Cultural Heritage site, Protected monuments - listed by ASI/State | | ✓ | Krishnapuram Palace-2.90km |
| (iii) | Natural Forests / Protected Areas / Bio-Reserves Is the subproject in an eco-sensitive or adjoining an eco-sensitive area, with any schedule 1 species? If Yes, which is the area? | | ✓ | Azheekal Mangrove forest-6.90km<br>Kayamkulam/Ayiramthengu- 7.30km |
| (iv) | Other Wetlands/ Mangrove/ Estuarine Region | | ✓ | Kayamkulam Kayal-6.80km |
| (v) | Natural Habitat areas, roosting / nesting areas, spawning areas, breeding areas; areas with natural features like waterfalls, sacred groves | | ✓ | |
| (vi) | Other Sensitive Environmental Components listed in EMF | | ✓ | |
| (vii) | Drinking water source, upstream and downstream uses of rivers, etc | | ✓ | A Natural stream is at a distance of 25m from the dumpsite<br>Karippuzha Thodu -2250m |
| (viii) | Low-lying areas/areas of Tidal Influence (provide CRZ details) | | ✓ | |
| (ix) | Sensitive Receptors – a) Habitations / Households / | ✓ | | Distance to nearby Household: About 25 residential units under 100m radius. |

| Sl. No | Environmental Aspects | Yes | No | Details(include distance in Km, info on its importance) |
|---|---|---|---|---|
| | Hostels, other special areas, etc. b) School c) Religious Places d) Tourist Areas | | | Govt Homeo & Ayurvedic Hospital-558m<br>Kandalasseril Temple-162m<br>Holy Trinity school-518m |
| 2 | Is the site in Critical / Over Exploited Ground Water Block. Provide the level of the groundwater table | | ✓ | GWL 2-5m As per Ground water year book of kerala (2021-2022) Published on September 2022. |
| 3 | Is the site vulnerable to major natural or induced hazards such as Landslides, Flooding, Storm surge, Severe wind damage, Earthquakes, Fire, Explosion, Other (specify) | | ✓ | As per Disaster management plan Alappuzha the proposed location is not in the flood plain . Even if the Kerala comes in category of Zone III ,The magnitude of earth quake is nill as per DMP, Alappuzha Published in 2015. |
| 4 | Describe the type of soil and vegetation on site | | | Coastal Alluvial soil. No vegetation on site. |
| 5 | Is the site present in the flood plains as recorded in the last 100 years? Provide the HFL level of the site/region | | ✓ | As per Disaster management plan Alappuzha the proposed location is not in the flood plain |
| 6 | Existing pollution/contamination or degradation on site | ✓ | | Water contamination and Air pollution to the nearby households. Existing open dumpsite |
| 7 | Any other remark on baseline condition | | | Within the dumpsite location there is one RRF , MCF and Thumboormozhi . |

**Anticipated Environmental Impacts: Impacts on Air, Noise, Land, Geology, and Soils**
